The Alte Mainbrücke, a red sandstone structure of fourteen arches, 815 ft. long, dates from the 14th century. On it are a mill, a statue of Charlemagne and an iron crucifix surmounted by a gilded cock. Frankfurt lies at the junction of lines from Berlin to Basel, from Cologne to Würzburg and Vienna, from Hamburg and Cassel, and from Dresden and Leipzig to France and Switzerland. The river Main has been dredged so as to afford heavy barge traffic with the towns of the upper Main and with the Rhine. Frankfurt is now an important inland port, heavy barges can navigate the Main as far as Aschaffenburg, and canalization is being carried as far as Würzburg. The Rhine-Main-Danube canal is under reconstruction, and a scheme has been prepared for a waterway to the Weser, which will link Frankfurt with Bremen.

Trade, Commerce and Industries.—Frankfurt, formerly more a commercial than an industrial town, has developed its industries considerably. The famous banking houses weathered the period of inflation well, and have led the way to the restoration of Germany's economic position in the world. The suburbs of Sachsenhausen and Bockenheim have developed particularly in publishing and printing, brewing and the manufacture of quinine. It also produces type, machinery, rolling stock, asbestos, rubber, gutta-percha, soap, ready-made clothing, chemicals, electro-technical apparatus and metal wares. Market gardening is extensively carried on in the neighbourhood and much cider manufactured. There are two great fairs held in the town—the Ostermesse, or spring fair, and the Herbstmesse, or autumn fair. The former, the original nucleus of all the commercial prosperity of the city, begins on the second Wednesday before Easter; and the latter on the second Wednesday before the 8th of September. They last three weeks, and the last day save one, called the *Nickelchestag*, is distinguished by the influx of people from the neighbouring country. The trade in leather is of great and growing importance. A horse fair has been held twice a year since 1862 under the patronage of the agricultural society; and the wool market was reconstituted in 1872 by the German Trade Society (Deutscher Handelsverein). In the 17th century the town was the seat of a great book trade, but is now eclipsed by Leipzig. The *Frankfurter Zeitung* circulates widely. A memorial monument was erected in 1858 in honour of the early German printers. The statue of Goethe (1844) in the Goetheplatz is by Ludwig von Schwanthaler. The Schiller statue, erected in 1863, is the work of a Frankfurt artist, Johann Dielmann.

Government.—The present municipal constitution of the city dates from 1867. Bismarck was desirous of giving the city a more liberal constitution than is usual in ordinary cases. Formerly fifty-four representatives were elected, but provision was made for increasing the number. Since 1885 the city has been supplied with water from the Stadtwald, Goldstein and Hinkelstein. The population of Frankfurt has steadily increased since the beginning of the 19th century; it amounted in 1817 to 41,458, and in 1925 was 466,311. During the World War Frankfurt was several times bombed, and it was occupied for a short time by the French in 1920 during the invasion of the Ruhr area by German militarists.

HISTORY

Excavations around the cathedral have suggested that Frankfurt-on-Main (*Traiectum ad Moenum*) was probably founded in the 1st century of the Christian era. The first genuine historical notice of the town occurs in 793, when Einhard, Charlemagne's biographer, tells us that he spent the winter in the villa Frankonovurd. The name "Frankfurt" is also found in several official

documents of Charlemagne's reign; and from the notices that occur in the early chronicles and charters it would appear that the place was the most populous at least of the numerous villages of the Main district. During the Carolingian period it was the seat of no fewer than 16 imperial councils of colloquies.

Under the Hohenstaufens many brilliant diets were held within its walls. That of 1147 saw, also, the first election of a German king at Frankfurt, in the person of Henry, son of Conrad III. But as the father outlived the son, it was Frederick I., Barbarossa, who was actually the first reigning king to be elected here (in 1152). With the beginning of the 13th century the municipal constitution appears to have taken definite shape. The chief official was the royal bailiff (*Schultheiss*), who is first mentioned in 1193, and whose powers were subsequently enlarged by the abolition, in 1219, of the office of the royal *Vogt* or *advocatus*. About this time a body of *Schöffen* (*scabini*, jurats), 14 in number, was formed to assist in the control of municipal affairs, and with their appointment the first step was taken towards civic representative government. Soon, however, the activity of the *Schöffen* became specifically confined to the determination of legal disputes, and in their place a new body (*Collegium*) of counsellors—*Ratmannen*—also 14 in number, was appointed for the general administration of local matters. In 1311, the two burgomasters, now chiefs of the municipality, take the place of the royal *Schultheiss*. In the 13th century Frankfurt Fair (first mentioned in 1150, but clearly of greater antiquity) was largely frequented. By the famous Golden Bull of 1356 Frankfurt was declared the seat of the imperial elections, and it still preserves an official contemporaneous copy of the original document as the most precious of the eight imperial bulls in its possession. At the Reformation Frankfurt heartily joined the Protestant party, and in consequence it was hardly treated both by the emperor Charles V. and by the archbishop of Mainz. Between 1612 and 1616 occurred the great Fettmilch insurrection, perhaps the most remarkable episode in the internal history of Frankfurt. The magistracy had been acquiring more and more the character of an oligarchy, all power was practically in the hands of a few closely-related families, and the gravest peculation and malversation took place without hindrance. The ordinary citizens were roused to assert their rights, and they found a leader in Vincenz Fettmilch, who carried the contest to dangerous excesses, but lacked ability to bring it to a successful issue. An imperial commission was ultimately appointed, and the three principal rebels and several of their associates were executed in 1616. It was not till 1801 that the last mouldering head of the Fettmilch company dropped unnoticed from the Rententurm, the old tower near the bridge. The insurrection completely destroyed the political power of the guilds, gave new strength to the supremacy of the patriciate, and brought no further advantage to the rest of the citizens than a few improvements in the organization and administration of the magistracy. The Jews, who had been attacked by the popular party, were solemnly reinstated by imperial command in all their previous privileges, and received full compensation for their losses.

The independence of Frankfurt was brought to an end in 1806, on the formation of the Confederation of the Rhine; but on the reconstitution of Germany in 1815 it again became a free city, and in the following year it was declared the seat of the German Confederation. In April 1833 occurred what is known as the Frankfurt Insurrection (*Frankfurter Attentat*), in which a number of insurgents led by Georg Bunsen attempted to break up the diet. During the revolutionary period of 1848 the people of Frankfurt, where the united German parliament held its sessions, took a chief part in political movements, and the streets of the town were more than once the scene of conflict. In the war of 1866 they were on the Austrian side. On July 16 the Prussian troops, under Gen. Vogel von Falkenstein, entered the town, and on Oct. 18 it was formally incorporated with the Prussian State. A fine of 6,000,000 florins was exacted. On May 10, 1871 the treaty which concluded the Franco-German War was signed in the Swan hotel by Prince Bismarck and Jules Favre, and it is consequently known as the Peace of Frankfurt.

FRANKFURT-ON-ODER, a town of Germany, in the Prussian province of Brandenburg, 50 m. S.E. from Berlin by rail. Pop. (1925) 70,725. It owes its origin and name to a settlement of Franconian merchants, in the 13th century, on land conquered from the Wends. In 1253 it was made a town by the margrave John I. and borrowed from Berlin the Magdeburg civic constitution. In 1379 it received the right to free navigation of the Oder; it belonged (1368–c. 1450) to the Hanseatic League. The university, opened in 1506, was removed in 1516 to Kottbus and restored again to Frankfurt in 1539. It was dispersed during the Thirty Years' War and again restored by the Great Elector, but finally transferred to Breslau in 1811.

In the 15th century Frankfurt successfully withstood sieges by the Hussites (1429 and 1432), by the Poles (1450) and by the duke of Sagan (1477). Also in the Thirty Years' War and Napoleonic Wars it suffered much.

The town proper lies on the left bank of the river Oder and is connected by a stone bridge 900 ft. long, with the suburb of Damm. The Evangelical Marienkirche (Oberkirche), a brick edifice of the 13th century with five aisles, and the Rathaus dating from 1607, and bearing the device of a member of the Hanseatic League, are notable. Frankfurt-on-Oder was long the seat of the court of appeal for the province, but of this it was deprived in 1879. Its industries include the manufacture of machinery, metal ware, chemicals, paper, leather and soap. It has an extensive system of water communication by means of the Oder and its canals to the Vistula and the Elbe. Trade in corn, cattle and wine is fostered by its three annual fairs, held respectively at *Reminiscere* (the second Sunday in Lent), St. Margaret's day and at Martinmas. In the neighbourhood are extensive coal fields.

FRANKINCENSE or **OLIBANUM**, a gum-resin obtained from certain species of trees of the genus *Boswellia*, and natural order *Burseraceae*. Sir George Birdwood distinguishes five species of *Boswellia*: (A) *B. thurifera*, Colebr. (*B. glabra* and *B. serrata*, Roxb.), indigenous to the mountainous tracts of central India and the Coromandel coast, and *B. papyrifera* (*Plösslea floribunda*, Endl.) of Abyssinia, which, though both thuriferous, are not known to yield any of the olibanum of commerce; and (B) *B. Frereana*, *B. Bhua-Dajiana*, and *B. Carterii*, the "Yegaar," "Mohr Add," and "Mohr Madow" of the Somali country, in East Africa. The last species including a variety, the "Maghrayt d'Sheehaz" of Hadramaut, Arabia, all of which are sources of true frankincense or olibanum. To obtain the frankincense a deep incision is made in the trunk of the tree, and below it a narrow strip of bark 5 in. in length is peeled off. When the milk-like juice ("spuma pinguis," Pliny) which exudes has hardened by exposure to the atmosphere, the incision is deepened. In about three months the resin has attained the required degree of consistency. The season for gathering lasts from May until the first rains in September. The large clear globules are scraped off into baskets, and the inferior quality that has run down the tree is collected separately. Much as formerly described by Arrian, in the region of Sakhalite in Arabia (the tract between Ras Makalla and Ras Agab), so now on the sea-coast of the Somali country, the frankincense when collected is stored in heaps at various stations. Thence, packed in sheep- and goat-skins, in quantities of 20 to 40 lb., it is carried on camels to Berbera, for shipment either to Aden, Makalla and other Arabian ports, or directly to Bombay. At Bombay, like gum-acacia, it is assorted, and is then packed for re-exportation to Europe, China and elsewhere. Olibanum is a reputed natural product of China.

Frankincense, or olibanum, occurs in commerce in semi-opaque, round, ovate or oblong tears or irregular lumps, which are covered externally with a white dust, the result of their friction against

one another. It has an amorphous internal structure, a dull fracture; is of a yellow to yellowish-brown hue, the purer varieties being almost colourless, or possessing a greenish tinge, and has a somewhat bitter aromatic taste, and a balsamic odour, which is developed by heating. Immersed in alcohol it becomes opaque, and with water it yields an emulsion. It contains about 72% of resin soluble in alcohol (Kurbatow); a large proportion of gum soluble in water, and apparently identical with gum arabic; and a small quantity of a colourless inflammable essential oil, one of the constituents of which is the body oliben, $C_{10}H_{16}$. Frankincense burns with a bright white flame, leaving an ash consisting mainly of calcium carbonate, the remainder being calcium phosphate, and the sulphate, chloride and carbonate of potassium (Braconnot). Good frankincense, Pliny tells us, is recognized by its whiteness, size, brittleness and ready inflammability. That which occurs in globular drops is, he says, termed "male frankincense"; the most esteemed, he further remarks, is in breast-shaped drops, formed each by the union of two tears. The best frankincense, as we learn from Arrian, was formerly exported from the neighbourhood of Cape Elephant in Africa (the modern Ras Fiel); and A. von Kremer, in his description of the commerce of the Red Sea (*Aegypten*, etc., p. 185, ii. Theil, Leipzig, 1863), observes that the African frankincense, called by the Arabs "asli," is of twice the value of the Arabian "luban." Frankincense was used by the ancient Egyptians in their religious rites, but, as Herodotus tells us (ii. 86), not in embalming. It constituted a fourth part of the Jewish incense of the sanctuary (Ex. xxx. 34), and is frequently mentioned in the Pentateuch. With other spices it was stored in a great chamber of the house of God at Jerusalem (1 Chron. ix. 29, Neh. xiii. 5-9).

As a medicine it was in former times in high repute. Pliny (*Nat. Hist.* xxv. 82) mentions it as an antidote to hemlock. Avicenna (ed. Plempii, lib. ii. p. 161, Lovanii, 1658, fol.) recommends it for tumours, ulcers of the head and ears, affections of the breast, vomiting, dysentery and fevers. In the East frankincense has been found efficacious as an external application on carbuncles, blind boils and gangrenous sores, and as an internal agent is given in gonorrhoea. In China it was an old internal remedy for leprosy and struma, and is accredited with stimulant, tonic, sedative, astringent and vulnerary properties. It is not used in modern medicine, being destitute of any special virtues. (See Waring, *Pharm. of India*, p. 443, etc.; and F. Porter Smith, *op. cit.*, p. 162.)

Common frankincense (*thus*, or *abietis resina*), is the term applied to a resin which exudes from fissures in the bark of the Norway spruce fir, *Abies excelsa*, D.C.; when melted in hot water and strained it constitutes "Burgundy pitch," *Pix abietina*.

FRANKING. A term used for the right of sending letters or postal packages free (Fr. *franc*) of charge. The privilege was claimed by the House of Commons in 1660 in "a Bill for erecting and establishing a Post Office," their demand being that all letters addressed to or sent by members during the session should be carried free. The clause embodying this claim was struck out by the Lords, but with the proviso in the Act as passed for the free carriage of all letters to and from the King and the great officers of state, and also the single inland letters of the members of that present parliament during that session only. It seems, however, that the practice was tolerated until 1764, when, by an Act dealing with postage, it was legalized, every peer and each member of the House of Commons being allowed to send free ten letters a day, not exceeding an ounce in weight, to any part of the United Kingdom, and to receive 15. The Act did not restrict the privilege to letters either actually written by or to the member, and thus the right was very easily abused, members sending and receiving letters for friends, all that was necessary being the signature of the peer or M.P. in the corner of the envelope. Wholesale franking grew usual, and M.P.'s supplied their friends with envelopes already signed to be used at any time. In 1837 the scandal had become so great that more strict regulations came into force. The franker had to write the full address, to which he had to add his name, the post-town and the day of the month; the letter had to be posted on the day written or the following day at the latest, and in a post-town not more than 20m. from the place

where the peer or M.P. was then living. On Jan. 10, 1840, parliamentary franking was abolished on the introduction of the uniform penny rate.

In the United States the franking privilege was first granted in Jan. 1776 to the soldiers engaged in the American War of Independence. The right was gradually extended till it included nearly all officials and members of the public service. By special Acts the privilege was bestowed on Presidents and their widows. By an Act of March 3, 1845, franking was limited to the President, vice-president, members and delegates in Congress and postmasters, other officers being required to keep quarterly accounts of postage and pay it from their contingent funds. In 1851 free exchange of newspapers was re-established. By an act of March 3rd, 1863, the privilege was granted the President and his private secretary, the vice-president, chiefs of executive departments, such heads of bureaus and chief clerks as might be designated by the postmaster-general for official letters only, senators and representatives in Congress for all correspondence, senders of petitions to either branch of the legislature and to publishers of newspapers for their exchanges. There was a limit as to weight. Members of Congress could also frank, in matters concerning the federal department of agriculture, "seeds, roots, and cuttings," the weight to be fixed by the postmaster-general. This Act remained in force till Jan. 31, 1873, when franking was abolished. Since 1875 by sundry Acts, franking for official correspondence, government publications, seeds, etc., has been allowed to congressmen, ex-congressmen (for nine months after the close of their term), congressmen-elect and other government officials. By special acts the franking privilege was granted to the widows of Presidents Garfield, Grant, McKinley, Cleveland, Roosevelt, Harding and Wilson.

FRANKL, LUDWIG AUGUST, RITTER VON HOCHWART (1810-1894), Austrian poet, was born at Chrast, Bohemia, on Feb. 3, 1810. In 1838 he became secretary of the Jewish community in Vienna. In the revolutionary year of 1848 his poem, *Die Universität*, had an enormous circulation. He wrote lyrics, epic and many excellent critical works on his contemporaries. He is perhaps best remembered for his services to Jewish education. He established the first Jewish school in Jerusalem, and wrote an account of his eastern travels, *Nach Jerusalem* (2 vols., 1858).

See his *Briefwechsel* (1907), edit. Bruno Frankl; his *Erinnerungen* (1910), edit. St. Hock.

FRANKLAND, SIR EDWARD (1825-1899), English chemist, was born at Churchtown, near Lancaster, on Jan. 18, 1825. In 1845 he entered Lyon Playfair's laboratory in London, subsequently working under R. W. Bunsen at Marburg. In 1847 he was appointed science-master at Queenwood school, Hampshire, where he met J. Tyndall, and in 1851 first professor of chemistry at Owens college, Manchester. Returning to London six years later he became lecturer in chemistry at St. Bartholomew's hospital, and in 1863 professor of chemistry at the Royal Institution. In 1865 he succeeded A. W. von Hofmann at the School of Mines, where he remained for twenty years. In 1894 he received the Copley medal, the highest honour of the Royal Society. He was made a K.C.B. in 1897 and died while on holiday at Golaa (Norway) on Aug. 9, 1899.

Analytical problems, such as the isolation of certain organic radicles, attracted his attention to begin with, but he soon turned to synthetical studies, and he was only about twenty-five years of age when he discovered the organo-metallic compound. A consideration of these and other substances led Frankland, in 1852, to the conception that the atoms of each elementary substance can only combine with a certain limited number of the atoms of other elements. The theory of valency thus founded dominated the subsequent development of chemical doctrine, and formed the basis of modern structural chemistry.

In applied chemistry Frankland's great work was in connection with water-supply. He was appointed a member of the second royal commission on the pollution of rivers in 1868, and in the course of six years he brought to light an enormous amount of valuable information respecting the contamination of rivers by sewage, trade-refuse, etc., and the purification of water for domes-

tic use. He also showed that the luminosity of a flame was not only connected with the presence of solid particles, but also with the pressure of the burning gas or vapour; even hydrogen at a pressure of 10 to 20 atmospheres burns with a luminous flame. Further, he showed that the spectrum of a dense ignited gas resembles that of an incandescent liquid or solid, and he traced a gradual change in the spectrum of an incandescent gas under increasing pressure. An application of these results to solar physics in conjunction with Sir Norman Lockyer led to the view that at least the external layers of the sun cannot consist of matter in the liquid or solid forms, but must be composed of gases or vapours. Frankland and Lockyer were also the first to realise the existence of helium (*q.v.*).

See memorial lecture delivered by Professor H. E. Armstrong before the London Chemical Society on Oct. 31, 1901, also *Journal of the Chemical Society* (1905); *Autobiographical Sketches* (1902); W. A. Tilden, *Famous Chemists* (1902). His original papers, down to 1877, were collected and published as *Experimental Researches in Pure, Applied and Physical Chemistry*.

FRANKLAND, PERCY FARADAY (1858—), British chemist, second son of Sir Edward Frankland, was born in London on Oct. 3, 1858. He was educated at the Royal School of Mines and at Würzburg. In 1888 he was appointed professor of chemistry at Dundee, and then occupied the chair at Mason college, Birmingham, from 1893 to 1918. He was awarded the Davy medal of the Royal Society in 1919. His work in pure chemistry was concerned chiefly with optical activity and stereo-chemistry. He has also been interested in problems of water purification and sewage treatment, and made a special study of micro-organisms in connection with these matters. He has also worked on the subject of fermentation and gave the Pasteur Memorial lecture to the Chemical Society in 1897.

He has written a number of books including, *Micro-organisms in Water* (1894) and *Life of Pasteur* (1897).

FRANKLIN, BENJAMIN (1706–1790), American philosopher, statesman and man of letters, was born in Boston on Jan. 17, 1706 (old style, Jan. 6), and was baptized at once in the Old South church, thus beginning his life in a thoroughly puritan environment. His father, Josiah Franklin, had come from England where he had worked first at Banbury as a dyer. There he married and had three children. About the year 1685 he left England and settled in Boston, Mass., then a city of 5,000–6,000 inhabitants. He gave up his trade of dyer and became a tallow chandler and soap boiler. He was a hardworking, serious and strong man, always much respected by his son Benjamin, who describes him minutely and affectionately in his autobiography: "He had an excellent constitution of body, was of middle stature, but well set and very strong; he was ingenious, could draw prettily, was skilled a little in music, and had a clear, pleasing voice, so that when he played psalm tunes on his violin and sung withal, as he sometimes did in an evening after the business of the day was over, it was extremely agreeable to hear. He had a mechanical genius, too, and, on occasion, was very handy in the use of other tradesmen's tools; but his great excellence lay in prudential matters, both in private and public affairs." The family had been Protestant for a long time and Josiah Franklin was a Nonconformist.

Boyhood.—The first wife of Josiah Franklin died in 1689 and he married very soon after Abiah Folger, daughter of Peter Folger, one of the first settlers of the island of Nantucket, a broad-minded, "godly, learned Englishman." By her Josiah Franklin had ten children, six boys and four girls. Benjamin was the last one of the boys. Boston was then a small city but a thriving and growing one, and Josiah Franklin gave a good education to each of his children. He sent Benjamin to a grammar school at the age of eight, intending him for the Church; there he kept him a year, sending him afterwards to George Brownell's school for writing and arithmetic. When the boy was ten his father apprenticed him to his own business, but Benjamin did not like it. He dreamed restlessly of the sea, and his father became aware that if something were not done quickly the boy would follow the example of one of his elder brothers and leave suddenly. To prevent this he tried to find some business which would suit the character

and fancy of his son. Finally he put him as apprentice with his half-brother James, who was a printer in Boston. Benjamin was then a healthy, sturdy and bold little boy. He was equally strong physically and mentally. He had learned to swim and do all kinds of physical exercises. But at the same time he had become a bookish lad and had read all the books he had been able to find or to buy, especially Bunyan's *Pilgrim's Progress*, Locke, *On the*

Human Understanding, the *Spectator* (3rd vol.), Plutarch's *Lives*, Defoe's *Essay on Projects* and Mather's *Essay to do Good*.

From the age of 12 to the age of 17 he worked with his brother. James Franklin was young, eager to make a success and daring. He established a newspaper which was the rallying centre of the liberal minds of Boston at a time when theocracy and the ruling aristocracy of puritans were beginning to lose their supremacy. The *New England Courant* (established Aug. 1721) has been called the "first sensational newspaper of America." It was often in trouble with the Government and James found himself at one time in such difficulties that he had to ask the boy to publish the sheet under his name (Feb. 11, 1723).

In this atmosphere of intellectual excitement and political struggle Benjamin developed quickly. His first articles, the famous *Dogood Papers*, are full of juvenile charm, and, although in close imitation of the English *Spectator*, have a certain quality of intelligent realism and accuracy which is all their own. He quarrelled with his brother and would not listen to his father who tried to reconcile them. Finally he left the city with a young friend, Collins. He sailed for New York and Philadelphia, arriving in the latter city in Oct. 1723. He found a job as printer with a certain Keimer, a rather queer and unreliable man. The governor of Pennsylvania, William Keith, noticing him for his appearance, his industry and his reputation of learning, offered to help the boy to set up a printing press for himself. Benjamin went to Boston to try to get the permission and backing of his father, but the latter thought him too young and inexperienced. Having returned to Philadelphia he was persuaded by Keith to go to London

to finish his education as a printer and collect the things needed to establish a printing firm at Philadelphia. The governor had promised to give him a letter of credit and some useful letters of introduction, but being himself in trouble with the Penn family and having apparently a weak character, Keith failed to fulfil his promise and Franklin found himself in London with little money, no English friend, and no other means of livelihood than his trade (Dec. 1724).

Early Life as Printer.—He worked as a journeyman printer at Palmer's printing house for about a year, then at Watts's printing house, where he met a number of the men who became great in the English publishing world of the 18th century. He had sailed from Philadelphia with a friend, Ralph, a dissolute boy, who spent all their money, until they separated. At this period Franklin seems to have been nearly an unbeliever. He wrote then and printed himself in a small edition his *Dissertation on Liberty and Necessity, Pleasure and Pain* (1725), in which he endeavoured to prove that everything we do is according to fate. The booklet attracted some attention and gave him a chance to meet some of the leaders of the deists, especially Mandeville. His pleasant appearance, his industry, cleverness and skill in swimming made him many friends and, had he stayed in England, he would doubtless have had a successful English career. He chose to go back to Philadelphia.

He accepted the proposal of Denham, a wealthy Quaker merchant who became interested in him and offered him a situation as clerk and bookkeeper in the store he intended to open in Philadelphia. After about 19 months in England Franklin sailed from Gravesend (July 21, 1726), and landed in Philadelphia on Oct. 11. He was then 20 years old, but the formative period of his life was ended. He had seen and learned much. From his family he had received that earnest, hardworking temperament which helped him so much in his long life of struggle, difficulties and well-earned success. From the same origin and the Boston culture he seems to have derived that deep feeling for religion, prayer and morality, which after a short crisis was never to leave him. From his early readings, from the little group of Liberals in Boston, from his associations in London, he secured that intellectual impetus, that clearness and boldness of mind, too enthusiastic at the beginning

BENJAMIN FRANKLIN

of his life, but later tempered by moderation and good sense, which made him the most acute and broadminded thinker of his time. By 1726 Benjamin Franklin had all these qualities and he continued to show them steadily for more than 60 years. After a few months in Denham's store both were taken ill and Denham died. When Franklin recovered, he went back to the printing business and hired out again to Keimer who used him to run his printing house while he himself took care of the stationer's shop (1727). The following year, with the co-operation of Hugh Meredith, a fellow workman, he established a printing house for himself and was able in ten years to make it the most flourishing business of this kind in the English colonies. It was not only the co-operation of a few friends, his untiring activity and common sense, which made his success, but also his imagination and initiative. He had planned to create a newspaper and purchased the *Pennsylvania Gazette* in Sept. 1729. It was then a dull, poorly printed sheet, appearing weekly. Franklin made it alive, liberal and amusing. Besides the news items, which were entertaining, well chosen or well invented, he wrote various articles and essays. The circulation at the beginning was small but finally became the largest in America, 8,000–10,000, and the advertisements,

which he had developed from the time he took control of the paper, proved very profitable. In 1732 he wrote and sold his first *Poor Richard's Almanack*, the book which was to make his fortune. For many Americans of that time the Almanacks were the only publications bought regularly and read carefully. Franklin's Almanack, full of wisdom, wit and useful hints, was soon the most widely read in all the colonies. Later he collected the best of his maxims (1757) and published them as the "Speech of Father Abraham" in the Almanack of that year.

Activity in Philadelphia.—In 1730 Franklin became public printer for Pennsylvania, a position which added not a little to his social prominence and to his business. The same year (Sept. 1730) he married Deborah Read whom he had loved as early as 1723. But when he went to England she thought he had deserted her (and he was not far from agreeing) and she married another man. This man having disappeared the two young people decided to become husband and wife. She seems to have made him a good wife; and Franklin reciprocated her affection. When they married Franklin already had a son (maybe by her?) to whom she was kind. Later they had another boy who died of smallpox (Francis Folger Franklin, 1732–36) and a girl, Sarah Franklin, born in 1744, who married Richard Bache, a young merchant in 1767. Franklin was a tender father and the death of his son was a lifelong sorrow to him. At the time that he was building his business and his fortune he did not forget his great moral and social aims. In 1727 he founded with several young men of Philadelphia a kind of club, resembling very much a freemason lodge. This little group known at first as the Leathernapron club, but always called by him "The Junto," played a great part in Franklin's life. It was there that he learned to be a leader of men and acquired his first group of staunch friends. With the help of this group, which grew rapidly, Franklin began to be known as a public man in Philadelphia. The pamphlet he published in favour of paper money (*A Modest Inquiry into the Nature and Necessity of a Paper Currency*, 1729), at a time when the colony was in great need of more currency attracted much attention. Gradually he became one of the most influential citizens of the growing city, respected for his thrift, his public-spirited activities and his wisdom. In 1731 he founded the Library Company, the first circulating library established in America. He had become a freemason (Feb. 1731) and in 1732 was elected grand master of the grand lodge of Pennsylvania, which broadened his scope of activity and influence. In 1736 he was chosen clerk of the Pennsylvania Assembly (1736–1751) and the same year he organized the first fire company in Philadelphia, a much-needed institution where nearly all the buildings were of wood. In 1737 he was appointed postmaster at Philadelphia, a position which enabled him quite honestly to give a new impetus to his newspaper and distribute it more easily.

The field of his activities was constantly broadening. He was not only the first printer and bookseller of Philadelphia, he also established a printing office in New York in partnership with James Parker (1741), having previously done the same thing, in Charleston, S.C., in 1733, and later he sent an outfit to Antigua. He was also interested in a printing office in Kingston, Jamaica, and subsequently helped two of his nephews who had been his apprentices to establish themselves as printers. In the end he had business connections with most of the English colonies in America: Boston, New Haven, New York, Charleston, etc. By these means and by a careful economy he acquired a competence and thought of retiring from active business. A Scotch journeyman, David Hall, who had been sent to him by his English friend, Peter Collinson, became his partner in 1748. "The partnership continued 18 years successfully for us both," Franklin wrote later. To give an idea of the prosperity of their industry one need simply quote the profits of his printing office, which during that time amounted to about £1,000 a year.

As soon as he had Hall with him he found time to start a new line of activity. Franklin had always a curious and fertile mind and occasionally in the *New England Courant*, and the *Pennsylvania Gazette* he printed little philosophical or scientific essays of his own, on earthquakes for instance; but he had previously

never been able to devote much time to research, although since 1733 he had studied in his spare hours French, Italian, Spanish and Latin. In 1743 he founded the American Philosophical Society. He had invented a new kind of open stove, a great improvement on its predecessors, but he was tempted to the more recondite kinds of research. At a time when the discoveries of Muschenbroek and his disciples and the recent experiments of the Leyden jar had attracted the attention of the whole world, Franklin, in his modest and remote home in Philadelphia, began to experiment with a small apparatus sent to him from England by Peter Collinson (1745). He was naturally versatile and as electricity was still in its very infancy, and the theories to explain it were most unsatisfactory, his accuracy and common sense led him to the discovery of the identity of lightning and electricity (1752). He was not the first to think of it but he was the first to prove it. He framed a new theory of electricity, involving the existence of two different kinds of electricity, which he called positive and negative, a division which still holds good. He finally invented a means of avoiding the disastrous effects of lightning, the lightning rod, which gave him a public prestige equalled by few scientists of the 18th century (1748-52). In 1749 he retired from printing but continued to advise, help and back Hall. During his 21 years of active business he had been a good, progressive printer, issuing such interesting and useful books as the medical treatises of Cadwallader Colden, *Essay on the Iliac Passion*, *Essay on the West India Dry Gripes*, or the reprint of Richardson's *Pamela* (1744), the first novel printed in America; but his *Poor Richard's Almanack* was his best venture, as is proved by the innumerable translations and reprints. By 1900 75 English editions of the "Sayings of Poor Richard" were known, 56 French, 11 German and nine Italian, and the list is by no means complete. (See ALMANAC.)

Entry into Politics.—His political career was equally brilliant and eventful. He was elected in 1748 a member of the city council and in 1750 a member of the assembly of Pennsylvania, to which office he was re-elected annually for 14 years. During that time he was one of the most active and efficient members. He sided with what might be called the popular and progressive party. The most important question at issue was whether the estates of the proprietaries, the Penn family, should or should not pay taxes, as did the other landowners. The popular party and Franklin contended that they should, but the Penns flatly refused. Consequently parliamentary life in Pennsylvania was a long conflict. The enemies of the proprietaries were at the same time ardent patriots and looked to the Crown to make Pennsylvania a royal province. In the middle of this struggle two wars came and made the situation critical at times (1744-48 and 1755-63). The Quakers, in accordance with their principles, would not serve as soldiers or appropriate money for arms and ammunitions; the Penns would give no money or scarcely any; the remaining inhabitants saw no reason to pay money or fight for people who did not want to fight; and finally the Germans, who had settled in large colonies in the western parts of Pennsylvania, were suspected of being pro-French, because many of them were Roman Catholics. In the midst of all these difficulties Franklin proved himself a faithful subject of the king and a staunch loyalist. With the help of the middle class of Philadelphia and of his friends (the "Junto" and the Freemasons) he stimulated interest in the establishment of a militia and fostered the organization of an association of volunteers for the defence of the city and province. To achieve this aim he wrote a strong pamphlet: *Plain truth, or Serious Considerations on the present state of the city of Philadelphia and Province of Pennsylvania* (1747). In 1753 he was sent as a member of the commission from the council and assembly to confer with the Indians of Carlisle with respect to a treaty to protect the western frontiers of Pennsylvania. In 1754 again he went to Albany as a commissioner for Pennsylvania at the congress which met to confer with the chiefs of the "Six Nations" and to get their help against the French. Struck by the magnitude of the danger Franklin wrote his famous *Plan for a Union of the English Colonies in America*, which was finally turned down in London. In 1755 he aided Gen. Braddock, who had been sent

from England to attack the French in the west, to transport his army to the theatre of operations by establishing a system of transport. He did it at his own risk, as the province was occupied with internal disputes, which left no time for the war. After Braddock's defeat and at a moment of panic he entered the military service and accepted the dangerous mission of organizing the north-western frontier which was constantly subjected to bloody raids by the Indians. When this danger disappeared the popular party decided to send Franklin to England to see if an agreement could be made with the proprietaries. He had planned for several years to go to London; see his old friends, meet his new scientific friends who had received with such warm enthusiasm the papers he had sent them: *Experiments and Observations on Electricity made at Philadelphia in America* (1751); *Supplemental Experiments and Observations on Electricity* (London, 1753); *New Experiments and Observations on Electricity made at Philadelphia in America* (1754). These books had attracted so much attention that he had received the Copley medal from the Royal Society in London, and a complimentary letter from Louis XV. (1753).

He was then a rich and influential man. His *Gazette*, to which he still contributed, was very widely read, and having been deputy postmaster-general for America since 1753 he could do much to circulate it all over the colonies, from Carolina to Massachusetts. Although this post was a very difficult one, he hoped to make it useful both for himself and his country. He succeeded. After a few years the American post office, which had never brought any income to the English administration, began to prosper. From Aug. 1753 to Aug. 1756 there was a deficit of £678 7s. 2d. From Aug. 1761 to the beginning of 1764 there was a surplus of £2,070 12s. 3d. One of the most valuable evidences of Franklin's devotion to the public interest (besides an improvement in Philadelphia street paving, street lamps and a hospital) was the Academy of Philadelphia, called first "The Academy and Charitable School of the Province of Pennsylvania," and later the "University of Pennsylvania." As early as 1743 Franklin had printed and circulated a paper *Proposals for establishing an Academy*. In 1749 he succeeded in getting the necessary support and the academy was established. Franklin delighted in it, although it was to be also a great source of annoyance. He had in mind when he proposed it the organization of a new and up-to-date institution, where the children of Philadelphia should be taught practical things and, especially, instructed in English. The English language was for him the centre of the proposed education. But there he ran against a general prejudice of the upper classes of the 18th century. His money, his activity and his support were accepted but little by little his plan was changed, the academy was made a classical school, Latin was given the first place and English gradually allowed to drop. All Franklin's efforts against this only made him unpopular and were used against him by his enemies, mainly by William Smith, a clergyman, whom he had himself generously and imprudently introduced into the academy and made provost.

Visits to England.—England received him cordially (1757). The University of St. Andrews conferred upon him the degree of doctor of laws in 1759 and the University of Oxford the degree of doctor of civil laws in 1762. He was already a member of the Royal Society (elected 1752), where he became influential. He had innumerable friends, some political or fashionable like Sir Francis Dashwood (Lord Le Despenser), Lord Shelburne, Sir Grey Cooper and later the elder Pitt, others more intimate and intellectual, like Priestley, Price and Sir John Pringle (the king's physician). His activities were manifold. But the most important was his work for Pennsylvania, for in 1760 he succeeded in persuading the Penn family to agree finally to some taxation of their estates. He published in London *Some account of the Success of Inoculation for the Smallpox in England and America* (1760), and in the same year his *Parable against Persecution*. In 1760 also he took part in the discussion concerning the conditions of peace England should ask or rather impose and wrote his famous pamphlet, *The Interest of Great Britain considered with regard to her Colonies*, which is thought to have had great weight in the de-

sion of the English ministry to retain Canada rather than Guadeloupe. In 1761 he made a tour of Holland and then returned to Philadelphia (Nov. 1, 1762). His return was triumphant, but this was not to continue long. In the midst of the happiness of the peace of 1763 the English colonies of America were thunderstruck by the bloody Pontiac war and other Indian troubles. At the same time the new governor, John Penn, repudiated the agreement of 1760. The old quarrel started again and this time Franklin came out openly in favour of a radical change in the status of the province to that of a royal province. The election of 1764 was most bitterly disputed. Franklin and his intimate friend and adviser, Galloway, failed of re-election, but their party kept its majority and he was sent again to England, this time to ask openly that the king take over Pennsylvania.

He sailed in November and started to work at once only to find himself in an awkward position. Just at the time when Pennsylvania was throwing itself into the arms of the king the ministers of the king imposed upon the colonies a Stamp Act, the very idea of which was hated throughout America. So Franklin had at once to combat the ministers and to treat them as chosen patrons. Small wonder that things were not easy during these years. When the Stamp Act was passed, he thought that the best thing would be to accept it temporarily. This, however, was not the view of the people at home and he had to change his point of view, not without bitter criticism. Finally he was fortunate enough to see the Stamp Act repealed in 1766, largely through his efforts, and as a result of his famous examination before the House of Commons (Feb. 1766). This success made him the best known of all Americans both in Europe and the New World. Georgia appointed him her agent in London in 1768 and Massachusetts in 1770. He visited Ireland and Scotland in 1771, where he was received with the utmost courtesy, especially by the learned circles of Edinburgh. He went to France in Aug.-Sept. 1767 and July-Aug. 1769, and to Germany (June, 1766). He found everywhere the same enthusiastic welcome.

His work did not give him much leisure. Immediately after the repeal of the Stamp Act new schemes and methods of taxing the American colonies were devised in England (Townshend's Acts, 1767). Franklin fought tirelessly against them, but every day his attitude as an ardent American, a faithful subject of the king and a good British citizen became more difficult to sustain. He thought he had found a way when he laid hands on a bunch of papers which proved that many of the most objectionable measures against the colonies had been taken on the advice of certain "American Tories," especially Gov. Hutchinson of Massachusetts. Franklin thought it would be a master stroke to show the Americans that if the English king, ministry and people had done offensive things against America, they had at least the excuse of having been incited by people in America itself. If the English ministers had been farsighted they could have derived great advantage from this, but they saw in Franklin's act only an attack upon some of the most faithful servants of the Crown. Franklin had sent the letters to Massachusetts and had allowed his friends to circulate them. The assembly of Massachusetts had written a "Petition to the King for the removal of Gov. Hutchinson." This document was at once loyal to the king and bitter against Hutchinson, whose friends lost no time in instigating a counter intrigue. As a result Franklin was called before the privy council, examined, and insulted by Wedderburn, the attorney-general, who called him a thief (Jan. 1774). A few days later he was dismissed from his office of deputy postmaster-general, and it was rumoured that his arrest was contemplated. He nevertheless stayed a little longer in England, then sailed for Philadelphia a famous but a beaten man. He had failed in what had been one of his chief purposes in life: to keep the British empire united and help America to grow inside the empire.

His Mission to France.—He came back to America with the prestige of having lost a high position and thrown away a brilliant career for the sake of his country. His situation, at one time rather unsafe because of the hostility of the upper classes in Pennsylvania and Massachusetts, was again prominent and solid. He was at once made a member of Congress, elected postmaster-

general of the colonies (1775), then chosen as one of the three commissioners of Congress to Canada (1776). He went to Montreal but could not stir up any enthusiasm in favour of independence or an alliance with the Protestant colonies, and, after many dangers and great fatigue, returned to Philadelphia, where he presided over the constitutional convention of Pennsylvania. Congress elected him one of a committee to frame the Declaration of Independence, which was written by Jefferson, but corrected by Franklin. In Sept. 1776 he was chosen as one of three commissioners to France, whose help was sorely needed. And although the English cruisers, the winter weather and his old age made it a most dangerous enterprise, he sailed at once.

He arrived in France in Dec. 1776. His reputation as a scientist and Liberal philosopher had preceded him and he was at once popular, but his task was not easy. He knew that the war would be prolonged and the help of France most needed. But he came to this absolute, Catholic and traditional monarchy as the envoy of rebel provinces to ask the assistance of Louis XVI. against a legitimate king, in favour of insurgents, who were Protestants, and had been for a century and a half the bitterest enemies of France in the New World. He had against him many prejudices, many principles; the prestige of England, the peaceful temper of Louis XVI. and his ministers, and the situation of France, which was in dire need of financial reforms and economy. Moreover, he had no assistance other than that of ignorant, clumsy or jealous Americans, and his grandson William Temple Franklin, a boy of 18, illegitimate son of William Franklin, governor of New Jersey for the king of England and a staunch Tory.

Franklin had lost his wife in Jan. 1773. His only son had deserted him for the other side, his house and property were at times in the hands of his enemies. He was cut off from his English friends and many of his old friends in America were dead or had become Tories. In these tragic circumstances Franklin worked as courageously and as efficiently as if he had been a man in the prime of life. He had been a member of the French Academy of Sciences since 1772, and had many friends among the French scientists and philosophers at a time when philosophy was the fashion in France. He made use of them and met through them all kinds of people. He fascinated everybody, mostly the ladies, who were not a negligible part of high society at the time. He accepted the hospitality of a wealthy French financier, Le Ray de Chaumont, and lived at Passy near Paris, in wise obscurity. Vergennes esteemed him. He went to Versailles regularly and was able to keep in touch with the French administration. He persuaded them to help America financially and materially by sending foodstuffs, arms and ammunition, and led them into an alliance which was signed at Versailles in Feb. 1778.¹ A few weeks later (March 20) he was received by the king and queen who treated him most civilly. But this was not the end of his troubles. The war was slower, longer and more difficult than the French had expected, and Franklin was obliged to ask constantly for more money. He received from the king and his Government about 10 million French *livres* as a gift and 45 million *livres* in loans, a large sum for the time. He had at the same time to fight English propaganda. To achieve this he gave out many articles and news items, particularly to the curious newspaper *Les Affaires de l'Angleterre et de l'Amérique* (1776-79), and published several of his famous and successful hoaxes, *An Edict of the King of Prussia* (1773), *Letter of the Count de Schaumburg to the Baron Hohendorf Commanding the Hessian troops in America* (1777), the fictitious *Supplement to the Boston Chronicle* (1782), etc. At the same time he wrote and distributed amongst a few chosen friends his charming little pieces called *Bagatelles*, full of wit, emotion and wisdom. He dedicated some of them to Madame Helvétius, the still beautiful widow of the famous philosopher (whom he had tried to marry), and some to Madame Brillon, the charming wife of a French financier, who had taken the title and position of "his daughter," but all these pleasures were disturbed by the sour jealousy of his American colleagues, espe-

¹To tell the truth the department of foreign affairs in France had been hoping for the American revolution for years, and was very willing to help it.

cially Arthur Lee and John Adams. Both were suspicious of the French and could not agree with Franklin on anything. In 1781 when he was appointed a member of the commission to negotiate a treaty of peace between England and the United States he was overruled by his colleagues, who obliged him to ignore the instructions Congress had given and to negotiate with England without consulting Vergennes. Finally the treaty was signed at Versailles on Sept. 3, 1783. Franklin's last two years in France are really a curious spectacle of a popularity that was almost like an apotheosis. He was so prominent that the king of France made him one of the commissioners to report on Mesmer and animal magnetism (1784). His position as one of the highest dignitaries in freemasonry (he was "venerable" of the lodge of the Nine Sisters—the most intellectual and seemingly the most important in France in 1779–81) put him in contact with all the philosophers and future revolutionaries, and he did much to develop and clarify their ideas. He wished to see France more liberal but was opposed to any violent revolution.

Later Life.—His resignation as minister to France was accepted by Congress in 1785 and he returned at once to Philadelphia where he arrived in Sept. after spending a few days on the English coast with old friends and his son, with whom he was reconciled, although his attitude during the war had deeply hurt him.

He was elected president of the commonwealth of Pennsylvania and re-elected thrice. Surrounded by his children (his daughter and his son-in-law, Mr. and Mrs. Bache and their family) he led a happy and busy life, building three houses, trying to finish his autobiography (commenced in England in 1771, continued in France in 1784, but brought up only to 1757). In 1787 he was appointed a delegate to the constitutional convention and in it he played an important part. He suggested or advocated only a few of the final articles, but his influence, constantly exerted in favour of co-operation and compromise, contributed strongly to the final agreement. He had not forgotten his old scientific interests and published in 1786 *Maritime Observations in a letter from Dr. Franklin to Mr. Alphonsus le Roy*, in 1787 *Observations on the causes and cures of Smoky Chimneys*. His unabated zeal for the welfare of mankind led him to publish in the last months of his life several papers on behalf of the abolition of slavery.

But his time had come. The strong body which had withstood so many tests and fights was breaking down. He had been a great sufferer from gallstones for several years and was afflicted also with gout. He was slow to recover from a fall on the stairs. Finally he died in Philadelphia on April 17, 1790, after a short illness. Philadelphia gave him a magnificent funeral. The French assembly went into mourning for three days. The whole civilized world was moved by the disappearance of the old sage who had done so much good during his long life.

His Character and Achievements.—Franklin's achievements are so great and so numerous that it is impossible to sum up all of them. We can say, nevertheless, that recent documents disprove most of the accusations which were hurled at him. He did not advise the English Government in favour of the Stamp Act, as many have said; he did not betray his country in favour of France as Adams thought; he was not a plotter and a deceitful politician as too many people in England and France have believed. The only justifiable reproaches would be that he seems to have been too fond of his family and too eager to work in their behalf and that, when he had a difficult and honest aim, he did not hesitate to use roundabout methods to achieve it. Nobody in the 18th century knew so well as he how to pull the wires of public opinion and make use of newspapers, secret societies, academies and so on. He was one of the broadest as well as one of the most creative minds of his time; his theory of electricity was not original, but was surprisingly clear and accurate, and the ideas he expressed on the Aurora Borealis, the origin of the north-east storms in America, earthquakes and sundry subjects of natural history or mathematics are always precise and interesting even when facts have not confirmed them. The scientists of the 18th century, unable to experiment and too absorbed in logic, admired him for his practical and realistic talents. His medical theories

were equally esteemed, and received much recognition, particularly his theory on the origin of colds.

He was less fortunate in politics. He had broad, generous and progressive ideas. His great hope was to see America grow and develop within the British empire and become so strong that it would be *ipso facto* and without struggle the centre of the empire, or, at any rate, free. He wished to avoid a bloody revolution, and thought that if the Americans were patient enough they would be sure to win simply by waiting and without using force. But when the war began he showed a splendid spirit of energy. He offered all the money he had to Congress. He gave up all his English affiliations, thoroughly changed his point of view, was strongly in favour of the French alliance, and felt deep gratitude to the French Government.

His economic ideas were not original. He took them at first from the English writers of the mercantile school (mostly William Petty) and after 1766 was much under the influence of the French physiocrats. But he was always clearer, less abstract and more practical than the theorists he followed. In politics he was radical, believing in universal suffrage and preferring one chamber to the bicameral system. In religion he was a moderate deist, respectful of all religions but more attracted by the moral side of them than by their dogmas. He did not believe in revelation. But this point of view, which seems to have been the typical point of view of the freemasons of his time, at least in England and America, he gradually changed towards the end of his life, under the influence of age and of the sentimental atmosphere which prevailed in the fashionable circles of France. He spoke more often of Christ and seems to have been nearer to Presbyterianism than before.

As a writer he shows a remarkable logic, elegance and felicity of expression, his style is dignified without being pompous, and precise without being dry or cold. He excels in wit, but is able to express strong feelings. When he gave vent to his indignation against the Government of England in particular, he wrote some forceful pages (*Rules for reducing a great Empire to a small one*). Nobody could approach him without being charmed by his conversation, his humour, wisdom and kindness. He had been a strong, tall, good looking youth; he was a large, rather heavy old man but with very keen eyes and great dignity. He had a way of telling stories that delighted all his friends and was well liked by the ladies because he seemed equally to enjoy listening to them. He was certainly ambitious, possibly a little more so than he himself realized, but he was never led by his ambition to dishonesty or baseness. He was thrifty and made good use of the money he earned, but he knew how to be generous and especially in the later period of his life enjoyed helping many people. Other men may have been greater, but very few have been more human.

BIBLIOGRAPHY.—The first edition of Franklin's works was published long after his death by his grandson William Temple Franklin (1817–19, 6 vols.), to whom he bequeathed nearly all his papers. But Temple did not take reasonable care of them and used them rather indiscriminately, eliminating things of great importance. Jared Sparks in 1836–42 made another edition in 10 vols. which added a great deal and included many interesting letters addressed to Franklin. John Bigelow in 1887–89 made the so-called "Complete edition" with more material and a great number of letters to Franklin (10 vols.). The best edition of his writings is the Centennial edition made by Smyth (1905–07, 10 vols.). It is a remarkable piece of work; the only drawback is the suppression of nearly all the letters addressed to Franklin, which Smyth was obliged to omit because of the great abundance of new Franklin material.

The Calendar of the Papers of Benjamin Franklin in the Library of the American Philosophical Society, edit. by I. Minis Hays (Philadelphia, 1908, 5 vols.) and the *Calendar of the Papers of Benjamin Franklin in the Library of the University of Pennsylvania*, are necessary for a complete study of Franklin's work and life.

There are still many unpublished letters of Franklin, 500–600 of which are known. There is also an immense number of vitally interesting papers concerning Franklin, as yet unpublished, owned by the American Philosophical Society, Philadelphia. Other important centres of Franklin documents are first of all at Evanston, Ill., the collection of the University of Pennsylvania, the Huntington library in Pasadena (which possesses the original manuscript of the autobiography), the Clements library in Ann Arbor, Mich., the Library of Congress, the Public Record office in London, and the *Archives du ministère des Affaires Étrangères* in Paris.

A great many lives of Franklin have been written. Parton's "Life

of Franklin" is old but remarkably well documented (2 vols., 1864) and exceedingly interesting. Paul Leicester Ford wrote two excellent books on Franklin: *His Many-Sided Franklin*, perhaps the most intelligent interpretation of Franklin's supple and rich personality, also very rich in original information, and his excellent *Bibliography of Benjamin Franklin* (1889). But the essential document is Franklin's own *Autobiography*, famous all over the world. P. E. More's book, *Benjamin Franklin*, and S. G. Fisher's *The True Benjamin Franklin*, are interesting. J. B. MacMaster's *Benjamin Franklin as a Man of Letters* is useful, M. L. Weems, *Life of Benjamin Franklin* (1815) and P. Russell's *Franklin the First Civilized American* (1927) are entertaining. W. S. Mason has published an illuminating essay on "Franklin and Galloway" (*Am. Antiq. Soc., Proc.*, 1924). The *Collections and Proceedings of the Massachusetts Hist. Soc.* and the files of the *Pennsylvania Mag. of Hist.* are full of valuable information about Franklin. See also Bernard Fay, *Benjamin Franklin: The Apostle of Modern Times* (1929). There is no really up-to-date study of his scientific and philosophic achievements. (B. F.)

FRANKLIN, EDWARD CURTIS (1862–), American chemist, was born on Mar. 1, 1862, at Geary City, Kansas. He was educated at the University of Kansas (B.S., 1888; M.S., 1890) and Johns Hopkins university (Ph.D., 1894). He was assistant in chemistry at the University of Kansas, 1889–94, associate professor, 1894–99, and professor, 1899–1903. In 1903 he became associate professor of organic chemistry at Stanford university, Calif., and in 1906 was made professor. He served on the U.S. Assay Commission in 1907, in 1911–12 was professor at the hygienic laboratory of the U.S. Public Health Service and in 1918 was physical chemist of the Bureau of Standards. His chief researches have been on the ammonia system of compounds, and liquid ammonia as an electrolytic solvent, and are published in the *American Chemical Journal* and *Journal of the American Chemical Society*.

FRANKLIN, SIR JOHN (1786–1847), English rear-admiral and explorer, was born at Spilsby, Lincolnshire, on April 16, 1786. He was educated at St. Ives and Louth grammar school, and entered as a midshipman on board the "Polyphemus," in which he served at the battle of Copenhagen (April 2, 1801). Two months later he joined the "Investigator," and took part, under his cousin Capt. Flinders, in the exploration of the Australian coast. He was on board the "Porpoise" when she and the "Cato" were wrecked there in 1803, returned to England, and joined the "Bellerophon" in time to take part in the battle of Trafalgar. For the rest of the war he was on the "Bedford." In 1818 he was in command of the "Trent" in Capt. Buchan's Arctic expedition, which was cut short by Buchan's ship being damaged by pack-ice. He had done enough, however, to establish his fitness for such work, and in 1819 he was put in command of an expedition that was to proceed overland from Hudson bay to the shores of the Arctic ocean, and explore the coast eastwards from the mouth of the Coppermine. This, and the mouth of the Mackenzie, far to the West, were then the only points known on the north coast of America. Franklin and his party arrived at the Hudson's Bay Co.'s depot at the end of August 1819, and after a journey of 700 m. wintered on the Saskatchewan. Failure of the promised supplies held them up the next summer, but in 1821 they descended the Coppermine to its mouth, and surveyed part of the coast to the eastward. They returned over the Barren Ground, and after severe suffering, and the death of Hood, they reached York Factory in June 1822, and returned to England the same year. Franklin was promoted post-captain on his return. The narrative of the expedition was published in 1823, and soon after he married Eleanor, daughter of William Porden, an architect. Early in 1825 he was given command of a second overland expedition, his wife, who was dying, herself urging him to sail without delay. In 1826 he traced the North American coast from the Mackenzie to 149° 37' W. long., while Richardson with another party connected the mouths of the Mackenzie and the Coppermine. The two expeditions together had added 1,200 m. of coastline to the American continent. He returned in 1827 and in 1828 married Jane, daughter of John Griffin. In 1829 he was knighted. In 1836 he was appointed lieutenant-governor of Van Diemen's land, Tasmania, a post he held until 1843. During this time convicts from all over the empire were sent to Tasmania. He founded a college there, and established a scientific society

at Hobart Town. Years later the colony voted £1,700 to Lady Franklin's efforts for the search for and relief of her husband.

At the time of his return to England there was a renewal of interest in Polar exploration, and he took command of a new expedition for the discovery of the North-West passage. Under him were Capt. Crozier, who had been with Parry and Ross, and Capt. Fitzjames, in command of the "Erebus." Victualled for

FROM ROSS, "VOYAGE TO THE SOUTHERN SEAS" (1847)

THE "EREBUS" AND "TERROR" OF SIR JOHN FRANKLIN'S ILL-FATED ARCTIC EXPEDITION (1845–1848) WEATHERING A GALE IN THE PACK

three years, and equipped with every appliance then known, the expedition, consisting of the "Erebus" and "Terror" (129 officers and men), sailed from Greenhithe on May 19, 1845. The ships were last seen at the entrance to Lancaster sound, on July 26, and it was 14 years before the mystery of their subsequent movements was finally solved. Franklin's instructions were to push through Lancaster sound and Barrow strait as far as Cape Walker (c. long. 98° W.), and thence southwards, with the alternative of Wellington channel, if navigable. No news arrived of their doings, and from 1848 onwards a series of expeditions was sent to search for them, which between them explored thousands of miles in the Arctic regions. The first traces were found by Capt. Ommanney in Aug. 1851, at Franklin's winter quarters at Beechey island. In 1854, Dr. Rae, on a sledging expedition from Repulse bay, learned from Eskimos that some white men had been seen dragging a boat southward along the west shore of King William's island. He also obtained from them various articles which were identified as belonging to members of the expedition. In 1855 a party went down the Mackenzie in canoes, and established that an attempt had been made to reach the Hudson's Bay Co.'s settlement by the Fish river route from the "Erebus" and "Terror." With this the Government was content, but Lady Franklin organized another attempt. Capt. M'Clintock in the "Fox" left Aberdeen in July 1857, and in the spring of 1859 the fate of Franklin's expedition was revealed. In addition to skeletons and other remains in King William's island, and reports from the Eskimo in Boothia, a record was found in a cairn at Point Victory telling the history of the expedition up to April 25, 1848. In 1845–1846 the "Erebus" and "Terror" had wintered at Beechey island, on the south-west coast of North Devon, after having ascended Wellington channel to lat. 77°, and returned by the west side of Cornwallis island. In 1846 he followed the route specially assigned to him. He had navigated Peel and Franklin straits southward, but had been stopped by ice coming down M'Clintock channel (then unknown). On the margin of this was an addendum dated April 25, 1848, signed by Fitzjames and Crozier telling that the "Erebus" and "Terror" were deserted on April 22, 1848, having been ice-beset since Sept. 12, 1846. Franklin had died on June 11, 1847, and the total loss to date had been nine officers and 15 men. It was added that they would start the next day for Back's Fish river. Strength must have failed; an Eskimo woman said that they fell down and died as they walked. Franklin is certainly entitled to the

honour of being the discoverer of the North-West passage. The point the ships reached was within a few miles of the known waters of America. Lady Franklin died in 1875, aged 83, and a monument in Westminster Abbey commemorates both her husband's fame and her own connection with it.

Franklin* (1896); *Life Diary and Correspondence of Jane Lady Franklin* (ed. W. F. Rawnsley, 1923).

FRANKLIN, WILLIAM BUEL (1823–1903), Federal general in the American Civil War, was born at York, Pa., on Feb. 27, 1823. He graduated at West Point, at the head of his class, in 1843, and served with distinction in the Mexican War. After the war he was engaged in miscellaneous engineering work, becoming a first lieutenant in 1853 and a captain in 1857. Soon after the outbreak of the Civil War in 1861 he was made colonel of a regular infantry regiment, and a few days later brigadier-general of volunteers. He led a brigade in the first battle of Bull Run, and on the organization by McClellan of the army of the Potomac he received a divisional command. He commanded first a division and then a corps in the operations before Richmond in 1862; was promoted major-general, U.S.V., in July, 1862; commanded a corps at South mountain and Antietam; and at Fredericksburg commanded the "Left Grand Division" of two corps. His part in the last battle led to charges of disobedience and negligence being preferred against him by the commanding general, A. E. Burnside, on which the congressional committee on the conduct of the war reported unfavourably for Franklin, largely, it seems, because Burnside's orders to Franklin were not put in evidence. Franklin was a corps commander in the abortive Red River Expedition. In this expedition he received a severe wound at the action of Sabine Cross Roads (April 8, 1864), in consequence of which he took no further active part in the war. After the war Franklin was vice-president of the Colt's Patent Firearms Manufacturing Co.; 1880 to 1899, president of the board of managers of the national home for disabled volunteer soldiers; and he was for a time a director of the Panama railway. He died at Hartford, Conn., on March 8, 1903. He wrote a pamphlet, *The Gatling Gun for Service Ashore and Afloat* (1874).

See *A Reply of Major-General William B. Franklin to the Report of the Joint Committee of Congress on the Conduct of the War* (1863; 2nd ed., 1867); Jacob L. Greene, *Gen. W. B. Franklin and the Operations of the Left Wing at the Battle of Fredericksburg* (Hartford, 1900); and James H. England, "William Buell Franklin," *U.S. Engineers' Department*, vol. x., p. 485–89 (1918).

FRANKLIN, WILLIAM SUDDARDS (1863–), American physicist, was born in Geary City, Kansas, on Oct. 27, 1863. He was educated at the University of Kansas (A.B., 1887; M.S., 1888) and Cornell university (Sc.D., 1901). He was assistant professor of physics at the University of Kansas, 1887–90, and professor of physics at Iowa State college, 1892–97 and at Lehigh university 1897–1915. In 1917 he became professor of physics at the Massachusetts Institute of Technology. While having carried on research in many fields of physics, especially in the theory of alternating currents, his chief contribution has been in the field of technical education.

He published *Elements of Alternating Currents* (with R. B. Williamson) (2nd ed., 1901); *Elements of Electricity and Magnetism; Light and Sound; Practical Physics; Electric Waves* (1909); *Electric Lighting* (1912); *Elements of Calculus; Bill's School and Mine* (1913); and was joint author of *Elements of Electrical Engineering* (1906); *Dynamos and Motors* (1909); *Advanced Theory of Electricity and Magnetism* (1915); *Lessons in Heat* (1920); *Transmission Line Theory* (1926).

FRANKLIN, a division of the North-West Territories, Canada, extending from the Arctic Circle to the North Pole. It was formed into an organized district by order-in-council in Oct. 1895, and includes numerous islands and peninsulas, such as Banks, Prince Albert, Victoria, Wollaston, King Edward and Baffin Land, Melville, Bathurst, Prince of Wales and Cockburn islands. Of these, Baffin Land alone extends south of the Arctic Circle. The district was re-organized in 1905 and its limits were definitely

fixed in 1920. The area is 554,032 sq.m., but the inhabitants consist of a few Indians, Eskimo and fur-traders. Musk-oxen, polar bears, foxes and other valuable fur-bearing animals are found in large numbers. The district is named after Sir John Franklin.

FRANKLIN, a city of central Indiana, U.S.A., 20m S. by E. of Indianapolis; the county seat of Johnson county. It is on Federal highway 31, and is served by the Big Four, the Pennsylvania and the Interstate Public Service Company (electric) railways. The population was 4,909 in 1920; 1930 it was 5,682. It has sundry manufacturing industries, and is the seat of the State Masonic Home and of Franklin college (Baptist), founded in 1834. Franklin was settled about 1823 and was chartered as a city in 1861.

FRANKLIN, a city of Merrimack county, New Hampshire, at the confluence of the Pemigewasset and the Winnepesaukee rivers to form the Merrimack. It is on Federal highways 3 and 4, and is served by the Boston and Maine railroad. The area is 14.4 sq.m., and the population in 1920 was 6,318 and was 6,576 in 1930. It is a centre for summer touring and winter sports, and has important manufactures (for which the rivers supply good water power), especially paper, woollen stockings and suitings, knitting machines and latch needles. Franklin was the birthplace of Daniel Webster, and the house, still in good condition, is kept as a museum. On the Webster farm is the New Hampshire orphans' home (established 1871). The earliest settlement within the limits of Franklin was made in 1748. The town was formed in 1828, from parts of four others, and was incorporated as a city in 1895.

FRANKLIN, a town of Norfolk county, Massachusetts, 27m S.W. of Boston; served by the New York, New Haven and Hartford railroad. The population was 7,028 in 1930. It has important manufactures of cotton and woollen goods, carpets, rugs, felt, rubber products and printing presses. The town was formed from part of Wrentham and incorporated in 1778. It was the first of the many places named after Benjamin Franklin, and was the birthplace of Horace Mann.

FRANKLIN, a city of north-western Pennsylvania, U.S.A., 70m N. by E. of Pittsburgh, at the confluence of French creek with the Allegheny river; the county seat of Venango county. It is on Federal highway 322, and is served by the Erie, the New York Central and the Pennsylvania railways and by motorbus lines in every direction. The population was 9,970 in 1920 and 10,254 in 1930. Including the suburbs of Rocky Grove and Prospect park, the local estimate for 1928 was 15,000. Franklin is picturesquely situated among the foot-hills of the Alleghenies, at an altitude varying from 985 to 1,500 feet. It is in the chief oil and gas region of the State, and its refineries have a daily capacity of 12,000 barrels. Other important manufactures are oil-well supplies, gagger irons, mine-car loaders, portable cranes, brake beams, gas and oil engines, pneumatic tools, castings (grey iron, brass and bronze), silica sand, paints and printing. The aggregate value of these products in 1927 was estimated at \$35,600,000. At Polk, 6m S.W., is the State school for the feeble-minded (established 1897), with 2,225 inmates and grounds covering 2,014 acres.

There was an Indian village here about 1735. In 1749 the French took possession of the region, burying leaden plates at various points in token of their claim, and in 1753 they built Fort Machault, on a site in the heart of the present city, which they abandoned and burned after the capture of Fort Duquesne by the British in 1759. The British in 1760 built Fort Venango, near by. This was taken by the Indians in 1763, during the Conspiracy of Pontiac, and the entire garrison was massacred. Venango county and the surrounding territory was purchased by the State from the Six Nations in 1784. In 1787 Fort Franklin was built by American soldiers, about 1m. above the mouth of French creek. It was abandoned in 1796 for a stronger fortification, known as "Old Garrison," and in 1803 the troops were permanently withdrawn. The importance of the site as a frontier station led to the establishment of a town in 1795 by act of the State legislature, which named it in honour of Benjamin Franklin. It was platted the same year by Andrew Ellicott, the surveyor of Washington,

D.C.; was incorporated as a borough in 1823, and as a city in 1868. Oil was discovered 30m. N. in 1859, and soon became the basis of the region's prosperity. The peak of production in Venango county was in 1882, when the output was 30,460,000 bbl. from 3,269 wells. In recent years the annual output of the county has been about 1,300,000 barrels.

FRANKLIN, a town of central Tennessee, U.S.A., 20m. S. of Nashville, on the Harpeth river; the county seat of Williamson county. It is on Federal highway 31, and is served by the Louisville and Nashville railroad. The population was 3,123 in 1920; 3,377 in 1930. During the Civil War Franklin was the scene of a minor engagement on April 10, 1863; and on Nov. 30, 1864, of one of the fiercest battles of the war, when the Confederate general, J. B. Hood, with an army of 27,000, attacked Gen. Schofield, whose forces numbered about 28,000. The engagement was indecisive, but the losses were very heavy: 6,500 on the Confederate, 2,326 on the Union side.

FRANKLIN, a word derived from the Late Lat. *francus*, free, meaning primarily a freeman, and more specifically a free landholder who was not of noble birth. It appears in England soon after the Norman Conquest, but is rarely found in private charters, and never became a legal term. Some of the older English writers occasionally use it to mean a liberal host.

FRANKLIN INSTITUTE, THE, of the State of Pennsylvania, U.S.A., founded in 1824, is the oldest institution in the United States devoted to the study and promotion of the mechanic arts and applied sciences. The cornerstone of the quaint old building it occupies in Philadelphia on the east side of Seventh below Market street was laid in 1825, the structure being occupied the next year. Classes were opened, Dr. Keating, one of the leading scientists of the University of Pennsylvania, teaching chemistry, and William Strickland, then America's most noted architect, occupying the chair of architecture. Exhibitions of American manufactures were promptly undertaken and held regularly for many years, and the publication of a journal devoted to the progress of the useful arts and sciences was also begun. Up to 1832, when the city started a high school, the institute served as the forerunner of the central high school. Through its committees the institute conducts considerable scientific research. Its library of over 86,800 volumes and 27,000 pamphlets (1928) is the richest technical library of its kind in the country. Its record of American invention is the most complete outside the files of the Patent Office. Its medals and certificates of award, given to advance physical science, in its application, discovery or original research or the perfection of a useful invention or showing of skilled workmanship, are prizes of world recognition. Associated with the institute now is the Bartol Research Foundation, established in 1921 as a result of a munificent bequest from Henry W. Bartol, a life member, for the purpose of studying the fundamental problems of physical science, particularly electrical, and for investigating all scientific problems that may happen to arise in the industries.

FRANKLINITE, a member of the spinel group of minerals, consisting of oxides of iron, manganese and zinc in varying proportions (Fe, Zn, Mn) (Fe, Mn) $_{2-4}$. It occurs as octahedral crystals often with rounded edges, and as granular masses. The colour is iron-black and the lustre metallic; hardness 6, specific gravity 5.2. It thus resembles magnetite, but is readily distinguished by the fact that it is only slightly magnetic. It is found in considerable amount, associated with zinc and manganese minerals in crystalline limestone, at Franklin Furnace, N.J., where it is mined as an ore of zinc (containing 5 to 20% of the metal); after the extraction of the zinc, the residue is used in the manufacture of spiegeleisen.

FRANK-MARRIAGE (*liberum maritagium*), in real property law, a species of estate tail, now obsolete. When a man was seized of land in fee simple, and gave it to a daughter on marriage, the daughter and her husband were termed the donees in frank-marriage, because they held the land granted to them, and the heirs of their two bodies free from all manner of service, except fealty, to the donor or his heirs, until the fourth degree of consanguinity from the donor was passed.

FRANKPLEDGE. The frankpledge system provided that all men not in the household of some great man, who would be responsible for their good behaviour and appearance in court in case of necessity, should be in frankpledge or tithing. The frankpledge was an association of men, generally twelve in number, the members of which were mutually responsible for the production of any one of them in court. If a man fled rather than pay for his crime the frankpledge of which he was a member had to pay. This idea of keeping the peace by a system of mutual responsibility goes back to very remote times. In the 12th century the greater efficiency of the central administration enabled the system to be regularly enforced. Originally the frankpledge was confined to free men, the unfree were left to their lord. By the time records began to be kept the system embraced all but persons of established position. The word frankpledge was not used uniformly all over England to describe these associations. In some parts they were known as tithings or *decennae*. The custom ruling the arrangements of the frankpledges and tithings, too, varied considerably. Sometimes the frankpledge was known by the name of the chief member, the chief pledge or the tithing man. Sometimes it was known by the name of the village or hamlet. It is possible that the density of population had much to do with deciding the local practice. The View of Frankpledge was a bi-annual enquiry as to the proper observance of the law with regard to frankpledges; an enquiry whether everyone was in frankpledge, whether the frankpledges were of an adequate size, and were performing their duty. Originally the sheriff held the view of frankpledge in the shire court twice a year. It is clear that he made the view an occasion for extortion and in the 1217 issue of Magna Carta the holding of this court is regulated. In the 13th century this franchise, the view of frankpledge, was often in private hands. This did not prevent the law with regard to frankpledges being enforced, since the franchise was a valuable one and it paid the lords of the courts to conduct the enquiry.

See W. A. Morris, *The Frankpledge System* (1910). (D. M. S.)

FRANKS, SIR AUGUSTUS WOLLASTON (1826-1897), English antiquary, was born on March 20, 1826, and was educated at Eton and at Trinity college, Cambridge. In 1851 he was appointed assistant in the antiquities department of the British Museum. Here, and as director of the Society of Antiquaries, an appointment he received in 1858, he made himself the first authority in England upon mediaeval antiquities of all descriptions, upon porcelain, glass, the manufactures of savage nations, and in general upon all Oriental curiosities and works of art later than the Classical period. In 1866 the British and mediaeval antiquities, with the ethnographical collections, were formed into a distinct department under his superintendence; and the Christy collection of ethnography in Victoria street, London, afterwards transferred to the British Museum was also under his care. He retired in 1896, and died on May 21, 1897. His fortune was largely devoted to the collection of ceramics and precious objects of mediaeval art, most of which became the property of the nation, either by donation in his lifetime or by bequest at his death. The most famous of the objects bequeathed by him to the British Museum is the carved bone casket, Northumbrian work of the 8th century, known as the "Franks Casket."

FRANKS. The earliest mention in history of the name Franks is an entry on the *Tabula Peutingeriana*, "Chamavi qui et Pranci." The earliest occurrence of the name in any author is in the *Vita Aureliani* of Vopiscus, referring to the year 241.

All the Germanic tribes, which were known from this time onwards by the generic name of Franks, doubtless spoke a similar dialect and were governed by customs which must scarcely have differed from one tribe to another—all they had in common. Each tribe was politically independent; they formed no confederations. Sometimes two or three tribes joined forces to wage a war; but, the struggle over, the bond was broken, and each tribe resumed its isolated life.

Of these tribes the Salians were to become most prominent. They are mentioned for the first time in 358, by Ammianus Marcellinus (xvii. 8, 3). At this time they occupied the region south of the Meuse, between that river and the Scheldt. The Caesar

Julian defeated them completely, but allowed them to remain as *foederati* of the Romans. They perhaps paid tribute, and they certainly furnished Rome with soldiers; *Salii seniores* and *Salii juniores* are mentioned in the *Notitia dignitatum*, and *Salii* appear among the *auxilia palatina*.

At the beginning of the 5th century, when the Roman legions withdrew from the banks of the Rhine, the Salians installed them-

FROM SEYMOUR DE RICCI, "THE J. P. MORGAN MEROVINGIAN COLLECTION"

FRANKISH METALWORK OF THE 4TH TO THE 8TH CENTURIES A.D.

One of a pair of bird or dragon-shaped fibulae of bronze coated with gold; D. Iron umbo of a shield covered with gilt silver; E. Gilt silver belt buckle inlaid with niello; F. Gilt silver plaque from spear

selves in the district as an independent people. The place-names became entirely Germanic; the Latin language disappeared; and the Christian religion suffered a check, for the Franks were to a man pagans. The Salians were subdivided into a certain number of tribes, each tribe placing at its head a king, distinguished by his long hair and chosen from the most noble family (*Historia Francorum*, ii. 9).

The most ancient of these kings, reigning over the principal tribe, who is known to us is Chlodio. Towards 431 he crossed the great Roman road from Bavay to Cologne, which was protected by numerous forts and had long arrested the invasions of the barbarians. He then invaded the territory of Arras, but was severely defeated at Hesdin-le-Vieux by Aetius, the commander of the Roman army in Gaul. Chlodio, however, soon took his revenge. He explored the region of Cambrai, seized that town and occupied all the country as far as the Somme. At this time Tournai became the capital of the Salian Franks.

After Chlodio a certain Meroveus was king of the Salian Franks. Perhaps the remarks of the Byzantine historian Priscus may refer to Meroveus. A king of the Franks having died, his two sons disputed the power. The elder journeyed into Pannonia to obtain support from Attila; the younger betook himself to the imperial court at Rome. "I have seen him," writes Priscus; "he was still very young, and we all remarked his fair hair which fell upon his shoulders." Aetius welcomed him warmly and sent him back a friend and *foederatus*. In any case, Franks fought (451) in the Roman ranks at the great battle of the Catalaunian fields, which arrested the progress of Attila, and there is some evidence that Meroveus was among the combatants. Towards 457 Meroveus was succeeded by his son Childeric. At first Childeric was a faithful *foederatus* of the Romans, fighting for them against the Visigoths and the Saxons south of the Loire; but he soon sought to make himself independent and to extend his conquests. He died in 481 and was succeeded by his son Clovis, who conquered the whole of Gaul with the exception of the kingdom of Burgundy and Provence. Clovis imposed his authority on the other Salian tribes, and put an end to the domination of the Riparian Franks.

These Ripuarians had settled in the 5th century on the left bank of the Rhine, but their progress was slow. It was not until the middle of the century that they occupied Cologne, which was not permanently in their possession until 463. The Ripuarians subsequently occupied all the country from Cologne to Trier.

Aix-la-Chapelle, Bonn and Zülrich were their principal centres and they even advanced southward as far as Metz, which appears to have resisted their attacks. The Roman civilization and the Latin language disappeared from the countries which they occupied; indeed it seems that the actual boundaries of the German and French languages nearly coincide with those of their dominion. In their southward progress the Ripuarians encountered the Alamanni, who, already masters of Alsace, were endeavouring to extend their conquests in all directions. The Ripuarians long remained allies of Clovis, the son of their king fighting under him at Vouillé in 507. Ultimately, however, Clovis destroyed the Riparian dynasty and was himself chosen as king of this people. Thus the Salian Franks united under their rule all the Franks on the left bank of the Rhine. During the reigns of Clovis' sons they again turned their eyes on Germany, and imposed their suzerainty upon the Franks on the right bank. This country, north of the Main and the first residence of the Franks, then received the name of *Francia Orientalis*, and became the origin of one of the duchies into which Germany was divided in the 10th century—the duchy of Franconia (Franken).

The Franks were redoubtable warriors, and were generally of great stature. Their fair or red hair was brought forward from the crown of the head towards the forehead, leaving the nape of the neck uncovered; they shaved the face except the upper lip. They wore fairly close breeches reaching to the knee and a tunic fastened by brooches. Round the waist over the tunic was worn a leathern girdle having a broad iron buckle damascened with silver. From the girdle hung the single-edged missile axe or *francisca*, the *scramasax* or short knife, a poniard and such articles of toilet as scissors, a comb (of wood or bone), etc. The Franks also used a weapon called the *framea* (an iron lance set firmly in a wooden shaft), and bows and arrows. They protected themselves in battle with a large wooden or wicker shield, the centre of which was ornamented with an iron boss (*umbo*). Frankish arms and armour have been found in the cemeteries which abound throughout northern France, the warriors being buried fully armed.

Schultz, *Deutsche Geschichte von der Urzeit bis zu den Karolingern*, vol. ii. (Stuttgart, 1896). Also the article SALIC AND EARLY GERMANIC LAWS. (C. FF.)

FRANZ, ROBERT (1815-1892), German composer, whose original name was KNAUTH, born at Halle on June 28, 1815, was one of the most gifted of German song writers. He was 20 years old when his father reluctantly allowed him to go to Dessau to study organ-playing under Schneider. The two years of dry study under that famous teacher made him intimate with the works of Bach and Handel, his knowledge of which he used in later life in his considerably criticized editions of the *Matthew Passion*, *Magnificat*, ten cantatas, and of the *Messiah* and *L'Allegro*. In 1843 he published his first book of 12 songs, which ultimately was followed by some 50 more books, containing in all about 250 songs. The first book was warmly praised by Schumann and Liszt, the latter of whom wrote a long review of it in Schumann's paper, *Die Neue Zeitschrift*. Deafness had begun to make itself apparent as early as 1841, and Franz suffered also from a nervous disorder, which in 1868 compelled him to resign his offices. His future was then provided for by Liszt, Joachim, and others, who gave him the receipts of a concert tour, amounting to some 100,000 marks. Franz died on Oct. 24, 1892. On his 70th birthday he published his first and only pianoforte piece. It is easy to find here and there among his songs gems that are hardly less brilliant than the best of Schumann's.

See A. Saran, *Robert Franz und das deutsche Volks und Kirchenlied* (1875); von Procházka, *Robert Franz* (1894); Hermann von der Pfordten, *Robert Franz* (1923).

FRANZEN, FRANS MICHAEL (1772-1847), Finnish-Swedish poet, was born on Feb. 9, 1772 at Uleåborg, and studied

at Abo where he became professor in 1798. On the annexation of Finland to Russia in 1809, he went to Sweden and in 1831 was appointed bishop of Hernösand, where he died on Aug. 14, 1847. His poems, which show a naive, idyllic spirit, were published in 7 vols. (Obebro 1867-9). His chief prose works are: *Minnestekningar*, a collection of Swedish biographies (3 vols., 1848-60) and *Predikningar* (5 vols., 1841-45).

FRANZENSBAD, a spa in the district of Cheb, north-west Bohemia (Czech, *Františkovy Lázně*). Situated about 1,500 ft. above sea-level amidst delightful mountain scenery its springs have been known and used since the 16th century, though the modern town has developed around the *Kurhaus*, built in the late 18th century. The springs, 18 in number, are rich in carbon dioxide, iron, Glauber's salt, lithium and radium and are used for drinking and bathing cures; in addition there exist large quantities of ferruginous mineral mud in local peat swamps. The waters have an average temperature between 50.2° F and 54.5° F and are of healing value in the treatment of women's diseases, nervous disabilities, abdominal troubles and affections of the heart and blood. Franzensbad was a favourite after-cure resort for patients from Carlsbad and Marienbad but is rapidly developing importance as a principal centre of treatment and as a holiday resort for the population of nearby industrial areas. Pop. (1923), 3,141.

FRANZ JOSEF LAND, an arctic archipelago lying east of Spitsbergen and north of Novaya Zemlya, extending northward from about 80° to 82° N., and between 43° and 65° E. The islands are all very similar in appearance and consist of platforms of fossiliferous clay, shales and sandstone rising to 400-600 ft. capped by 500-700 ft. of Tertiary basalt. Intrusive sills also occur. The basalts are related to those of Jan Mayen, Iceland, Greenland and W. Scotland. The islands are clearly remains of a more extensive land surface that was broken and partially submerged along lines of faults subsequent to the volcanic period. Raised beaches indicate recent elevations. The islands have caps of ice or névé and valley glaciers or sheer ice faces to the sea. Vegetation is scanty and includes 14 flowering plants and some

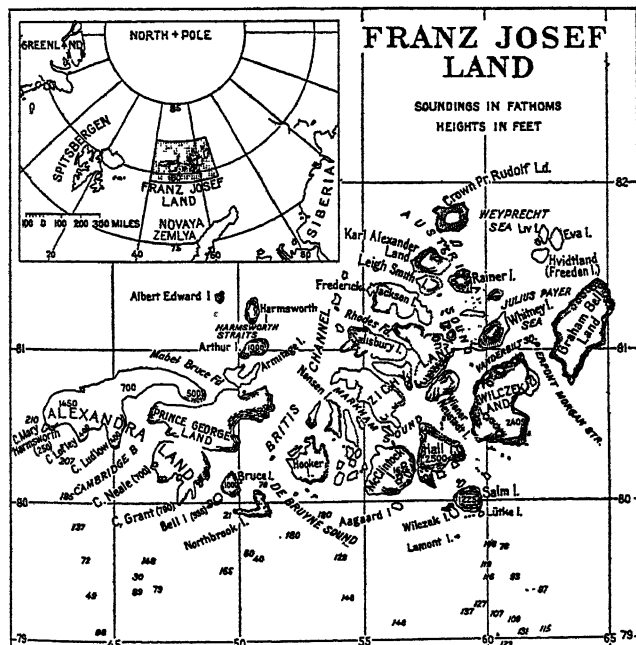

"Tegetthof" being then beset, high land was seen to the north-west. Later in the season, Payer led expeditions to Hochstetter and Wilczek islands, and after a second winter in the ice-bound ship, a difficult journey was made northward through Austria Sound, which was reported to separate two large masses of land, Wilczek Land on the east from Zichy Land on the west, to Cape Fligely, in 82° 5' N. Cape Fligely was the highest latitude attained by Payer, and remained the highest attained in the Old World till 1895. Payer reported that from Cape Fligely land (Rudolf Land) stretched north-east to a cape (Cape Sherard Osborn), and mountain ranges were visible to the north, indicating lands beyond the 83rd parallel, to which the names King Oscar Land and Petermann Land were given. In 1879 De Bruyne sighted high land in the Franz Josef Land region, but otherwise it remained untouched until B. Leigh Smith, in the yacht "Eira," explored the whole southern coast from 42° to 54° E. in 1881 and 1882, discovering many islands and sounds, and ascertaining that the coast of Alexandra Land, in the extreme west, trended to north-west and north.

In 1894 Alfred Harmsworth (afterwards Lord Northcliffe) fitted out an expedition in the "Windward," under F. G. Jackson, with the object of establishing a permanent base in Franz Josef Land, from which a journey should be made to the Pole. Jackson's base was at "Elmwood," near Cape Flora, at the western extremity of Northbrook Island. After a preliminary reconnaissance to the north, the summer of 1895 was spent in extending discovery to the west. In 1896 the Jackson-Harmsworth expedition worked northwards and reached Cape Richthofen, whence an expanse of open water was seen to the north, which received the name of Queen Victoria sea. To the west of the British channel appeared glacier-covered land, and an island which was probably Payer's King Oscar Land lay to the northward. To north a water-sky appeared in the supposed position of Petermann Land. Thus Zichy Land itself was resolved into a group of islands, and the outlying land sighted by Payer was found to be islands also. Meanwhile Nansen, on his southward journey, had approached Franz Josef Land from the north-east, finding only sea at the north end of Wilczek Land. Nansen wintered near Cape Norway, Jackson Island, only a few miles from the spot reached by Jackson in 1895. He had finally proved that a deep oceanic basin lies to the north. On June 17, 1896, the dramatic meeting of Jackson and Nansen took place, and in the same year the "Windward" revisited "Elmwood" and brought Nansen home, the work of the Jackson-Harmsworth expedition being continued for another year. As the non-existence of land to the north had been proved, the attempt to penetrate northwards was abandoned, and the last season was devoted to a survey and scientific examination of the archipelago, especially to the west, by Jackson, A. B. Armitage, R. Koettlitz, H. Fisher, W. S. Bruce and D. W. Wilton.

Further light was thrown on the relations of Franz Josef Land and Spitsbergen during 1897 by the discoveries of Captain Robertson of Dundee. In August 1898 an expedition under Walter Wellman, an American, landed at Cape Tegetthof. The eastern limits of the archipelago were explored by E. Baldwin and many new islands added to the map. Wellman reached 82° N. In June 1899, the duke of Abruzzi in the "Stella Polare," succeeded in forcing his ship through the British channel to Rudolf Land, and wintered in Teplitz bay, in 81° 33' N. lat. In March 1900, a sledge party of 13, under Captain Cagni, started northwards. They found no trace of Petermann Land, but with great difficulty crossed the ice to 86° 33' N. lat. (See ARCTIC REGIONS.) Baldwin did some work again in 1901-2 and A. Fiala, in 1904, lost his ship in Teplitz bay. The Russian, G. L. Sedoff, used Hooker Island in 1913 as a base for a sledge journey to the Pole, but died near Rudolf Land.

See *Geographical Journal*, vol. xi, Feb. 1898; F. G. Jackson, *A Thousand Days in the Arctic* (1899) (with appendices on geology and botany); Duke of Abruzzi, *On the Polar Star* (1903) *The Ziegler Polar Expedition 1903-5*, *Scientific Res.*, ed. A. Fiala (Wash. 1907).

FRANZOS, KARL EMIL (1848-1904), German novelist, was born of Jewish parentage on Oct. 25, 1848, in Russian Poland, and spent his early years at Czortków in Galicia. He studied law at Vienna and Graz, and, becoming a journalist, travelled

mooses and lichens. Pack-ice renders access difficult, but occasionally Norwegian trappers have wintered there. The bear and fox are the only land mammals; insects are rare; but the avifauna includes at least 22 species of which probably 15, including the ivory gull, nest there.

August Petermann expressed the opinion that Baffin may have sighted the west of Franz Josef Land in 1614, but the first actual discovery is due to Julius Payer, who was associated with Weyprecht in the Austrian polar expedition fitted out by Count Wilczek on the ship "Tegetthof" in 1872. On Aug. 31, 1873, the

extensively in the Near East, visiting Asia Minor and Egypt. In 1877 he returned to Vienna, where from 1884 to 1886 he edited the *Neue illustrierte Zeitung*. In 1887 he removed to Berlin and founded the fortnightly review *Deutsche Dichtung*. Franzos died on Jan. 28, 1904. His earliest collections of stories and sketches, *Aus Halb-Asien, Land und Leute des östlichen Europas* (1876) and *Die Juden von Barnow* (1877) depict graphically the life and manners of the races of south-eastern Europe. Among other of his works may be mentioned the short stories, *Junge Liebe* (1878), *Stille Geschichten* (1880), and the novels *Moschko von Parma* (1880), *Ein Kampf ums Recht* (1882), *Der Präsident* (1884), *Judith Trachtenberg* (1890), *Der Wahrheitsucher* (1894).

FRASCATI, a town and episcopal see of Italy, province of Rome, 15 m. S.E. of Rome by rail, and also reached by electric tramway via Grottaferrata. Pop. (1921) 11,100. The town is situated 1,056 ft. above the sea-level, on the northern slopes of the outer crater ring of the Alban Hills, and commands a very fine view of the Campagna and of Rome. The cathedral contains a memorial tablet to Charles Edward, the Young Pretender, whose body for some while rested here; his brother, Henry, Cardinal York, was long bishop of Frascati. The villas of the Roman nobility, with their beautiful gardens and fountains, are the chief attractions of Frascati. The earliest in date is the Villa Falconieri, planned by Cardinal Rufini before 1550; the most important of the rest are the Villa Torlonia (formerly Conti), Lancelotti (formerly Piccolomini), Rufinella (now belonging to Prince Lancellotti), Aldobrandini, Borghese and Mondragone (now a Jesuit school). Frascati seems to have arisen on the site of a very large villa (probably that of Passienus Crispus, the second husband of Agrippina the younger, who compassed his death for the sake of his property, which thus passed into the possession of her son Nero and remained imperial) about the 9th century. The mediaeval stronghold of the counts of Tusculum (*q.v.*), which occupied the site of the ancient city, was dismantled by the Romans in 1191, and the inhabitants put to the sword or mutilated. Many of the fugitives naturally took refuge in Frascati. For the greater part of the middle ages Frascati belonged to the papacy.

See T. Ashby in *Papers of the British School at Rome*, v. (1910), 301 sqq.; F. Tomassetti, *Campagna Romana*, iv. (1926), 346 sqq. (T. A.)

FRASER, CLAUD LOVAT (1890-1921), British artist and designer, was born in London on May 15, 1890, and was educated at Charterhouse. He began to follow his father's profession as a solicitor in 1908, but abandoned this three years later for art. After working with Walter Sickert for a time, he exhibited in 1913, being responsible in the same year for the decoration of the *Flying Fame* chapbooks and broadsheets. He served in France with the Durham Light Infantry during 1915-16, but was gassed and invalided home. His gift for spirited design and lively colour, based to a great extent on 18th century conventions, developed rapidly, and he not only illustrated successfully many books, but exercised a rejuvenating influence on English stage designs by his production of *The Beggar's Opera* (1920), *As You Like It* (1920) and *If* (1921). A career of great promise was cut short by his death, June 18, 1921. See John Drinkwater and Albert Rutherton, *Claud Lovat Fraser* (1923).

FRASER, JAMES BAILLIE (1783-1856), Scottish traveller and author, was born at Reelick in Inverness. He went to India early in life, and in 1815 made a tour of exploration in the Himalayas. He was appointed to look after the exiled Persian princes, Reza Kuli Mirza and Nejeff Kuli Mirza, while they were in England, and returned with them as far as Constantinople. Sent to Persia on a diplomatic mission he travelled through Asia Minor to Teheran on horseback. In 1823 he married a daughter of Lord Woodhouselee. He died at Reelick in Jan. 1856. Some of the astronomical observations taken on his journeys were of great service to the cartography of Asia. He wrote accounts of his travels and stories of Eastern life, his most important works being published between 1820 and 1842.

FRASER, JAMES EARLE (1876-), American sculptor, was born at Winona, Minn., on Nov. 4, 1876. In the public

schools of Minneapolis he early revealed his talent by carving figures from sticks of chalk given him to do his sums. His father, an engineer, then at work on the construction of the Northern Pacific railroad, had the boy with him in the Dakotas, where his friendship with the Indians, the sight of buffalo bones whitening on the prairies where herds had once trod, gave him the inspiration for much of his future Indian subjects—his "End of the Trail,"

"THE END OF THE TRAIL," A BRONZE GROUP BY JAMES E. FRASER

"Prayer" and the design for the United States "buffalo" five-cent piece. At 18 he entered the Art institute in Chicago, and six months later the École des Beaux Arts in Paris. His work exhibited in the Salon of 1897-98 won the prize offered for the best work of an American artist and so impressed Saint Gaudens that he invited the youth to become one of his assistants. Fraser worked with Saint Gaudens until 1902, when he returned to America and established his own studio. In 1906 he became an instructor in the Art Students' league. Among his best known works are the bust of Theodore Roosevelt in the Senate chamber, that of Alexander Hamilton in the Treasury building at Washington; and the statue "Journey Through Life" in the Rock Creek cemetery, the monument to Bishop Potter in the cathedral of St. John the Divine, the portrait relief of Morris K. Jessup in the Museum of Natural History, New York city; the equestrian group "The End of the Trail," exhibited at the Panama-Pacific International Exposition in San Francisco in 1915 and later placed in Waupun, Wis.; the "Canadian Officer," in Winnipeg and "Victory," in the Bank of Montreal.

See Helen Christine Bennett, "James Earle Fraser, Sculptor," *Arts and Decoration*, vol. i., p. 375-376 (1911); and Effie Seachrest, "James Earle Fraser," *Am. Mag. of Art*, vol. viii., p. 276-278 (Washington, 1917).

FRASER, the chief river of British Columbia, Canada, rising in two branches among the Rocky Mountains near 52° 45' N., 118° 30' W. Length 740 m. It flows north-west for about 160 m., rounds the head of the Cariboo Mountains, flows directly south for over 400 m. to Hope, turns again abruptly and flows west for 80 m., falling into the Gulf of Georgia at New Westminster. The chief tributaries after the two branches join are the Stuart, the Quesnel one hundred miles farther down, the Chilcotin, and about 180 m. from the sea the Thompson. Several of these drain mountain lakes and have deep and impassable canyons. Below Hope the Lillooet flows in from the north. The Fraser is a typical mountain stream, rapid and impetuous through all its length, and like most of its tributaries is in many parts not navigable even by canoes. On its southern course between Lytton and Yale, while bursting its way through the Coast Range, it flows through majestic canyons, which, like those of the Thompson, were the scene of many tragedies during the days of the gold-rush to the Cariboo district. At Yale, about 100 m. from its mouth, it becomes navigable, though its course is still very rapid. Government works have recently been undertaken at

the mouth. In the Cariboo district, comprised within the great bend of the river, near Tête Jaune Cache, are many valuable gold deposits. With its tributaries the Fraser drains the whole province from 54° to 49° N., except the extreme south-eastern corner, which is within the basin of the Columbia and its tributary the Kootenay.

FRASERBURGH, burgh of barony, parish and seaport, north coast of Aberdeenshire, Scotland. Pop. (1931), 9,720. It is situated 47½ m. by rail N. of Aberdeen, from which there is a branch line, of which it is the terminus, of the L.N.E.R. It takes its name from Sir Alexander Fraser, who obtained for it in 1613 a charter as a burgh of royalty, and also in 1592 a charter for the founding of a university; this project, however, was not carried out. The old castle of the Frasers on Kinnaird head now contains a lighthouse, and close by is the Wine tower, with a cave below. The town cross is a fine structure. The port is one of the leading stations of the herring fishery in Scotland and the head of a fishery district. During the herring season (June to September) the population is very largely increased. The harbour, originally a refuge for ships of war, is one of the best on the east coast, and has been improved by widening the piers, the extension of the breakwaters, and recently by the addition of a new harbour, making the total area about 30 acres. It is easy of access, and affords anchorage for vessels of every size. The chief import is timber, the chief export fish.

FRASERVILLE (formerly Rivière du Loup en Bas), a town and watering-place in Temiscouata county, Quebec, Canada, 107 m. (by water) N.E. of Quebec, on the St. Lawrence river, and at the mouth of the Rivière du Loup, on the Canadian National railways. Pop. (1931) 8,499.

FRATER, FRATER HOUSE or **FRATERY**, a term in architecture for the hall where the members of a monastery or friary met for meals or refreshment. The word is by origin synonymous with "refectory." The older forms, such as *freitur* and *fraytor*, show the word to be an adaptation of the O.Fr. *fraitour*, a shortened form of *refraitour*, from the Med. Lat. *refectorium*. The word has been confused with *frater*, a brother or friar, and hence sometimes confined in meaning to the dining-hall of a friary, while "refectory" is used of a monastery.

FRATERNAL ORGANIZATIONS: see FRIENDLY SOCIETIES.

FRATERNITIES, COLLEGE, a variety of student organizations peculiar to the colleges and universities of the United States and Canada, usually named from letters of the Greek alphabet; hence frequently called "Greek letter societies." They are nominally secret, each with its individual badge, coat of arms, flag, colours, flower, motto, grip and passwords and having other common characteristics. They have a central governing body, each fraternity having branches, of which only one is established in any college, called "chapters," which are also usually designated by Greek letters, although they sometimes bear the name of the institutions where they are located. As a rule each chapter admits its new members from the lowest or freshman college class. Members cease to be active when they leave college. In a relatively small number of institutions admission of freshmen is forbidden by college rule. In some of the large universities there are chapters of 60 or more fraternities. All of the fraternities aim to be select and to choose their members carefully from the mass of incoming students, the "rushing," as the process of selection is called, being well organized and supervised by the older members.

The fraternities play a prominent part in American college life and have a marked influence upon their members. These join in the impressionable years of their youth; they retain for their organizations a peculiar loyalty and affection, and contribute freely toward their advancement. At commencements and on other home-coming occasions former active members of the chapters return to the chapter-houses and help to foster the pride and loyalty of the undergraduates. The chapter-houses usually are owned by corporations made up of alumni, who provide committees of their own number to manage the property and to supervise and regulate scholarship, financial affairs, conduct of the

undergraduate members and the relationship of the chapter to the college administration and to college affairs. This brings the undergraduates into contact with men of mature age and often of national fame, who treat their membership as a serious privilege. Young men living together in the intimate relationship of daily contact in the same house, having much the same background, tastes and aspirations, naturally form among themselves enduring friendships and develop an *esprit de corps* leading to great pride in the achievements of members of the house in competition with members of similar organizations on the campus in scholarship, athletic contests or in other student activities.

Phi Beta Kappa.—The first of these fraternities was *Phi Beta Kappa*, founded at the College of William and Mary, Williamsburg, Va., on Dec. 5, 1776. It was a social club of five students, John Heath, Richard Booker, Thomas Smith, Armistead Smith and John Jones. It had all the features which characterize the modern fraternity, a ritual with secret obligations, a motto, a grip and a badge in the form of a square silver medal displaying on one side the Greek letters of its name and on the other side the monogram *SP* for *Societas Philosophica*. In 1781 the College of William and Mary was closed, its buildings being occupied for military purposes in turn by British, French and American troops. The society would have ceased to exist had it not been for a grant made in 1779 to Elisha Parmele, one of its members, to establish "meetings" or chapters at Yale and Harvard. This was done, at Yale in 1780 and at Harvard in 1781. By these two, chapters were started at Dartmouth in 1787, at Union in 1817 and at Bowdoin in 1826. But in 1826 the society changed its character, becoming non-secret and purely honorary, admitting to its membership a certain proportion of the scholars of highest standing, usually in the classical courses and members of the graduating class. In 1926 this society, with over a hundred chapters and a total membership approximating 60,000, celebrated its sesquicentennial by presenting to the College of William and Mary an administration building containing memorial features and by raising an endowment fund of more than a quarter of a million dollars. Its golden key badge is a coveted award of American college life.

History and Growth.—In 1825, at Union college, Schenectady, N.Y., *Kappa Alpha* was organized, copying many of the features of its predecessor. In the same college, in 1827, two other societies, *Sigma Phi* and *Delta Phi* were founded. In 1831 *Sigma Phi* established a branch in Hamilton college, and the next year *Alpha Delta Phi* was founded there. In 1833 *Psi Upsilon* was organized as the fourth fraternity at Union. That same year *Alpha Delta Phi* carried the idea into the West by establishing a chapter at Miami university in Ohio, and, in 1839, *Beta Theta Pi*, the first western fraternity, resulted. And so the system spread until in 1928 there were upwards of 70 such undergraduate societies among men students in American colleges. Two of these had more than a hundred chapters each. The ten largest, each of which in 1928 had over 70 chapters, are *Kappa Sigma*, *Sigma Alpha Epsilon*, *Phi Delta Theta*, *Sigma Nu*, *Alpha Tau Omega*, *Sigma Chi*, *Beta Theta Pi*, *Delta Tau Delta*, *Lambda Chi Alpha* and *Pi Kappa Alpha*. In 1927 66 of the fraternities had 2,430 active chapters all told, with a total membership of 554,937. They owned 1,576 chapter houses valued at \$52,980,155, these houses for the most part being college homes affording room and board to members. In addition to these real estate holdings many of the fraternities had substantial endowment funds. Beside these chartered fraternities for men there were in 1927 over 400 local societies acting as independent units. Some of the older of these are permanent in character, owning chapter houses and competing successfully with the fraternity chapters for members and for college honours, but the majority of them are temporary, designed to maintain an organization until the local society becomes a chapter of one of the national fraternities.

The fraternities are well organized. The usual plan includes a legislative body composed of delegates from the different chapters, and a small executive or administrative board elected by the delegates. A number of the fraternities maintain central offices with a permanent staff giving its entire time to administration.

Few of the fraternities have any judiciary. The financial methods are sound. The conventions of delegates, either annual or biennial, held in various parts of the country attract large numbers of members. Most of the fraternities have an inspection system by which these chapters are visited periodically and are kept up to a certain level of excellence. The fraternities publish magazines, usually from four to eight times during the college year. The earliest of these was the *Beta Theta Pi*, established in 1872 and published continuously since. The older and more prosperous have published histories and most of them have song books, sheet music, handbooks and other local and ephemeral publications. Many of them have substantial revolving loan funds for aiding their members and trophies of permanent value which are used as awards for distinct achievement.

The alumni of the fraternities are organized into clubs or associations of somewhat loose constitution having headquarters in centres of population. Some of them own and maintain fine club-houses. They exert much influence upon their fraternities on occasion, and through their meetings for luncheon or dinner they keep up the interest of the members. Often they render much aid to the college chapters through recommendations of likely candidates for membership.

Satellite societies in large numbers, both for men and women students, most of them bearing Greek-letter names, attend the fraternity system. These include the professional fraternities, as in medicine, law, dentistry, pharmacy, education and agriculture. They maintain chapter-houses, hold conventions, publish magazines, have alumni associations, and in most respects function along the lines of the undergraduate societies. There are many honorary societies where membership is granted for distinction of varied sort in separate school, department, or class. There are the nationally distributed honour societies, membership in which is highly prized through life, such as *Phi Beta Kappa* in general scholarship, *Sigma Xi* in science, *Tau Beta Pi* in engineering, *Phi Kappa Phi* in general ability, the *Order of the Coif* in law and *Alpha Omega Alpha* in medicine.

There are a few colleges and universities which never have permitted fraternities to exist, this ban ordinarily resulting from fundamental religious or denominational opposition to secret societies. Curiously enough, too, while the fraternity system is practically uniform throughout the United States, at Harvard, Yale and Princeton it differs in many respects from its character elsewhere. At Harvard there are chapters of a few fraternities but their influence is small compared with that of local societies of long standing. At Yale the fraternities have chapters of the ordinary type in the engineering department (Sheffield Scientific school); but in the college or classical department the fraternity chapters are called "junior societies," because they limit their membership to the three upper classes and allow the juniors each year practical control of chapter affairs. Senior societies, of which the oldest is Skull and Bones, which are inter-fraternity societies admitting freely members of all the fraternities, are more influential at Yale than the fraternities themselves. Princeton has only local social clubs, without Greek names, and unaffiliated with organizations in other colleges.

Inter-fraternity Relations.—In earlier years the sharp rivalry among fraternity chapters fostered clannishness and led to much bitterness of feeling, but in 1909 representatives of the organizations met in New York and formed the *Interfraternity Conference*, which has held annual meetings since and has had wide influence. It has secured acquaintanceship and cemented friendships among leaders of the co-operating societies, improved relationships among the fraternities, and secured common action in needed advances. It has stimulated the expansion of existing fraternities and the formation of new ones, so as to offer fraternity benefits to a larger number of students. Its influence has extended among the graduate members who have organized inter-fraternity clubs in the cities, binding together in fellowship college men who have the common tie of Greek-letter society membership. An inter-fraternity quarterly, *Banta's Greek Exchange*, in 1928 in its 16th volume, has been a valuable medium for the exchange of ideas and information among workers in a common

field. A select library of fraternity literature, based upon the extensive collection of the late William Raimond Baird, is maintained by the New York Public library. This interfraternity movement has practically wiped out opposition to the fraternities, the sincerity of purpose of the leaders having made strong appeal to college administrators, as the common interest of college and fraternity has been emphasized in friendly conference and co-operation. (For women's societies see *SORORITIES*.)

(F. W. SH.)

BIBLIOGRAPHY.—The standard authority on the fraternities is Baird, *Manual of American College Fraternities* (11th ed., 1927). See also Dean Thomas Arkle Clark, *The Fraternity and the College* (1916) and *The Fraternity and the Undergraduate* (1917).

FRATICELLI, the name given during the 13th, 14th and 15th centuries to a number of religious groups in Italy, differing widely from each other, but all derived more or less directly from the Franciscan movement. The word is a plural diminutive of Ital. *frate*, brother. As early as 1238 Gregory IX., in his bull *Quoniam abundavit iniquitas*, condemned and denounced as forgers (*tanquam falsarios*) all who begged or preached in a habit resembling that of the mendicant orders, and this condemnation was repeated by him or his successors. The term Fraticelli was used contemptuously to denote, not any particular sect, but the members of orders formed on the fringe of the church.

The name Fraticelli may more justly be applied to an extreme and fanatical offshoot of Franciscanism, which we hear of definitely in 1322 as established in Sicily, and known as Fraticelli. This group of exalted and isolated ascetics soon began to regard itself as the sole legitimate order of the Minorites and then as the sole Catholic Church. After being excommunicated as "schismatics and rebels, founders of a superstitious sect, and propagators of false and pestiferous doctrines," they proceeded to elect a general and then a pope called Celestine. For nearly a century they were able to carry on an active propaganda throughout Italy, until pope Martin V., in 1426, appointed two of the strict and orthodox section of the Franciscans known as Observants, with orders to make a special crusade against the heresy of the Fraticelli. From 1426 to 1449 the Fraticelli were unremittently pursued, imprisoned and burned. The sect gradually died out after losing the protection of the common people, whose sympathy was now transferred to the austere Observants and their miracle-worker Capistrano. From 1466 to 1471 there were sporadic burnings of Fraticelli, and in 1471 Tommaso di Scarlino was sent to Piombino and the littoral of Tuscany to track out some Fraticelli, who had been discovered in those parts. After that date the name disappears from history.

See F. Ehrle, "Die Spirituellen, ihr Verhältnis zum Franziskanerorden und zu den Fraticellen" and "Zur Vorgeschichte des Concils von Vienne," in *Archiv für Literatur- und Kirchengeschichte des Mittelalters*, vols. I., II., III.; Wetzer and Welte, *Kirchenlexikon*, s.v. "Fraticellen"; H. C. Lea, *History of the Inquisition of the Middle Ages*, III. 129-180 (London, 1888).

FRAUD. To succeed in an action claiming damages for fraud the person aggrieved must first prove a representation of fact, made either by words, by writing or by conduct, which is in fact untrue. Mere concealment is not actionable unless it amounts not only to *suppressio veri*, but to *suggestio falsi*. An expression of opinion or of intention is not enough, unless it can be shown that the opinion was not really held, or that the intention was not really entertained, in which case the state of a man's mind is a matter of fact. Next, it must be proved that the representation was made without any honest belief in its truth, that is, either with actual knowledge of its falsity, or with a reckless disregard whether it is true or false. It was finally established, after much controversy, in the case of *Derry v. Peek* in 1889, that a merely negligent misstatement is not actionable. Further, the person aggrieved must prove that the representation was made with the intention that he should act on it, though not necessarily made directly to him, and that he did in fact act in reliance on it. Lastly the complainant must prove that, as the direct consequence, he has suffered actual damage capable of pecuniary measurement. (See *CONTRACT*; *COMPANY*.)

For fraud, in its wider sense of dishonest dealing, see *FRAUDS*.

FRAUDS. Frauds practised for material gain were common in remote antiquity and they have remained with us ever since. Wherever men have found themselves gifted with ingenuity a persuasive tongue and histrionic talent without a moral sense to restrain them, they have dishonestly turned their gifts to their own profit. Their exploits have come down to us from the very dawn of history. According to Herodotus, the mason who built the stone treasury of Rameses III. contrived a secret entrance through which he passed nightly to steal a portion of the royal treasure. The Old Testament describes how Jacob defrauded his brother Esau of his birthright and how the Hebrews in bondage defrauded their Egyptian taskmasters of their jewels. Specimens of loaded dice have been found in Herculaneum and it is probable that in every crowded community of the ancient and medieval world there were individuals who practised fraud as a profession. In modern times frauds are not confined to persons born with glib tongues and no moral sense. They have been practised more often by men of natural probity who took the first step in the hope of retrieving themselves from financial ruin.

Frauds for personal gain must be distinguished from those perpetrated solely for mischief. The catalogue of literary forgeries is already long. The person who fabricated a grammar of the Formosan language in Dr. Johnson's time was a laborious practical joker, as were the joint authors of *Wanderings in New Guinea*, by "Capt. Lawson R.N.," a book which was accepted as authentic by all British learned societies except the Linnean, because the wardroom officers of H.M.S. *Basilisk* who produced their book in advance of that which they had discovered to be projected by their unpopular Admiral, knew less about insects than they did about the fauna in fur and feathers. A later forger of travel books who signed himself de Rougemont, had been a footman in the family of an Australian Governor. It is supposed that he was also the author of more than one imaginative book on the exploration of South America for which he took the name of Paul Fountain, but since he made some money by these literary forgeries, he might more properly have been referred to in the paragraphs dealing with frauds for profit. The person who fabricated the doggerel lines that appeared in the *Times* during the World War, over the name of Rudyard Kipling, may have had the mixed motive of injuring the reputation of both the poet and the newspaper.

The motives of Wenzel Hanka, who fabricated poems in the old Tchech language was purely patriotic. Other nations had old national poetry and Hanka did not wish his nation to take an inferior place. So good was the literary form of his productions that they were admired and quoted for nearly forty years. Goethe himself was inspired by them for some of his poems. The manuscript produced by Hanka appeared to date from the twelfth century, but when it was submitted to chemists they found in the colouring of the illuminated initials, Prussian blue, which was not discovered until a later date. After Hanka's death, his library was searched and the instruments used in the fraud together with a draft of the poems in his own handwriting were found concealed. The motives of the youth, Thomas Chatterton, who committed suicide in 1770 at the age of 18, was rather to obtain a hearing than to embellish the literature of his native country. He, too, was no mean poet, though he was less skilled in the arts of the forger than Hanka. He had chosen for his mouth-piece a fictitious monk of the 15th century whom he called Thomas Rowley.

It was scarcely possible that the modern interest in archaeology should escape the attention of impostors. Quite a factory of ancient documents alleged to have been found in tombs and in the sand of the Fayum are submitted to foreign tourists year by year. For the most part they are not unskillfully forged upon sheepskin and papyrus, though they would not deceive any qualified expert: some are clumsily executed, as for example, the goat-skins in which the eye holes have been mistaken by the forger for missing portions of the skin and he has elided a word or two to allow for them; or where he has used an ink or a kind of pen that had not been invented at the period to which the manuscript is ascribed. Hand in hand with these documentary forgeries go

the scarabs and the figurines and the objects alleged to have been recovered from Pompeii and Herculaneum. Dupes are always to be found to carry such antiquities back to their private museums and to defend their authenticity against every assailant.

Even Egyptian mummies have been fabricated with success. A Dresden doctor having purchased the corpse of a young woman, embalmed it and disposed of it as the mummy of the Queen Nitocris for a considerable sum. Unfortunately his process was defective and when the mummy, which was supposed to have resisted the ravages of time for three millenniums, began to decompose, the fraud was discovered. Dr. M. W. Shapira (1830-1884) aimed higher when he offered to the British Museum fifteen sheep-skin strips cut from the ends of synagogue rolls 300 years old, treated with chemicals, as an earlier version of the history contained in the Book of Deuteronomy, belonging to the 9th century B.C. He was a Polish Jew, who kept an antiquity shop in Jerusalem. On the discovery of the Moabite stone in 1872, he had sold to the Prussian government forged Moabite pottery, which was exposed by Clermont-Ganneau, who had deciphered the Moabite stone. This scholar was sent to London to examine the sheep-skins and he declared them to be a forgery, probably by four or five people. Shapira committed suicide in Rotterdam in March 1884.

Savants of reputation seem to have a vein of credulous simplicity which makes them the natural prey of the forger. Chasles, a mathematician of European reputation, was induced by a clumsy forger named Vrain-Lucas to purchase letters of which Cicero, Socrates, St. Jerome and Lazarus, after his resurrection, were said to be the authors, and these distinguished persons wrote their letters in modern French and on contemporary notepaper. Such clumsy mistakes are not uncommon. A will purporting to be signed in 1862 was written on paper bearing the 1870 watermark: envelopes addressed by celebrities in the 18th century have been offered for sale, though envelopes were unknown before 1842. Red ink appears in documents dated in the 17th century though red ink was unknown before 1780.

Fraudulent Claims.—Fraudulent claims to titles and estates have been common in modern times. In the early 17th century a Frenchwoman appeared in Limoges claiming to be Queen Henrietta Maria, the daughter of Louis XIII., who at the moment was in London as consort of Charles I. Nevertheless, she carried off her part with such distinction that she was widely accepted as a royal personage. A commission was sent down from Paris to examine her and she signed her interrogatory as "Henriette de Bourbon." Nevertheless she was condemned to be whipped by the hangman and to be imprisoned till further orders. No less than seven pretenders have claimed to be Louis XVII. of France, though the death of the Dauphin in the Temple on June 8th, 1795, was testified to by responsible witnesses. More romantic was the claim of the young impostor who assumed the title of hereditary prince of Medina in 1748. He had been landed under mysterious circumstances by a French merchant ship on the island of Martinique. Assuming the title of count de Tarnand, he signed a letter, as if by inadvertence, in the name of D'Este and the rumour at once spread that he was Hercules D'Este, hereditary prince of Medina. He defied the governor of the island and took up residence in a Jesuit convent where he gave audiences, received petitions and transacted public business. He had borrowed money freely and finding that his popularity was waning, he set sail for Europe under a royal salute and flying an admiral's flag. He was arrested at Madrid and sentenced to the galleys at Ceuta, whence he escaped. Having been refused permission to land at Gibraltar, he set sail and was never again heard of. He was a good linguist and well educated, but his identity has never been determined.

False claims to titles and estates in England have been not uncommon. In 1824, Richard Cook laid forcible claim to the barony of Stafford by taking possession of Stafford castle for a few hours and collecting the rents of the estate. He made a "state entry" into Stafford in a hired carriage emblazoned with the Stafford arms and four horses. These were unyoked by a mob of

his admirers, who drew him in triumph to his hotel. The next false claimant was Thomas Provis who laid claim to the baronetcy and estates of Sir Hugh Smyth of Ashton hall, Gloucestershire. On the trial of the action in 1853, his proof broke down, for it was shown that at the time when he alleged that he had had an interview with Lady Bath, he was actually serving a sentence in gaol for horsetealing. He was sentenced to penal servitude for 21 years.

As an instance of the gullibility of people when titles are claimed, the case of Robert Taylor, who represented himself to be the son and heir of Lord Kennedy, ought to be quoted. This youth had been married more than once before he was 21; he was uneducated and common-looking, having been, in fact, apprenticed to a chimney-sweep in Durham. Nevertheless many people were found to believe in him and a huge crowd attended his trial. He was sentenced to 2½ years' imprisonment. His chief concern when sentenced was to know whether any of his wives could pursue him on his release.

The impudent claim of Arthur Orton, a Wapping butcher, to the title and estates of Sir Roger Tichborne in May 1871, aroused greater public interest than any trial of this nature before or since. Sir Roger Tichborne had been born in 1829 and educated at Stonyhurst. He was an officer in the carabineers for 3½ years. He had become secretly engaged to his cousin and this being discovered by her father there was a stormy scene and he sailed for South America in 1852. He was then presumptive heir to the baronetcy. His uncle died while he was in Valparaiso. On April 20, 1854, he sailed for Australia in the *Palma*. A few days later wreckage from that vessel was picked up and none of the crew was ever heard of again. Roger Tichborne's will was proved and legal proof was given of his death. Meanwhile, his mother, unwilling to believe in his death, had advertised a reward for his discovery. Thirteen years after the loss of the *Palma* one of her advertisements came to the notice of a solicitor in Wagga-wagga, Victoria, who wrote to Lady Tichborne that her son was living in the town under the name of Castro. Funds having been provided for his journey, this man made a devious journey to Paris during which he went to Wapping to inquire about the Orton family and to Tichborne where he was shown over the house as an ordinary visitor. Roger Tichborne had been a slight, narrow-chested man: the claimant weighed nearly twenty stone. Nevertheless Lady Tichborne made an affidavit that she recognized her son and she allowed him £1,000 a year until the trial. She died before the claim came before the court. The trial took up the greater part of two years. Among the claimant's witnesses were old servants, friends of the family and troopers in the carabineers. England was divided between pro- and anti-claimants. But as the trial wore on and the claimant himself was cross-examined and admitted that as far as he could remember Caesar and Virgil wrote in Greek and that *laus Deo semper* meant "laws of God forever," and went on to say that he had seduced the lady to whom Roger Tichborne had been engaged—the lady being since married and being actually in court at the time—there was a wave of public sentiment against him. He lost his case and was subsequently sentenced to fourteen years' penal servitude for perjury.

There was a mingling of the practical joke and the fraud for profit in the exploit of the ex-convict, William Voigt, who in 1896 assumed the uniform of a captain in the First Prussian Guards and, having collected a force of eleven genuine soldiers, entered the town hall at Koepenick, confiscated the funds of the municipal treasury and sent the burgomaster and the treasurer under military arrest to Berlin. He was sentenced to four years' imprisonment.

Company Frauds.—The list of company frauds is a very long one. The South Sea Company, founded in 1710, was at first unwisely and afterwards dishonestly managed. The "South Sea bubble," as it was called, burst in 1720 ruining thousands of families. In the following year the directors' estates, to the value of over two million sterling, were seized and sold. By fraudulent artifice the shares had been run up from £100 to £1,000. Knight, the cashier, absconded with £100,000. Twenty-three years later he compounded the fraud for £10,000 and returned to England.

A parliamentary enquiry was held in Nov. 1720 and as a result, Aislabie, chancellor of the exchequer and several members of parliament were expelled the House. The crash had followed the collapse of Law's bubble in France. John Law of Edinburgh, had been made controller general of the French finances upon the strength of a scheme for an East Indian and Mississippi Company by which the national debt of France was to be paid off. In 1716 he opened a bank in his own name. The shares rose to 20-fold their original value and in 1719 they were worth 80 times the amount of all the current specie in France. In 1720 the whole fabric of false credit collapsed, spreading ruin throughout the country. Nine years later Law died in poverty at Venice.

Company and banking frauds were commoner during the first half of the 19th century than they are now. They were due generally to the misplaced confidence of directors in their servants. Walter Watts, an assistant clerk in the Globe Assurance Office, on a salary of £200 a year, succeeded in robbing his employers undetected for years and in leading a double life quite unknown to them. He owned houses in London and Brighton; entertained largely; gave balls and suppers, and even controlled two of the London theatres without a whisper of his real identity reaching the ears of his employers in the city. His defalcations amounted to £70,000. He ended his life in a convict prison.

Hard upon his heels followed Robson, chief clerk in the Crystal Palace Company, on a salary of £150 a year. He too entertained largely in the West End. He wrote plays good enough to be given in London theatres and he dressed fashionably and maintained a smart carriage. His directors were aware of this, but they accepted his story that he had been lucky on the Stock Exchange. His income was really derived by creating fictitious shares in the company's stock. All went well with him until the head of his department asked him one day to produce certain scrip which he had made away with. He said that he had taken the certificate home. His chief insisted upon accompanying him to his house and while he waited, Robson escaped by the back door to Sweden where he was arrested for extradition. His defalcations proved to be £27,000 and he was transported for 20 years.

Robson's conviction caused a profound sensation in the commercial world and the great undertakings began to look into their affairs. The Great Northern Railway Company became uneasy when it discovered that larger dividends had been paid than the capital warranted. Their books were well-kept and in a published report they stated that "they had every confidence in their registrar, Mr. Redpath." Yet this trusted servant had issued no less than £200,000 of fictitious stock. He invented new shareholders, endowed them with forged stock for which the dividend passed to him. Redpath is interesting as a psychological study: he was an open-handed philanthropist who would forge a share certificate and sign a cheque for a charity within the hour. He was a collector and a patron of the arts, given to lavish hospitality, but his greatest luxury lay in giving to the poor. His downfall was dramatic. On the platform of a railway station he was passing the chairman of the company who was in conversation with a certain peer and he raised his hat. The peer stopped him and shook hands. "What do you know of our clerk?" enquired the chairman. "Only that he is a charming fellow who gives the best dinners in London." Struck with uncomfortable surprise, the chairman ordered an investigation and Redpath fled to Paris, but he returned voluntarily, stood his trial and was sentenced to transportation for life.

The failure of the Liberator Society brought to light defalcations by Jabez Balfour, Hobbs and Wright of two million sterling. The Liberator Building Society had been bankrupt for some 15 years, but the fact was concealed from the shareholders. When Balfour joined it he was a member of the House of Commons with a considerable estate in Oxfordshire. The arrest of Wright and Hobbs, his partners in the fraud, warned him what was coming. He resigned his seat, gave his sister a power of attorney, and fled with all the ready money in notes and gold that he could lay his hands upon. His chosen asylum was the Argentine where he purchased a brewery and felt comparatively safe, since the Argentine Government had refused to grant his extradition. The case was fought from court to court for twelve months, but at last the

supreme court adjudicated against him. Even then there were desperate attempts to rescue him. His trial dragged on for months in England, but he was eventually sentenced to 14 years' penal servitude.

The London and Globe Company frauds of the early 'nineties were the work of Whitaker Wright, an Englishman who had spent many years as a mining engineer in Philadelphia. He returned to England in 1889 and began at once to float companies. His method was always the same—to rob the companies in which he was concerned and to conceal the facts under a cloud of complicated details. The directors of the London and Globe Company were puppets in his hands and believed everything that he told them. The crash came in 1903, when Wright was charged with issuing a fraudulent balance sheet and on Jan. 27, 1904, he was sentenced to 7 years' penal servitude. While the judge was passing sentence he swallowed cyanide of potassium and died before he could be removed from the courthouse.

Banking Frauds.—Like company frauds, banking frauds were commoner in the 19th century than they are now. Roland Stephenson of Remington, Stephenson and Co.'s Bank succeeded in embezzling half a million of money and in ruining hundreds of his clients. Stephenson entertained on a lavish scale and outwardly appeared to be the most cautious and responsible of bankers. Secretly he was a gambler. He sat in the House of Commons and was treasurer of St. Bartholomew's hospital where he occupied a room on the night before his disappearance. The bank was still open and at 11 A.M. the president of the hospital was able to withdraw £5,000, but the door closed two hours later and the bank suspended payment. Stephenson had absconded with his chief clerk, carrying £70,000 in cash. They had crossed to Ireland where they took ship in a brig bound for the West Indies. Neither they nor the brig were ever heard of again.

The reasons that impelled John Sadleir to take to crime are unknown. He was frugal, not given to hospitality or to excesses and no one knew how the money that he stole from his customers was spent. He began life as a solicitor in Tipperary and was connected with a long-established private bank that bore the name of his family. As a member of Parliament he rose to be junior lord of the Treasury and to be associated with various financial undertakings in the City. As chairman of the London and County Bank he developed its business and made no attempt to rob it, but when his family bank suspended payment it was found that his defalcations exceeded £400,000. He had issued false stock in the Swedish railway of which he was chairman to the value of £150,000 and had forged thousands of false acceptances put into circulation through his creatures. The first hint of suspicion came when he resigned office. His credit was shaken and the drafts of his bank were dishonoured. When ruin seemed irretrievable his body was found lying on Hampstead Heath poisoned with prussic acid. He left behind him letters expressing contrition.

The failures of private banks such as Strahan and Paul, the Royal British, and the Eastern Banking Corporation were all due more or less to the same cause—the partners using their customers' deposits for private speculation. In the case of the City of Glasgow Bank, which failed in 1878, the directors had issued false balance sheets and declared dividends when the bank was insolvent. When arrested it was found that several of the directors had enormously overdrawn their private accounts. They were sentenced to very moderate terms of imprisonment. The Union Bank of London was robbed by its cashier, Bullinger, over a period of more than 15 years of the enormous sum of £263,000 and the directors had not discovered it. Bullinger's method was to produce a forged passbook instead of the real Bank of England passbook for inspection. He was a steady unobtrusive man with no vice except a passion for gambling through outside brokers. He made no defence and was sentenced to 14 years' penal servitude.

Turf Frauds.—Conspicuous among the turf frauds was the case of Henry Benson, a man who might have prospered by honest courses if he had been born with any moral sense. His father was a prosperous merchant of good repute and he had an excellent education. He spoke and wrote several languages with ease; he was a good musician and his manners were excellent. Having

already served a sentence for an impudent fraud in London, he advertised for employment as a linguist and was engaged by a certain William Kurr, who was concerned in dubious turf business. With Benson's ingenuity and education, a gigantic criminal organization was built up. Kurr was under police suspicion and Benson set to work to suborn the police. He bought over three chief inspectors at Scotland Yard, all of whom were concerned in watching Benson's new activities in France. By means of a specially fabricated copy of a sporting paper, he induced French investors to trust him with their money. The French Government pressed for the arrest of the swindlers and the police warned Benson of his danger. It was too late: he, Kurr and his police confederates were arrested and sentenced. On release in 1887, Benson and Kurr crossed to America where they prospered as bogus company promoters. Subsequently Benson was found exploiting mines in Brussels, but after a term in a Belgian prison, he transferred himself to Geneva as an American banker. So well did he play his part that he won the heart of the daughter of a retired Indian officer whom he induced to part with all his capital in return for worthless scrip. He was arrested on the point of embarking for the United States, and it was then discovered that all the wedding presents of jewellery were sham. On his release from prison he turned up in Mexico personating Madame Patti's agent and netted £5,000 in advance bookings. Arrested in New York and lodged in the Tombs prison to answer for this offence he committed suicide. He was then still under forty.

Frauds by Individuals.—Two inter-related cases of fraud in the 18th century have been frequently referred to. The twin brothers Perreau—Robert, a physician in good practice, and Daniel, a city merchant—had obtained £7,000 from Drummond's Bank on a forged acceptance. They maintained that it had been given to them by Mrs. Rudd who kept house for them and that they believed it to be genuine. They were convicted on her evidence as a witness for the crown. Public sympathy was strongly in their favour. Nevertheless both were convicted and hanged though they protested their innocence even on the scaffold. The accounts of the trial that are preserved suggest that Robert Perreau was innocent.

The Rev. Dr. Dodd, a canon of Brecon and chaplain to George III., obtained funds from moneylenders by forging his former patron, Lord Chesterfield's, signature. Nothing might have been heard of the transaction had the document not been shown to Lord Chesterfield who denied its authenticity and allowed the forger to be arrested. In his extremity Dr. Dodd refunded the money. Nevertheless he was convicted with a strong recommendation to mercy. Dodd was a fashionable clergyman of the day and a noted preacher and courtier. All London joined in a petition to the King. Dr. Johnson himself became his champion, but with King George III. they cried to deaf ears. "If Dodd is pardoned, it will be said that the Perreaus were murdered," said his majesty, being unable to appreciate the difference between the two cases. The poor chaplain was hanged at Newgate pouring forth paeans of praise upon the king.

The Victory Bond Scheme for which Horatio Bottomley was sentenced to a term of penal servitude was an ingenious method of exploiting patriotic enthusiasm and the gambling instinct at the same time. The Victory Bonds were issued by the Government at £5: Bottomley invited subscribers at £1 or more, on the understanding that the interest should be drawn for as a lottery and the capital investment should remain intact. So strong was the bait that some 30,000 people trusted him with their money at the rate of £10,000 a day.

The poor suffer no less from fraud than the rich investor. The confidence trick in its various forms is still practised in the London streets and public houses. So various and intricate are the devices of the modern cheat that new schemes come to the notice of the police nearly every day. Struggling farmers and even labourers still fall victims to the wiles of the "Spanish prisoner" writing from Valencia, though the fraud has been so often exposed in the press; but the lure of hidden treasure—of obtaining something for nothing—will always find a victim. The mock auction in which confederates are seen bidding furiously

for worthless goods, still flourishes in London. The fortune-teller is never long without a client; the quack doctor or the vendor of patent remedies without a patient. Even habitual inebriates are made to contribute their quota, for among the advertised remedies for intemperance is a compound of 98% of sugar and 2% of common salt, sold at a fantastic price. The menace of Bolshevism has produced bands of Russian impostors who peddle forged documents to foreign embassies. As long as dupes continue to abound, the vultures are never far away.

(B. T.)

THE UNITED STATES

Dubious investments are apparently marketed in America more expeditiously than anywhere else on the globe. It is said that a Frenchman hoards his savings, an Englishman buys a home or consols, but the small American investor's guiding principle seems to be a mixture of gambling, a desire to get something for nothing, and to become rich without work. This principle, according to Andrew Mellon, secretary of the U.S. Treasury, has caused a loss of \$1,700,000,000 annually in the United States, in financial ventures alone. Americans depend upon "headlines" for information, and believe statements because they are in print. A business in itself is that of marketing "sucker lists," of various nationalities. Brokers sell them at 1 cent a name, and so sure are persons once "fleeced" to be good prospects again that swindlers pay over 5 cents a word for lists of veteran victims. Names and addresses of corporation stockholders are also sold by "sucker" list dealers.

The department of business research of New York university made a survey in 1927 of a selected list of professional and business men in 15 States during three years, and found that the average investment in unsound securities was over \$1,190 per person, the average loss \$1,100. In the three years surveyed 418 persons lost \$435,000. Generally, they were lured by dividends of 8% or over, and the purchase of unlisted common stocks of oil, automobile and mining companies. The following are the factors said to have induced such purchase (numbers refer to persons): Hope of extraordinary gain, 218; salesman's persuasion, 112; confidence in the company, 83; own judgment, 55; "tips" on the stock market, 37; stock bonus, 27; appeal to social position, 23; offer of trade, 16; hope of recovering past losses, 14. Total persons reporting, 401; total mentioning two or more factors, 154.

The swindler's business has increased since the World War, owing to the high wages paid to industrial workers, general prosperity and the sale of corporate securities to small investors begun in the patriotic Liberty Loan drives and continued by many corporations selling stock to employees on instalments. Persons who before had placed their savings in banks thus learned new methods. The swindler offered to take Liberty Bonds in payment for his stocks, bonds and real estate. Most fraudulent schemes and methods are ancient; but their presentation changes daily. As classified when detected some are listed below:—

Blind Pool or Participating Syndicate.—Promoters of this scheme tell their victims that they deal only in high-class securities, and can "work the market" because the pool managers are "among the great financial wizards of Wall street" (New York's financial district). They promise 24 to 120% yearly dividends on money put in the "pool" to be invested as the managers think best. These "syndicates" probably never buy or sell stock. Operated by an honest banking firm as a form of investment trust, syndicates may help the investor, but an unscrupulous "outfit" can make them extremely dangerous.

The Faked "Rights" Game.—In this a promoter forms a corporation with a name similar to that of a well-known firm, and having secured a list of the latter's stock-holders, usually through a dishonest employee, tries to sell his prospective victim one "rights" certificate in the new firm for every share that he holds in the reputable company.

"Front Money" Parasites flourished during 1920-29 in various cities. Posing as service companies, brokers or investment dealers, they get advance fees from poor or inexperienced com-

panies needing new capital or from optimists trying to develop new propositions. For fake services, *i.e.*, analysis of the company's business, preparing stock certificates, or filing and publishing incorporation papers to comply with the Martin Law, a New York State law to protect investors, they charge fees of \$100 to \$1,000 with extras.

"Declaration of Trust" or "Common Law Trusts," a legal instrument under which have worked many pseudo oil promoters in the South-west. It can be honest, but shareholders in fake companies usually get only "certificates" entitling them to an interest in the "trust's" earnings. The value and trusteeship of shares under such a "trust" should be examined carefully.

"Housing Trusts" have been operated throughout the United States, a number of States declaring them lotteries violating State laws. Promoters offer contracts; the buyer agrees to pay \$7.50 a month for 10 years; when his contract "matures" he is to get \$1,000 from a "trust fund." As a lure, he is allowed to borrow an amount equal to the face of his certificate at 3 or 4% interest. When all costs which the holder must pay are totalled the interest rate is usually about 7%. The first three or four monthly payments, and perhaps a part of subsequent payments, do not reach the "trust fund." Expenses and salaries have used them up. Actual loans at 3 or 4% can be had on demand but the contract holders supply the funds for all loans. And the first several monthly payments are forfeited and lost if the holder wishes to withdraw.

"Interim Certificates."—Some promoters try to keep up prices for stocks in new companies by selling interest-bearing "interim certificates," which grant limited rights and are not exchangeable for shares until after a stated period. They cannot usually be bought and sold in the open market. They may be legitimate, but sales are sometimes manipulated in such a way as to create false market prices.

Oil Royalties Companies may be genuine or not, according to the personnel of the management. Oil royalties are paid by producing companies to owners for drilling their lands. The rate is usually $\frac{1}{8}$ interest in any oil produced; the company pays all expense. Since banks in oil territories lend on certain royalties, assigning and recording them as though they were deeds, "royalty companies" have been formed, paying land-owners cash for royalties and holding them for shareholders. The next step in the development of these companies was the issuance of various securities against the pooled royalty holdings. The investor should remember that the rights of these companies are constantly shrinking in value, a fact rarely obvious until too late. In any case, before investing, the purchaser should know: (1) The company's holdings and locations, and the amounts paid for them; (2) the producing and non-producing areas; (3) the estimated life of wells, and the authority for the estimates; (4) the identity and reputation of the drilling companies; (5) the method of selecting and valuing properties; (6) trust agreement for control of funds and shareholders' rights.

The "Trick Merger" Company.—Shareholders in defunct or inactive oil-drilling companies are offered for their shares stock in consolidation companies with "wonderful chances to realize the success just missed by the first company." In exchanging shares, shareholders often pay 25%, more or less, of the original prices to the consolidation. Rarely are such rejuvenated enterprises any better than the companies they amalgamate.

The "Reloading Game."—Unsuccessful companies sometimes contract with fiscal concerns who make a business of selling additional issues of worthless stock. They "reload" old stock-holders who have realized nothing on their original investment. Issues are agreed upon and the fiscal concerns contract to sell the issues at prices which will net the companies a specified sum per share sold. A letter is sent over the president's signature; stock selling starts; the fiscal concern boosts prices. Sometimes no par value common stock sells at \$50. The original company gets \$5, \$45 going to the stock-selling "outfit."

The "Fake Race" Swindle.—Through the U.S. post office a "bunco" or swindling game, played by confidence men on those in good circumstances, has been stopped in several places; but it

may appear in others at any time. One man, it is said, parted with \$60,000 in order to collect a fake bet of \$160,000 which he believed he had won on a horse race. The plan operates somewhat in this fashion: The swindler meets the victim en route to some fashionable resort and suggests a hotel where there is a confederate acting as clerk. During motor rides and meetings more confederates are introduced as employees of "big men" following the races with sure tips. After much persuasion they reluctantly pass the tips on to their friends. During a trip to an "exchange" elaborately equipped with employees and complete racing paraphernalia the victim is impressed. He raises the cash and accompanies his "tipster" to a local bank where there is an official who asks no questions about deposits of large drafts and immediate cash withdrawals. When they return to the exchange, a confederate bets "by mistake" with the victim's money while it is in the hands of a manager for verification and count, along with the money alleged to have been won by the victim but not yet paid to him. The fake race is "finished just before the error is noted." The confederates fight with each other for the victim's benefit. There follow disorder, riot, cry of police, advice to the dupe to leave town, and assurances that his "friends" will cover the loss and meet him in another city. At a Florida resort recently over \$1,000,000 was lost in schemes like this, which the mails are used to further. Since the post office began its campaign against such procedure 28 "fake race" confidence men have been arrested and rather than go to trial some of them have forfeited a good many thousands of dollars in bail bonds.

The Confidence Man.—In New York, in 1927, the most notorious confidence man was "Lord Beaverbrook." He, like most of his ilk, posed as an admirer of wealthy divorcées and widows, using \$78,000 worth of jewellery which one woman gave him to ensure for her as a present to another woman whom he was said to have bigamously married in order to gain control of her wealth. Often a confidence man pretends to a feminine "client" that there is a chance to invest in "a sure thing" and that he will go "fifty-fifty" with her in "a plunge." To prove his good faith, he gives her fraudulent securities for safe keeping, and vanishes with her cash. Newspapers carry many stories of confidence men who promise marriage, and pretend to borrow the savings of their victims for the purpose of furnishing new homes. As some of the latter keep their cash until after the ceremony, this sort of swindler may be liable for bigamy when there is no other tangible charge against him.

The Nationality Game.—Most of the various schemes which have been and will be described in this article are worked on foreigners or aliens. Swindlers find it very helpful to speak the language of their victim and to advertise in the many foreign newspapers published in the United States. A Czechoslovak who has just arrived is delighted at the interest and friendship of a fellow countryman and listens readily to talk of how to get rich "like other Americans." Germans are easily persuaded to invest in a machine invented by a German. In Jan. 1928 New York newspapers ran a typical story of a swindler haled to court with over 50 foreigners, mostly poor Italians, who had paid him from \$100 to \$5,000. He had posed as head of a foreign exchange firm, and had sold "consolidated Italian" bonds. The specific charge came from an Italian who had given up \$1,421 on a promise of getting "\$50,000 worth of bonds" when he had paid a balance of \$341. The Italian came to pay and to get the bonds, but the office was closed, the money and manager gone. The only asset was office furniture.

Tactics.—The first move in any scheme is to establish confidence. Sometimes this is done by attacking legitimate business, getting the small investor's cash through his prejudice against "big interests"; or by working the Wall street bogey, or by pretending to be in with the "big fellows" there. The swindler fakes endorsements of reputable business leaders; fakes letter-heads, using, except for one inconspicuous word to save him from jail, a reputable firm's name. He advertises in what is called a "tipster" or "dope sheet," a journal supposedly printed in the interest of finance but really no more than an advertising medium, apparently disinterested, for fraudulent securities. He supplements

these by fake market-letters and advisory investment service. It is estimated that one swindler disposed of at least \$15,000,000 in stock with a make-believe market to aid him. His stock, like that of many of his kind, was listed on an irresponsible exchange. The "hurry up" appeal on the telephone accomplishes much for the swindler, who, if he operates widely, equips an office, hires those who can ape the vernacular of financial experts, gives each a desk and a selected telephone list. The promoter keeps well out of the picture, usually in a near by office under a different firm name.

REAL ESTATE FRAUDS

The "Peak Game" is played by fraudulent real estate agents. First, the victim is sold a lot; then, called to another real estate office, the victim hears that a buyer will pay several times the price of the first lot if, with it, the former will turn over the two adjacent lots. The victim hurries to buy the two adjoining lots, returns to the second company, and finds that the customer is gone.

Tax-title Sales.—Sometimes land sold to "suckers" is a tax title only. The buyer receives what seems to be a deed, in reality mere paper. The land has unpaid taxes, and is bought for their amount; usually small compared to what the "sucker" paid. The title may prove worthless or the original owner pay his taxes and legally regain his land.

The "Gyp" Company sometimes buys real estate on contract and never completes its payments, but sells the land in small lots, 20% down, the rest monthly. The buyer goes to the office to make his last payment and receive his deed, only to find the company gone. The title remains with the original owner who was not paid in full.

The Free Lot Scheme.—In this some one hears that he has won a free lot, and arrangements are made for him to see it. When he visits it he is told that to build he must buy the adjoining lot or lots. If he does so, he pays more for the extra two than the three are worth. Or he is shown a very undesirable lot as the "free" one, but is sold desirable property at a high price on which the "value" of the "free" lot is credited. Or, again, he is asked to pay from \$5 to \$10 transfer costs, making the price of the "free" lot more than its worth.

The Development Scheme was widely exploited in parts of Florida during the "land boom," ending in 1927. The "development company" sent out cards asking the recipients to respond to the sender. Those replying were told that as a stockholder in a certain company, a defunct one, they might exchange their stock and \$2,000 in cash, as payment for a "valuable" lot. The scheme flourished until it was discovered that the "valuable" lot was practically worthless.

The Fraudulent Contract.—This was also exploited in Florida. The name of an honest and well-known real estate firm was printed in fake contracts giving the buyer such a "square deal" that sales with cash deposits were rapid. Before a victim discovered the fraud, the swindlers decamped.

MIXED FINANCE-AND-MERCHANDISE FRAUDS

"Directory" or "Year Book" Frauds thrive on the modern business complexity and the need for specialized directory service. One "transportation association" may inveigle persons in the transport business into paying \$50 for listing in a directory of railroad, steamship and warehouse service which is never published. The business public pays an annual toll of possibly a million dollars to fake directory schemes.

Business Men's Protective League, one of various so-called city "leagues" or "associations" which promise police or political protection for advertisements usually never printed. A "judge," possibly once a small town magistrate, is president. He, or some one in his name, telephones, paying the way for a salesman to collect advertisements for a business men's manual, the price to cover jury duty exemption, immunity from traffic and parking penalties, omission of factory inspectors' visits, etc. From \$10 to \$300 a year is charged; the graft totals hundreds of thousands annually.

The Salesman's Bond is a deposit which a salesman who has just been employed is told that he must furnish, without a receipt, for goods in his keeping. An inventory is soon taken and he is charged with "lost" goods covered by his bond. He has no redress.

Photograph Frauds are popular, seemingly even with the public. A telephone call comes from a local "press" bureau to a man or woman who is temporarily prominent, or anxious for newspaper publicity. The bureau requests an immediate sitting at Blank's studio, in order to obtain for their files a photograph, "entirely without charge." A few days later the proofs are delivered, with prices ranging from \$10 to \$200. The victim, if he does not buy, loses no money, although he may have spent considerable time to no purpose.

"Ambulance Chasers," a term in general use in America to signify lawyers who accept or solicit doubtful cases and prey upon victims of accidents, and who offer a person injured, whether slightly or seriously, their services, for a large part of any damages secured. They are in league with any dishonest persons who may be possible witnesses; and the step from valid to fraudulent claims is short and easy. In 1926, in New York city a "gang" consisting of lawyers, stenographers, taxi drivers, doctors and professional "victims," who involved themselves in accidents for a consideration, were exposed in extended court hearings. The New York courts, 1927-28, were full of fake claims which delayed valid cases. The insurance companies had to raise premiums and postpone authentic claim payments.

MERCHANDISING FRAUDS

Contracts Signed But Not Read.—Fraudulent furniture dealers will often advertise certain articles, sell them to customers, give duplicates of signed contracts for instalment purchases and deliver entirely different articles.irate victims are suavely asked to read the signed contracts, which describe not the articles seen, but those delivered. The same scheme obtains in selling other goods.

The "Give Away" Graft.—A mail-order concern circularizes with a "discount cheque," which is neither a cheque nor a discount. The cheque, plus the price, is a liberal amount for the article. With books the "give away" plan varies little in method. "Representative" persons receive a notice that each will get a set of books free because the company wants one citizen in each community whose opinion counts to accept a free set, in order to act as a local reference. The petition, which is "confidential," says that there is only a "shipping memo" to sign. In a few days a carbon of the "memo" returns and the citizen finds that he is pledged to make a monthly payment for "supplementary material," usually amounting to \$75 or \$100, regularly charged for the set.

Coupon Companies and Endless Chains formerly sold silk hose and underwear by mail. The victim paid \$1 for a coupon as part payment on hosiery "worth \$10," and he agreed to remit to the company the coupon and \$3. This arrangement entitled him to a receipt and three coupons and the title of "receipt holder." The title gave him the privilege of selling the three coupons at \$1 each, keeping the money. The first "receipt holder" paid \$1. If, and when, each of three subsequent buyers sent \$3 to the company the first "receipt holder" got his hosiery without further payment. This scheme was stopped by the post office.

Suit Clubs, a "graft" usually worked in office buildings. A pretty girl sells suit club memberships at \$2 a week. In the weekly drawing, a lucky number wins a \$50 suit. Those who never draw a lucky number are told that they will get a suit upon paying \$50. Police investigations in one city showed that \$30,000 paid into one club group yielded but five suits. Those who had paid \$50 and went to get their suits found only cheap materials and a make-believe tailor's shop.

Merchandise Insurance Frauds.—Dishonest importers find profit and yet escape consequences. Import duties do not have to be paid until goods are removed from warehouses, if sufficiently large bonds are put up with surety companies and the goods are stored in bonded warehouses. In 1926-27 a wily merchant imported an assortment of costly European goods which he stored in

a bonded warehouse. Then he secretly removed it, burned the warehouse, and having his goods concealed and duty free, collected the amount of the insurance.

OTHER FRAUDS

Fraudulent Bankruptcies.—The Federal bankruptcy law says that if liabilities are so much greater than assets that a debtor cannot begin to pay his debts, he may "go into bankruptcy." Trustees are then appointed, to whom the petitioner must turn over all assets. The trustees divide available assets among creditors, and the bankrupt is released. He is no longer in debt. Creditors can make no further demands upon him, regardless of how much money he may make thereafter. Fake statements made in order to acquire merchandise on credit or to conceal tangible merchandise violate the criminal law. Thus a dishonest dealer in silks, furs or diamonds can get stock on credit from wholesalers, conceal or sell it to a "fence" (one handling stolen goods), announce himself bankrupt, and pay wholesalers only a percentage of the value of the merchandise illegally disposed of.

Mail Frauds.—Most major swindles listed under finance and real estate are managed more or less by mail. Other forms are conducted by mail entirely, but in scheme and method they, too, come under the heads already listed. Selling "gold mine" and "oil" stock, and Utopian real estate, is often exclusively managed through the mails, or by telephone. The post office issues fraud orders against swindlers who try to keep within the "technical truth" in advertisements. When they advertise in a woman's magazine, "10 yd. of silk for shirtwaists at 10 cents" and send 10 yd. of silk thread, they are trading on the fact that "silk" generally means cloth, not thread.

"Home Work" Swindles, frequently advertisements, with every mark of honest business, describing work women can "do at home in spare time." The initial payment is perhaps not over 10 cents. But if the plan includes the purchase of materials for making embroidery or lace, or any other needle-work, she who endeavours to eke out an income in this way finds that she must invest many times and that her work never satisfies the company.

Patent Medicines.—The mails are indispensable in the sale of fake patent medicines. Petty grafters advertise profusely in cheap fiction magazines, farm journals and country papers, "finding their most fertile field in the delusion that because it is in print it must be so." Quack advertisements deliberately suggest that the reader suffers from a variety of diseases which a particular lotion or pill will cure.

The Loan Shark business in America is old, but it is still very active. The modern American Shylock is suave, has a corps of legal counsel, auditors, expert advisers and high pressure salesmen to help him get cash for his "working capital." It is claimed that 100,000 workers in 1,000 railroad centres pay from 240 to 1,000% to unscrupulous lenders who buy wages at heavy discounts. Over 350 offices exist, each handling from 400 to 1,000 accounts. Employees frequently need cash when wages are paid bi-weekly or monthly. Even when wages are paid weekly, loan sharks keep up salary-buying pretences as long as there is the possibility of a salary to sell. Rural and industrial areas are full of small, secret offices for carrying on this usurious business. The Uniform Small Loan law, now in effect, wholly or partly, in 21 of the States has, to a certain extent, mitigated this evil. It authorizes any person to obtain a State licence, to make loans to \$300 at not more than 3½% a month, computed on unpaid balances. The law strictly regulates the conduct of the lender's business; it prohibits, and provides suitable punishment for loans by unlicensed lenders or loans exceeding the legal rate.

FRAUENBURG, a town of Germany, in the republic of Prussia, on the Frische Haff, at the mouth of the Bande, 41 m. S.W. from Königsberg by rail. Pop. (1925) 2,285. The cathedral (founded 1329) is known as Dom-Frauenburg, and is the seat of the Roman Catholic bishop of Ermeland. Within is a monument to the astronomer Copernicus. Frauenburg was founded in 1287 and received the rights of a town in 1310.

FRAUENFELD, the capital of the Swiss canton of Thurgau, 27 m. by rail N.E. of Zürich, on the Murg stream a little above its junction with the Thur. It is a prosperous town, at the convergence of several routes, and has iron manufactures. In 1920 its population (including the neighbouring villages) was 8,711, mainly German-speaking, while there were 6,304 Protestants to 2,342 Roman Catholics. The old upper town centres round the castle, of which the tower dates from the 10th century, though the rest is later. Both stood on land belonging to the abbot of Reichenau, who, with the count of Kyburg, founded the town, first mentioned in 1255. The abbot retained all manorial rights till 1803, while the political powers of the Kyburgers (who were the "protectors" of Reichenau) passed to the Habsburgs in 1273, and were seized by the Swiss in 1460 with the rest of the Thurgau. In 1712 the town succeeded Baden in Aargau as the meeting-place of the Federal Diet, and continued to be the capital of the Confederation till its transformation in 1798. In 1799 it was successively occupied by the Austrians and the French. The old Capuchin convent (1591-1848) is now a vicarage.

FRAUENLOB, the name by which HEINRICH VON MEISSEN, a German poet of the 13th century, is generally known. He seems to have acquired the sobriquet because in a famous *Liederstreit* with his rival Regenbogen he defended the use of the word *Frau* (i.e., *frouwe*=lady) instead of *Weib* (*wip*=woman). Frauenlob was born about 1250 of a humble burgher family, but he gradually acquired a reputation as a singer at the various courts of the German princes. In 1278 we find him with Rudolph I. in the Marchfeld, in 1286 he was at Prague at the knighting of Wenceslaus (Wenzel) II., and in 1311 he was present at a knightly festival celebrated by Waldemar of Brandenburg before Rostock. After this he settled in Mainz, and there according to the popular account, founded the first school of Meistersingers (*q.v.*). He died on Nov. 29, 1318.

Frauenlob's poems make a great display of learning; he delights in far-fetched metaphors, and his versification abounds in tricks of form and rhyme. They were edited by L. Ettmüller in 1843; a selection will be found in K. Bartsch, *Deutsche Liederdichter des 12. bis 14. Jahrhunderts* (3rd ed., 1893). An English translation of Frauenlob's *Cantica canticorum*, by A. E. Kroeger, with notes, appeared in 1877 at St. Louis, U.S.A. See A. Boerke, *Frauenlob* (2nd ed., 1881); Pfannmüller, *Frauenlobs Marienleich* (1913).

FRAUNCE, ABRAHAM (c. 1558-1633), English poet, a native of Shropshire, was born between 1558 and 1560. He was educated at Shrewsbury and St. John's College, Cambridge, where his Latin comedy of *Victoria*, dedicated to Sidney, was probably written. He was called to the bar at Gray's Inn in 1588, and then apparently practised in the court of the Welsh marches. After the death of Sir Philip Sidney, Fraunce was protected by Sidney's sister Mary, countess of Pembroke. His last work was published in 1592, and we know nothing more until his death in 1633.

His works are: *The Lamentations of Amintas for the death of Phyllis* (1587), a version in English hexameters of Thomas Watson's, Latin *Amyntas*; *The Louiers Logike, exemplifying the precepts of Logike by the practise of the common Lawe* (1588); *Arcadian Rhetorike* (1588); *Abrahami Fransi Insignium, Armorum . . . explicatio* (1588); *The Countess of Pembroke's Yvychurch* (1591/2), containing a translation of Tasso's *Aminta*, a reprint of his earlier version of Watson, "The Lamentation of Corydon for the love of Alexis" (Virgil, eclogue ii.), a short translation from Heliodorus, and, in the third part (1592) "Aminta's Dale," a collection of "conceited" tales supposed to be related by the nymphs of Ivychurch; *The Countess of Pembroke's Emanuell* (1591); *The Third Part of the Countess of Pembroke's Ivychurch, entituled Aminta's Dale* (1592). His *Arcadian Rhetorike* owes much to earlier critical treatises, but has a special

interest from its references to Spenser, and Fraunce quotes from the *Faerie Queene* a year before the publication of the first books. In "Colin Clout's come home again," Spenser speaks of Fraunce as Corydon, on account of his translations of Virgil's second eclogue. His poems are written in classical metres, and he was regarded by his contemporaries as the best exponent of Gabriel Harvey's theory. Even Thomas Nashe had a good word for "sweete Master Fraunce."

The Countess of Pembroke's Emanuell, hexameters on the nativity and passion of Christ, with versions of some psalms, were reprinted by Dr. A. B. Grosart in the third volume of his *Miscellanies of the Fuller Worthies Library* (1872). Joseph Hunter in his *Chorus Vatum* stated that five of Fraunce's songs were included in Sidney's *Astrophel and Stella*, but it is probable that these should be attributed not to Fraunce, but to Thomas Campion. See a life prefixed to the transcription of a ms. Latin comedy by Fraunce, *Victoria*, by Professor G. C. Moore Smith, published in Bang's *Materialien zur Kunde des älteren englischen Dramas*, vol. xiv., 1906.

FRAUNHOFER, JOSEPH VON (1787-1826), German optician and physicist, was born at Straubing in Bavaria on March 6, 1787, the son of a glazier who died in 1798. He gained experience in working optical glass and obtained work at the Utzschneider optical institute at Benedictbeuern, near Munich, of which he in 1818 became sole manager; the institute was in 1819 removed to Munich. Fraunhofer acquired great skill in the manufacture of achromatic lenses and various optical instruments. While measuring the refractive index of glass of various kinds he noticed and made use of the D lines in the sodium spectrum. Continuing this work he observed the dark lines in the solar spectrum. His researches were published in the *Denkschriften der Münchener Akademie* for 1814-15. These dark lines had been noted earlier by W. H. Wollaston (*Phil. Trans.*, 1802), but were for the first time carefully observed by Fraunhofer, and have on that account been designated "Fraunhofer's lines." He mapped 576 of these lines, the principle of which he denoted by the letters of the alphabet from A to G; and by ascertaining their refractive indices he determined that their relative positions are constant, whether in spectra produced by the direct rays of the sun, or by the reflected light of the moon and planets. The spectra of the stars he obtained by using, outside the object-glass of his telescope, a large prism through which the light passed to be brought to a focus in front of the eye-piece.

In 1823 he was appointed conservator of the physical cabinet at Munich, where he died on June 7, 1826.

See J. von Utzschneider, *Kurzer Umriss der Lebensgeschichte des Herrn Dr. J. von Fraunhofer* (Munich, 1826); G. Merz, *Das Leben und Wirken Fraunhofers* (Landshut, 1865).

FRAUSTADT (Polish, *Wszowa*), a town of Germany, in the Prussian province of Grenzmark, 50 m. S.S.W. of Posen by rail. Pop. (1925) 7,458. Cigars and bricks are manufactured and trade is in corn and cattle. Fraustadt was founded by Silesians in 1348, and afterwards belonged to the principality of Glogau.

FRAYSSINOUS, DENIS ANTOINE LUC, COMTE DE (1765-1841), French prelate and statesman, was born of humble parentage at Curières on May 9, 1765. He owes his reputation mainly to the lectures on dogmatic theology delivered in the church of Saint Sulpice, Paris, from 1803 to 1809. As court preacher and almoner to Louis XVIII., he later exercised great public activity and influence. In connection with the controversy raised by the signing of the reactionary concordat of 1817, he published in 1818 his *Vrais Principes de l'église Gallicane sur la puissance ecclésiastique*. The consecration of Frayssinous as bishop of Hermopolis "in partibus," his election to the French Academy, and his appointment to the grand-mastership of the university, followed in rapid succession. In 1824, he became minister of public instruction and of ecclesiastical affairs under the administration of Villèle; and about the same time he was created a peer of France with the title of count. In 1828 he, along with his colleagues in the Villèle ministry, was compelled to resign office, and the subsequent revolution of July 1830 led to his retirement to Rome. He died at St. Géniez on Dec. 12, 1841. His lectures were published in 1825 as *Défense du Christianisme* (15th ed. 1843, Eng. trans 1836).

See Bertrand, *Bibl. Sulpicienne* (t. ii. 135 sq.; iii. 253) for bibliography, and G. A. Henrion (*Vie de M. Frayssinous*, 1844).

FRAZER, SIR JAMES GEORGE (1854–), British anthropologist, was born at Glasgow on Jan. 1, 1854. Educated at Helensburgh, Glasgow university and Trinity college, Cambridge, he was elected a fellow of the latter college in 1879 and called to the bar in the same year. He was knighted in 1914, received the O.M. in 1925 and the order of commander of the Legion of Honour in 1926. His fame as an author was established by the publication in 1890 of *The Golden Bough* (re-issued in 12 volumes under seven titles between 1907 and 1915; in 1922 appeared an abridged edition under the original title). This work is a comprehensive study of ancient cults and folk lore and covers a vast field of anthropological research. In 1926 he issued vol. 1 of *The Worship of Nature*, dealing with the worship of the sky and of the earth. Among his many other publications are: *Totemism* (1887); *Adonis, Attis, Osiris, Studies in the History of Oriental Religion* (1906, 2nd ed. 1907, 3rd ed. 1914); *Totemism and Exogamy* (1910). In his honour the Frazer Memorial lectureship has been founded by which in rotation an annual lecture on some anthropological topic, in the field in which Sir James's special activities are most prominent, is delivered at the universities with which he has been associated.

FRÉCHETTE, LOUIS HONORÉ (1839–1908), French-Canadian poet, was born at Levis, Quebec, on Nov. 16, 1839, and died on June 1, 1908. He was called to the Canadian bar in 1864. He started the *Journal de Levis*, and his revolutionary doctrines compelled him to leave Canada for the United States. After some years spent in journalism at Chicago, he was in 1874 elected Liberal member for Levis in the Canadian parliament. He lost the seat in 1878. He edited *La Patrie* and other French papers in the Dominion; and in 1889 was appointed clerk of the Quebec legislative council. He was long a warm advocate of the political union of Canada and the United States, but in later life became less ardent, and in 1897 accepted the honour of C.M.G. from Queen Victoria. His works include: *Mes Loisirs* (1863); *La Voix d'un exilé* (1867), a satire against the Canadian Government; *Pêle-mêle* (1877); *Les Fleurs boréales*, and *Les Oiseaux de neige* (1880), crowned by the French academy; *La Légende d'un peuple* (1887); two historical dramas, *Papineau* (1880) and *Félix Poutré* (1880); *La Noël au Canada* (1900), and several prose works and translations.

See H. D'Arles, *Louis Fréchette* (Toronto, 1924); *Makers of Canadian Literature*.

FREDEGOND (*Fredigundis*) (d. 597), Frankish queen. Originally a serving-woman, she inspired the Frankish king, Chilperic I., with a violent passion. At her instigation he repudiated his first wife Audovera, and strangled his second, Galswintha, Queen Brunhilda's sister. A few days after this murder Chilperic married Fredegond (567). This woman exercised a most pernicious influence over him. She forced him into war against Austrasia, in the course of which she procured the assassination of the victorious king Sigebert (575); she carried on a malignant struggle against Chilperic's sons by his first wife, Theodebert, Merwich and Clovis, who all died tragic deaths; and she persistently endeavoured to secure the throne for her own children. Her first son Thierry, however, to whom Bishop Ragnemod of Paris stood godfather, died soon after birth, and Fredegond tortured a number of women whom she accused of having bewitched the child. Her second son also died in infancy. Finally, she gave birth to a child who afterwards became king as Clotaire II. Shortly after the birth of this third son, Chilperic himself perished in mysterious circumstances (584). Fredegond has been accused of complicity in his murder, but with little show of probability, since in her husband she lost her principal supporter.

Henceforth Fredegond did all in her power to gain the kingdom for her child. Taking refuge at the church of Notre Dame at Paris, she appealed to King Guntram of Burgundy, who took Clotaire under his protection and defended him against his other nephew, Childebert II., king of Austrasia. From that time until her death Fredegond governed the western kingdom. She endeavoured to prevent the alliance between King Guntram and Childebert, which

was cemented by the pact of Andelot; and made several attempts to assassinate Childebert by sending against him hired bravoos armed with poisoned *scramasaxes* (heavy single-edged knives). After the death of Childebert in 595 she resolved to augment the kingdom of Neustria at the expense of Austrasia, and to this end seized some cities near Paris and defeated Theodebert at the battle of Laffaux, near Soissons. Her triumph, however, was short-lived, as she died quietly in her bed in 597 soon after her victory.

See V. N. Augustin Thierry, *Récits des temps mérovingiens* (Brussels, 1840), Ulysse Chevalier, *Bio-bibliographie* (2nd ed.), s.v. "Frédégonde." (C. Fr.)

FREDERICIA (FRIEDERICIA), a seaport of Denmark, near the south-east corner of Jutland, on the west shore of the Little Belt opposite the island of Fünen. Pop. (1925) 18,454. It has good railway communication, and a steam ferry connects with Middelfart, a seaside resort on Fünen. There are a considerable shipping trade and railway works, and industries comprise the manufacture of tobacco, salt and chicory, and of cotton goods. A small fort was erected on the site of Fredericia by Christian IV. of Denmark, and his successor, Frederick III., determined about 1650 to make it a powerful fortress. The town first bore the name of Frederiksdode, and only received its present designation in 1664. In 1657 it was taken by the Swedes and in 1659, after the fortress had been dismantled, it was occupied by Frederick William of Brandenburg. It was refortified in 1709–10. Monuments in the town and vicinity commemorate the fighting of 1849 with the Prussians. The fortress was strengthened again in 1864 and stood a short siege before the Austro-Prussian occupation.

FREDERICK, "king or lord of peace" (Ger. *Friedrich*; Ital. *Federigo*; Fr. *Frédéric* and *Fédéric*). A Christian name borne by many European sovereigns and princes.

FREDERICK I. (c. 1123–1190), Holy Roman emperor, called "Barbarossa" or "Redbeard" by the Italians, was the son of Frederick II. of Hohenstaufen, duke of Swabia, and Judith, daughter of the Welf Henry IX., duke of Bavaria. When his father died in 1147 Frederick became duke of Swabia, and immediately afterwards accompanied his uncle, the German king Conrad III., on his disastrous crusade, during which he won the complete confidence of the king. In 1152 the dying king advised the princes to choose Frederick as his successor to the exclusion of his own young son. Frederick was chosen German king at Frankfurt on March 5, 1152, and crowned at Aix-la-Chapelle on the 9th, owing his election partly to his personal qualities, and partly to the fact that he united in himself the blood of the rival families of Welf and Waiblingen.

The new king saw clearly that the restoration of order in Germany was a necessary preliminary to the enforcement of the imperial rights in Italy. Issuing a general order for peace, he was prodigal in his concessions to the nobles. Abroad Frederick decided a quarrel for the Danish throne in favour of Svend, or Peter as he is sometimes called, who did homage for his kingdom, and negotiations were begun with the East Roman emperor, Manuel Comnenus. About this time he obtained a divorce from his wife Adela, on the ground of consanguinity, and made a vain effort to obtain a bride from the court of Constantinople. On his accession Frederick had communicated the news of his election to Pope Eugenius III., but neglected to ask for the papal confirmation. But a treaty was concluded between king and pope at Constance in March 1153, by which Frederick promised in return for his coronation to make no peace with Roger I. king of Sicily, or with the rebellious Romans, without the consent of Eugenius, and generally to help and defend the papacy.

The journey to Italy made by the king in 1154 was the precursor of five other expeditions which engaged his main energies for 30 years, during which the subjugation of the peninsula was the central and abiding aim of his policy. He was crowned emperor at Rome on June 18, 1155. He left Italy in the autumn of 1155 to prepare for a new and more formidable campaign. Disorder was again rampant in Germany, especially in Bavaria, but general peace was restored by Frederick's vigorous measures. Bavaria was transferred from Henry II. Jasomirgott, margrave of

Austria, to Henry the Lion, duke of Saxony; and the former was pacified by the erection of his margraviate into a duchy, while Frederick's step-brother Conrad was invested with the Palatinate of the Rhine. On June 9, 1156 the king was married at Würzburg to Beatrix, daughter and heiress of the dead count of Upper Burgundy, Renaud III., when Upper Burgundy or Franche Comté, as it is sometimes called, was added to his possessions. An expedition into Poland reduced Duke Boleslaus IV. to submission, after which Frederick received the homage of the Burgundian nobles at Besançon in Oct. 1157.

In June 1158 Frederick set out upon his second Italian expedition, during which imperial officers called *podestas* in the cities of northern Italy, captured revolted Milan, and the long struggle began with pope Alexander III., who excommunicated the emperor on March 2, 1160. During this visit Frederick summoned the doctors of Bologna to Roncaglia in November 1158, and as a result of their inquiries into the rights belonging to the kingdom of Italy he obtained a large amount of wealth. Returning to Germany towards the close of 1162, Frederick prevented a conflict between Henry the Lion, duke of Saxony, and a number of neighbouring princes, and severely punished the citizens of Mainz for their rebellion against archbishop Arnold. In 1163 his plans for the conquest of Sicily were checked by a powerful league against him provoked by the exactions of the *podestas* and the enforcement of the rights declared by the doctors of Bologna. Frederick had supported an anti-pope Victor IV. against Alexander, and on Victor's death in 1163 a new anti-pope called Paschal III. was chosen to succeed him. At a diet at Würzburg in May 1165 he took an oath, followed by many of the clergy and nobles, to remain true to Paschal and his successors. A temporary alliance with Henry II., king of England, the magnificent celebration of the canonization of Charlemagne at Aix-la-Chapelle, and the restoration of peace in the Rhineland, occupied Frederick's attention until Oct. 1166, when he made his fourth journey to Italy. Having captured Ancona, he marched to Rome, stormed the Leonine city, and procured the enthronement of Paschal, and the coronation of his wife Beatrix; but the sudden outbreak of a pestilence destroyed the German army and drove the emperor to Germany. During the next six years the imperial authority was asserted over Bohemia, Poland and Hungary. Friendly relations were entered into with the emperor Manuel, and a better understanding was sought with Henry II., king of England, and Louis VII., king of France.

In 1174, Frederick made his fifth expedition to Italy. The campaign was a complete failure. The refusal of Henry the Lion to bring help into Italy was followed by the defeat of the emperor at Legnano on May 29, 1176, when he was wounded and believed to be dead. He concluded with Alexander the treaty of Venice (Aug. 1177), and at the same time a truce with the Lombard league was arranged for six years. Frederick, loosed from the papal ban, recognized Alexander, and in July 1177 knelt before him and kissed his feet. The possession of the vast estates left by Matilda, marchioness of Tuscany, and claimed by both pope and emperor, was to be decided by arbitration, and in Oct. 1178 the emperor was again in Germany. Henry the Lion was deprived of his duchy, and sent into exile; a treaty was made with the Lombard league at Constance in June 1183; and Frederick's son Henry was betrothed in 1184 to Constance, daughter of Roger I., king of Sicily, and heiress of the reigning king, William II. This betrothal, which threatened to unite Sicily with the Empire, made it difficult for Frederick, when during his last Italian expedition in 1184 he met Pope Lucius III. at Verona, to establish friendly relations with the papacy. The question of Matilda's estates was left undecided; and Lucius had refused to crown Henry or to recognize the German clergy who had been ordained during the schism. Frederick then formed an alliance with Milan, where the emperor, who had been crowned king of Burgundy, or Arles, at Arles on July 30, 1178, had this ceremony repeated (Jan. 27, 1186); while his son Henry was crowned king of Italy and married to Constance, who was crowned queen of Germany.

The quarrel with the papacy was continued with the new pope Urban III., and open warfare was begun. But Frederick was re-

called to Germany by the news of a revolt raised by Philip of Heinsberg, archbishop of Cologne, and instigated by the pope. Hostilities were checked by the death of Urban and the election of a new pope as Gregory VIII. In 1188 Philip submitted, and immediately afterwards Frederick joined the Third Crusade. He left Regensburg in May 1189 at the head of a splendid army, and having overcome the hostility of the Eastern Roman emperor Isaac Angelus, marched into Asia Minor. On June 10, 1190, Frederick was either bathing or crossing the river Calycadnus (Geuksu), near Seleucia (Selefké) in Cilicia, when he was drowned. The place of his burial is unknown, and the legend which says he still sits in a cavern in the Kyffhäuser mountain in Thuringia waiting until the need of his country shall call him, is now thought to refer, at least in its earlier form, to his grandson, the emperor Frederick II. He left by his wife, Beatrix, five sons, of whom the eldest afterwards became emperor as Henry VI.

Frederick encouraged the growth of towns, easily suppressed the few risings against his authority, and took strong and successful measures to establish order in Germany. His power rested upon his earnest and commanding personality, and also upon the support which he received from the German church, the possession of a valuable private domain, and the care with which he exacted feudal dues from his dependents. Even in Italy, though his general course of action was warped by wrong prepossessions, he in many instances showed exceptional practical sagacity in dealing with immediate difficulties and emergencies. From the beginning, however, he treated the Italians, as indeed was only natural, less as rebellious subjects than as conquered aliens.

In appearance Frederick was a man of well-proportioned, medium stature, with flowing yellow hair and a reddish beard. He delighted in hunting and the reading of history, was zealous in his attention to public business, and his private life was unimpeachable. Carlyle called him "a terror to evil-doers and a praise to well-doers in this world, probably beyond what was ever seen since."

The principal contemporary authority for the earlier part of the reign of Frederick is the *Gesta Friderici imperatoris*, mainly the work of Otto, bishop of Freising. This is continued from 1156 to 1160 by Rahewin, a canon of Freising, and from 1160 to 1170 by an anonymous author. The various annals and chronicles of the period are to be found in the *Monumenta Germaniae historica. Scriptores* (Hanover and Berlin, 1826-92); many valuable documents are found in the *Monumenta Germaniae selecta*, vol. iv., edited by M. Doeberl (Munich, 1889-90).

FREDERICK II. (1194-1250), Holy Roman emperor; king of Sicily and Jerusalem, was son of the emperor Henry VI. and Constance of Naples, daughter of Roger I., king of Sicily, and therefore grandson of the emperor Frederick I. Born at Jesi near Ancona on Dec. 26, 1194, and chosen German king at Frankfurt in 1196, he was baptized Frederick Roger, and after his father's death crowned king of Sicily at Palermo on May 17, 1198. His mother, who assumed the government, died in November 1198, leaving Pope Innocent III. as regent of Sicily and guardian of her son. In 1208 he was declared of age, and in 1209 he married Constance, daughter of Alphonso II. king of Aragon, and widow of Emerich or Imre, king of Hungary. In September 1211, a number of influential German princes met at Nuremberg, declared Otto IV. deposed, and invited Frederick to come and occupy the vacant throne. He accepted the invitation; and having recognized the papal supremacy over Sicily, and procured the coronation of his son Henry as its king, he reached Germany in the autumn of 1212. Frederick was welcomed in Swabia, and the renown of the Hohenstaufen name and a liberal distribution of promises made his

progress easy. He was chosen German king a second time at Frankfort on Dec. 5, 1212, and crowned Dec. 9, at Mainz. Anxious to retain the pope's support, Frederick promulgated a bull at Eger on July 12, 1213, by which he renounced all lands claimed by the pope since the death of the emperor Henry VI. in 1197, gave up the right of spoils and all interference in episcopal elections, and acknowledged the right of appeal to Rome. He again affirmed the papal supremacy over Sicily, and promised to root out heresy in Germany. He had allied himself with Philip Augustus of France against Otto, and the victory of his French allies at Bouvines on July 27, 1214 greatly strengthened his position. He was crowned the German king at Aix-la-Chapelle on July 25, 1215. In May 1218 the death of Otto left him undisputed ruler of Germany. His son Henry was brought to Germany and chosen by the princes German king at Frankfort in April 1220, though Frederick assured the new pope, Honorius III., that this step, which would involve the future union of Sicily with Germany, had been taken without his consent. In August 1220 Frederick set out for Italy, and was crowned emperor at Rome on Nov. 22, 1220; after which he repeated the undertaking he had entered into at Aix-la-Chapelle in 1215 to go on crusade, and made lavish promises to the Church. The clergy were freed from taxation and from lay jurisdiction, the ban of the Empire was to follow the ban of the Church, and heretics were to be severely punished.

But Frederick was occupied until 1225 in restoring order in Sicily. The island was seething with disorder, but by stern and sometimes cruel measures the emperor suppressed anarchy. Meanwhile the crusade was postponed again and again; until under a threat of excommunication, after the fall of Damietta in 1221, Frederick definitely undertook to set out in August 1227. On Nov. 9, 1225, he married his second wife Iolande (Yolande or Isabella), daughter of John, count of Brienne, titular king of Jerusalem. She died in 1227. Frederick then himself assumed the title of king of Jerusalem. He then summoned a diet at Cremona, but the cities, watchful and suspicious, renewed the Lombard league and took up a hostile attitude. Frederick's reply was to annul the treaty of Constance and place the cities under the imperial ban; but he was forced by lack of military strength to accept the mediation of Pope Honorius and the maintenance of the *status quo*.

After these events, which occurred early in 1227, preparations for the crusade were pressed on, and the emperor sailed from Brindisi on Sept. 8. A pestilence, however, which attacked his forces compelled him to land in Italy three days later, and on the 29th of the same month he was excommunicated by the new pope, Gregory IX. The greater part of the succeeding year was spent by pope and emperor in a violent quarrel. Alarmed at the increase in his opponent's power, Gregory denounced him in a public letter, to which Frederick replied in a clever document addressed to the princes of Europe. The reading of this manifesto, drawing attention to the absolute power claimed by the popes, was received in Rome with such evidences of approval that Gregory was compelled to fly to Viterbo. Frederick again set sail for Palestine, where he met with considerable success, the result of diplomatic rather than of military skill. By a treaty made in February 1229 he secured possession of Jerusalem, Bethlehem, Nazareth and the surrounding neighbourhood. Entering Jerusalem, he crowned himself king of that city on March 18, 1229. These successes had been won in spite of the hostility of Gregory, which deprived Frederick of the assistance of many members of the military orders and of the clergy of Palestine. But although the emperor's possessions on the Italian mainland had been attacked in his absence by the papal troops and their allies, Gregory's efforts had failed to arouse serious opposition in Germany and Sicily; so that when Frederick returned unexpectedly to Italy in June 1229 he had no difficulty in driving back his enemies, and compelling the pope to sue for peace. By the treaty of San Germano (July 1230), the emperor, loosed from the ban, promised to respect the papal territory, and to allow freedom of election and other privileges to the Sicilian clergy. Frederick then pacified Sicily. In 1231 a series of laws were published at Melfi which destroyed the ascendancy of the feudal nobles. Royal officials were appointed for administrative purposes, large estates were recovered for the crown, and

fortresses were destroyed, while the church was placed under the royal jurisdiction and all gifts to it were prohibited. At the same time certain privileges of self-government were granted to the towns, representatives from which were summoned to sit in the diet. In short, by means of a centralized system of government, the king established an almost absolute monarchical power.

In Germany, an entirely different policy was pursued. The concessions granted by Frederick in 1220, together with the Privilege of Worms, dated May 1, 1231, made the German princes virtually independent. All jurisdiction over their lands was vested in them, no new mints or toll-centres were to be erected on their domains, and the imperial authority was restricted to a small and dwindling area. A fierce attack was made on the rights of the cities. Compelled to restore all their lands, their jurisdiction was bounded by their city-walls; they were forbidden to receive the dependents of the princes; all trade guilds were declared abolished; and all official appointments made without the consent of the archbishop or bishop were annulled. A further attack on the Lombard cities at the diet of Ravenna in 1231 was answered by a renewal of their league, and was soon connected with unrest in Germany. About 1231 a breach took place between Frederick and his elder son Henry, who appears to have opposed the Privilege of Worms and to have favoured the towns against the princes. After refusing to travel to Italy, Henry changed his mind and submitted to his father at Aquileia in 1232; and a temporary peace was made with the Lombard cities in June 1233. But on his return to Germany Henry again raised the standard of revolt, and made a league with the Lombards in December 1234. Frederick, meanwhile, having helped Pope Gregory against the rebellious Romans and having secured the friendship of France and England, appeared in Germany early in 1235 and put down this rising without difficulty. Henry was imprisoned, but his associates were treated leniently. In August 1235 a splendid diet was held at Mainz, during which the marriage of the emperor with Isabella (1214-1241), daughter of John, king of England, was celebrated. A general peace (*Landfrieden*), which became the basis of all such peaces in the future, was sworn to; a new office, that of imperial justiciar, was created, and a permanent judicial record was first instituted. Otto of Brunswick, grandson of Henry the Lion, duke of Saxony, was made duke of Brunswick-Lüneburg; and war was declared against the Lombards.

Frederick was now at the height of his power. His second son, Conrad, was invested with the duchy of Swabia, and the claim of Wenceslaus, king of Bohemia, to some lands which had belonged to the German king Philip was bought off. The attitude of Frederick II. (the Quarrelsome), duke of Austria, had been considered by the emperor so suspicious that during a visit paid by Frederick to Italy a war against him was begun. Compelled to return by the ill-fortune which attended this campaign, the emperor took command of his troops, seized Austria, Styria and Carinthia, and declared these territories to be immediately dependent on the Empire. In January 1237 he secured the election of his son Conrad as German king at Vienna; and in September went to Italy to prosecute the war which had broken out with the Lombards in the preceding year. Pope Gregory attempted to mediate, but the cities refused to accept the insulting terms offered by Frederick. The emperor gained a great victory over their forces at Cortenuova (Nov. 27, 1237); but his failure to take Brescia in October 1238, together with the changed attitude of Gregory, turned the fortune of war. The pope had become alarmed by the project of marriage between the heiress of Sardinia, Adelasia, and Frederick's natural son Enzo, who afterwards assumed the title of king of Sardinia. But as his warnings had been disregarded, he made an alliance with the Lombards, and excommunicated (Mar. 20, 1239), the emperor. A violent war of words ensued. Frederick, accused of heresy, blasphemy and other crimes, called upon all kings and princes to unite against the pope, who on his side used his emissaries, a crowd of wandering friars, to preach rebellion in Germany. It was, however, impossible to find an anti-king. In Italy, Spoleto and Ancona were declared part of the imperial dominions, and Rome itself was threatened. A number of ecclesiastics proceeding to a council called by Gregory were captured by Enzo at the sea-

fight of Meloria, and the emperor was about to undertake the siege of Rome when the pope died (August 1241). Germany was at this time menaced by the Mongols; but Frederick contented himself with issuing directions for a campaign against them, until in 1242 he was able to pay a short visit to Germany, where he gained some support from the towns by grants of extensive privileges.

Gregory's immediate successor, Pope Celestine IX., died soon after his election; and after a delay of eighteen months, during which Frederick marched against Rome on two occasions and devastated the lands of his opponents, one of his partisans, Sinibaldo Fiesco, was chosen pope, and took the name of Innocent IV. Negotiations for peace were begun, but the relations of the Lombard cities to the Empire could not be adjusted, and when the emperor began again to ravage the papal territories Innocent fled to Lyons. Hither he summoned a general council, which met in June 1245; but although Frederick sent his justiciar, Thaddeus of Suessa, to represent him, and expressed his willingness to treat, sentence of excommunication and deposition was pronounced against him. Accused by Innocent of violating treaties, breaking oaths, persecuting the church and abetting heresy, Frederick replied by an open letter rebutting these charges, and denouncing the clergy and threatening the confiscation of their wealth. In vain the mediation of the saintly king of France, Louis IX., was invoked. Innocent declared Frederick deposed, and ordered the Germans to elect a new king. War soon became general in Germany and Italy. Henry Raspe, landgrave of Thuringia, was chosen German king in opposition to Frederick in May 1246, but neither he nor his successor, William II., count of Holland, could drive the Hohenstaufen from Germany. In Italy, during the emperor's absence, his cause had been upheld by Enzo and by the ferocious Eccelino da Romano. In 1246 a formidable conspiracy of the discontented Apulian barons against the emperor was crushed with ruthless cruelty. Suddenly news reached Frederick that Parma, a stronghold of the imperial authority in the north, had been surprised, while the garrison was off its guard, by the Guelphs. He therefore concentrated his forces on the city, building over against it a wooden town which, in anticipation of the success that astrologers had predicted, he named Vittoria. The siege was protracted, and finally, in February 1248, during the absence of the emperor on a hunting expedition, was brought to an end by a sudden sortie of the men of Parma, who stormed the imperial camp. The emperor's forces were destroyed or scattered; the treasury, with the imperial insignia, together with Frederick's harem and some of the most trusted of his ministers, fell into the hands of the victors. Thaddeus of Suessa was hacked to pieces by the mob; the imperial crown was placed in mockery on the head of a hunch-backed beggar, who was carried back in triumph into the city.

Frederick's old confidence had left him; he had grown moody and suspicious, and his temper gave a ready handle to his enemies. Pier della Vigna, accused of treasonable designs, was disgraced; and the once all-powerful favourite and minister, blinded now and in rags, was dragged in the emperor's train, as a warning to traitors, till in despair he dashed out his brains. Then, in May 1248, the tidings of Enzo's capture by the Bolognese broke the emperor's spirit. He retired to southern Italy, and after a short illness died at Fiorentino on Dec. 13, 1250, after having been loosed from the ban by the archbishop of Palermo. He was buried in the cathedral of that city, where his splendid tomb may still be seen. By his will he appointed his son Conrad to succeed him in Germany and Sicily, and Henry, his son by Isabella of England, to be king of Jerusalem or Arles, neither of which kingdoms, however, he obtained. Frederick left several illegitimate children: Enzo has already been referred to; Frederick, who was made the imperial vicar in Tuscany; and Manfred, his son by the beloved Bianca Lancia or Lanzia, who was legitimatized just before his father's death, and was appointed by his will prince of Tarento and regent of Sicily.

The character of Frederick is one of extraordinary interest and versatility, and contemporary opinion is expressed in the words *stupor mundi et immutator mirabilis*. Licentious and luxurious in his manners, cultured and catholic in his tastes, he united in his person the most diverse qualities. His Sicilian court was a centre

of intellectual activity. Michael Scot, the translator of some treatises of Aristotle and of the commentaries of Averroes, Leonard of Pisa, who introduced Arabic numerals and algebra to the West, and other scholars, Jewish and Mohammedan as well as Christian, were welcome at his court. Frederick himself had a knowledge of six languages, was acquainted with mathematics, philosophy and natural history, and took an interest in medicine and architecture. In 1224 he founded the university of Naples, and he was a liberal patron of the medical school at Salerno. He formed a menagerie of strange animals, and wrote a treatise on falconry (*De arte venandi cum avibus*) which is remarkable for its accurate observation of the habits of birds.¹ It was at his court, too, that—as Dante points out—Italian poetry had its birth. Pier della Vigna there wrote the first sonnet, and Italian lyrics by Frederick himself are preserved to us. His wives were kept secluded in oriental fashion; a harem was maintained at Lucera, and eunuchs were a prominent feature of his household. His religious ideas have been the subject of much controversy. Frederick's rule in Germany and Italy was a failure, but this fact may be accounted for by the conditions of the time and the inevitable conflict with the papacy. In Germany the enactments of 1220 and 1231 contributed to the disintegration of the Empire and the fall of the Hohenstaufen, while conflicting interests made the government of Italy a problem of exceptional difficulty. In Sicily Frederick was more successful. He quelled disorder, and under his rule the island was prosperous and contented. His ideas of government were those of an absolute monarch, and he probably wished to surround himself with some of the pomp which had encircled the older emperors of Rome. His chief claim to fame, perhaps, is as a lawgiver. The code of laws which he gave to Sicily in 1231 bears the impress of his personality, and has been described as "the fullest and most adequate body of legislation promulgated by any western ruler since Charlemagne." Without being a great soldier, Frederick was not unskilful in warfare, but was better acquainted with the arts of diplomacy. In person he is said to have been "red, bald and short-sighted," but with good features and a pleasing countenance. It was believed in Germany for about a century after his death that Frederick was still alive, and many impostors attempted to personate him. A legend, afterwards transferred to Frederick Barbarossa, told how he sat in a cavern in the Kyffhäuser before a stone table through which his beard had grown, waiting for the time for him to awake and restore to the Empire the golden age of peace.

The contemporary documents relating to the reign of Frederick II. are very numerous. Many of the more important ones are given in the *Historia diplomatica Friderici II.*, edited by M. Huillard-Bréholles (Paris, 1852-61); *Acta imperii selecta. Urkunden deutscher Könige und Kaiser*, edited by J. F. Böhmer and J. Ficker (Innsbruck, 1870); *Acta imperii inedita seculi XIII. Urkunden und Briefe zur Geschichte des Kaiserreichs und des Königreichs Sicilien*, edited by E. Winkelmann (Innsbruck, 1880); *Epistolae saeculi XIII. selectae e regestis pontificum Romanorum*, edited by C. Rodenberg, tome i. (Berlin, 1883); P. Pressutti, *Regesta Honorii papae III.* (Rome, 1888); L. Auvray, *Les Registres de Grégoire IX.* (Paris, 1890).

The best modern authorities are M. Huillard-Bréholles, *Vie et corr. de Pierre de la Vigne* (1865); F. von Rümer, *Geschichte der Hohenstaufen* (vols. iii. & iv., 5th ed., 1878); C. Köhler, *Das Verhältnis Kaiser Friedrichs II. zu den Päpsten seiner Zeit* (Breslau, 1888); W. von Giesebrecht, *Gesch. der deut. Kaiserzeit*, vol. v. (Leipzig, 1888); G. Blondel, *Etude sur la politique de l'empereur Frédéric II. en Allemagne* (1892); K. Hampe, *Kaiser Friedrich II.* (Munich, 1899); A. Folz, *Kaiser Friedrich II. und Papst Innocenz IV. ihr Kampf 1244-45* (1905); W. Cohn, *Das Zeitalter der Hohenstaufen in Sizilien* (1925).

FREDERICK III. (1415-1493), Holy Roman emperor—as Frederick IV., German king; as Frederick V., archduke of Austria,—son of Ernest of Habsburg, duke of Styria and Carinthia, was born at Innsbruck on Sept. 21, 1415. After his father's death in 1424 he lived at the court of his uncle and guardian, Frederick IV., count of Tirol. In 1435, together with his brother, Albert the Prodigal, he undertook the government of Styria and Carinthia, but there were constant feuds between the brothers, which lasted until Albert's death in 1463. In 1439 the deaths of the German king Albert II. and of Frederick of Tirol left Frederick

¹First printed at Augsburg in 1596; German edition by Schöpffer (Berlin, 1896).

the senior member of the Habsburg family, and guardian of Sigismund, count of Tirol. In the following year he also became guardian of Ladislaus, the posthumous son of Albert II., and heir to Bohemia, Hungary and Austria. On Feb. 2, 1440 Frederick was chosen German king at Frankfort, but, owing to his absence from Germany, the coronation at Aix-la-Chapelle was delayed until June 17, 1442.

Disregarding the neutral attitude of the German electors towards the papal schism, and acting under the influence of Aeneas Sylvius Piccolomini, afterwards Pope Pius II., Frederick in 1445 made a secret treaty with Pope Eugenius IV. This developed into the Concordat of Vienna, signed in 1448 with the succeeding pope, Nicholas V., by which the king, in return for a sum of money and a promise of the imperial crown, pledged the obedience of the German people to Rome, and so checked for a time the rising tide of liberty in the German church. Taking up the quarrel between the Habsburgs and the Swiss cantons, Frederick invited the Armagnacs to attack his enemies, but after meeting with a stubborn resistance at St. Jacob on Aug. 26, these allies proved faithless, and the king soon lost every vestige of authority in Switzerland. In 1451 Frederick, disregarding the revolts in Austria and Hungary, travelled to Rome where, on March 16, 1452, his marriage with Leonora of Portugal was celebrated, and three days later he was crowned emperor by pope Nicholas. He was the last emperor crowned in Rome. On his return he found Germany seething with indignation. His capitulation to the pope was not forgotten; his refusal to attend the diets, and his apathy in the face of Turkish aggressions, constituted a serious danger; and plans for his deposition failed only because the electors could not unite upon a rival king.

In 1457 Ladislaus, king of Hungary and Bohemia, and archduke of Austria, died; Frederick failed to secure either kingdom, but obtained lower Austria, from which however, he was soon driven by his brother Albert, who occupied Vienna. On Albert's death in 1463 the emperor united upper and lower Austria under his rule, but these possessions were constantly ravaged by George Poděbrad, king of Bohemia, and by Matthias Corvinus, king of Hungary. A visit to Rome in 1468 to discuss measures against the Turks with Pope Paul II. had no result, and in 1470 Frederick began negotiations for a marriage between his son Maximilian and Mary, daughter and heiress of Charles the Bold, duke of Burgundy. The emperor met the duke at Treves in 1473, when Frederick, unwilling to bestow the title of king upon Charles, left the city secretly, but brought about the marriage after the duke's death in 1477. Again attacked by Matthias, the emperor was driven from Vienna (1490), and soon handed over the government of his lands to Maximilian, whose election as king of the Romans he vainly opposed in 1486. Frederick then retired to Linz, where he passed his time in the study of botany, alchemy and astronomy, until his death on Aug. 19, 1493.

Frederick was a listless and incapable ruler, lacking alike the qualities of the soldier and of the diplomatist, but possessing a certain cleverness in evading difficulties. With a fine presence, he had many excellent personal qualities, is spoken of as mild and just, and had a real love of learning. He contributed to the aggrandisement of his family by the marriage of Maximilian with Mary of Burgundy, and delighted to inscribe his books and other articles of value with the letters A.E.I.O.U. (*Austria es imperare orbi universo*; or in German, *Alles Erdreich ist Oesterreich unterthan*). His tomb, in red and white marble, is in the cathedral of St. Stephen at Vienna.

Chmel, *Geschichte Kaiser Friedrichs IV. und seines Sohnes Maximilians I.* (Hamburg, 1840); A. Bachmann, *Deutsche Reichsgeschichte im Zeitalter Friedrichs III. und Maximilians I.* (Leipzig, 2 vols., 1884-94); A. Huber, *Geschichte Oesterreichs* (Gotha, 1885-92).

FREDERICK II. (1534-1588), king of Denmark and Norway, son of Christian III., was born at Hadersleben on July 1, 1534. His mother, Dorothea of Saxe-Lauenburg, was the elder sister of Catherine, the first wife of Gustavus Vasa and the mother of Eric XIV. The two little cousins, born the same year, were destined to be lifelong rivals. At the age of two Frederick was

proclaimed successor to the throne at the *Rigsdag* of Copenhagen (Oct. 30, 1536), and homage was done to him at Oslo for Norway in 1548. He married his cousin, Sophia of Mecklenburg, on July 20, 1572.

The reign of Frederick II. falls into two well-defined periods, one of war, 1559-70; and the other of peace, 1570-88. The period of war began with the Ditmarsh expedition, when the independent peasant-republic of the Ditmarshers of West Holstein, which had stoutly maintained its independence for centuries against the counts of Holstein and the Danish kings, was subdued by a Dano-Holstein army of 20,000 men in 1559, Frederick and his uncles John and Adolphus, dukes of Holstein, dividing the land between them. Frederick was also victorious in the Scandinavian Seven Years' War. There were many causes of quarrel between Denmark and Sweden, but the detention at Copenhagen in 1563 of an embassy on its way to Germany, to negotiate a match between Eric XIV. of Sweden and Christina of Hesse, which King Frederick for political reasons was determined to prevent, precipitated hostilities. The war was very unpopular in Denmark, and the closing of the Sound against foreign shipping, in order to starve out Sweden, had exasperated the maritime powers and all the Baltic states. On New Year's Day, 1570, Frederick threatened to abdicate; but the peace of Stettin (Dec. 13, 1570) reconciled all parties, and though Frederick had now to relinquish his ambitious dream of re-establishing the Union of Kalmar, he had at least succeeded in maintaining the supremacy of Denmark in the north.

After the peace Frederick aspired to the dominion of all the seas which washed the Scandinavian coasts, and before he died he suppressed the pirates who for so long had haunted the Baltic and the German Ocean. He also erected the fortress of Kronborg, to guard the Sound. Frederick gave free scope to ministers whose superiority in their various departments he frankly recognized, rarely interfering personally unless absolutely called upon to do so. His influence, always great, was increased by his genial and unaffected manners as a host. He was one of the few kings of the house of Oldenburg who had no illicit *liaison*. He died at Antvorskov on April 4, 1588. No other Danish king was ever so beloved by his people.

FREDERICK III. (1286?-1330), surnamed "the Fair," German king and duke of Austria, was the second son of the German king, Albert I. In 1298, when his father was chosen king, Frederick was invested with some of the family lands (see HABS-BURG), and in 1306, when his elder brother Rudolph became king of Bohemia, he succeeded to the duchy of Austria. In 1307 Rudolph died, and Frederick failed to obtain the Bohemian throne. Neither did he obtain the German crown on his father's death in 1308, and the relations between the new king, Henry VII., and the Habsburgs were far from friendly. Frederick asked to be confirmed in the possession of Austria, and be invested with Moravia, a demand which Henry refused; and the duke eventually agreed to renounce Moravia in return for a payment of 50,000 marks. Frederick then became involved in a quarrel with his cousin Louis IV., duke of Upper Bavaria (afterwards the emperor Louis IV.), over the guardianship of Henry II., duke of Lower Bavaria. He was defeated by Louis at the battle of Gammelsdorf (Nov. 9, 1313), and compelled to renounce his claim.

Meanwhile the emperor Henry VII. had died in Italy, and a stubborn contest ensued for the vacant throne. After a long delay Frederick was chosen German king at Frankfort by a minority of the electors on Oct. 19, 1314, while a majority elected Louis of Bavaria. Six days later Frederick was crowned at Bonn by the archbishop of Cologne, and war broke out between the rivals. Frederick drew his chief strength from southern and eastern Germany, and was supported by the full power of the Habsburgs. The struggle continued for seven years. At Mühldorf (Sept. 28, 1322) Frederick was finally defeated and sent as a prisoner to Trausnitz, where he remained for three years. Then

by the treaty of Trausnitz (March 13, 1325) Frederick acknowledged the kingship of Louis in return for freedom, and promised to return to captivity unless he could induce his brother Leopold to make a similar acknowledgment. As Leopold refused, Frederick, although released from his oath by Pope John XXII., returned to Bavaria. It was agreed that Frederick should govern Germany while Louis went to Italy for the imperial crown. But this arrangement did not prove generally acceptable, and the death of Leopold in 1326 deprived Frederick of a powerful supporter. He returned to Austria, and died at Gutenstein on Jan. 13, 1330. He was buried at Mauerbach, whence his remains were removed in 1783 to the cathedral of St. Stephen at Vienna. He married Elizabeth, daughter of James I., king of Aragon, and left two daughters. His voluntary return into captivity is used by Schiller in his poem *Deutsche Treue*, and by J. L. Uhland in the drama *Ludwig der Bayer*.

FREDERICK III. (1609-1670), king of Denmark and Norway, son of Christian IV. and Anne Catherine of Brandenburg, was born on March 18, 1609 at Hadersleben. While still a lad he became successively bishop of Bremen, bishop of Verden and coadjutor of Halberstadt, while at the age of 18 he was the chief commandant of the fortress of Stade. In 1643 he married Sophia Amelia of Brunswick-Lüneburg. During the disastrous Swedish War of 1643-45 Frederick was appointed *generalissimo* of the duchies by his father; he quarrelled with the Earl-Marshall Anders Bille, who commanded the Danish forces, and the Danish nobility began to regard him with extreme distrust. The death of his elder brother Christian in June 1647 opened to him the prospect of the succession, but the question was still unsettled when Christian IV. died on Feb. 28, 1648. On July 6 Frederick III. was acknowledged king, after he had signed a *Haandfaestning* or charter, by which the already diminished royal prerogative was still further curtailed.

Frederick lacked the brilliant qualities of his impulsive, jovial father, but he possessed compensating virtues of moderation, sobriety and self-control. He rightly regarded the accession of Charles X. of Sweden (June 6, 1654) as a source of danger to Denmark. Charles's invasion of Poland (July 1654) came as a distinct relief to the Danes, who had feared an attack on themselves, but even the Polish War was full of latent peril to Denmark. Frederick resolved on a rupture with Sweden at the first convenient opportunity. The *Rigsdag* of 1657 granted subsidies for mobilization and other military expenses; on April 23 Frederick received the assent of the majority of the *Rigsraad* to an attack on Sweden's German provinces; in the beginning of May the still pending negotiations with Sweden were broken off, and on June 1 Frederick signed the manifesto justifying a war which was never formally declared. The Swedish king traversed all the plans of his enemies by his passage of the frozen Belts, in January and February 1658 (see CHARLES X. of Sweden). Frederick III. at once sued for peace; and, persuaded by the English and French ministers, Charles finally agreed to be content with mutilating instead of annihilating the Danish monarchy (treaties of Taastrup, Feb. 18, and of Roskilde, Feb. 26, 1658). The conclusion of peace was followed by a remarkable episode. Charles X. was the Danish king's guest for three days (March 3-5) at the castle of Fredriksborg, and friendship seemed to be established. But on July 17, without any reasonable cause, without a declaration of war, in defiance of all international equity, Charles again attacked Denmark.

The main Swedish army landed at Korsör in Zealand. None had anticipated the sudden and brutal attack, and the Danish capital was inadequately fortified and garrisoned. The Danes had only three days' warning of the approaching danger; and the vast and dilapidated line of defence had at first but 2,000 regular defenders. But Government and people displayed exemplary energy, under the constant supervision of the king, the queen and burgomaster Hans Nansen. Charles X. began a regular siege, which he

abandoned when, on Oct. 29, an auxiliary Dutch fleet, after reinforcing and reprovioning the garrison, defeated, in conjunction with the Danish fleet, the Swedish navy of 44 liners in the Sound. The traditional loyalty of the Danish middle classes was transformed into a boundless enthusiasm for the king personally, and for a brief period Frederick found himself the most popular man in his kingdom. He used his popularity to convert an elective into an absolute monarchy by the Revolution of 1660 (see DENMARK: *History*). Frederick III. died on Feb. 6, 1670 at the castle of Copenhagen.

See R. N. Bain, "Scandinavia," in *Cambridge Modern History* (1905); Knud Fabricius, *Kongeloven* (1920).

FREDERICK VIII. (1843-1912), king of Denmark, eldest son of Christian IX., was born at Copenhagen on June 3, 1843. As crown prince of Denmark he took part in the war of 1864 against Austria and Prussia, in which the duchies of Schleswig-Holstein and Lauenburg were lost. He then assisted his father in the duties of government, becoming king on Christian's death in Jan. 1906. In 1869 Frederick married Louise (1851-1926), daughter of Charles XV. of Sweden, by whom he had four sons and four daughters. In 1907, during a visit to Iceland, Frederick appointed a mixed commission to draft a measure of home rule, but it was thrown out at the next election, when the island claimed full state independence, though "personal union" with Denmark was retained (see ICELAND). During his reign he gained the confidence of his people by his energetic interest in politics, his genial manner, and his simple mode of living. He died at Hamburg on May 14, 1912.

He was succeeded by his eldest son Christian X. (*q.v.*) and his second son, Charles (b. 1872), who married his cousin Maud, daughter of Edward VII. of Great Britain, became king of Norway as Haakon VII. (*q.v.*) in 1905.

FREDERICK I. (1657-1713), first king of Prussia, and (as Frederick III.) elector of Brandenburg, was the second son of the great elector, Frederick William, by his first marriage with Louise Henriette of Orange. Born at Königsberg on July 11, 1657, he was educated and greatly influenced by Eberhard Dancelmann, and became heir to the throne of Brandenburg through the death of his elder brother, Charles Emil, in 1674. He appears to have taken some part in public business before his father's death; and the court at Berlin was disturbed by quarrels between the young prince and his stepmother, Dorothea of Holstein-Glücksburg. In 1686 Dorothea persuaded her husband to bequeath outlying portions of his lands to her four sons; and Frederick, fearing he would be poisoned, left Brandenburg determined to prevent any diminution of his inheritance. By promising to restore Schwiebus to Silesia after his accession he won the support of the emperor Leopold I.; but eventually he gained his end in a peaceable fashion. After he became elector of Brandenburg in May 1688, his half-brothers renounced their rights under their father's will in return for a sum of money, and the new elector thus secured the whole of Frederick William's territories. He fulfilled his bargain with Leopold and gave up Schwiebus in 1695. At home and abroad Frederick continued the policy of the great elector. He helped William of Orange to make his descent on England; added various places, including Bonn, Quedlinburg, the principality of Neuchâtel, to his lands; and placed his large and efficient army at the disposal of the emperor and his allies (see BRANDENBURG). He was present in person at the siege of Bonn in 1689, but was not often in command of his troops. The elector sought to model his court upon that of Louis XIV., and directed his main energies towards obtaining for himself the title of king. He gave Leopold, in return for a promise of military aid, the imperial sanction to Frederick's request in November 1700; and the elector, hurrying at once to Königsberg, crowned himself king of Prussia on Jan. 18, 1701. During the War of the Spanish Succession the troops of Brandenburg-Prussia rendered great assistance to the allies at Blenheim and elsewhere. Frederick, who was deformed through an injury to his spine, died Feb. 25, 1713. He founded the university of Halle, and the Academy of Sciences at Berlin; welcomed and protected Protestant refugees from France and elsewhere; and lavished money on the erection of public

buildings. The king was married three times. His second wife, Sophie Charlotte (1668-1705), sister of the English king George I., was the friend of Leibnitz and one of the most cultured princesses of the age; she bore him his only son, his successor, King Frederick William I.

Heyck, *Friedrich I. und die Begründung des preussischen Königtums* (Bielefeld, 1901); *Aus dem Briefwechsel König Friedrichs I. von Preussen und seiner Familie*, ed. Berner (Berlin, 1901); H. von Hymmen, *Der erste preussische König* (1904).

FREDERICK II., known as "the Great" (1712-1786), king of Prussia, was born on Jan. 24, 1712. Two elder brothers having died in infancy, he became heir of his father, Frederick William I., who brought him up with extreme rigour, in the hope that he would become a hardy soldier, and "acquire thrift and frugality." The result was just the opposite. Encouraged by his mother, and under the influence of his governess Madame de Roucoulle, and of his first tutor Duhan, a French refugee, Frederick acquired a taste for literature and music, secretly learned Latin, which his father had forbidden, scoffed at religion, refused to ride or shoot, preferred the French language, literature and dress, and openly despised German habits and life. His discontent was heartily shared by his sister, Wilhelmina, a bright and intelligent young princess for whom Frederick had a warm affection.

Early Years.—Frederick William, seeing his son absorbed in frivolous and effeminate amusements, conceived for him an intense dislike, which had its share in causing him to break off the negotiations for a double marriage between the prince of Wales and Wilhelmina, and the princess Amelia, daughter of George II., and Frederick; for Frederick had been so indiscreet as to carry on a separate correspondence with the English court and to vow that he would marry Amelia or no one. Frederick William's hatred of his son, openly avowed, displayed itself in violent outbursts and public insults, and so harsh was his treatment that Frederick frequently thought of running away and taking refuge at the English court. He at last resolved to do so during a journey which he made with the king to south Germany in 1730. He was helped by his two friends, Lieutenant Katte and Lieutenant Keith; but the secret was found out.

Frederick was arrested, deprived of his rank as crown prince, tried by court-martial, and imprisoned in the fortress of Cüstrin. Keith escaped; but Katte was captured and sentenced by court martial to imprisonment for life. This sentence the king changed to one of death and, to enforce the example, had Katte beheaded in Frederick's presence (Nov. 5, 1730). The object-lesson had some effect. The prison chaplain reported that Frederick's heart was changed, while the Emperor himself interceded for him. His father released him from solitary confinement and sent him to work in the auditing office of the departments of war and agriculture at Cüstrin, pending the earning of a full pardon. "The whole town shall be his prison," wrote the king; "I will give him employment, from morning to night, in the departments of war, and agriculture, and of the Government. He shall work at financial matters, receive accounts, read minutes and make extracts. . . . But if he kicks or rears again, he shall forfeit the succession to the crown, and even, according to circumstances, life itself."

Frederick's submissive conduct under these conditions earned him gradual alleviations. On Nov. 30, 1731, he was allowed again to appear in uniform, and in 1732 was made colonel in command of the regiment at Neuruppin. On June 12, 1733, he married the princess Elizabeth Christina, daughter of the duke of Brunswick-Bevern, a niece of the Empress and cousin of Maria Theresa. He was given the estate of Rheinsberg, near Neuruppin, and there he lived until he succeeded to the throne. These years were perhaps the happiest of his life, although the marriage, concluded by his father's orders, was unhappy. He seldom visited his wife, who was childless, treating her harshly and even brutally. His conscientious performance of his duties, however, at last earned his father's esteem. At the same time, he was able to indulge his personal tastes.

He carried on a lively correspondence with Voltaire and other French men of letters, and was a diligent student of philosophy,

history and poetry. Two of his best-known works were written at this time—*Considérations sur l'état présent du corps politique de l'Europe* and his *Anti-Macchiavel*. In the former he calls attention to the growing strength of Austria and France, and insists on the necessity of some third power, by which he clearly means Prussia, to counterbalance their excessive influence. The second treatise, which was issued by Voltaire in The Hague in 1740, contains a generous exposition of some of the favourite ideas of the 18th-century philosophers respecting the duties of sovereigns, which may be summed up in the famous sentence: "the prince is not the absolute master, but only the first servant of his people." It was during this period that he became a freemason, and finally repudiated Christianity.

The Throne and Austria.—On May 31, 1740, he became king. He maintained all the forms of government established by his father, but ruled in a far more enlightened spirit; he tolerated every form of religious opinion, abolished torture, except for whole-sale murder, conspiracy, lèse-majesté and high treason, was most careful to secure an exact and impartial administration of justice, and, while keeping the reins of government strictly in his own hands, allowed every one with a genuine grievance free access to his presence. The Potsdam regiment of giants was disbanded, but the real interests of the army were carefully studied, for Frederick realized that the two pillars of the Prussian state were sound finances and a strong army. On Oct. 20, 1740, the emperor Charles VI. died. Frederick at once began to make extensive military preparations, with a view to asserting the ancient claims put forward by his house, but always denied by Austria, to the three Silesian duchies. Frederick undoubtedly believed in the justice of his claims, and the lawfulness of repudiating, for Silesia, his father's guarantee of the Pragmatic Sanction. He confessed, however, himself, that his scheme was prompted by "the desire of glory, even curiosity," and "a means of acquiring reputation and of increasing the power of the State."

Frederick sent an ambassador to Vienna, offering, in the event of his rights in Silesia being conceded, to aid Maria Theresa against her enemies. The queen, who regarded the proposal as that of a mere robber, haughtily declined; whereupon Frederick immediately invaded Silesia with an army of 30,000 men. His first victory was gained at Mollwitz on April 10, 1741. Under the impression, in consequence of a furious charge of Austrian cavalry, that the battle was lost, he rode rapidly away at an early stage of the struggle—a mistake which gave rise for a time to the groundless idea that he lacked personal courage. A second Prussian victory was gained at Chotusitz, near Časlau, on May 17, 1742; and Maria Theresa was forced to conclude the Peace of Breslau (June 11, 1742), ceding Breslau to Prussia, Upper and Lower Silesia as far as the Oppa, together with the county of Glatz. Frederick made good use of the next two years, fortifying his new territory, and repairing the evils inflicted upon it by the war. By the death of the prince of East Friesland, without heirs, he also gained possession of that country (1744). In the same year, in view of Austria's increasing strength and determination to recover Silesia, Frederick formed the union of Frankfurt with Bavaria, the Elector Palatine and Hesse-Cassel, concluded a secret treaty with France (June 4, 1744) and suddenly invaded Bohemia, taking Prague. He was forced to retreat, but in 1745 won a series of victories, and the Peace of Dresden (Dec. 25, 1745) assured to Frederick a second time the possession of Silesia. (See AUSTRIAN SUCCESSION, WAR OF THE.)

Internal Administration.—Frederick was now, at the age of 33, the most conspicuous sovereign of his time. He was a thoroughly absolute ruler, his so-called ministers being mere clerks whose business was to give effect to his will. To use his own famous phrase, however, he regarded himself as but "the first servant of the State"; and during the next 11 years he proved that the words expressed his inmost conviction and feeling. All kinds of questions were submitted to him, important and unimportant, even questions of trivial detail. A keen judge of character, he filled the public offices with faithful, capable, energetic men, who were kept up to a high standard of duty by the consciousness that their work might at any time come under his

strict supervision. The Academy of Sciences, which had fallen into contempt during his father's reign, he restored, infusing into it vigorous life; and he did more to promote elementary education than any of his predecessors. He did much, too, for the economic development of Prussia, especially for agriculture; he established colonies, peopling them with immigrants, extended the canal system, drained and diked the great marshes of the Oderbruch, turning them into rich pasturage, encouraged the planting of fruit trees and of root crops; and, though in accordance with his ideas of discipline he maintained serfdom, he did much to lighten the burdens of the peasants. All kinds of manufacture, too, particularly that of silk, owed much to his encouragement. To the army he gave unremitting attention, reviewing it at regular intervals, and sternly punishing negligence on the part of the officers. Its numbers were raised to 160,000 men, while fortresses and magazines were always kept in a state of readiness for war. The influence of the king's example was felt far beyond the limits of his immediate circle. The nation was proud of his genius, and displayed something of his energy in all departments of life. Lessing, who as a youth of 20 came to Berlin in 1749, composed enthusiastic odes in his honour, and Gleim, the Halberstadt poet, wrote of him as of a kind of demi-god. These may be taken as fair illustrations of the popular feeling long before the Seven Years' War.

Tastes and Character.—He despised the German language although it is remarkable that at a later period, in a French essay on German literature, he predicted for it a great future. He habitually wrote and spoke French, and had a strong ambition to rank as a distinguished French author. Nobody can now read his verses, but his prose writings have a certain calm simplicity and dignity, without, however, giving evidence of the splendid mental qualities which he revealed in practical life. To this period belong his *Mémoires pour servir à l'histoire de Brandebourg* and his poem *L'Art de la guerre*. The latter, judged as literature, is intolerably dull; but the former is valuable, throwing as it does considerable light on his personal sympathies as well as on the motives of important epochs in his career. He continued to correspond with French writers, and induced a number of them to settle in Berlin, Maupertuis being president of the Academy. In 1752 Voltaire, who had repeatedly visited him, came at Frederick's urgent entreaty, and received a truly royal welcome. The famous Hirsch trial, and Voltaire's vanity and caprice, greatly lowered him in the esteem of the king, who, on his side, irritated his guest by often requiring him to correct bad verses, and by making him the object of rude banter. The publication of *Doctor Akakia*, which brought down upon the president of the Academy a storm of ridicule, finally alienated Frederick; while Voltaire's wrongs culminated in the famous arrest at Frankfurt, the most disagreeable elements of which were due to the misunderstanding of an order by a subordinate official.

The king lived as much as possible in a retired mansion, to which he gave the name of Sans-Souci—not the palace so called, which was built after the Seven Years' War, and was never a favourite residence. He rose regularly in summer at five, in winter at six, devoting himself to public business till about eleven. During part of this time, after coffee, he would aid his reflections by playing on the flute, of which he was passionately fond, being a really skilful performer. At eleven came parade, and an hour afterwards, punctually, dinner, which continued till two, or later, if conversation happened to be particularly attractive. After dinner he glanced through and signed cabinet orders written in accordance with his morning instructions, often adding marginal notes and postscripts, many of which were in a caustic tone. These disposed of, he amused himself for a couple of hours with literary work; between six and seven he would converse with his friends or listen to his reader (a post held for some time by La Mettrie); at seven there was a concert; and at half-past eight he sat down to supper, which might go on till midnight. He liked good eating and drinking, although even here the cost was sharply looked after, the expenses of his kitchen amounting to no higher figure than £1,800 a year. At supper he was always surrounded by a number of his most intimate friends, mainly Frenchmen;

and he insisted on the conversation being perfectly free. His wit, however, was often cruel, and any one who responded with too much spirit was soon made to feel that the licence of talk was to be complete only on one side. At Frederick's court ladies were seldom seen, a circumstance that gave occasion to much scandal. The queen he visited only on rare occasions, though he provided her with a generous income, half of which she gave away in charity. Although without charm, she was a woman of many noble qualities; and, like her husband, she wrote French books, some of which attracted a certain attention in their day. She survived him by 11 years, dying in 1797.

War and Reconstruction.—From 1756 to 1763 Frederick's energies were wholly taken up in the Seven Years' War (*q.v.*) in which virtually the whole Continent was in arms against him. Although Prussia was fearfully exhausted by this struggle, and at times seemed on the verge of ruin, Frederick's tenacity and military genius carried him through, and the peace of Hubertushof (Feb. 15, 1763) restored the territorial *status quo ante bellum*. Morally, however, the Seven Years' War was a great victory for Prussia. She was now universally recognized as one of the great powers of the Continent, and definitely took her place in Germany as the rival of Austria. From this time it was inevitable that there should be a final struggle between the two nations for predominance, and that the smaller German states should group themselves around one or the other.

Frederick's first care after the war was, as far as possible, to enable the country to recover from its terrific losses; a task which he undertook with genius and energy. Pomerania and Neumark were freed from taxation for two years, Silesia for six months. Many nobles whose lands had been wasted received corn for seed; his war horses were within a few months to be found on farms all over Prussia; and money was freely spent in the re-erection of houses which had been destroyed. The coinage, which had been debased, was gradually restored to its proper value, and trade received a favourable impulse by the foundation of the Bank of Berlin. All these matters were carefully looked into by Frederick himself, who, while acting as generously as his circumstances would allow, insisted on the maximum of efficiency and economy.

Unfortunately, he adopted the French ideas of excise, and the French methods of imposing and collecting taxes—a system known as the *Regie*. This system secured a large revenue, but led to much petty tyranny, all the more intolerable because it was carried out by French officials. It was continued to the end of Frederick's reign, and nothing did so much to injure his otherwise immense popularity. He was quite aware of the discontent the system excited, and the good-nature with which he tolerated the criticisms directed against it and him is illustrated by a well-known and well-authenticated incident. Riding along the Jäger Strasse one day, he saw a crowd of people. "See what it is," he said to the groom who was attending him. "They have something posted up about your Majesty," said the groom, returning. Frederick, riding forward, saw a caricature of himself: "King in very melancholy guise," says Preuss (as translated by Carlyle), "seated on a stool, a coffee-mill between his knees, diligently grinding with the one hand, and with the other picking up any bean that might have fallen. 'Hang it lower,' said the king, beckoning his groom with a wave of the finger; 'lower, that they may not have to hurt their necks about it.' No sooner were the words spoken, which spread instantly, than there rose from the whole crowd one universal huzzah of joy. They tore the caricature into a thousand pieces, and rolled after the king with loud '*Lebe Hoch*, our Frederick for ever,' as he rode slowly away."

Frederick took particular interest in the proper administration of justice. He disliked the formalities of the law, and in one instance, "the miller Arnold case," where he thought injustice had been done to a poor man, he dismissed the judges, condemned them to a year's fortress arrest, and compelled them to make good out of their own pockets the loss sustained by their supposed victim—really a violation of justice, but one springing from a generous motive. He once defined himself as "*l'avocat du pauvre*," and few things gave him more pleasure than the famous answer of the miller whose windmill stood on ground

which was wanted for the king's garden. The miller sturdily refused to sell it. "Not at any price?" said the king's agent; "could not the king take it from you for nothing, if he chose?" "Have we not the Kammergericht at Berlin?" was the answer, which became a popular saying in Germany.

The Prussian Code.—Soon after he came to the throne Frederick began to make preparations for a new code. In 1747 appeared the *Codex Fridericianus*, by which the Prussian judicial body was established. But a greater monument of Frederick's interest in legal reform was the *Allgemeines preussisches Landrecht*, completed by the grand chancellor Count Johann H. C. von Carmer (1721-1801) on the basis of the *Project des Corporis Juris Fridericiani*, completed in 1749-51 by the eminent jurist Samuel von Cocceji (1679-1755). The *Landrecht*, a work of vast labour and erudition, combines the two systems of German and Roman law supplemented by the law of nature; it was the first German code, but only came into force in 1794, after Frederick's death.

Looking ahead after the Seven Years' War, Frederick saw no means of securing himself so effectually as by cultivating the goodwill of Russia. In 1764 he accordingly concluded a treaty of alliance with the empress Catherine for eight years. Six years afterwards, unfortunately for his fame, he joined in the first partition of Poland, by which he received Polish Prussia, without Danzig and Thorn, and Great Poland as far as the river Netze. Prussia was then for the first time made continuous with Brandenburg and Pomerania.

Relations With Austria.—Joseph II. greatly admired Frederick, and visited him at Neisse, in Silesia, in 1769, a visit which Frederick returned, in Moravia, in the following year. The young emperor was frank and cordial; Frederick was more cautious, for he detected under the respectful manner of Joseph a keen ambition that might one day become dangerous to Prussia. Nothing came of these suspicions till the death of Maximilian Joseph, elector of Bavaria, without children, in 1777, led ultimately to the War of the Bavarian Succession (the Potato War) in which Frederick invaded Bohemia (July 1778). No general engagement was fought, and after many delays the Treaty of Teschen was signed on May 13, 1779. Austria received the circle of Burgau, and consented that the king of Prussia should take the Franconian principalities.

Frederick never abandoned his jealousy of Austria, whose ambition he regarded as the chief danger against which Europe had to guard. He seems to have had no suspicion that evil days were coming in France. It was Austria which had given trouble in his time; and if her pride were curbed, he fancied that Prussia at least would be safe. Hence one of the last important acts of his life was to form, in 1785, a league of princes (the "Fürstenbund") for the defence of the imperial constitution, believed to be imperilled by Joseph's restless activity. The league came to an end after Frederick's death; but it is of considerable historical interest, as the first open attempt of Prussia to take the lead in Germany.

Last Years.—Frederick's chief trust was always in his treasury and his army. By continual economy he left in the former the immense sum of 70 million thalers; the latter, at the time of his death, numbered 200,000 men, disciplined with all the strictness to which he had throughout life accustomed his troops. He died at Sans-Souci on Aug. 17, 1786; his death being hastened by exposure to a storm of rain, stoically borne, during a military review. He passed away on the eve of tremendous events, which for a time obscured his fame; but now that he can be impartially estimated, he is seen to have been in many respects one of the greatest figures in modern history.

He was rather below the middle size, in youth inclined to stoutness, lean in old age, but of vigorous and active habits. An expression of keen intelligence lighted up his features, and his large, sparkling grey eyes darted penetrating glances at every one who approached him. He was uncleanly in his personal habits. In his later years an old blue uniform with red facings was his usual dress, and on his breast was generally some Spanish snuff, of which he consumed large quantities. He shared many of the chief intellectual tendencies of his age, including its scepticism.

Of Christianity he always spoke in the mocking tone of the "enlightened" philosophers, regarding it as the invention of priests; but after the Seven Years' War, the trials of which steadied his character, he sought to strengthen the church for the sake of its elevating moral influence.

In his judgments of mankind he often talked as a misanthrope. When a school inspector named Sulzer expressed to him the opinion that "the inborn inclination of men is rather to good than to evil," he replied. "Ah, my dear Sulzer, you don't know this damned race" ("Ach, mein lieber Sulzer, er kennt nicht diese verdammte Rasse"). This fearful saying unquestionably expressed a frequent mood of Frederick's; and he sometimes acted with great harshness, and seemed to take a malicious pleasure in tormenting his acquaintances. Yet he was capable of genuine attachments. He was beautifully loyal to his mother and his sister Wilhelmina; his letters to the duchess of Gotha are full of a certain tender reverence; the two Keiths found him a devoted friend. In his lonely old age, his best-loved companions were his greyhounds, who slept in his bed; he erected monuments to them, and gave orders that he was to be buried near them. As a king, however, he laboured genuinely for humanity.

Taking the reign of Frederick II. as a whole, it must be said that he looked upon his power rather as a trust than as a source of personal advantage; and the trust was faithfully discharged according to the best lights of his day. He has often been condemned for doing nothing to encourage German literature; and it is true that he was supremely indifferent to it. Before he died a tide of intellectual life was rising all about him; yet he failed to recognize it, declined to give Lessing even the small post of royal librarian, and thought *Götz von Berlichingen* a vulgar imitation of vulgar English models. But when his taste was formed, German literature did not exist; the choice was between Racine and Voltaire on the one hand and Gottsched and Gellert on the other. He survived into the era of Kant, Goethe and Schiller, but he was not of it, and it would have been unreasonable to expect that he should in old age pass beyond the limits of his own epoch. It was better, indeed, that he let German literature alone, thus letting it become a thoroughly independent product. Indirectly he powerfully promoted it by deepening the national life from which it sprang. At a time when there was no real bond of cohesion between the different States, he stirred among them a common enthusiasm; and in making Prussia great he laid the foundation of a genuinely united empire.

BIBLIOGRAPHY.—The main sources for the biography of Frederick the Great are his own works, which, in the words of Leopold von Ranke, "deal with the politics and wars of the period with the greatest possible objectivity, i.e., truthfulness, and form an imperishable monument of his life and opinions." A magnificent edition of Frederick's complete works was issued (1846-57), at the instance of Frederick William IV., under the supervision of the historian Johann D. E. Preuss (1785-1868). It is in 30 volumes, of which six contain verse, seven are historical, two philosophical, and three military, 12 being made up of correspondence. So long as the various State archives remained largely inaccessible historians relied upon this as their chief authority. Among works belonging to this period may be mentioned Thomas Carlyle, *History of Frederick II. of Prussia* (6 vols., 1858-65); J. G. Droysen, *Friedrich der Grosse* (2 vols., Leipzig, 1874-76, forming part V. of his *Geschichte der preussischen Politik*); Ranke, *Friedrich II., König von Preussen* (*Werke*, vols. II. and III.). A great stimulus to the study of Frederick's history has since been given by the publication of collections of documents preserved in various archives. Of these the most important is the great official edition of Frederick's political correspondence (35 vols., Berlin, 1879-1911). Of later works, based on modern research, may be mentioned L. Paul-Dubois, *Frédéric le Grand, d'après sa correspondance politique* (1903); W. F. Reddaway, *Frederick the Great and the Rise of Prussia* (1904); E. Zeller, *Friedrich der Grosse als Philosoph* (1886); H. Pigge, *Die Staatstheorie Friedrichs des Grossen* (Münster, 1904); T. von Bernhardt, *Friedrich der Grosse als Feldherr* (2 vols., 1881); Ernest Lavisse, *La Jeunesse du Grand Frédéric* (1891, 3rd ed., 1899; Eng. transl., 1891); R. Brode, *Friedrich der Grosse und der Konflikt mit seinem Vater* (Leipzig, 1904); W. von Bremen, *Friedrich der Grosse* (Bd. II. of *Erzieher des preussischen Heeres*, 1905); *Dreissig Jahre am Hofe Friedrichs des Grossen. Aus den Tagebüchern des Reichsgrafen Anasuerus Heinrich von Lehndorff, Kammerherrn der Königin Elisabeth Christine von Preussen* (Gotha, 1907). The great work on the wars of Frederick is that issued by the Prussian General Staff: *Die Kriege Friedrichs des Grossen* (15 vols. in three parts.

1890-1913). See also G. Künstel, *Politisches Testament Friedrichs des Grossen von 1752* (1911); G. Koser, *Geschichte Friedrichs des Grossen* (4 vols., 1912-14); N. Young, *The Life of Frederick the Great* (1919); Werner Hegemann, *Friedrich der Grosse* (1924, English trans. by Winifred Ray, *Frederick the Great*, 1929). For a list of other works see Dahlmann-Waitz, *Quellenkunde* (Leipzig, 1912). (J. St.; X.)

FREDERICK III. (1831-1888), king of Prussia and German emperor, was born at Potsdam on Oct. 18, 1831, being the eldest son of prince William of Prussia, afterwards first German emperor, and the princess Augusta. He was carefully educated, and in 1849-50 studied at the university of Bonn. The next years were spent in military duties and in travels, in which he was accompanied by Moltke. In 1851 he visited England on the occasion of the Great Exhibition. He married Victoria, princess royal of Great Britain, in London on Jan. 25, 1858. On the death of his uncle in 1861 and the accession of his father, Prince Frederick William, as he was then called, became crown prince of Prussia. His education, the influence of his mother, and perhaps still more that of his wife's father, the Prince Consort, had made him a strong Liberal, and he disliked the course of events in Prussia after the appointment of Bismarck as minister. In June 1863, he publicly dissociated himself from the press ordinances which had just been published. He ceased to attend meetings of the council of state, and was much away from Berlin. The opposition of the crown prince to the ministers was increased by Bismarck's refusal to support the claims of his friend the prince of Augustenburg to Schleswig-Holstein. During the war with Denmark Frederick had his first military experience, being attached to the staff of Marshal von Wrangel; he performed valuable service in arranging the difficulties caused by the disputes between the field marshal and the other officers, and was eventually given a control over him. After the war he continued to support the prince of Augustenburg, and was strongly opposed to the war with Austria. During the campaign of 1866 he received the command of an army consisting of four army corps; he was assisted by General von Blumenthal, as chief of the staff, but took a very active part in directing the difficult operations by which his army fought its way through the mountains from Silesia to Bohemia, fighting four engagements in three days, and showed that he possessed genuine military capacity. In the decisive battle of Königgrätz the arrival of his army on the field of battle, after a march of nearly 200 m., secured the victory. During the negotiations which ended the war he persuaded the king to accept Bismarck's policy as regards peace with Austria. He was anxious to see the king of Prussia unite the whole of Germany, with the title of emperor, and was impatient of the caution with which Bismarck proceeded.

He played a conspicuous part in the year 1870-71, being appointed to command the armies of the Southern States, General Blumenthal again being his chief of the staff; his troops won the victory of Wörth, took an important part in the battle of Sedan, and later in the siege of Paris. During the years that followed, little opportunity for political activity was open to him. He and the crown princess took a great interest in art and industry, especially in the royal museums; and the excavations conducted at Olympia and Pergamum were chiefly due to him. In 1878, when the emperor was incapacitated by the shot of an assassin, the prince acted for some months as regent. His palace was the centre of all that was best in the literary and learned society of the capital. For many reasons the accession of the prince was looked forward to with great hope by a large part of the nation. Unfortunately he was attacked by cancer in the throat; he spent the winter of 1887-88 at San Remo; in January 1888 the operation of tracheotomy had to be performed. On the death of his father, (March 9), he at once journeyed to Berlin; but he came to the throne only to die. While the Liberals hoped the emperor would use his power for some signal declaration of policy, the adherents of Bismarck made bitter attacks on the empress. The emperor's most important act was a severe reprimand addressed to von Puttkamer, the reactionary minister of the interior, which caused his resignation; in the distribution of honours he chose many who belonged to classes and parties hitherto excluded from court favour. Queen Victoria visited Berlin to see her dying son-in-law. He died at Potsdam on June 15, 1888, after a reign of 99 days.

After the emperor's death Professor Geffcken, a personal friend, published in the *Deutsche Rundschau* extracts from the diary of the crown prince containing passages which illustrated his differences with Bismarck during the war of 1870. The object was to injure Bismarck's reputation, and a very unseemly dispute ensued. The treatment of the crown prince's illness also gave rise to an acrimonious controversy, for which see MACKENZIE, SIR MORELL.

The empress VICTORIA, who, after the death of her husband, was known as the empress Frederick, died on Aug. 5, 1901 at the castle of Friedrichskron, Cronberg, near Homburg, where she spent her last years. Of the emperor's children two, Prince Sigismund (1864-1866) and Prince Waldemar (1869-1879), died in childhood. He left two sons, William, his successor as emperor, and Henry, who adopted a naval career. Of his daughters, the princess Charlotte was married to Bernard, hereditary prince of Meiningen; the princess Victoria to Prince Adolph of Schaumburg-Lippe; the princess Sophie to the duke of Sparta, crown prince of Greece; and the princess Margaretha to Prince Friedrich Karl of Hesse.

See also Bismarck, *Reflections and Reminiscences*; Rennell Rodd, *Frederick, Crown Prince and Emperor* (1888); Gustav Freytag, *Der Kronprinz und die deutsche Kaiserkrone* (1889; English trans., 1890); Otto Richter, *Kaiser Friedrich III.* (2nd ed., 1903). For his illness, see the official publication, *Die Krankheit Kaiser Friedrichs III.* (1888), and Morell Mackenzie, *The Fatal Illness of Frederick the Noble* (1888). Most of the copies of the *Deutsche Rundschau* containing the extracts from the crown prince's diary were confiscated, but there is an English edition, published in 1889.

FREDERICK III. (1272-1337), king of Sicily, third son of King Peter of Aragon and Sicily, and of Constance, daughter of Manfred. Peter died in 1285, leaving Aragon to his eldest son Alphonso, and Sicily to his second son James. When Alphonso died in 1291 James became king of Aragon, and left his brother Frederick as regent of Sicily. The war between the Angevins and the Aragonese for the possession of Sicily was still in progress, and although the Aragonese were successful in Italy James's position in Spain became very insecure owing to internal troubles and French attacks. Peace negotiations were begun with Charles II. of Anjou, but were interrupted by the successive deaths of two popes; at last under the auspices of Boniface VIII. James concluded a shameful treaty, by which, in exchange for being left undisturbed in Aragon and promised possession of Sardinia and Corsica, he gave up Sicily to the Church, for whom it was to be held by the Angevins (1295). The Sicilians refused to be made over once more to the hated French whom they had expelled in 1282, and found a national leader in the regent Frederick. In vain the pope tried to bribe him with promises and dignities; he was determined to stand by his subjects, and was crowned king by the nobles at Palermo in 1296. Although the second Frederick of Sicily, he called himself third, being the third son of King Peter. He reformed the administration and extended the powers of the Sicilian parliament, which was composed of the barons, the prelates and the representatives of the towns.

War with the Angevins.—His refusal to comply with the pope's injunctions led to a renewal of the war. Frederick landed in Calabria, where he seized several towns, encouraged revolt in Naples, negotiated with the Ghibellines of Tuscany and Lombardy, and assisted the house of Colonna against Pope Boniface. In the meanwhile James married his sister Yolanda to Robert, the third son of Charles II. Unfortunately for Frederick, a part of the Aragonese nobles of Sicily favoured King James, and both John of Procida and Ruggiero di Lauria went over to the Angevins, and the latter completely defeated the Sicilian fleet off Cape Orlando. Charles's sons Robert and Philip landed in Sicily, but after capturing Catania were defeated by Frederick, Philip being taken prisoner (1299). For two years more the fighting continued with varying success, until Charles of Valois, who had been sent by Boniface to invade Sicily, was forced to sue for peace, his army being decimated by the plague, and in Aug. 1302 the treaty of Caltabellotta was signed, by which Frederick was recognized king of Trinacria (the name Sicily was not to be used) for his lifetime, and was to marry Eleonora, the daughter of Charles II.; at his death the kingdom was to revert to the Angevins (this

clause was inserted chiefly to save Charles's face), and his children would receive compensation elsewhere. Boniface tried to induce King Charles to break the treaty, but the latter was only too anxious for peace, and finally in May 1303 the pope ratified it, Frederick agreeing to pay him a tribute.

Later Struggles.—For a few years Sicily enjoyed peace, and the kingdom was reorganized. But on the descent of the emperor Henry VII., Frederick entered into an alliance with him, and in violation of the pact of Caltabellotta made war on the Angevins again (1313), and captured Reggio. He set sail for Tuscany to co-operate with the emperor, but on the latter's death (1314) he returned to Sicily. Robert, who had succeeded Charles II. in 1309, made several raids into the island. A truce was concluded in 1317, but as the Sicilians helped the north Italian Ghibellines in the attack on Genoa, and Frederick seized some Church revenues for military purposes, the pope (John XXII.) excommunicated him and placed the island under an interdict (1321) which lasted until 1335. An Angevin fleet and army, under Robert's son Charles, was defeated at Palermo by Giovanni da Chiaramonte in 1325, and in 1326 and 1327 there were further Angevin raids on the island, until the descent into Italy of the emperor Louis the Bavarian distracted their attention. The election of Pope Benedict XII. (1334), who was friendly to Frederick, promised a respite; but after fruitless negotiations the war broke out once more, and Chiaramonte went over to Robert, owing to a private feud. In 1337 Frederick died at Paternione, and in spite of the peace of Caltabellotta his son Peter succeeded. During Frederick's reign the Aragonese dynasty became thoroughly national and helped to weld the Sicilians into a united people.

Speciale's "Historia Sicula" (in Muratori's *Script. rer. ital. x.*) is the most important; for the first years of Frederick's reign see M. Amari, *La Guerra del Vespro Siciliano* (Florence, 1876), and F. Lanzani, *Storia dei Comuni italiani* (Milan, 1882); for the latter years C. Cipolla, *Storia delle signorie italiane* (Milan, 1881); also F. Testa, *Vita di Federico di Sicilia* (1775).
(L. V.)

FREDERICK I. (1372?–1440), elector of Brandenburg, founder of the greatness of the House of Hohenzollern, was born at Nuremberg, a son of Frederick V., burgrave of Nuremberg, and first came into prominence by saving the life of Sigismund, king of Hungary, at the battle of Nicopolis in 1396. In 1397 he became burgrave of Nuremberg, and after his father's death in 1398 he shared Ansbach, Bayreuth, and the smaller possessions of the family, with his only brother John, but became sole ruler after his brother's death in 1420. Loyal at first to King Wenceslaus, the king's neglect of Germany drove Frederick to take part in his deposition in 1400, and in the election of Rupert III., count palatine of the Rhine, whom he accompanied to Italy in the following year. In 1401 he married Elizabeth, or Elsa, daughter of Frederick, duke of Bavaria-Landshut (d. 1393), and in 1409 took service again with King Sigismund, whom he assisted in his struggle with the Hungarian rebels. The double election to the German throne in 1410 first brought Frederick into relation with Brandenburg. Sigismund, anxious to obtain another vote in the electoral college, appointed Frederick to exercise the Brandenburg vote on his behalf, and it was largely through his efforts that Sigismund was chosen German king. Frederick then restored a certain degree of order in Brandenburg, and was formally invested with the electorate and margraviate by Sigismund at Constance on April 18, 1417 (see BRANDENBURG). He took part in the war against the Hussites, but became estranged from Sigismund when in 1423 the king invested Frederick of Wettin, margrave of Meissen, with the vacant electoral duchy of Saxe-Wittenberg. In 1427 he was one of the band of electors who sought to impose reforms upon Sigismund. An unsuccessful candidate for the German throne in 1438, Frederick was chosen king of Bohemia in 1440, but declined the honour. He took part in the election of Frederick III. as German king in 1440, and died at Kadolzburg on Sept. 21, of the same year. In 1902 a statue was erected to his memory at Friesack. Another one is in the "Siegesallee," Berlin.

See E. Brandenburg, *König Sigismund und Kurfürst Friedrich I. von Brandenburg* (1891).

FREDERICK I. (1425–1476), elector palatine of the Rhine, surnamed "the Victorious," and called by his enemies "wicked Fritz," second son of the elector palatine Louis III., was born on Aug. 1, 1425. He inherited a part of the Palatinate on his father's death in 1439, but surrendered this inheritance to his elder brother, the elector Louis IV. On his brother's death in 1449 he became guardian of the young elector Philip, and in 1451 he persuaded the nobles to recognize him as elector, on condition that Philip should be his successor. The elector was leader among the princes who formed plans to secure a more efficient government for Germany, and even discussed the deposition of Frederick III. In alliance with Louis IX., duke of Bavaria-Landshut, Frederick gained several victories during the ensuing struggle between the princes, and in 1462 won a decisive battle at Seckenheim over Ulrich V., count of Württemberg. In 1472 the elector married Clara Tott, or Dett, the daughter of an Augsburg citizen, and by her he had two sons, Frederick, who died during his father's lifetime, and Louis (d. 1524), ancestor of the counts of Löwenstein. He died at Heidelberg on Dec. 12, 1476, and was succeeded, according to the compact, by his nephew Philip. Frederick was a wise and intelligent ruler who added to the area of the Palatinate and furthered its internal prosperity.

See N. Feeser, *Friedrich der Siegreiche, Kurfürst von der Pfalz* (Neuberg, 1880).

FREDERICK II. (1482–1556), surnamed "the Wise," elector palatine of the Rhine, fourth son of the elector Philip was born Dec. 9, 1482. He fought under the emperor Maximilian I. in 1508; worked to secure the election of Charles, afterwards the emperor Charles V., as the successor of Maximilian in 1519; fought in two campaigns against the Turks; and being disappointed in his hope of obtaining the hand of one of the emperor's sisters, married in 1535 Dorothea (d. 1580), daughter of Christian II., who had been driven from the Danish throne. Frederick became elector palatine by the death of his brother, Louis V., in March 1544. In the religious troubles of Germany, he took up at first the rôle of a mediator, but in 1545 he joined the league of Schmalkalden, and in 1546 broke definitely with the older faith. He gave a little assistance to the league in its war with Charles, but soon submitted to the emperor, accepted the *Interim* issued from Augsburg in May 1548, and afterwards acted in harmony with Charles. The elector died on Feb. 26, 1556, and as he left no children was succeeded by his nephew, Otto Henry (1502–1559). He was a great benefactor to the university of Heidelberg.

Frederick's life, *Annales de vita et rebus gestis Friderici II. electoris palatini* (Frankfort 1624 Germ. trans. by E. von Bülow, 1849), was written by his secretary Hubert Thomas Leodius. See also Rott, *Friedrich II. von der Pfalz und die Reformation* (Heidelberg, 1904).

FREDERICK III. (1515–1576), called "the Pious," elector palatine of the Rhine, eldest son of John II., count palatine of Simmern, was born at Simmern on Feb. 14, 1515. In 1537 he married Maria (d. 1567), daughter of Casimir, prince of Bayreuth, and in 1546, mainly as a result of this union, adopted the reformed doctrines. In 1557 he became count palatine of Simmern by his father's death, succeeding his kinsman, Otto Henry (1502–1559), as elector palatine two years later. Although inclined to the views of Calvin rather than to those of Luther, and as the breach between the followers of the two reformers became wider, he definitely adopted Calvinism. This form of faith was established in the Palatinate; in its interests the "Heidelberg Catechism" was drawn up in 1563; and Catholics and Lutherans were persecuted alike, while the churches were denuded of all their ornaments. The Lutheran princes wished to root out Calvinism in the Palatinate, but were not willing to exclude the elector from the benefits of the religious peace of Augsburg, which were confined to the adherents of the confession of Augsburg, and the matter came before the diet in 1566. Boldly defending his position, Frederick refused to give way an inch, and as the Lutherans were unwilling to proceed to extremities the emperor Maximilian II. could only warn him to mend his ways. The elector aided the Huguenots in France and the insurgents in the Netherlands with men and money; one of his sons, John Casimir (1543–1592), took a prominent part in the French wars

of religion, while another, Christopher, was killed in 1574 fighting for the Dutch at Mooker Heath. Frederick sought in vain to prevent the election of a member of the Habsburg family as Roman king, to secure the abrogation of the "ecclesiastical reservation" clause in the peace of Augsburg, or to obtain for Protestants in the territories of the spiritual princes. He died at Heidelberg on Oct. 26, 1576.

See A. Kluckhohn, *Friedrich der Fromme* (Nördlingen, 1877-79); and *Briefe Friedrichs des Frommen*, edited by Kluckhohn (Brunswick, 1868-72).

FREDERICK IV. (1574-1610), elector palatine of the Rhine, only surviving son of the elector Louis VI., was born at Amberg on March 5, 1574. His uncle and guardian, John Casimir, brought him up as a Lutheran. In January 1592, on the death of John Casimir, Frederick undertook the government of the Palatinate, and continued the policy of his uncle, hostility to the Catholic Church and the Habsburgs, and co-operation with foreign Protestants. He was often in communication with Henry of Navarre, afterwards Henry IV. of France, and like him was unremitting in his efforts to conclude a league among the German Protestants, while he sought to weaken the Habsburgs by refusing aid for the Turkish War. After many delays and disappointments the Union of Evangelical Estates was actually formed in May 1608, under the leadership of the elector. Frederick married in 1593 Louise, daughter of William the Silent, prince of Orange. He died on Sept. 19, 1610.

FREDERICK V. (1596-1632), elector palatine of the Rhine and king of Bohemia, son of the elector Frederick IV. by his wife, Louisa Juliana, daughter of William the Silent, prince of Orange, was born at Amberg on Aug. 26, 1596. He became elector on his father's death in Sept. 1610, and was under the guardianship of his kinsman, John II., count palatine of Zweibrücken (d. 1635), until he was declared of age in July 1614. Frederick had married Elizabeth, daughter of the English king James I., in Feb. 1613, and was the recognized head of the Evangelical Union founded by his father to protect the interests of the Protestants. In 1619 he stepped into a larger arena. In Aug. 1619, a few months after the death of the emperor Matthias, the estates of Bohemia declared his successor, Ferdinand, afterwards the emperor Ferdinand II., deposed, and chose Frederick as their king. The elector was crowned king of Bohemia at Prague on Nov. 4, 1619. On Nov. 8, four days after his coronation, his forces were easily routed by the imperial army under Tilly at the White Hill, near Prague, and his short reign in Bohemia ended abruptly. The Palatinate was overrun by the Spaniards and Bavarians, and, after a futile attempt to dislodge them, Frederick, called in derision the "winter king," sought refuge in the Netherlands. His electorate was given in 1623 to Maximilian I. of Bavaria.

The remainder of Frederick's life was spent in obscurity. He died at Mainz on Nov. 29, 1632.

In addition to the numerous works which treat of the outbreak of the Thirty Years' War see A. Gindely, *Friedrich V. von der Pfalz* (Prague, 1884); J. Krebs, *Die Politik der evangelischen Union im Jahre 1618* (Breslau, 1890-1901).

FREDERICK I. (1370-1428), surnamed "the Warlike," elector and duke of Saxony, was the eldest son of Frederick "the Stern," count of Osterland, and Catherine, daughter and heiress of Henry VIII., count of Coburg. He was born at Altenburg on April 11, 1370, and was a member of the family of Wettin. In the division of their father's lands in 1382 Frederick and his brothers shared Meissen and Thuringia with their uncles Balthasar and William. Frederick's brother George died in 1402, and his uncle William in 1407. A further dispute then arose, but in 1410 a treaty was made at Naumburg, when Frederick and his brother William added the northern part of Meissen to their lands; and in 1425 the death of William left Frederick sole ruler. In the German town war of 1388 he assisted Frederick V. of Hohenzollern, burgrave of Nuremberg, and in 1391 did the same for the Teutonic Order against Ladislaus V., king of Poland and prince of Lithuania. He supported Rupert III., elector palatine of the Rhine, in his struggle with King Wenceslaus for the German throne, probably because Wenceslaus refused to fulfil a promise

to give him his sister Anna in marriage. He took a leading part in the war against the Hussites, receiving from the German King Sigismund, as a return for his services, various places in Bohemia and elsewhere in pledge, together with the vacant electoral duchy of Saxe-Wittenberg. He was formally invested at Budapest on Aug. 1, 1425. The elector was endeavouring to rouse the German princes to aid him in prosecuting the war against the Hussites when the Saxon army was almost annihilated at Aussig (1426). Frederick died at Altenburg on Jan. 4, 1428. In 1402 he married Catherine of Brunswick, by whom he left four sons and two daughters. He and his brother William founded the university of Leipzig for German students who had just left the university of Prague. Frederick's importance as an historical figure arises from his having obtained the electorate of Saxe-Wittenberg for the house of Wettin, and transformed the margraviate of Meissen into the territory which afterwards became the kingdom of Saxony. The ex-king of Saxony, the sovereigns of England and of the Belgians are his direct descendants.

See C. W. Böttiger and Th. Flathe, *Geschichte des Kurstaates und Königreichs Sachsen* (Gotha, 1867-73); and J. G. Horn, *Lebens- und Heldengeschichte Friedrichs des Streibaren* (Leipzig, 1733).

FREDERICK II. (1411-1464), called "the Mild," elector and duke of Saxony, eldest son of the elector Frederick I., was born at Leipzig on Aug. 22, 1411. He succeeded his father as elector in 1428, but shared the family lands with his three brothers, and was at once engaged in defending Saxony against the attacks of the Hussites. He obtained the burgraviate of Meissen in 1439, and some part of Lower Lusatia after a struggle with Brandenburg about the same time. In 1438 it was decided that Frederick, and not his rival, Bernard IV., duke of Saxe-Lauenburg, was entitled to exercise the Saxon electoral vote at the elections for the German throne. On the death of their cousin Frederick, margrave of Thuringia, the brothers Frederick and William divided Frederick's territory, but this arrangement was not satisfactory, and war broke out between them in 1446. After a struggle known as the *Brüderkrieg* peace was made in Jan. 1451, when William received Thuringia, and Frederick Altenburg and other districts. He died at Leipzig on Sept. 7, 1464. By his wife, Margaret (d. 1486), daughter of Ernest, duke of Styria, he left two sons and four daughters. In July 1455 occurred the celebrated *Prinzenraub*, the attempt of a knight named Kunz von Kaufungen (d. 1455) to abduct Frederick's two sons, Ernest and Albert. Having carried them off from Altenburg, Kunz was making his way to Bohemia when the plot was accidentally discovered and the princes restored.

See W. Schäfer, *Der Montag vor Kiliani* (1855); J. Gersdorf, *Einige Aktenstücke zur Geschichte des sächsischen Prinzenraubes* (1855); and T. Carlyle, *Critical and Miscellaneous Essays*, vol. iv. (1899).

FREDERICK III. (1463-1525), called "the Wise," elector of Saxony, eldest son of Ernest, elector of Saxony, and Elizabeth, daughter of Albert, duke of Bavaria-Munich (d. 1508), was born at Torgau on Jan. 17, 1463 and succeeded his father as elector in 1486. Retaining the government of Saxony in his own hands, he shared the other possessions of his family with his brother John, called "the Stedfast" (1468-1532). Frederick was among the princes who pressed the need of reform upon the German king Maximilian I. in 1495, and in 1500 he became president of the newly-formed council of regency (*Reichsregiment*). He took a genuine interest in learning; was a friend of Georg Spalatin; and in 1502 founded the university of Wittenberg, where he appointed Luther and Melancthon to professorships. In 1520 he refused to put into execution the papal bull ordering Luther's writings to be burned and the reformer to be put under restraint or sent to Rome; and in 1521, after Luther had been placed under the imperial ban by the diet at Worms, the elector had him conveyed to his castle at the Wartburg, and protected him. In 1519, Frederick, who alone among the electors refused to be bribed by the rival candidates for the imperial throne, declined to be a candidate himself, and assisted to secure the election of Charles V. He died unmarried at Langau, near Annaberg, on May 5, 1525.

FREDERICK, a city of Maryland, U.S.A., 45m. W. by N. of Baltimore, on a tributary of the Monocacy river; the county seat of Frederick county. It is on Federal highways 15, 40, 240 and 340, and is served by the Baltimore and Ohio, the Western Maryland, and the Pennsylvania railways, and by inter-urban motor-coach and trolley lines. The population was 11,066 in 1920 (88% native white) and 14,434 in 1930 according to Federal census. The "clustered spires" of Frederick, to borrow Whittier's description, rising from "meadows rich with corn," are "green-walled by the hills of Maryland." The modern city is an important trading, farming and manufacturing centre, with a factory output in 1927 valued at \$10,144,351, and bank clearings amounting to \$25,106,794. There are large flour mills, brush and silo factories, creameries, corn-canning factories and various other industrial plants. On the outskirts of the city is Hood college for women (Reformed Church), organized in 1893 on the foundation of a seminary chartered in 1839. The State school for the deaf was established here in 1867. On its grounds is a stone barrack built in 1777, which was used as quarters for prisoners from Saratoga, Trenton and Yorktown during the Revolution, and as a Union hospital during the Civil War. The town clock, in the tower of Trinity chapel, has been in constant service since 1796. Frederick was the birthplace of Francis Scott Key, author of "The Star-Spangled Banner," and of Admiral Winfield Scott Schley. "Rose Hill," home of the first governor of Maryland, Thomas Johnson (b. 1732), is one of the many beautiful colonial estates near the city, and within its limits is the summer home of Chief Justice Taney, with the slave quarters still standing. Frederick was settled by Germans in 1733, and was laid out in 1745. It is uncertain whether it was named after the last Lord Baltimore, the then Prince of Wales, or Frederick the Great of Prussia. The city was incorporated in 1817. Here in 1755 Gen. Braddock prepared for his expedition against Ft. Duquesne; and in the county courthouse on Nov. 23, 1765, the 12 county judges took official action (the first jurists of the country to do so) repudiating the British Stamp Act. During the Civil War the city was occupied at different times by Unionists and Confederates. The battle of Monocacy was fought 3m. south. The flag-waving by Barbara Fritchie, which through Whittier's ballad has become a cherished national legend, took place, if at all, during "Stonewall" Jackson's march to Harper's Ferry, in 1862. The site of Mrs. Fritchie's home was eaten away by the changing channel of the creek, and the materials of the house were made into canes and other souvenirs. A replica has been constructed for a museum in which the flag itself and other relics are preserved.

FREDERICK AUGUSTUS I. (1750-1827), king of Saxony, son of the elector Frederick Christian, was born at Dresden on Dec. 23, 1750. He succeeded his father under the guardianship of Prince Xavier in 1763, and was declared of age in 1768. In 1769 he married Maria Amelia, daughter of Duke Frederick of Zweibrücken, by whom he had one daughter, Princess Augusta. He was methodical and conscientious, and a good example to all his officials, whence his surname "the Just." He sided with Frederick the Great in the short Bavarian succession war of 1778 against Austria. At the peace of Teschen, which concluded the war, he received 6 million florins. In 1785 he joined the league of German princes (*Deutscher Fürstenbund*) formed by Prussia, but without prejudice to his neutrality. Thus he remained neutral during the quarrel between Austria and Prussia in 1790. In the following year he declined the crown of Poland. He refused to join the league against France (Feb. 7, 1792), but when war was declared his duty to the empire necessitated his taking part in it. Even after the peace of Basel (April 5, 1795) he continued the war. But when the French army, during the following year, advanced into the heart of Germany, he was compelled by General Jourdan to retreat (Aug. 13, 1796). In 1806 he joined Prussia against France. After the disastrous battle of Jena he concluded peace with Napoleon at Posen (Dec. 11, 1806), and, assuming the title of king, he joined the Confederation of the Rhine. But he did not alter the constitution and administration of his new

kingdom. After the peace of Tilsit (July 9, 1807) he was created by Napoleon grand-duke of Warsaw, but his sovereignty of Poland was little more than nominal. In 1809 Frederick Augustus fought with Napoleon against Austria. On several occasions (1807, 1812, 1813) Napoleon was entertained at Dresden, and when, on his return from his disastrous Russian campaign, he passed through Saxony by Dresden (Dec. 16, 1812), Frederick Augustus remained true to his friend and ally. In April 1813 he made overtures to Austria, but he soon afterwards returned to the side of the French. He returned to Dresden on May 10 and was present at the terrible battle of Aug. 26 and 27, in which Napoleon's army and his own were defeated. He fell into the hands of the Allies after their entry into Leipzig; and, although he regained his freedom after the congress of Vienna, he was compelled to give up the northern part—three-fifths—of his kingdom to Prussia (May 21, 1814). He entered Dresden on July 7, and was enthusiastically welcomed by his people. The remainder of his life was spent in repairing the damages caused by the Napoleonic wars, in developing the agricultural, commercial and industrial resources of his kingdom, reforming the administration of justice, establishing hospitals and other charitable institutions, encouraging art and science and promoting education. He had a special interest in botany, and originated the beautiful park at Pillnitz. He died on May 5, 1827.

BIBLIOGRAPHY.—The earlier lives, by C. E. Weisse (1811), A. L. Herrmann (1827), Pölitz (1830), are mere panegyrics. On the other side see Flathe in *Allgemeine deutsche Biographie*, and Böttiger-Flathe, *History of Saxony* (2nd ed., 1867 ff.), vols. ii. and iii.; A. Bonnefons, *Un Allié de Napoléon, Frédéric Auguste, premier roi de Saxe...* (1902); Fritz, Friedrich, *Politik Sachsens 1801-1803* (1898); P. Rühlmann, *Öffentliche Meinung...* 1806-1813 (1902). There are many pamphlets bearing on the Saxon question and on Frederick Augustus during the years 1814 and 1815.

FREDERICK AUGUSTUS II. (1797-1854), king of Saxony, eldest son of Prince Maximilian and of Caroline Maria Theresia of Parma, was born on May 18, 1797, at Dresden. He was twice married—in 1819 (October 7) to the duchess Caroline, fourth daughter of the emperor Francis I. of Austria (d. May 22, 1832), and in 1833 (April 4) to Maria, daughter of Maximilian I. of Bavaria. There were no children of either marriage. In 1830 a rising in Dresden led to his being named joint regent of the kingdom along with King Antony, and on June 6, 1836, he succeeded his uncle. Frederick Augustus was at first in favour of the programme of German unity put forward at Frankfort in 1848, but he refused to acknowledge the democratic constitution of the German parliament. This attitude led to the insurrection at Dresden in May 1849, which was suppressed by the help of Prussian troops. Count Beust, leader of the Austrian and feudal party in Saxony, became his principal minister and guided his policy. He died in consequence of a carriage accident near Brennbühel, between Imst and Werns in Tirol (August 9, 1854). Frederick Augustus was a keen botanist, and wrote *Flora Marienbadensis, oder Pflanzen und Gebirgsarten, gesammelt und beschrieben* (Prague, 1837).

FREDERICK CHARLES (FRIEDRICH KARL NIKOLAUS), PRINCE (1828-1885), Prussian general field marshal, son of Prince Charles of Prussia and grandson of King Frederick William III., was born in Berlin on March 20, 1828. He entered the army on his tenth birthday as second lieutenant in the 14th Foot Guards. He studied at Bonn where he lived for two years, being accompanied throughout by Major von Roon, afterwards the famous war minister. He served in the Schleswig-Holstein War on the staff of Marshal von Wrangel. In 1849 he took part in the campaign against the Baden insurgents, and was wounded at the action of Wiesenthal while leading a desperate charge against entrenched infantry. In 1852 he became colonel, and in 1854 major-general and commander of a cavalry brigade. In this capacity he was brought closely in touch with General von Reyher, the chief of the general staff, and with Moltke. He married, in the same year, Princess Marie Anne of Anhalt.

In 1858 he visited France, where he minutely investigated the state of the French army, but was recalled when Prussia mobilized

her forces during the Franco-Austrian war. The prince was made a divisional commander in the II. army corps with a liberty of action which had previously been denied to him. About this time (1860) he gave a lecture to the officers of his command on the French army and its methods, the substance of which (*Eine militärische Denkschrift von P.F.K.*, Frankfurt on Main, 1860) was circulated more widely than the author intended, and in the French translation gave rise to much indignation in France. In 1861 Frederick Charles became general of cavalry. He was then commander of the III. (Brandenburg) army corps. This post he held from 1860 to 1870, except during the campaigns of 1864 and 1866, and in it he displayed his real qualities as a troop leader. Ten years of his continuous and thorough training brought the III. corps to a pitch of real efficiency which the Guard corps alone, in virtue of its special recruiting powers, slightly surpassed. Prince Frederick Charles' work was to be tested when von Alvensleben and the III. corps engaged the whole French army on Aug. 16, 1870. In 1864 the Prussian contingent under Frederick Charles formed a corps of the allied army, operating against the Danes, and half of it was drawn from the III. corps. After the storming of the Düppel lines the prince succeeded Wrangel in the supreme command, with Moltke as his chief of staff. These two great soldiers then planned and brilliantly carried out the capture of the island of Alsén, after which the war ended.

In 1866 came the Seven Weeks' War with Austria. Prince Frederick Charles was appointed to command the I. Army, which he led through the mountains into Bohemia, driving before him the Austrians and Saxons to the upper Elbe, where on July 3, took place the decisive battle of Königgrätz or Sadowa. This was brought on by the initiative of the leader of the I. Army, which had to bear the brunt of the fighting until the advance of the II. Army turned the Austrian flank. After the peace he returned to the III. army corps, which he finally left, in July 1870, when appointed to command the II. German Army in the war with France. In the early days of the advance the prince's ruthless energy led to much friction between the I. and II. Armies (see FRANCO-GERMAN WAR), while his strategical mistakes seriously embarrassed the great headquarters staff. The advance of the II. Army beyond the Saar to the Moselle and from that river to the Meuse displayed more energy than careful strategy, though the "red prince" (as he was called from the colour of his favourite hussar uniform) was in thorough sympathy with the king's headquarters on the one hand and the feelings of the troops on the other. Then came the discovery that the French were not in front, but to the right rear of the II. Army (August 16). Alvensleben with the III. corps held the French to their ground at Vionville while the prince hurried together his scattered forces. He himself directed with superb tactical skill the last efforts of the Germans at Vionville, and the victory of St. Privat on the 18th was due to his leadership (see METZ), which shone all the more by contrast with the failures of the I. Army at Gravelotte. The prince was left in command of the forces which blockaded Bazaine in Metz, and received the surrender of that place and of the last remaining field army of the enemy. He was promoted at once to the rank of general field marshal, and shortly afterwards the II. Army was despatched to aid in crushing the newly organized army of the French republic on the Loire. Here again he retrieved strategical errors by energy and tactical skill, and his work was in the end crowned by the victory of Le Mans on Jan. 12, 1871.

He now became inspector-general of the 3rd "army inspection," and a little later inspector of cavalry, and in the latter post he brought the Germany cavalry to a high degree of perfection in manoeuvre and general training. His sternness of character kept him aloof from the court and from his own family, and he spent his leisure months chiefly on his various country estates. In 1872 and in 1882 he travelled in the Mediterranean and the Near East. He died on June 15, 1885, at Klein-Gliencke near Berlin, and was buried at the adjacent church of Nikolskoe. His third daughter, Princess Louise Margareta, was married, in March 1879, to the duke of Connaught. His *Denkwürdigkeiten* were edited by W. Foerster in 1910.

See Müller-Bohn, *Der Eiserne Prinz* (1902).

FREDERICK HENRY (1583-1647), prince of Orange, the youngest child of William the Silent, was born at Delft about six months before his father's assassination on Jan. 29, 1584. His mother, Louise de Coligny, daughter of the Huguenot leader, Admiral de Coligny, was the fourth wife of William the Silent. The boy was trained to arms by his elder brother, Maurice of Nassau, one of the first generals of his age. On the death of Maurice in 1625, Frederick Henry succeeded him in his paternal dignities and estates, and also in the stadtholderates of the five provinces of Holland, Zeeland, Utrecht, Overysel and Gelderland, and in the important posts of captain and admiral-general of the Union. Frederick Henry proved himself scarcely inferior to his brother as a general, and a far more capable statesman and politician. For 22 years he remained at the head of affairs in the United Provinces, and the "period of Frederick Henry," as it is usually styled by Dutch writers, is generally accounted the golden age of the republic. The chief military exploits of Frederick Henry were the sieges and captures of Hertogenbosch in 1629, of Maas-tricht in 1632, of Breda in 1637, of Sas van Ghent in 1644, and of Hulst in 1645. The alliance with France against Spain had been the pivot of Frederick Henry's foreign policy, but in his last years he sacrificed the French alliance to conclude at Münster a separate peace with Spain, by which the United Provinces obtained the advantages for which they had for 80 years been contending. Frederick Henry died on March 14, 1647, and was buried at Delft. The actual signing of the peace was delayed by his death until 1648. Frederick Henry was married in 1625 to Amalia von Solms, and left one son, William II. of Orange and four daughters. See also NETHERLANDS: *History*.

Frederick Henry left an account of his campaign in his *Mémoires de Frédéric Henri* (Amsterdam, 1743). See *Cambridge Mod. Hist.* vol. iv. chap. 24, and the bibliography on p. 931.

FREDERICK LOUIS (1707-1751), prince of Wales, eldest son of George II., was born at Hanover on Jan. 20, 1707. After his grandfather, George I., became king of Great Britain and Ireland in 1714, Frederick was known as duke of Gloucester (though never actually created) and made a knight of the Garter. He had been betrothed to Wilhelmina Sophia Dorothea (1709-1758), daughter of Frederick William I., king of Prussia, and sister of Frederick the Great, but the match was prevented by the ill will between the parents. On the accession of George II. in 1727 Frederick came to England and in 1729 was created prince of Wales; but the relations between father and son were unfriendly, and the king refused to make him an adequate allowance. In 1735 Frederick wrote, or inspired the writing of, the *Histoire du prince Titi*, a book containing offensive caricatures of both king and queen; "he made his court" says Lecky, "the special centre of opposition to the government, and he exerted all his influence for the ruin of Walpole." After a marriage between the prince and Lady Diana Spencer, afterwards the wife of John, 4th duke of Bedford, had been frustrated by Walpole, Frederick married in April 1736 Augusta (1719-1772), daughter of Frederick II., duke of Saxe-Gotha. George proposed to allow the prince £50,000 a year; but this sum was regarded as insufficient by the latter, whose appeal to parliament was unsuccessful. After the birth of his first child, Augusta, in 1737, Frederick was ordered by the king to quit St. James's Palace, and foreign ambassadors were requested to refrain from visiting him. In 1745 George II. refused to allow his son to command the British army against the Jacobites. On March 20, 1751, the prince died in London, and was buried in Westminster Abbey. He left five sons and two daughters. The sons were George (afterwards King George III.), Edward Augustus, duke of York and Albany (1739-1767), William Henry, duke of Gloucester and Edinburgh (1743-1805), Henry Frederick, duke of Cumberland (1745-1790), and Frederick William (1750-1765); the daughters were Augusta (1737-1813), wife of Charles William Ferdinand, duke of Brunswick, and Caroline Matilda (1751-1775), wife of Christian VII., king of Denmark.

See Lord Hervev of Ickworth, *Memoirs of the Reign of George II.*, edited by J. W. Croker (London, 1884); Horace Walpole, *Memoirs of the Reign of George II.* (London, 1847); and Sir N. W. Wraxall, *Memoirs*, edited by H. B. Wheatley, vol. i. (London, 1884).

FREDERICK WILLIAM I. (1688–1740), king of Prussia, son of Frederick I. by his second marriage, was born on Aug. 15, 1688. He was early imbued with a passion for military life, and this was deepened by acquaintance with the duke of Marlborough (1709), Prince Eugene, whom he visited during the siege of Tournai, and Prince Leopold of Anhalt (the "Old Dessauer"). In nearly every respect he was the opposite of his father, having frugal, simple tastes, a passionate temper and a determined will. His life was simple and puritanical, being founded on the teaching of the Bible. He was, however, fond of hunting and somewhat given to drinking. He intensely disliked the French, and highly disapproved of the imitation of their manners by his father and his court. When he came to the throne (Feb. 25, 1713) his first act was to dismiss from the palace every unnecessary official and to regulate the royal household on principles of the strictest parsimony. The greater part of the beautiful furniture was sold. His importance for Prussia is twofold: in internal politics he laid down principles which continued to be followed long after his death; he was one of the greatest administrators who have ever worn the Prussian crown. His foreign policy was less successful, though under his rule the kingdom acquired some extension of territory.

Thus at the peace of Utrecht (April 11, 1713), after the War of the Spanish Succession, he acquired the greater part of the duchy of Gelderland. By the treaty of Schwedt, concluded with Russia, he was assured of an important influence in the solution of the Baltic question, and Swedish Pomerania, as far as the Peene, was occupied by Prussia. But Charles XII. on his return turned against the king, though without success, for the Pomeranian campaign of 1715 ended in favour of Prussia (fall of Stralsund, Dec. 22). This enabled Frederick William I. to maintain a more independent attitude towards the tsar; he refused, for example, to provide him with troops for a campaign (in Schonen) against the Swedes. When on May 28, 1718, in view of the disturbances in Mecklenburg, he signed at Havelberg the alliance with Russia, he confined himself to a defensive attitude, and, on the other hand, on Aug. 14, 1719, he also entered into relations with his former enemies, England and Hanover. By the treaty of Stockholm (Feb. 1, 1720), Frederick William succeeded in obtaining the consent of Sweden to the cession of that part of Pomerania which he had occupied (Usedom, Wollin, Stettin, Hither Pomerania, east of the Peene) in return for a payment of 2,000,000 thalers.

In order to secure the succession to the Lower Rhine duchies of Jülich and Berg, Frederick William finally agreed to the treaty of Wusterhausen (Oct. 12, 1726; ratified at Berlin, Dec. 23, 1728), in which he recognised the Pragmatic Sanction. In the War of the Polish Succession against France (1734–35), Frederick William remained faithful to the emperor's cause, and sent an auxiliary force of 10,000 men. The peace of Vienna, which terminated the war, led to a reconciliation between France and Austria, and so to a further estrangement between Frederick William and the emperor. In 1738 the western Powers, together with the emperor, insisted in identical notes on the recognition of the emperor's right to decide the question of the succession in the Lower Rhine duchies. A breach with the emperor was now inevitable, and this explains why in a last treaty (April 5, 1739) Frederick William obtained from France a guarantee of a part, at least, of Berg (excluding Düsseldorf).

But Frederick William's failures in foreign policy were more than compensated for by his splendid services in the internal administration of Prussia. He saw the necessity of rigid economy not only in his private life but in the whole administration of the state. During his reign Prussia obtained for the first time a centralized and uniform financial administration. It was the king himself who composed and wrote in the year 1722 the famous instruction for the general directory (*Generaldirektorium*) of war, finance and domains. When he died the income of the state was about seven million thalers (£1,050,000). The consequence was that he paid off the debts incurred by his father, and left to his successor a well filled treasury. In the administration of the domains he made three innovations: (1) the private estates of the king were turned into domains of the crown (Aug. 13,

1713); (2) the freeing of the serfs on the royal domains (March 22, 1719); (3) the conversion of the hereditary lease into a short-term lease on the basis of productiveness. His industrial policy was inspired by the mercantile spirit. On this account he forbade the importation of foreign manufactures and the export of raw materials from home, a policy which had a very good effect on the growth of Prussian industries.

The work of internal colonization he carried on with especial zeal. Most notable of all was his *rétablissement* of East Prussia, to which he devoted six million thalers (c. £900,000). His policy in respect of the towns was motivated largely by fiscal considerations, but at the same time he tried also to improve their municipal administration; for example, in the matter of buildings, of the letting of domain lands and of the collection of the excise in towns. Frederick William had many opponents among the nobles because he pressed on the abolition of the old feudal rights, introduced in East Prussia and Lithuania a general land tax (the *General hufenschoss*), and finally in 1739 attacked in a special edict the *Legen*, i.e., the expropriation of the peasant proprietors.

He did nothing for the higher learning, and even banished the philosopher Christian Wolff at 48 hours' notice "on pain of the halter," for teaching, as he believed, fatalist doctrines. Afterwards he modified his judgment in favour of Wolff, and even, in 1739, recommended the study of his works. He established many village schools, which he often visited in person; and after the year 1717 (Oct. 23) all Prussian parents were obliged to send their children to school (*Schulzwang*). Under him the people flourished; and although it stood in awe of his vehement spirit it respected him for his firmness, his honesty of purpose and his love of justice. He was devoted also to his army, the number of which he raised from 38,000 to 83,500, so that under him Prussia became the third military power in the world, coming next after Russia and France. There was not a more thoroughly drilled or better appointed force. The Potsdam guard, made up of giants collected from all parts of Europe, sometimes kidnapped, was a sort of toy with which he amused himself. The reviewing of his troops was his chief pleasure. But he was also fond of meeting his friends in the evening in what he called his Tobacco-College, where amid clouds of tobacco smoke he not only discussed affairs of state but heard the newest "guard-room jokes." He died on May 31, 1740, leaving behind him his widow, Sophia Dorothea of Hanover, whom he had married on Nov. 26, 1706. His son was Frederick the Great (see FREDERICK II., king of Prussia), who opposed him. This opposition became so strong in 1730 that the crown prince fled from the court, and was later arrested and brought before a court martial. A reconciliation was brought about, at first gradually. In later years the relations between father and son came to be of the best.

See the references s.v. Prussia; also *Hohenzollernjahrbuch*, viii. (1905), for particulars of Frederick William's education and death; letters to Prince Leopold of Anhalt-Dessau in the *Acta Borussica* (1905). There is a picturesque account of him in Thomas Carlyle's *Frederick the Great*.

FREDERICK WILLIAM II. (1744–1797), king of Prussia, son of Augustus William, second son of King Frederick William I. and of Louise Amalie of Brunswick, sister-in-law of Frederick the Great, was born at Berlin on Sept. 25, 1744, and became heir to the throne on his father's death in 1757. Although the prince had a numerous family, he was completely under the influence of his mistress, Wilhelmine Enke, afterwards created Countess Lich-tenau, a woman of strong intellect and much ambition. He was a handsome man, and devoted to the arts—Beethoven and Mozart enjoyed his patronage and his private orchestra had a European reputation. Frederick the Great, who had employed him in various services—notably in an abortive confidential mission to the court of Russia in 1780—openly expressed his misgivings as to the character of the prince and his surroundings.

The misgivings were justified by the event. Frederick William's accession to the throne on the death of the great Frederick (Aug. 17, 1786) was, indeed, followed by a series of measures for lightening the burdens of the people, reforming the oppressive French system of tax-collecting, and encouraging trade by the diminution of customs dues and the making of roads and canals. The educated

classes were pleased by his removal of Frederick's ban on the German language by the admission of German writers to the Prussian Academy, and by the active encouragement given to schools and universities. But these reforms were vitiated in their source. In 1781 Frederick William, then prince of Prussia, had joined the Rosicrucians, and had fallen under the influence of the fanatical Johann Christof Wöllner (1732-1800), and by him the royal policy was inspired. On Aug. 26, 1786 Wöllner was appointed privy councillor for finance (*Geheimer Oberfinanzrath*). Though not in name, in fact he was prime minister, and the fiscal and economic reforms of the new reign were the application of his theories. Bischoffswerder, another Rosicrucian, was also called into the king's counsels; by 1789 he was already an adjutant-general. In 1788 Wöllner became privy councillor of state and of justice and head of the spiritual department for Lutheran and Catholic affairs. War was at once declared on what—to use a later term—we may call the "modernists." On July 9 was issued the edict forbidding ministers to teach anything not contained in the letter of their official books, proclaiming the necessity of protecting the Christian religion against the "enlighteners" (*Aufklärer*), and placing educational establishments under the supervision of the orthodox clergy. On Dec. 18, a new censorship law was issued, to secure the orthodoxy of all published books; and finally, in 1791, a sort of Protestant Inquisition was established at Berlin (*Immediat-Examinations-commission*) to watch over all ecclesiastical and scholastic appointments. The effects of this policy of blind obscurantism outweighed any good that resulted from economic and financial reform; and even this reform was but spasmodic and partial. Far more fateful for Prussia was the king's attitude towards the army and foreign policy. Frederick William, who had no taste for military matters, put his authority as "War-Lord" into commission under a supreme college of war (*Oberkriegs-Collegium*) under the duke of Brunswick and General von Möllendorf. It was the beginning of the process that ended in 1806 at Jena.

The Dutch campaign of 1787, entered on for purely family reasons, was indeed successful; but Prussia received not even the cost of her intervention. An attempt to intervene in the war of Russia and Austria against Turkey failed of its object; Prussia did not succeed in obtaining any concessions of territory from the alarms of the Allies, and the dismissal of Hertzberg in 1791 marked the final abandonment of the anti-Austrian tradition of Frederick the Great. For, meanwhile, the French Revolution had entered upon alarming phases, and in Aug. 1791 Frederick William, at the meeting at Pillnitz, arranged with the emperor Leopold to join in supporting the cause of Louis XVI. A formal alliance was signed on Feb. 7, 1792, and Frederick William took part personally in the campaigns of 1792 and 1793. A subsidy treaty with the sea powers (April 19, 1794) filled his coffers; but the insurrection in Poland that followed the partition of 1793, and the threat of the isolated intervention of Russia, hurried him into the separate treaty of Basle with the French Republic (April 5, 1795), which was regarded by the great monarchies as a betrayal, and left Prussia morally isolated in Europe on the eve of the revolutionary era. Prussia had paid a heavy price for the vast territories acquired at the expense of Poland in 1793 and 1795, and when, on Nov. 16, 1797, Frederick William died, he left the state in bankruptcy and confusion, the army decayed and the monarchy discredited.

Frederick William II. was twice married: (1) in 1765 to Elizabeth of Brunswick (d. 1841), by whom he had a daughter, Frederika, afterwards duchess of York, and from whom he was divorced in 1769; (2) in 1769 to Frederika Louisa of Hesse-Darmstadt, by whom he had four sons, Frederick William III., Louis (d. 1796), Henry and William, and two daughters, Wilhelmina, wife of William of Orange, afterwards William I., king of the Netherlands, and Augusta, wife of William II., elector of Hesse. Besides his relations with his *maitresse en titre*, the countess Lichtenau, the king—who was a frank polygamist—contracted two "marriages of the left hand" with Fräulein von Voss and the countess Dönhoff.

kultur, vol. iii. "Friedrich Wilhelm II." (Leipzig, 1885); Paulig, *Friedrich Wilhelm II., sein Privatleben u. seine Regierung* (Frankfurt-am-der-Oder, 1896).

FREDERICK WILLIAM III. (1770-1840), king of Prussia, eldest son of King Frederick William II., was born at Potsdam on Aug. 3, 1770. His father, then prince of Prussia, was out of favour with Frederick the Great and entirely under the influence of his mistress, and the boy led a solitary and repressed life. As a soldier he received the usual training of a Prussian prince, obtained his lieutenancy in 1784, became a colonel commanding in 1790, and took part in the campaigns of 1792-94. In 1793 he married Louise, daughter of Prince Charles of Mecklenburg-Strelitz, whom he met at Frankfort. He succeeded to the throne on Nov. 16, 1797, and at once began to remedy the worst abuses of his father's reign. But he had neither the strength nor the ability to meet the difficult foreign situation. The consequences of his infirmity of purpose are written large on the history of Prussia from the treaty of Lunéville in 1801 to the downfall that followed the campaign of Jena in 1806. By the treaty of Tilsit (July 9, 1807) Frederick William had to surrender half his dominions, and what remained to him was exhausted by French exactions and liable at any moment to be crushed out of existence by Napoleon. Only the indomitable courage of Queen Louise helped the weak king not to despair of the state. She seconded the reforming efforts of Stein and the work of Scharnhorst and Gneisenau in reorganizing the army, by which the resurrection of Prussia became a possibility. When Stein was dismissed at the instance of Napoleon, Hardenberg succeeded him as chancellor (June 1810). In the following month Queen Louise died, and the king was left alone to deal with circumstances of ever-increasing difficulty. He was forced to join Napoleon in the war against Russia; and even when the disastrous campaign of 1812 had for the time broken the French power, it was not his own resolution, but the loyal disloyalty of General York in concluding with Russia the convention of Tauroggen that forced him into line with the patriotic fervour of his people.

Once committed to the Russian alliance, however, he became the faithful henchman of the emperor Alexander. He was one of the original co-signatories of the Holy Alliance, though he signed it with reluctance; and in the counsels of the Grand Alliance he allowed himself to be practically subordinated to Alexander and later to Metternich. At the various congresses, from Aix-la-Chapelle (1818) to Verona (1822), he showed himself in sympathy with the repressive policy formulated in the Troppau Protocol. The promise of a constitution, which in the excitement of the War of Liberation he had made to his people, remained unfulfilled. But though reluctant to play the part of a constitutional king, Frederick William laboured assiduously at the enormous task of administrative reconstruction involved in welding the heterogeneous elements of the new Prussian kingdom into a united whole. He was sincerely religious; but his well-meant efforts to unite the Lutheran and Reformed Churches, revealed the limits of his paternal power; not till 1834, after a régime of coercion and confiscation, was outward union secured on the basis of common worship but separate symbols, the opponents of the measure being forbidden to form communities of their own. With the Roman Catholic Church, too, the king came into conflict on the vexed question of "mixed marriages," a conflict in which the Vatican gained an easy victory (see BUNSEN, CHRISTIAN CHARLES JOSIAS).

The revolutions of 1830 strengthened Frederick William in his reactionary tendencies; the question of the constitution was indefinitely shelved, and in 1831 Prussian troops concentrated on the frontier helped the task of the Russians in reducing the military rising in Poland. Yet, in spite of all, Frederick William was beloved by his subjects, who valued him for the simplicity of his manners, the goodness of his heart and the memories of the dark days after 1806. He died on June 7, 1840. In 1824 he had contracted a morganatic marriage with the countess Auguste von Harrach, whom he created Princess von Liegnitz. He wrote *Luther in Bezug auf die Kirchenagenda von 1822 und 1823* (Berlin, 1827), *Reminiscenzen aus der Kampagne 1792 in Frankreich*, and *Journal meiner Brigade in der Kampagne am Rhein 1793*.

The correspondence (*Briefwechsel*) of King Frederick William III. and Queen Louise with the emperor Alexander I. has been published (Leipzig, 1900) and also that between the king and queen (*ib.* 1903), both edited by P. Bailleu. See W. Hahn, *Friedrich Wilhelm III. und Luise* (3rd ed., Leipzig, 1877); M. W. Duncker, *Aus der Zeit Friedrichs des Grossen und Friedrich Wilhelms III.* (Leipzig, 1876); *Briefe und Aktenstücke zur Geschichte Preussens unter Friedrich Wilhelm III.* (ed. Rühl, 3 vols., 1899-1902).

FREDERICK WILLIAM IV. (1795-1861), king of Prussia, eldest son of Frederick William III., was born on Oct. 15, 1795. From his first tutor, Johann Delbrück, he imbibed a love of culture and art, but after a time Delbrück was dismissed, his place being taken by the pastor and historian Friedrich Ancillon, while a military governor was also appointed. By Ancillon he was grounded in religion, in history and political science, and his tutor impressed upon him his own hatred of the Revolution and its principles. This hatred was confirmed by the sufferings of his country and family in the terrible years after 1806, and his first experience of active soldiering was in the campaigns that ended in the occupation of Paris by the Allies in 1814. On his return to Berlin he studied art under the sculptor Christian Daniel Rauch and the painter and architect Karl Friedrich Schinkel (1781-1841), proving himself in the end a good draughtsman, a born architect and an excellent landscape gardener. At the same time he was being tutored in law by Savigny and in finance by a series of distinguished masters. In 1823 he married the princess Elizabeth of Bavaria, who adopted the Lutheran creed. The union, though childless, was very happy. A long tour in Italy in 1828 was the beginning of his intimacy with Bunsen and did much to develop his knowledge of art and love of antiquity.

On his accession to the throne in 1840 Frederick William reversed the unfortunate ecclesiastical policy of his father, allowing a wide liberty of dissent, and releasing the imprisoned archbishop of Cologne; he modified the press censorship; he promised the deputations of the provincial diets to create a central constitution, which he admitted to be required by the royal promises. But the idea of the sovereignty of the people was to him utterly abhorrent, and even any delegation of sovereign power on his own part would have seemed a betrayal of a God-given trust. "I will never," he declared, "allow to come between Almighty God and this country a plotted parchment, to rule us with paragraphs, and to replace the ancient, sacred bond of loyalty." His vision of the ideal state was that of a patriarchal monarchy, surrounded and advised by the traditional estates of the realm—nobles, peasants, burghers—and cemented by the bonds of evangelical religion. In Prussia, with its traditional loyalty and its old-world caste divisions, he believed that such a conception could be realized, and he stood half-way between those who would have rejected the proposal for a central diet altogether as a dangerous "thin end of the wedge," and those who would have approximated it more to the modern conception of a parliament. With a charter, or a representative system based on population, he would have nothing to do. The united diet which was opened on Feb. 3, 1847, was no more than a congregation of the diets instituted by Frederick William III. in the eight provinces of Prussia. Unrepresentative though it was—for the industrial working-classes had no share in it—it at once gave voice to the demand for a constitutional system.

The revolutionary outbreaks of 1848 rudely awakened Frederick William from his mediaeval dreamings; he even allowed himself to be carried away for a while by the popular tide. The loyalty of the Prussian army remained inviolate; but the king was too tender-hearted to use military force against his "beloved Berliners," and when the victory of the populace was thus assured his impressionable temper yielded to the general enthusiasm. He paraded the streets of Berlin wrapped in a scarf of the German black and gold, symbol of his intention to be the leader of the united Germany; and he even wrote to the indignant tsar in praise of "the glorious German revolution." But the united Germany which he was prepared to champion was not the democratic state of the Frankfort national parliament, but the old Holy Roman Empire, the heritage of the house of Habsburg. Finally, when Austria had been excluded from the new empire,

he replied to the parliamentary deputation that came to offer him the imperial crown that he might have accepted it had it been freely offered to him by the German princes, but that he would never stoop "to pick up a crown out of the gutter."

In fact the German empire would have lost immeasurably had it been the cause rather than the result of the inevitable struggle with Austria. However that may be, Frederick William's refusal gave the deathblow to the parliament and to all hope of the immediate creation of a united Germany. For Frederick William the position of leader of Germany now meant the employment of the military force of Prussia to crush the scattered elements of revolution that survived the collapse of the national movement. His establishment of the northern confederacy was a reversion to the traditional policy of Prussia in opposition to Austria, which, after the emperor Nicholas had crushed the insurrection in Hungary, was once more free to assert her claims to dominance in Germany. But Prussia was not ripe for a struggle with Austria, and the result was the humiliating convention of Olmütz (Nov. 29, 1850), by which Prussia agreed to surrender her separatist plans and to restore the old constitution of the confederation. Yet Frederick William had so far profited by the lessons of 1848 that he consented to establish (1850) a national parliament, though with a restricted franchise and limited powers.

In religious matters Frederick William sought a *rapprochement* between the Lutheran and Anglican churches, the first-fruits of which was the establishment of the Jerusalem bishopric under the joint patronage of Great Britain and Prussia; but the only result of his efforts was to precipitate the secession of J. H. Newman and his followers to the Church of Rome. In the summer of 1857 he had a stroke of paralysis, and a second in October. From this time, with the exception of brief intervals, his mind was completely clouded, and the duties of government were undertaken by his brother William (afterwards emperor), who on Oct. 7, 1858, was formally recognized as regent. Frederick William died on Jan. 2, 1861.

Selections from the correspondence (*Briefwechsel*) of Frederick William IV. and Bunsen were edited by Ranke (Leipzig, 1873); his proclamations, speeches, etc., from March 6, 1848 to May 31, 1851, have been published (Berlin, 1851); also his correspondence with Bettina von Arnim, *Bettina von Arnim und Friedrich Wilhelm IV., ungedruckte Briefe und Aktenstücke*, ed. L. Geiger (Frankfort-on-Main, 1902). See L. von Ranke, *Friedrich Wilhelm IV., König von Preussen* (works 51, 52 also in *Allgem. deutsche Biog.* vol. vii.), especially for the king's education and the inner history of the debates leading up to the united diet of 1847; H. von Petersdorff, *König Friedrich Wilhelm IV.* (Stuttgart, 1900); H. von Poschinger (ed.), *Unter Friedrich Wilhelm IV. Denkwürdigkeiten des Ministers Otto Frhr. von Manteuffel, 1848-1858* (3 vols., 1902), and *Preussens auswärtige Politik, 1850-1858* (3 vols., *ib.*, 1902), documents selected from those left by Manteuffel; F. Rachfahl, *Deutschland, König Friedrich Wilhelm IV. und die Berliner Märzrevolution* (Halle, 1901), *Die deutsche Politik König Friedrich Wilhelm IV., im Winter 1848-49* (Munich, 1919).

FREDERICK WILLIAM (1620-1688), elector of Brandenburg, usually called the "Great Elector," was born in Berlin on Feb. 16, 1620, son of the elector George William, and Elizabeth Charlotte, daughter of Frederick IV., elector palatine of the Rhine. He studied at the university of Leyden and learned something of war and statecraft under Frederick Henry, prince of Orange, whose daughter, Louise Henriette he married in 1646. He became ruler of Brandenburg and Prussia by his father's death in Dec. 1640, and set to work at once to repair the damage wrought during the Thirty Years' War, still in progress. He secured his investiture as duke of Prussia from Wladislaus, king of Poland, in Oct. 1641, but was not equally successful in crushing the independent tendencies of the estates of Cleves. In Brandenburg, he showed his supreme skill as a diplomatist and administrator. His disorderly troops were replaced by an efficient and disciplined force; his patience and perseverance freed his dominions from the Swedish soldiers; and the restoration of law and order was followed by a revival of trade and an increase of material prosperity. After a tedious struggle he centralized the administration, controlled and increased the revenue, and no department of public life escaped his sedulous care (*see* BRANDENBURG). The area of his dominions was increased at the peace of Westphalia in 1648, and this treaty and the treaty of Oliva in 1660 added to his

prestige. By a clever but unscrupulous use of the position of his dominions between Sweden and Poland he procured his recognition as independent duke of Prussia from both powers and eventually crushed the stubborn opposition offered to his authority by the estates of the duchy (*see* PRUSSIA). In 1666 his title to Cleves, Jülich and Ravensburg was definitely recognized. He failed to annex the western part of the duchy of Pomerania, which he had conquered from the Swedes, owing to the insistence of Louis XIV. at the treaty of St. Germain-en-Laye in 1679, and he could not obtain the Silesian duchies of Liegnitz, Brieg and Wohlau from the emperor Leopold I. when they fell vacant in 1675.

Frederick William played an important part in European politics. Although found once or twice on the side of France, he was generally loyal to the interests of the empire and the Habsburgs. Himself a Protestant, he supported Protestant interests abroad on political rather than on religious grounds, and sought to strengthen Brandenburg by allaying the hostility between Lutherans and Calvinists. His success in founding and organizing the army of Brandenburg-Prussia was amply demonstrated by the great victory which he gained over the Swedes at Fehrbellin in June 1675, and by the eagerness with which foreign powers sought his support. He was also the founder of the Prussian navy. The elector assisted trade in every possible way. He made the canal which still bears his name between the Oder and the Spree; established a trading company; and founded colonies on the west coast of Africa. He encouraged Flemings to settle in Brandenburg, and both before and after the revocation of the edict of Nantes in 1685 welcomed large numbers of Huguenots, who added greatly to the welfare of the country. Education was not neglected; and if in this direction some of his plans were abortive, it was from lack of means and opportunity rather than effort and inclination. The services of the great elector to Brandenburg and Prussia can only be properly appreciated by comparing the condition of his country in 1640 and in 1688. Poverty had given place to comparative wealth, and anarchy to a system of government which afterwards made Prussia the most centralized state in Europe. In fighting local privileges his conduct was doubtless despotic. He regarded absolute rule as the best guarantee for the internal and external welfare of the state.

The great elector died at Potsdam on May 9, 1688, and was succeeded by his eldest surviving son, Frederick. He deserves the eulogy passed upon him by Frederick the Great, *Messieurs; celui-ci a fait de grandes choses*. By his second marriage, with Dorothea (d. 1689), widow of Christian Louis, duke of Brunswick-Lüneburg, he had four sons and three daughters. His concluding years were troubled by differences between his wife and her step-son, Frederick; and influenced by Dorothea he bequeathed portions of Brandenburg to her four sons, a bequest which was annulled under his successor.

See J. G. Droysen, *Geschichte der preussischen Politik* (Berlin, 1855-86); M. Philippson, *Der grosse Kurfürst* (Berlin, 1897-1903); E. Heyck, *Der grosse Kurfürst* (Bielefeld, 1902); Spahn, *Der grosse Kurfürst* (Mainz, 1902); H. Prutz, *Aus des grossen Kurfürsten letzten Jahren* (Berlin, 1897). Also *Urkunden und Aktenstücke zur Geschichte des Kurfürsten Friedrich Wilhelm von Brandenburg* (Berlin, 1864-1902); T. Carlyle, *History of Frederick the Great*, vol. i. (London, 1858); and A. Waddington, *Le Grand Électeur et Louis XIV.* (Paris, 1905).

FRÉDÉRIC-LEMAÎTRE, ANTOINE LOUIS PROSPER (1800-1876), French actor, was born at Havre on July 28, 1800, and died in Paris on Jan. 26, 1876. On July 12, 1823, he appeared as Robert Macaire in *L'Auberge des Adrêts*, playing the part seriously, and failed; the next night he turned it into a burlesque rôle, and all Paris came to see it. Frédéric-Lemaître created many important parts; the greatest of all was perhaps Ruy Blas in Hugo's drama of that name.

FREDERICKSBURG, a city of Virginia, U.S.A., 60m. N. of Richmond, at the head of navigation on the Rappahannock river; in Spottsylvania county, but politically independent of it. It is on Federal highways 1 and 17, and is served by the Richmond, Fredericksburg and Potomac and the Virginia Central railways, and by steamers to Baltimore. The population was 5,882 in 1920; 1930, 6,819. It is a beautiful old city, with many his-

toric associations, which has modern industries, schools and improvements, is the seat of a State teachers college, and has had since 1914 a city-manager form of government. Its manufactures include metal egg-crates which go to all parts of the country, and it is a large railroad-tie market. Captain John Smith landed here in 1608 and had negotiations with Indian villages in the vicinity, and in 1671 a settlement (called Leaseland) of 40 colonists was established. The city was incorporated in 1727 and was named after the then prince of Wales. It was one of the homes of the Washington family, where George lived (at "Ferry Farm") from 1739 until his marriage in 1759, and where his mother died in 1789. Her home, and that of his sister after her marriage to Colonel Fielding Lewis ("Kenmore," built in 1752), still stands. Other places of historic interest are the old Masonic lodge, in which Washington in 1752 was initiated and Lafayette later received an honorary degree; the Rising Sun tavern, a favourite stopping place in pre-Revolutionary days; St. George's Episcopal church, where many prominent citizens were buried; James Monroe's law office, now a museum in his memory; the sentry-box from which a watch was kept in three wars for enemy ships on the Rappahannock; Gunnersy Springs, where in 1775 the General Assembly of Virginia established a manufactory of small arms; and the old slave block. During the Civil War Fredericksburg was in the theatre of some of the most desperate fighting. The national cemetery here contains 15,295 graves (12,795 marked "unknown"), and the Confederate cemetery 5,000 (3,500 "unknown"). These battle-grounds were in 1927 made a national memorial park.

Military Operations.—The battle of Fredericksburg, an important conflict in the American Civil War, was fought on Dec. 13, 1862, between the Union forces (Army of the Potomac) under Major-General A. E. Burnside and the Confederates (Army of Northern Virginia) under Gen. R. E. Lee. When Lee withdrew across the Potomac after his "political" move into Maryland, the Union Government was anxious for a counter-offensive, also with a political motive—that of influencing the autumn elections by a military success. But McClellan's belated advance was ineffective and being also politically opposed to Emancipation, he was superseded (Nov. 7) by Burnside in the command of the Army of the Potomac. Burnside then manoeuvred eastwards from the neighbourhood of Warrenton with a view to beginning an offensive move from Fredericksburg and, as a preliminary, to seizing a foothold beyond the Rappahannock at or near that place. His first Grand Division under Sumner arrived at Falmouth, opposite Fredericksburg, on Nov. 17. Sumner wished to send a detachment across at once and seize the town but was stopped by Burnside, who feared that it might be left isolated by a rise of the river. The pontoon train, demanded from Washington, did not arrive until Nov. 25 and even then Burnside was slow to decide upon a plan in face of the gathering strength of the Confederate Army. Lee had at first intended to await Burnside on the North Anna, 36m. further south, where there was scope for a counter-stroke, but yielded to President Davis's preference for defending the line of the Rappahannock. Longstreet's corps concentrated at Fredericksburg while Jackson's watched the crossings below the town as far as Port Royal (18m.). Its presence frustrated Burnside's initial idea of attempting a crossing at Skinker's Neck 12m. below Fredericksburg, and at last Burnside decided to cross the river and to attack frontally the Confederate position on the heights beyond the town. The respective forces were Union 122,000, Confederate 79,000. Maj.-Gen. E. V. Sumner, commanding the Federal right wing (II. and IX. Corps), was to cross at Fredericksburg, Maj.-gen. W. B. Franklin with the left (I. and VI. Corps) some miles below, while the centre (III. and V. Corps) under Maj.-gen. Joseph Hooker was to connect the two attacks and to reinforce either at need. The Union artillery took position along the heights of the north bank to cover the crossing, and no opposition was encountered opposite Franklin's command, which formed up on the other side during the 11th and 12th. Opposite Sumner, however, the Confederate riflemen, hidden in the gardens and houses of Fredericksburg, caused much trouble and considerable losses to the Union pioneers, and a body of volunteers from the infantry had to be rowed across under fire before the enemy's

skirmishers could be dislodged. Sumner's two corps crossed on the 12th. The battle took place next morning. Burnside had crossed the river without settling his plan. On the afternoon of the 12th he held a conference at which Franklin proposed a strong blow against the Confederate right, but Burnside settled nothing. During the night he at last issued orders, of a different nature, for a tentative blow on each flank with weak force, apparently hoping that these would force the Confederates to evacuate the centre of the ridge. Whatever chance of success there was in such an attack on the well-posted enemy was thrown away through misunderstandings; nothing but misunderstandings could be expected from the vague and bewildering orders issued by the general in command. The actual battle can be described in a few words. *Jackson*, whose two outlying divisions only came into position on the morning of the 13th, held the right of *Lee's* line from Hamilton's crossing, *Longstreet* the left, the whole covering a 6m. front, partially entrenched. Franklin, tied by his instructions, attacked with one division only, which a little later he supported by two more (I. Corps) out of eight or nine available. His left flank was harassed by the Confederate horse artillery under the young and brilliant *Capt. John Pelham*, and after breaking the first line of *Stonewall Jackson's* corps the assailants were in the end driven back with heavy losses. On the other flank, where part of *Longstreet's* corps held the low ridge opposite Fredericksburg called Marye's Heights, Burnside ordered in the II. Corps about noon, and thenceforward division after division, on a front of little more than 800 yds., was sent forward to assault with the bayonet. They had half a mile to traverse, the last part bare, before they could reach the enemy. The "Stone Wall" along the foot of Marye's and a higher tier of fire up the slope was thickly lined with the riflemen of *Longstreet's* corps, and above them the Confederate guns fired heavily on the assailants, whose artillery, on the height beyond the river, was too far off to assist them. Not a man of the Federals reached the wall, though the bravest were killed a few paces from it, and Sumner's and a number of Hooker's brigades were broken one after the other as often as they tried to assault. At night the wrecks of the right wing were withdrawn. Burnside proposed next day to lead the IX. Corps, which he had formerly commanded, in one mass to the assault of the Stone Wall, but his subordinates dissuaded him, and on the night of the 15th the Army of the Potomac withdrew to its camps about Falmouth. The losses of the Federals were 12,650 men, those of the Confederates 4,200, little more than a third of which fell on *Longstreet's* corps.

Edmonds, *The Civil War in the United States* (1905); J. E. Gough, *Fredericksburg and Chancellorsville* (1913); and V. M. Fleming, *Battles of Fredericksburg and Chancellorsville* (1921).

FREDERICTON, a city of New Brunswick, Canada, capital of the province, situated on the St. John river, 84 m. from its mouth, and on the Canadian Pacific railway. The city was founded in 1785 by Sir Guy Carleton, and made the capital of the province, in spite of the jealousy of St. John, on account of its superior strategical position. It contains the parliament buildings and Government house. Fredericton is the chief commercial centre in the interior of the province, and has also a large trade in lumber. Its industries include canneries, tanneries and wooden ware factories. The river is navigable for large steamers up to the city, and above it by vessels of lighter draught. Pop. (1931) 8,830.

FREDONIA, village of Chautauqua county, New York, U.S.A., 45m. S.W. of Buffalo and 3m. from Lake Erie at Dunkirk. It is on Federal highway 20, and is served by the New York Central railroad. The population in 1930 was 5,814. It is in the grape-growing and nursery region of western New York, and ships annually over 6,000,000 grape roots, 2,500,000 berry bushes, and large quantities of seeds. Grape-juice and other grape products and canned fruits and vegetables are the principal manufactured products. It is the seat of a State normal school (est. 1867) and of a branch of the State agricultural experiment station. Fredonia was settled in 1804, and until 1817 was called Canandaway. It

was incorporated in 1829. A gas well (the first in the United States) was drilled here in 1821, and supplied enough gas to light the streets. It was piped to the tavern for use on the occasion of Lafayette's visit in 1825. The first grange of the order of the Patrons of Husbandry was established in Fredonia in 1867; and the Woman's Christian Temperance Union movement began with the organization here of a local union in 1873.

FREDRIKSHALD (FREDERIKSHALD, FRIEDRICHSHALL), a seaport of Norway, in Smaalenene amt (county), 85 m. by rail S. by E. of Oslo. Pop. (1920), 11,149. It is situated on both banks of the Tistedal river at its outflow to the Ide fjord. The town is surrounded by high ground on which is the famous fortress Fredriksten, protected on three sides by precipices, founded by Frederick III. (1661), and mainly showing, in its present form, the works of Frederick V. (1766) and Christian VII. (1808). Monuments commemorate the siege of the town in 1718. Fredrikshald is close to the Swedish frontier, and had previously (1660) withstood invasion. Its name was changed from Halden to the present form in 1665 in honour of Frederick III. The town was almost totally destroyed by fire in 1759 and 1826. The castle surrendered to the Swedes in 1814, and its capture was followed by the conquest of the kingdom and its union with Sweden. Fredrikshald exports timber and marble is quarried for ornamental work. There are railway communications with all parts of Sweden and coastal services.

FREDRIKSTAD (FREDERIKSTAD), a seaport and manufacturing town of Norway in Smaalenene amt (county), 58 m. S. by E. of Oslo by rail. Pop. (1927) 14,247. It lies at the mouth and on the eastern shore of the Oslo fjord, occupying both banks of the river Glommen, which, descending from the richly-wooded district of Østerdal, floats down vast quantities of timber. The new town on the right bank is therefore a centre of the timber export trade. Brick making and granite quarrying are important as well as the timber trade. The harbour is kept open in winter by an ice-breaker. In the vicinity is the island Hankö, a Norwegian seaside resort. The old town on the left bank was founded by Frederick II. in 1567. It was for a long time strongly fortified, and in 1716 Charles XII. of Sweden failed to capture it.

FREE BAPTISTS, formerly called (but no longer officially) FREEWILL BAPTISTS, an American denomination holding anti-paedobaptist and anti-Calvinistic doctrines, and practically identical in creed with the General Baptists of Great Britain. Many of the early Baptist churches in Rhode Island and throughout the South were believers in "general redemption" (hence called "general" Baptists); and there was a largely attended conference of this Arminian branch of the church at Newport in 1729. But the denomination known as "Free-willers" had its rise in 1779-1780, when anti-Calvinists in Loudon, Barrington and Canterbury, New Hampshire, seceded and were organized by Benjamin Randall (1749-1808), a native of New Hampshire. Randall was an itinerant missionary, who had been preaching for two years before his ordination in 1780; in the same year he was censured for "heterodox" teaching. The work of the church suffered a relapse after his death, but from 1820 to 1830 the abbreviation of the denominational name to "Free Baptists" suggests their liberal policy—indeed open communion is the main if not the only hindrance to union with the "regular" Baptist Church.

See I. D. Stewart, *History of the Free Will Baptists* (Dover, N. H., 1862) for 1780-1830, and his edition of the *Minutes of the General Conference of the Free Will Baptist Connection* (Boston, 1887); James B. Taylor, *The Centennial Record of the Free Will Baptists* (Dover, 1881); John Buzzell, *Memoir of Elder Benjamin Randall* (Parsonfield, Maine, 1827); and P. Richardson, "Randall and the Free Will Baptists," in *The Christian Review*, vol. xxiii. (Baltimore, 1858); J. T. Christian, *A History of the Baptists* (Nashville, Tenn., 1922); W. T. Whitley, *A History of British Baptists* (1923); G. Yuille, *History of the Baptists in Scotland* (Glasgow, 1926).

FREEBENCH, in English law, the interest which a widow had in the copyhold lands of her husband, corresponding to dower in the case of freeholds. It depended upon the custom of the manor, but as a general rule the widow took a third for her life of the lands of which her husband died seised, but it might be an estate greater or less than a third. Freebench disappeared with the abolition of copyhold tenures by the Law of Property Act

1922 and the Administration of Estates Act 1925.

FREEBOARD literally means the amount of the vertical side of a vessel which is above water—(free meaning clear, and board being the side of the vessel, e.g., starboard or steering side).

The freeboard is measured vertically at the middle of the length, generally from the line of the uppermost continuous deck to the centre of a circular disk, 12 in. in diameter, which is marked on the side of the ship, and which is called the freeboard mark, or sometimes, the Plimsoll mark, as defined in the Merchant Shipping act, inspired by Samuel Plimsoll.

The centre of the disk gives the limit of loading for the summer season. Certain further marks, away from the disk, give the appropriate limits for other seasons, such as winter, winter in the North Atlantic, and the Indian summer. Nearly all nations now require sea-going vessels to have a freeboard mark, which is determined in accordance with the conditions described in the article entitled *SHIPPING: Registration, Classification and State Regulation*.

FREE CHURCH FEDERATION. See *FEDERAL COUNCIL OF EVANGELICAL FREE CHURCHES; REUNION (CHURCH)*.

FREE CHURCH OF ENGLAND, a Protestant episcopal church "essentially one with the established church of England, but free to go into any parish, to use a revised edition of the Book of Common Prayer, to associate the laity with the clergy in the government and work of the church, and to hold communion with Christians of other denominations." It was founded in 1844 in opposition to the Tractarian movement, and embodies the distinctively evangelical elements of the Reformation, especially in its opposition to ritualism.

See G. H. Jones, article "Reformed Episcopal Church and Free Church of England," in *Hastings' Encyclopaedia of Religion and Ethics* vol. x. with references there given.

FREE CHURCH OF SCOTLAND. In one sense the Free Church of Scotland dated its existence from the Disruption of 1843, in another it claimed to be the rightful representative of the National Church of Scotland (see *SCOTLAND, CHURCH OF*) as it was reformed in 1560. In the ecclesiastical history of Scotland the Free Churchman saw three great reforming periods. In each of these the inherent scriptural right of the church to exercise a spiritual jurisdiction in which she is responsible to Christ alone, was asserted and practically maintained. The first reformation extended from 1560, when the church freely held her first General Assembly, and of her own authority acted on the First Book of Discipline, to 1592, when her Presbyterian order was finally and fully ratified by the parliament. The second period began in 1638, when, after 20 years of suspended animation, the Assembly once more shook off Episcopacy, and terminated in 1649, when the parliament of Scotland confirmed the church in her liberties in a larger and ampler sense than before. The Westminster standards were ratified, lay-patronage was abolished, and the coronation oath itself framed in accordance with the principles of Presbyterian church government. The Revolution Settlement of 1690 was not so entirely favourable to the freedom of the church as the legislation of 1649 had been. Presbyterianism was re-established, and the old rights of patrons were again discontinued; but the large powers which had been conferred on congregations by the act of 1649 were not wholly restored. Nevertheless, the great principle of a distinct ecclesiastical jurisdiction, embodied in the Confession of Faith, was accepted without reservation, and a Presbyterian polity effectively confirmed both then and at the ratification of the treaty of Union. This settlement, however, did not long subsist unimpaired. In 1712 the act of Queen Anne, restoring patronage to its ancient footing, was passed in spite of the earnest remonstrances of the Scottish people. For many years afterwards (until 1784) the Assembly continued to instruct each succeeding commission to make application to the king and the parliament for redress of the grievance. But meanwhile a new phase of Scottish ecclesiastical politics commonly known as Moderatism had been inaugurated, during the prevalence of which the church became even more indifferent than the lay patrons themselves to the rights of her congregations with regard to the "calling" of ministers.

The "Veto" Act.—The result was a protracted struggle which entered on its final stage with the passing in 1834 of the "Veto" Act, by which it was declared to be a fundamental law of the church that no pastor should be intruded on a congregation contrary to the will of the people, and by which it was provided that the simple dissent of a majority of heads of families in a parish should be enough to warrant a presbytery in rejecting a presentee. The question of the legality of this measure soon came to be tried in the civil courts; and it was ultimately answered in a sense unfavourable to the church by the decision (1838) of the court of session that a presbytery had no right to reject a presentee simply because the parishioners protested against his settlement, but was bound to disregard the veto (see *CHALMERS, THOMAS*). This decision elicited from the Assembly of that year a new declaration of the doctrine of the spiritual independence of the church. The "exclusive jurisdiction of the civil courts in regard to the civil rights and emoluments secured by law to the church and the ministers thereof" was acknowledged without qualification. At the same time it was insisted that "in all matters touching the doctrine, discipline and government of the church her judicatories possess an exclusive jurisdiction founded on the Word of God." And it was resolved to assert, and at all hazards defend, this spiritual jurisdiction, and firmly to enforce obedience to the same upon the office-bearers and members of the church. The decision of the court of session having been confirmed by the House of Lords early in 1839, it was decided in the Assembly of that year that the church should reaffirm the principle of "non-intrusion" as an integral part of the constitution of the Reformed Church of Scotland, and that a committee should be appointed to confer with the government with a view to the prevention, if possible, of any further collision between the civil and ecclesiastical authorities. Yet the conference with the government had no practical result, and grave complications were arising over other cases where congregations objected to ministers "intruded" by patrons. In the circumstances it was resolved by the Assembly of 1842 to transmit to the queen, by the hands of the lord high commissioner, a "claim, declaration and protest," complaining of the encroachments of the court of session, and also an address praying for the abolition of patronage. The home secretary's answer (received in January 1843) gave no hope of redress.

Difficulties of the Church.—A final appeal to parliament by petition was made in March 1843, when, by a majority of 135, the House of Commons declined to attempt any redress of the grievances of the Scottish Church. At the first session of the following General Assembly (May 18, 1843) the reply of the non-intrusion party was made in a protest, signed by upwards of 200 commissioners, to the effect that since, in their opinion, the recent decisions of the civil courts, and the still more recent sanction of these decisions by the legislature, had made it impossible at that time to hold a free Assembly of the church as by law established they therefore "protest that it shall be lawful for us, and such other commissioners as may concur with us, to withdraw to a separate place of meeting, for the purpose of taking steps for ourselves and all who adhere to us—maintaining with us the Confession of Faith and standards of the Church of Scotland as heretofore understood—for separating in an orderly way from the Establishment, and thereupon adopting such measures as may be competent to us, in humble dependence on God's grace and the aid of His Holy Spirit, for the advancement of His glory, the extension of the gospel of our Lord and Saviour, and the administration of the affairs of Christ's house according to His holy word." The reading of this document was followed by the withdrawal of the entire non-intrusion party to another place of meeting, where the first Assembly of the Free Church was constituted, with Dr. Thomas Chalmers as moderator. This Assembly sat from the 18th to the 30th of May, and transacted a large amount of important business. On Tuesday the 23rd, 396 ministers and professors publicly adhibited their names to the Act of Separation and deed of demission by which they renounced all claim to the benefices they had held in connection with the Establishment, declaring them to be vacant, and consenting to their being dealt with as such. By this impressive proceeding

the signatories voluntarily surrendered an annual income amounting to fully £100,000.

The first care of the voluntarily disestablished church was to provide incomes for her clergy and places of worship for her people. Dr. Chalmers had already prepared a carefully matured scheme, according to which "each congregation should do its part in sustaining the whole, and the whole should sustain each congregation"; and at the first Assembly it was announced that upwards of £17,000 had already been contributed. Each successive year showed a steady increase in the gross amount of the fund. To provide for the erection of the buildings which, it was foreseen, would be necessary, a general building fund, in which all should share alike, was also organized, and local building funds were as far as possible established in each parish, with the result that at the first Assembly a sum of £104,776 was reported as already available. At the end of four years considerably more than 700 churches had been provided. During the winter session 1843-1844 the divinity students who had joined the Free Church continued their studies under Dr. Chalmers and Dr. David Welsh (1793-1845); and at the Assembly of 1844 arrangements were made for the erection of suitable collegiate buildings. The New College, Edinburgh, was built in 1847 at a cost of £46,506; and divinity halls were subsequently set up also in Glasgow and Aberdeen.

The "Non-Intrusion" Party.—During the conflict preceding disruption the "non-intrusion" party strenuously denied that in any one respect it was departing from acknowledged principles of the National Church. It continued to do so after the disruption. In 1846, however, it was found to have become necessary, "in consequence of the late change in the outward condition of the church," to amend the "questions and formula" to be used at the licensing of probationers and the ordination of office-bearers. These were amended accordingly; and at the same time it was declared that, "while the church firmly maintains the same scriptural principles as to the duties of nations and their rulers in reference to true religion and the Church of Christ for which she has hitherto contended, she disclaims intolerant or persecuting principles, and does not regard her Confession of Faith, or any portion thereof when fairly interpreted, as favouring intolerance or persecution, or consider that her office-bearers by subscribing it profess any principles inconsistent with liberty of conscience and the right of private judgment." The main difference between the "formula" of the Free Church and that of the Established Church (as at the year 1900) was that the former referred to the Confession of Faith simply as "approved by General Assemblies of this Church," while the latter described it as "approved by the General Assemblies of this National Church, and ratified by law in the year 1690, and frequently confirmed by divers Acts of Parliament since that time"; and the Free Church inserted an additional clause,—*"I also approve of the general principles respecting the jurisdiction of the church, and her subjection to Christ as her only Head, which are contained in the Claim of Right and in the Protest referred to in the questions already put to me"*; and also added the words which are here distinguished by italics,—*"And I promise that through the grace of God I shall firmly and constantly adhere to the same, and to the utmost of my power shall in my station assert, maintain and defend the said doctrine, worship, discipline and government of this church by kirk-sessions, presbyteries, provincial synods and general assemblies, together with the liberty and exclusive jurisdiction thereof; and that I shall, in my practice, conform myself to the said worship and submit to the said discipline [and] government, and exclusive jurisdiction, and not endeavour directly or indirectly the prejudice or subversion of the same."*

In 1863 a motion was made and unanimously carried in the Free Church Assembly for the appointment of a committee to confer with a corresponding committee of the United Presbyterian Synod, and with the representatives of such other disestablished churches as might be willing to meet and deliberate with a view to an incorporating union. Formal negotiations between the representatives of these two churches were begun shortly afterwards, which resulted in a report laid before the following Assembly. From this document it appeared that the committees of the two

churches were not at one on the question as to the relation of the civil magistrate to the church. While on the part of the Free Church it was maintained that he "may lawfully acknowledge, as being in accordance with the Word of God, the creed and jurisdiction of the church," and that "it is his duty, when necessary and expedient, to employ the national resources in aid of the church, provided always that in doing so, while reserving to himself full control over the temporalities which are his own gift, he abstain from all authoritative interference in the internal government of the church," it was declared by the committee of the United Presbyterian Church that, "inasmuch as the civil magistrate has no authority in spiritual things, and as the employment of force in such matters is opposed to the spirit and precepts of Christianity, it is not within his province to legislate as to what is true in religion, to prescribe a creed or form of worship to his subjects, or to endow the church from national resources." Thus in a very short time it had been made perfectly evident that a union between the two bodies, if accomplished at all, could only be brought about on the understanding that the question as to the lawfulness of state endowments should be an open one. The Free Church Assembly, by increasing majorities, manifested a readiness for union, even although unanimity had not been attained on that theoretical point. But there was a minority which did not sympathize in this readiness, and after ten years of fruitless effort it was in 1873 found to be expedient that the idea of union with the United Presbyterians should for the time be abandoned. Other negotiations, however, which had been entered upon with the Reformed Presbyterian Church at a somewhat later date proved more successful; and a majority of the ministers of that church with their congregations were united with the Free Church in 1876.

Scholarship.—The mind of the Free Church was by no means absorbed only in questions of ecclesiastical polity. The Colleges of the Church have been the home of the most active interest in theological and historical questions. There was a stormy period, however, when extreme conservatism appeared to gain a victory. In 1870 W. Robertson Smith (*see SMITH, WILLIAM ROBERTSON*) was ordained to the office of professor of oriental languages and Old Testament exegesis in the Free Church College, Aberdeen. Here from the first he advocated views which though now widely accepted, were then regarded with apprehension. In 1876 a committee of the Free Church reported so adversely on his writings that Smith demanded a formal trial. The indictment failed; but a vote of want of confidence was passed, and in 1881 he was removed from his chair. This event, however, was no adequate expression of the real mind of the Church. During the last quarter of the 19th century the Free Church continued to be the most active, theologically, of the Scottish Churches. The College chairs were almost uniformly filled by theologians and historians of progressive views, inspired more or less by Professor A. B. Davidson of New College, Edinburgh. Dr. A. B. Bruce, author of *The Training of the Twelve*, etc., was appointed to the chair of apologetics and New Testament exegesis in the Glasgow College in 1875; Henry Drummond (author of *Natural Law in the Spiritual World*, etc.) was made lecturer in natural science in the same college in 1877 and became professor in 1884; and Dr. George Adam Smith (author of *The Twelve Prophets*, etc.) was called to the Hebrew chair in 1892. Attempts were made between 1890 and 1895 to bring all these professors except Davidson (similar attacks were also made on Dr. Marcus Dods, afterwards principal of the New College, Edinburgh) to the bar of the Assembly for unsound teaching or writing; but in every case these were abortive, the Assembly never taking any step beyond warning the accused that their primary duty was to teach and defend the church's faith as embodied in the confession. In 1892 the Free Church, following the example of the United Presbyterian Church and the Church of Scotland (1889), passed a Declaratory Act relaxing the stringency of subscription to the confession, with the result that a small number of ministers and congregations, mostly in the Highlands, severed their connection with the church and formed the Free Presbyterian Church of Scotland, on strictly orthodox lines. Meanwhile other changes were taking place. The

standard of parochial and congregational activity was raised, a new method of operation devised. The use of instrumental music was sanctioned and special attention given to the promotion of the ends of edification, order and reverence in public worship. And the establishment principle was from then onwards almost entirely abandoned.

19th and 20th Centuries.—During the last four or five years of the 19th century the Free and United Presbyterian churches, which after the failure of their union negotiations in 1873 had been connected together by a Mutual Eligibility Act enabling a congregation of one church to call a minister from the other, devoted their energy to the arrangement of an incorporating union. The Synod of the United Presbyterian Church resolved in 1896 to "take steps towards union," and in the following year the Free Assembly responded by appointing a committee to confer with a committee of the other church. The joint committee discovered a "remarkable and happy agreement" between the doctrinal standards, rules and methods of the two bodies, and with very little concessions on either side a common constitution and common "questions and formula" for the admission of ministers and office-bearers were arranged. A minority, always growing smaller, of the Free Church Assembly, protested against the proposed union, and threatened if it were carried through to test its legality in the courts; nevertheless the union was carried through. The supreme courts of the churches met for the last time in their respective places of meeting on the 30th of October 1900, and on the following day the joint meeting took place at which the union was completed, and the United Free Church of Scotland (*q.v.*) entered on its career. The protesting and dissenting minority at once claimed to be the Free Church. They met outside the Free Assembly Hall on the 31st of October, and, failing to gain admission to it, withdrew to another hall, where they elected Mr. Colin Bannatyne their moderator and held the remaining sittings of the Assembly. It was reported that between 16,000 and 17,000 names had been received of persons adhering to the anti-unionist principle. At the Assembly of 1901 it was stated that the Free Church had twenty-five ministers and at least sixty-three congregations. The character of the church is indicated by the fact that its office-bearers were the faithful survivors of the decreasing minority of the Old Free Church, which had protested against the disestablishment resolutions, against the relaxation of subscription, against toleration of the teaching of the Glasgow professors, and against the use in worship of organs or of human hymns. Her congregations were mostly in the Gaelic-speaking districts of Scotland. She was confronted with a very arduous undertaking; her congregations grew in number, but were far from each other and there were not nearly enough ministers. The church met with no sympathy or assistance at the hands of the United Free Church, and her work was conducted at first under considerable hardships, nor was her position one to appeal to the general popular sentiment of Scotland. But the little church continued her course with indomitable courage and without any compromise of principle. The Declaratory Act of 1892 was repealed after a consultation of presbyteries, and the old principles as to worship were declared. The desire of the Church of Scotland to obtain relaxation of her formula was declared to make union with her impossible.

The decision of the House of Lords in 1904 did not bring the trials of the Free Church to an end. In the absence of any arrangement with the United Free Church, she could only gain possession of the property declared to belong to her by an application in each particular case to the Court of Session, and a series of law-suits began which were trying to all parties. In the year 1905 the Free Church Assembly met in the historic Free Church Assembly Hall, but it did not meet there again. The urgent task confronting the church was that of supplying ordinances to her congregations. The latter numbered 200 in 1907, and the church had as yet only 74 ordained ministers, so that many of the mansees allocated to her by the commissioners were not yet occupied, and catechists and elders were called to conduct services where possible. The problem has been faced with energy and enthusiasm, but it is still serious.

See SCOTLAND, CHURCH OF, and UNITED FREE CHURCH OF SCOTLAND.

FREEDEN, WILHELM IHNO ADOLPH VON (1822–1894), German scientist, was born at Norden, Hanover, on May 12, 1822. He studied at Bonn and Göttingen and later held the posts of teacher of mathematics, physics and modern languages at the "Gymnasium" at Jever (1845–56) and headmaster of the Navigation school at Elsfléth near Bremen (1856–67). In 1867 he resigned his post at Elsfléth and went to Hamburg, where he established and became the first director of the Norddeutsche Seewarte (later Deutsche Seewarte). He afterwards took an active part in founding the North German Lloyd company. He also organized the first system of storm warnings for the German coast. Between 1871 and 1876 he served in the Reichstag as a member for Hamburg. He died at Bonn on Jan. 11, 1894.

He wrote *Nautische Hilfstafeln* (with T. Koster, 1862); *Handbuch der Nautik* (1864); *Barometerbuch zur Gebrauche der Seeleute* (1885); and a memoir on the use of the method of least squares.

FREEDMEN'S BUREAU (officially the BUREAU OF FREEDMEN, REFUGEES AND ABANDONED LANDS), a bureau created in the United States war department by an act of Congress (March 3, 1865), to last one year, but continued until 1872 by later acts. Its establishment was due partly to the fear entertained by the North that the Southerners if left to deal with the blacks would attempt to re-establish some form of slavery, partly to the necessity for extending relief to needy negroes and whites in the lately conquered South, and partly to the need of creating some commission or bureau to take charge of lands confiscated in the South. At the head of the bureau was a commissioner, General O. O. Howard, and under him in each Southern state was an assistant commissioner with a corps of local superintendents, agents and inspectors. The officials had the broadest possible authority in all matters that concerned the blacks. The work of the bureau may be classified as follows: (1) distributing rations and medical supplies among the blacks; (2) establishing schools for them and aiding benevolent societies to establish schools and churches; (3) regulating labour and contracts; (4) taking charge of confiscated lands; and (5) administering justice in cases in which blacks were concerned. For several years the ex-slaves were under the almost absolute control of the bureau. Whether this control had a good or bad effect is still disputed. Much necessary relief work was done, but demoralization was also caused by it. In educating the blacks the bureau made some progress, but the instruction imparted by the missionary teachers resulted in giving the ex-slaves notions of liberty and racial equality that led to much trouble, finally resulting in the hostility of the whites to negro education. When negro suffrage was imposed by Congress upon the Southern States, the bureau aided the Union League (*q.v.*) in organizing the blacks into a political party opposed to the whites. A large majority of the bureau officials secured office through their control of the blacks. The failure of the bureau system, its discontinuance, in the midst of reconstruction, without harm to the blacks, and the intense hostility of the Southern whites to the institution, caused by the irritating conduct of bureau officials, are indications that the institution was not well conceived nor wisely administered.

BIBLIOGRAPHY.—See *Report of the Joint Committee on Reconstruction* (Washington, 1866); J. W. Garner, *Reconstruction in Mississippi* (1901); P. S. Pierce, *The Freedmen's Bureau* (Iowa City, 1904); W. L. Fleming, *Civil War and Reconstruction in Alabama* (1905); *Documents relating to Reconstruction*, ed. W. L. Fleming (Cleveland, O., 1906); J. Eaton and E. O. Mason, *Grant, Lincoln and the Freedmen* (1907).

FREEHOLD, a borough of New Jersey, U.S.A., near the centre of the State; county seat of Monmouth county. It is served by the Central of New Jersey and the Pennsylvania railways. The population was 4,768 in 1920, and was 6,894 in 1930 by the Federal census. It is the trade centre of a large and productive agricultural area, and has pea and bean canneries, an iron foundry, and large factories making rugs and carpets. The town was founded in 1715. It was long known as Monmouth Court-House, but later took the name of Freehold (from the township) and was incorporated as a town in 1869. In 1919 it was incorporated as a borough. An important engagement of the Revolution (the Battle

of Monmouth) was fought near the court-house on June 28, 1778. It was in this battle that Molly Pitcher took the place of her husband, John C. Hays, an artilleryman, when he was injured, and served his gun, preventing its capture by the British.

FREEHOLD, in English and American law of real property, an estate in land, not being less than an estate for life (*see* **ESTATE**). The term *customary freeholds* was applied to a kind of copyhold tenure in the north of England, viz., tenure by copy of court-roll, but at the will of the lord. These were abolished by the Law of Property Acts 1922 and 1925.

FREE LANCE, a name applied to writers, both of editorial material and advertisements, who work on a fee basis and are not a part of any organization. There are free lance newspaper writers, free lance writers for technical and trade magazines, as well as free lance writers who prepare booklets and other advertisements.

FREELAND, a borough of Luzerne county, Pa., U.S.A., 30m. S. of Wilkes-Barre, on Broad mountain, at an altitude of nearly 2,000ft. It is served by the Lehigh Valley and electric railways. The population was 6,666 in 1920, and was 7,098 in 1930 by the Federal census. The mining of anthracite is the dominant occupation. There are large foundries and machine shops, and factories making silk, bobbins, overalls, shirts, cigars and hames. Freeland was settled about 1842, and was incorporated in 1876. It is the seat of the Mining and Mechanical institute of the anthracite region (chartered 1894), founded and endowed by Eckley B. Coxe, the first coal operator in this region, and modelled after the German *Steigerschulen*.

FREEMAN, EDWARD AUGUSTUS (1823-1892), English historian, was born at Harborne, Staffordshire, and educated privately until he went to Trinity college, Oxford, where he became a fellow in 1845. In 1847 he married a daughter of a former tutor, the Rev. R. Gutch. His life was one of strenuous literary work. He wrote many books, and countless articles for newspapers and reviews, especially for the *Saturday Review*, which was the vehicle for his prolonged attack on Froude. In politics he was a follower of Gladstone, but foreign politics interested him more than domestic, especially the struggle for independence of the small countries of eastern Europe. In 1854 he became Regius Professor of Modern History at Oxford, and he died at Alicante, in Spain, on March 16, 1892.

His reputation as an historian rests chiefly on his *History of the Norman Conquest* (15 vols., 1867-76), which is exhaustive in treatment and remarkably accurate. Its ruling idea, however—that of the permanence of the Anglo-Saxon elements in spite of the Conquest, and their continued importance as the basis of constitutional development—is less generally accepted now. He advanced the study of history in England in two main ways, by insisting on the unity of history, as against its artificial division into periodic or national sections, and by teaching the importance of original authorities. The central truth of European history, he thought, its bond of unity, was the permanence of Rome, and he wrote his *History of Sicily* (1891-94) to illustrate this.

See W. R. W. Stephens, *Life and Letters of E. A. Freeman* (1895).

FREEMAN, MARY ELEANOR WILKINS, (1862-1930), American writer, was born in Randolph (Mass.), Jan. 7, 1862, of Puritan ancestry. Her early education, chiefly from reading and observation, was supplemented by a course at Mount Holyoke seminary, South Hadley (Mass.). She subsequently lived in Brattleboro (Vt.), until her marriage in 1902 to Dr. Charles M. Freeman of Metuchen (N. J.). She contributed poems and stories to magazines and published several books for children, including *Young Lucretia and Other Stories* (1892) and *Once upon a Time and Other Child Verses* (1897). *A Humble Romance and Other Stories* (1887) and *A New England Nun and Other Stories* (1891) gave her a prominent place among American short-story writers. Her novels, however, are poorly constructed and, though successful in the portrayal of character, lack the compression, suggestiveness, and intensity of her short stories. Through her tales she has preserved vanishing aspects of New England life. She died at Metuchen, N. J., on March 13, 1930.

Among her novels the best, perhaps, are *Jane Field* (1892) and

Pembroke (1894). Besides her characteristic depictions of rural New England she has published *The Wind in the Rose-Bush* (1903), a collection of eerie ghost tales; *Giles Corey, Yeoman* (1893), a prose tragedy founded on incidents from New England history; the problem novel, *The Portion of Labor* (1901); *Jerome, A Poor Young Man* (1897), a purpose novel; *The Long Arm* (1895), a detective story which won a prize of \$2,000, and many others. Good criticism is afforded by F. L. Pattee's "On the Terminal Moraine of New England Puritanism," in his *Sidelights on American Literature* (1922).

FREEMAN, the term specifically applied to one who possesses the freedom of a city, borough or company. Before the passing of the Municipal Corporations Act 1835, each English borough admitted freemen according to its own peculiar custom and by-laws. The rights and privileges of a freeman, though varying in different boroughs, generally included the right to vote at a parliamentary election of the borough, and exemption from all tolls and dues. The act of 1835 respected existing usages, and every person who was then an admitted freeman remained one, retaining all his former rights and privileges. The admission of freemen is now regulated by the Municipal Corporations Act 1882, whereby the term "freeman" includes any person of the class whose rights and interests are reserved by the act of 1835 under the name either of freemen or of burgesses. No person can be admitted a freeman by gift or by purchase; that is, only birth, servitude or marriage are qualifications. By the Honorary Freedom of Boroughs Act 1885, however, the council of every borough may admit persons of distinction to be honorary freemen.

A person may become a freeman or freewoman of one of the London livery companies by (1) apprenticeship or servitude; (2) patrimony; (3) redemption; (4) gift.

See W. C. Hazlitt, *The Livery Companies of the City of London* (1892).

FREEMARTIN, the name used by farmers and breeders to denote the hermaphrodite (*q.v.*) of domestic cattle. Freemartins always occur as twin with normal males. For an explanation of this, *see* **SEX**.

FREEMASONRY. According to an old "Charge" delivered to initiates, Freemasonry is declared to be an "ancient and honourable institution: ancient no doubt it is, as having subsisted from time immemorial; and honourable it must be acknowledged to be, as by a natural tendency it conduces to make those so who are obedient to its precepts . . . to so high an eminence has its credit been advanced that in every age monarchs themselves have been promoters of the art, have not thought it derogatory from their dignity to exchange the sceptre for the trowel, have patronized our mysteries and joined in our assemblies."

The precise origin of the society has yet to be ascertained, and is not likely to be, as the early records are lost; there is, however, ample evidence remaining to justify the claim for its antiquity and its honourable character. Much has been written as to its eventful past, based upon actual records, but still more which has served only to amuse or repel enquirers, and led not a few to believe that the fraternity has no trustworthy history. An unfavourable opinion of the historians of the craft generally may fairly have been held during the 18th and early in the 19th centuries, but happily since the middle of the latter century quite a different principle has animated those brethren who have sought to make the facts of masonic history known to the brotherhood, as well as worth the study of students in general.

It is only necessary to refer to the old works on Freemasonry, and to compare them with the accepted histories of the present time to be assured that such strictures as above are more than justified. The premier work on the subject was published in London in 1723, the Rev. James Anderson being the author of the historical portion introductory to the first "Book of Constitutions" of the original Grand Lodge of England. Dr. Anderson gravely states that "Grand Master Moses often marshalled the Israelites into a regular and general lodge while in the wilderness . . . King Solomon was Grand Master of the lodge at Jerusalem . . . Nebuchadnezzar became the Grand Master Mason," etc., devoting many more pages to similar absurdities, but dismisses the impor-

tant modern innovation (1716-17) of a grand lodge with a few lines noteworthy for their brief and indefinite character.

In 1738, a second edition was issued dedicated to the prince of Wales ("a master mason and master of a lodge"), and was the work of the same brother (as respects the historical part), the additions being mainly on the same lines as the former volume, only, if possible, still more ridiculous and extravagant; e.g., Cyrus constituted Jerubbabel "provincial grand master in Judah"; Charles Martel was "the Right Worshipful Grand Master of France, and Edward I., being deeply engaged in wars, left the craft to the care of several successive grand masters" (duly enumerated). Such loose statements may now pass unheeded, but unfortunately they do not exhaust the objections to Dr. Anderson's method of writing history. The excerpt concerning St. Alban (apparently made from Coles's *Ancient Constitutions* [1728-29]) has the unwarranted additional title of grand master conferred on that saint, and the extract concerning King Aethelstan and Prince Edwin from the "old ms. charges" (given in the first edition) contains still more unauthorized modern terms, with the year added of 926; thus misleading most seriously those who accepted the volume as trustworthy, because written by the accredited historian of the grand lodge, junior grand warden in 1723. These examples hardly increase our confidence in the author's accuracy when Dr. Anderson comes to treat of the origin of the premier grand lodge; but he is our only informant as to that important event, and if his version of the occurrence is declined, we are absolutely without any information.

Early History.—In considering the early history of Freemasonry, from a purely matter-of-fact standpoint, it will be well to settle as a necessary preliminary what the term did and does now include or mean, and how far back the enquiry should be conducted as well as on what lines. If the view of the subject herein taken be correct, it will be useless to load the investigation by devoting considerable space to a consideration of the laws and customs of still older societies which may have been utilized and imitated by the fraternity, but which in no sense can be accepted as the actual forbears of the present society of Free and Accepted Masons. They were predecessors, or possibly prototypes, but not near relatives or progenitors of the Freemasons.

The mother grand lodge of the world is that of England, which was inaugurated in the metropolis on St. John Baptist's day, 1717, by four or more old lodges, three of which still flourish. There were other lodges also in London and the country at the time, but whether they were invited to the meeting is not now known. Probably not, as existing records of the period preserve a sphinx-like silence thereon. Likewise there were many scores of lodges at work in Scotland, and undoubtedly in Ireland the craft was widely patronized. Whatever the ceremonies may have been which were then known as Freemasonry in Great Britain and Ireland, they were practically alike, and the venerable *Old Charges* or ms. constitutions, dating back several centuries, were rightly held by them as the title-deeds of their masonic inheritance. It was not long before most of the lodges of the pre-grand-lodge era joined and accepted "constitution" by warrant of the grand master. Not only so, but Ireland quickly followed the lead, so early as 1725 there being a grand lodge for that country which must have been formed even still earlier, and probably by lodges started before any were authorized in the English counties. In Scotland the change was not made until 1736, many lodges even then holding aloof from such an organization. Indeed, out of some hundreds of lodges known to have been active then, only 33 responded and agreed to fall into line, though several joined later; some, however, kept separate down to the end of the 19th century, while others never united. Many of these lodges have records of the 17th century though not then newly formed; one in particular, the oldest (the lodge of Edinburgh, No. 1), possesses minutes so far back as the year 1599.

All the regular lodges throughout the world, and likewise all the grand lodges, directly or indirectly, have sprung from one or other of the three governing bodies named; Ireland and Scotland following the example set by their masonic mother of England in having grand lodges of their own. It is not proved how the

latter two became acquainted with Freemasonry as a secret society, guided more or less by the operative *Constitutions* or *Charges* common to the three bodies not met with elsewhere; but the credit of a grand lodge being established to control the lodges belongs to England. There is no other Freemasonry, as the term is now understood, than that which has been so derived. In other words, the lodges and grand lodges in both hemispheres trace their origin and authority back to England for working what are known as the Three Degrees, controlled by regular grand lodges. That being so, a history of modern Freemasonry, the direct offspring of the British parents aforesaid, should first of all establish the descent of three grand lodges from the Freemasonry of earlier days; such continuity, of five centuries or more, being a *sine qua non* of antiquity and regularity.

It will be found that from the early part of the 18th century back to the 16th century existing records testify to the assemblies of lodges, mainly operative, but partly speculative, in Great Britain, whose guiding stars and common heritage were the *Old Charges* and that when their actual minutes and transactions cease to be traced by reason of their loss, these same ms. *Constitutions* furnish testimony of the still older working of such combinations of freemasons, or masons, without the assistance, countenance or authority of any other masonic body; consequently such documents still preserved, of the 14th and later centuries (numbering about 70, mostly in form of rolls), with the existing lodge minutes referred to of the 16th century, down to the establishment of the premier grand lodge in 1717, prove the continuity of the society. Indeed so universally has this claim been admitted, that in popular usage the term *Free-mason* is only now applied to those who belong to this particular fraternity, that of *mason* being applicable to one who follows that trade, or honourable calling, as a builder. There is no evidence that during this long period any other organization of any kind, religious, philosophical, mystical or otherwise, materially or even slightly influenced the customs of the fraternity, though they may have done so; but so far as is known the lodges were of much the same character throughout, and consisted really of operatives (who enjoyed practically a monopoly for some time of the trade as masons or freemasons), and in part of "speculatives," i.e., noblemen, gentlemen and men of other trades, who were admitted as honorary members.

The rules and regulations of the masons were embodied in what are known as the *Old Charges*; the senior known copy being the *Regius ms.* (British Museum Bibl. Reg. 17 A, i.), which, however, is not so exclusively devoted to masonry as the later copies. David Casley, in his catalogue of the mss. in the King's Library (1734), unfortunately styled the little gem *A Poem of Moral Duties*; and owing to this misdescription its true character was not recognized until the year 1839, and then by a non-mason (Halliwell-Phillipps), who had it reproduced in 1840 and brought out an improved edition in 1844. Its date has been approximately fixed at 1390 by Casley and other authorities. The curious legend of the craft, therein made known, deals first of all with the number of unemployed in early days and the necessity of finding work "that they myght gete here lyvyng thereby." Euclid was consulted, and recommended the "onest craft of good masonry" and the genesis of the society is found "yn Egypte lande." By a rapid transition, but "mony erys afterwarde," we are told that the "Craft com ynto England yn tyme of good kynge Adelstonus (Aethelstan) day," who called an assembly of the masons, when 15 articles, and as many more points were agreed to for the government of the craft, each being duly described. Each brother was instructed that—

"He must love wel God, and holy Church algate
And hys mayster also, that he ys wythe."

"The thrydde poynt must be severle
With the prentes knowe hyt wele
Hys mayster counsel he kepe and close,
And hys felows by hys goode purpose;
The prevetyse of the chamber telle he no mon,
Ny yn the logge whatever they done,
Whatever thou heryst, or syste hem do,
Telle hyt no mon, whersever thou go."

The rules, generally, besides referring to trade regulations, are as

a whole suggestive of the Ten Commandments in an extended form, winding up with the legend of the *Ars quatuor coronatorum*, as an incentive to a faithful discharge of the numerous obligations. A second part introduces a more lengthy account of the origin of masonry, in which Noah's flood and the Tower of Babylon are mentioned as well as the great skill of Euclid, who—

"Through hye grace of Crist yn Heven,
He commensed yn the syens seven."

The "seven sciences" are duly named and explained. The compiler apparently was a priest, line 629 reading "And, when ye gospel *me rede schal*" thus also accounting for the many religious injunctions in the ms. The last hundred lines are evidently based upon *Urbanitatis* (Cott. ms. Caligula A 11, fol. 88) and *Instructions for a Parish Priest* (Cott. ms. Claudius A 11, fol. 27), instructions such as lads and even men would need who were ignorant of the customs of polite society, correct deportment at church and in the presence of their social superiors. The recital of the legend of the *Quatuor Coronati* has been held by Herr Findel in his *History of Freemasonry* (*Allgemeine Geschichte der Freimaurerei*, 1862; English editions, 1866–69) to prove that British Freemasonry was derived from Germany, but without any justification, the legend being met with in England centuries prior to the date of the *Regius ms.*, and long prior to its incorporation in masonic legends on the Continent.

The next ms., in order, is known as the "Cooke" (Ad. ms. 23, 198, British Museum), because Matthew Cooke published a fair reproduction of the document in 1861; and it is deemed by competent paleographers to date from the first part of the 15th century. There are two versions of the Old Charges in this little book, purchased for the British Museum in 1850. The compiler was probably a mason and familiar with several copies of these mss. *Constitutions*, two of which he utilizes and comments upon; he quotes from a ms. copy of the Policricon the manner in which a written account of the sciences was preserved in the two historic stones at the time of the Flood, and generally makes known the traditions of the society as well as the laws which were to govern the members.

Its introduction into England through Egypt is noted (where the Children of Israel "lernyd ye craft of Masonry"), also the "lande of behest" (Jerusalem) and the Temple of Solomon (who "confirmed ye charys yt David his Fadir" had made). Then masonry in France is interestingly described; and St. Alban and "Aethelstane with his yongest sone" (the Edwin of the later mss.) became the chosen mediums subsequently, as with the other *Charges*, portions of the Old Testament are often cited in order to convey a correct idea to the neophyte, who is to hear the document read, as to these sciences which are declared to be free in themselves (*fre in hem selfe*). Of all crafts followed by man in this world "Masonry hathe the moste notabilite," as confirmed by "Elders that were bi for us of masons [who] had these charys wryten," and "as is write and taught in ye boke of our charges."

For long no representative of this particular version had been traced, but in 1890 one was discovered of 1687 (since known as the *William Watson ms.*). Of some seventy copies of these old scrolls which have been unearthed, by far the greater proportion have been made public since 1860. They have all much in common, though often curious differences are to be detected; are of English origin, no matter where used; and when complete, as they mostly are, whether of the 16th or subsequent centuries, are noteworthy for an invocation or prayer which begins the recital:—

"The mighte of the ffather of heaven
And the wysedome of the glorious Sonne
through the grace and the goodness of the holly
ghoste yt been three p'sons and one God
be with us at or beginning and give us grace
so to gou'ne us here in or lyving that wee maye
come to his blisse that nevr shall have ending.—
Amen."

(*Grand Lodge ms. No. 1, A.D. 1583*.)

They are chiefly of the 17th century and nearly all located in England; particulars may be found in Hughan's *Old Charges of the British Freemasons* (1872, 1895 and supplement 1906). The

chief scrolls with some others have been reproduced in facsimile in six volumes of the *Quatuor Coronatorum Antigrapha*; and the collection in Yorkshire has been published separately either in the *West Yorkshire Reprints* or the *Ancient York Masonic Rolls*. Several have been transcribed and issued in other works.

These scrolls give considerable information as to the traditions and customs of the craft, together with the regulations for its government, and were required to be read to apprentices long after the peculiar rules ceased to be acted upon, each lodge apparently having one or more copies kept for the purpose. The old Lodge of Aberdeen ordered in 1670 that the Charge was to be "read at ye entering of everie entered prentise"; another at Alnwick in 1701 provided—

"Noe Mason shall take any apprentice [but he must]
Enter him and give him his Charge, within one whole year
after";

and still another at Swallwell (now No. 48' Gateshead) demanded that "the Apprentices shall have their Charge given at the time of Registering, or within 30 days after"; the minutes inserting such entries accordingly even so late as 1754, nearly 20 years after the lodge had cast in its lot with the Grand Lodge of England.

Their Christian character is further emphasized by the "First Charge that you shall be true men to God and the holy Church"; the *York ms. No. 6* beseeches the brethren "at every meeting and assembly they pray heartily for all Christians"; the *Melrose ms. No. 2* (1674) mentions "Merchants and all other Christian men," and the *Aberdeen ms.* (1670) terms the invocation "A Prayer before the Meeting." Until the grand lodge era, Freemasonry was thus wholly Christian. The *York ms. No. 4*, of 1693 contains a singular error in the admonitory lines:—

"The [n] one of the elders takeing the Booke and that
hee or shee that is to be made mason shall lay their
hands thereon and the charge shall be given."

This particular reading was cited by Hughan in 1871, but was considered doubtful; Findel, however, confirmed it, on his visit to York under the guidance of the celebrated masonic student the late Rev. A. F. A. Woodford. The mistake was due possibly to the transcriber, who had an older roll before him, confusing "they," sometimes written "the" with "she," or reading that portion which is often in Latin as *ille vel illa*, instead of *ille vel illi*.

In some of the *Codices*, about the middle of the 17th century and later, new articles are inserted, such as would be suitable for an organization similar to the Masons' company of London, which had one, at least, of the *Old Charges* in its possession according to inventories of 1665 and 1676; and likewise in 1722, termed *The Book of the Constitutions of the Accepted Masons*. Save its mention ("Book wrote on parchment") by Sir Francis Palgrave in the *Edinburgh Review* (April 1839) as being in existence "not long since," this valuable document has been lost sight of for many years.

That there were signs and other secrets preserved and used by the brethren throughout this mainly operative period may be gathered from discreet references in these old mss. The *Institutions in parchment* (Nov. 22, 1696) of the Dumfries Kilwinning Lodge (No. 53, Scotland) contain a copy of the oath taken "when any man should be made":—

"These Charges which we now rehearse to you and all others ye secrets and misterys belonging to free masons you shall faithfully and truly keep, together with ye Counsell of ye assembly or lodge, or any other lodge, or brother or fellow."

"Then after ye oath taken and the book kissed," *i.e.*, the Bible, the "precepts" are read, the first being:—

"You shall be true men to God and his holy Church, and that you do not countenance or maintaine any eror, faction, schism or herisey, in ye church to ye best of your understanding."
(*History of No. 53*, by James Smith.)

The *Grand Lodge ms. No. 2* provides that "You shall keepe secret ye obscure and intricate pts. of ye science, not disclosing them to any but such as study and use ye same."

The *Harleian ms. No. 2054* (Brit. Mus.) is still more explicit, termed *The free Masons Orders and Constitutions*, and is in the

handwriting of Randle Holme (author of the *Academie of Armory*, 1688), who was a member of a lodge in Cheshire. Following the ms. *Constitutions*, in the same handwriting, about 1650, is a scrap of paper with the obligation:—

"There is sevrall words and signes of a free Mason to be revealed to yu wch as yu will answr. before God at the Great and terrible day of judgmt. yu keep secret and not to reveale the same to any in the heares of any p'son, but to the Mrs and fellows of the Society of Free Masons, so helpe me God, etc." (W. H. Rylands, *Mas. Mag.*, 1882.)

The lodge is often met with, either as the *tabulatum domicialem* (1200, at St. Alban's Abbey) or actually so named in the *Fabric Rolls* of York Minster (1370), *ye loge* being situated close to the fane in course of erection; it was used as a place in which the stones were prepared in private for the structure as well as occupied at meal-time, etc. Each mason was required to "swere upon ye boke yt he sall trewly ande bysyli at his power hold and kepe holy all ye poyntes of yis forsayde ordinance" (*Ordinacio Cementanorum*).

As to the term *free-mason*, from the 14th century it is held by some authorities that it described simply those men who worked "freestone," but there is abundant evidence to prove that, whatever may have been intended at first, *free-mason* soon had a much wider signification, the prefix *free* being also employed by carpenters (1666), sewers (15th century, tailors at Exeter) and others, presumably to indicate that they were free to follow their trades in certain localities. On this point Gould well observes: "The class of persons from whom the Freemasons of Warrington (1646), Staffordshire (1686), Chester, York, London and their congeners in the 17th century derived the descriptive title, which became the inheritance of the grand lodge of England, were *free men*, and masons of gilds or companies" (*History*, vol. ii. p. 160). Dr. Brentano may also be cited: "Wherever the craft gilds were legally acknowledged, we find foremost, that the right to exercise their craft, and sell their manufactures, depended upon the freedom of their city" (*Development of Gilds*, etc., p. 65). In like manner, the privilege of working as a mason was not conferred before candidates had been "made free." The regular freemasons would not work with men, even if they had a knowledge of their trade "if *unfree*," but styled them "Cowans," a course justified by the king's "Maister of Work," William Schaw, whose *Statutis and Ordinancies* (Dec. 28, 1598) required that "Na maister or fellow of craft ressaue any *cowanis* to wirk in his societie or companye, nor send nane of his servants to wirk wt. *cowanis*, under the pane of twentie pounds." Gradually, however, the rule was relaxed, in time such monopoly practically ceased, and the word "cowan" is only known in connection with speculative Freemasonry. Sir Walter Scott, as a member of Lodge St. David (No. 36) was familiar with the word and used it in *Rob Roy*. In 1707 a cowan was described in the minutes of Mother Lodge Kilwinning, as a mason "without the word," thus one who was not a *free mason* (*History of the Lodge of Edinburgh No. 1*, by D. Murray Lyon, 1900).

In the *New English Dictionary* (Oxford, vol. iv., 1897) under "Freemason" it is noted that three views have been propounded:—(1) "The suggestion that *free-mason* stands for free-stone-mason would appear unworthy of attention, but for the curious fact that the earliest known instances of any similar appellation are *mestre mason de franche peer* (Act 25 Edw. III., 1350), and *sculptores lapidum liberorum*, alleged to occur in a document of 1217; the coincidence, however, seems to be merely accidental. (2) The view most generally held is that freemasons were those who were free of the masons' guild. Against this explanation many forcible objections have been brought by Mr. G. W. Speth, who suggests (3) that the itinerant masons were called free because they claimed exemption from the control of the local guilds of the towns in which they temporarily settled. (4) Perhaps the best hypothesis is that the term refers to the mediaeval practice of emancipating skilled artisans, in order that they might be able to travel and render their services wherever any great building was in process of construction." Still it cannot be denied that members of lodges in the 16th and following centuries exercised the

privilege of making *free* masons and denied the freedom of working to cowans (also called *un-freemen*) who had not been so made free; "the Masownys of the luge" being the only ones recognized as *freemasons*. As to the prefix being derived from the word *frere* (brother), a sufficient answer is the fact that frequent reference is made to "Brother *freemasons*," so that no ground for that supposition exists (*cf.* articles by Mr. Gould in the *Freemason* for Sept. 1898 on "Free and Freemasonry").

There are numerous indications of masonic activity in the British lodges of the 17th century, especially in Scotland; the existing records of the southern part of the United Kingdom, though few, are of importance, some only having been made known in recent years. These concern the Masons' Company of London, whose valuable minutes and other documents are ably described and commented upon by Edward Conger, Jr., in his *Hole Crafte and Fellowship of Masons* (1894), the author then being the master of that ancient company. It was incorporated in 1677 by Charles II., who graciously met the wishes of the members, but the information "that is to be found in the Corporation Records at Guildhall proves very clearly that in 1376 the Masons' Company existed and was represented in the court of common council." The title then favoured was "Masons," the entry of the term "Freemasons" being crossed out. Herbert erroneously overlooked the correction, and stated in his *History of the Twelve Great Livery Companies* (vol. i) that the Freemasons returned two, and the Masons four members, but subsequently amalgamated; whereas the revised entry was for the "Masons" only. The company obtained a grant of arms in 1472 (12th year Edw. IV.) one of the first of the kind, being thus described: "A feld of Sablys A Chevron silver gailed thre Castellis of the same garnysshed wt. dores and wyndows of the feld in the Chevron or Cumpas of Black of Blak"; it is the authority (if any) for all later armorial bearings having a chevron and castles, assumed by other masonic organizations. This precious document was only discovered in 1871, having been missing for a long time, thus doubtless accounting for the erroneous representations met with, the artist not having the correct blazon to follow. The oldest masonic motto known is "God is our Guide" on Kerwin's tomb in St. Helen's church, Bishopgate, of 1594; that of "In the Lord is all our trust" not being traced until the next century. Supporters consisting of two Doric columns are mentioned in 1688 by Randle Holme, but the grand lodge of England in the following century used beavers, as operative builders. Its first motto was "In the beginning was the Word" (in Greek), exchanged a few years onward for "Relief and Truth," the rival grand lodge (Atholl Masons) selecting "Holiness to the Lord" (in Hebrew) and the final selection at the "Union of December 1813" being *Audi Vide Tace*.

Conder's discovery of a lodge of "Accepted Masons" being held under the wing of the company was a great surprise, dating as the records do from 1620 to 1621 (the earliest of the kind yet traced in England) when seven were made masons, all of whom were free of the company *before*, three being of the livery; the entry commencing "Att the making masons." The meetings were entitled the "Acception," and the members of the lodge were called *Accepted* masons, being so *accepted* and initiated, the terms never otherwise being met with in the records. An additional fee had to be paid by a member of the company to join the "Acception," and any not belonging thereto was mulct in twice the sum; though even then such "acceptance" did not qualify for membership of the superior body the fees for the "Acception" being £1 and £2 respectively. In 1638–1639, when Nicholas Stone entered the lodge (he was master of the company 1632–33) the banquet cost a considerable sum, showing that the number of brethren present must have been large.

Elias Ashmole (who according to his diary was "made a Free Mason of Warrington with Colonel Henry Mainwaring," seven brethren being named as in attendance at the lodge, Oct. 16, 1646) states that he "received a summons to appear at a lodge to be held next day at the Masons' Hall, London." Accordingly on March 11, 1682, he attended and saw six gentlemen "admitted into the Fellowship of Free Masons," of whom three only belonged

to the company; the master, however, Mr. Thomas Wise, the two wardens and six others being present on the occasion as members in their *dual* capacity. Ashmole adds: "We all dyned at the Halfe Moone Tavern in Cheapside at a noble dinner prepaired at the charge of the new-accepted Masons."

It is almost certain that there was not an operative mason present at the lodge held in 1646, and at the one which met in 1682 there was a strong representation of the speculative branch. Before the year 1654 the company was known as that of the Freemasons for some time, but after then the old title of Masons was reverted to, the terms "Acception" and "Accepted" belonging to the speculative lodge, which, however, in all probability either became independent or ceased to work soon after 1682. It is very interesting to note that subsequently (but never before) the lodge designation is met with of "Free and Accepted Masons," and is thus a combination of operative and speculative usage.

Conder is of opinion that in the records "there is no evidence of any particular ceremony attending the position of master mason, possibly it consisted of administering a different oath from the one taken by the apprentices on being entered." There is much to favour this supposition and it may provide the key to the vexed question of the plurality of degrees prior to the grand lodge era. The fellow-crafts were recruited from those apprentices who had served their time and had their essay (or sufficient trial of their skill) duly passed; they and the masters, by the *Schaw Statutes* of 1598, being only admitted in the presence of "sex Maisteris and *two enterit prenteissis*." As a rule a master mason meant one who was master of his trade, *i.e.*, duly qualified; but it sometimes described employers as distinct from journey-men Freemasons; being also a compliment conferred on honorary members during the 17th century in particular.

In Dr. Plot's *History of Staffordshire* (1686) is a remarkable account of the "Society of Freemasons," which, being by an unfriendly critic, is all the more valuable. He states that the custom had spread "more or less all over the nation"; persons of the most eminent quality did not disdain to enter the fellowship; they had "a large *parchment volum* containing the History and Rules of the Craft of Masonry"; St. Amphibal, St. Alban, King Athelstan and Edwin are mentioned, and these "charges and manners" were "after perusal approved by King Hen. 6 and his council, both as to Masters and Fellows of this right Worshipfull craft." He further remarks of its history that there is nothing he ever "met with more false or incoherent."

The author of the *Academie of Armory*, previously noted, knew better what he was writing about in that work of 1688 in which he declares: "I cannot but Honor the Fellowship of the Masons because of its Antiquity; and the more *as being a member of that Society called Free Masons*." In the same year, "A Tripos or Speech delivered at a commencement in the University of Dublin held there July 11, 1688, by John Jones, then A.B., afterwards D.D.," contained "notable evidence concerning Freemasonry in Dublin." The Tripos was included in Sir Walter Scott's edition of Dean Swift's works (1814), but as Dr. Chetwode Crawley points out, though noticed by the Rev. Dr. George Oliver (the voluminous masonic author), he failed to realize its historical importance. The satirical and amusing speech was partly translated from the Latin by Dr. Crawley for his scholarly introduction to the *Masonic Reprints*, etc., by Henry Sadler. "The point seems to be that Ridley (reputed to have been an informer against priests under the barbarous penal laws) was, or ought to have been, hanged; that his carcase, anatomized and stuffed, stood in the library; and that *frath scoundrellus* discovered on his remains the Freemasons' Mark." These are references to the craft in Ireland illustrative of the influence of the society at that time, of which records are lacking.

It is primarily to Scotland, however, that we have to look for such numerous particulars of the activity of the fraternity from 1599 to the establishment of its grand lodge in 1736, for an excellent account of which we are indebted to Lyon, the Scottish masonic historian. As early as 1600 (June 8) the attendance of John Boswell, Esq., the laird of Auchinleck, is entered in the minutes of the lodge of Edinburgh; he attested the record and

added his mark, as did the other members; so it was not his first appearance. Many noblemen and other gentlemen joined this ancient *atelier*, notably Lord Alexander, Sir Anthony Alexander and Sir Alexander Strachan in 1634, the king's master of work (Herrie Alexander) in 1638, General Alexander Hamilton in 1640, Dr. Hamilton in 1647, and many other prominent and distinguished men later, "James Neilson, Master Sklaitter to His Majestie," who was "entered and past in the lodge of Linlithgow, being elected a joining member," March 2, 1654. Quarter-Master General Robert Moray (or Murray) was initiated by members of the lodge of Edinburgh at Newcastle on May 20, 1641, while the Scottish army was in occupation.

The minute-books of a number of Scottish lodges, which are still on the register go back to the 17th century, and abundantly confirm the frequent admission of speculatives as members, and officers, especially those of the venerable "Mother Lodge Kilwinning" of which the earl of Cassillis was the deacon in 1672, who was succeeded by Sir Alexander Cunningham, and the earl of Eglinton, who like the first of the trio was but an apprentice. There were three head lodges according to the Scottish Code of 1599, Edinburgh being "the first and principall," Kilwinning "the second," and Stirling "the third lodge."

The Aberdeen Lodge (No. 1. *tris*) has records preserved from 1670, in which year what is known as the *Mark Book* begins, containing the oldest existing roll of members, numbering 49, all of whom have their marks registered, save two, though only ten were operatives. The names of the earls of Finlater, Erroll and Dunfermline, Lord Forbes, several ministers and professional men are on the list, which was written by a glazier, all of whom had been enlightened as to "the benefit of the measson word," and inserted in order as they "were made fellow craft." The Charter (*Old Charges*) had to be read at the "entering of everie prentise" and the officers included a master and two wardens.

The lodge at Melrose (No. 1. *bis*) with records back to 1674 did not join the Grand Lodge until 1891, and was the last of those working (possibly centuries before that body was formed) to accept the modern system of government. Of the many noteworthy lodges mention should be made of that of "Canongate Kilwinning No. 2," Edinburgh, the first of the numerous pendicles of "Mother Lodge Kilwinning No. o," Ayrshire, started in 1677; and of the Journeyman No. 8, formed in 1707, which was a secession from the Lodge of Edinburgh; the fellow crafts or journeymen not being satisfied with their treatment by the free-men masters of the Incorporation of Masons, etc. This action led to a trial before the Lords of Council and Session, when finally a "Decreet Arbitral" was subscribed to by both parties, and the junior organization was permitted "to give the mason word as it is called" in a separate lodge. The presbytery of Kelso in 1652 sustained the action of the Rev. James Ainslie in becoming a Freemason, declaring that "there is neither sinne nor scandale in that word," *i.e.*, the "Mason Word," which is often alluded to but never revealed in the old records already referred to. One Scottish family may be cited in illustration of the continuous working of Freemasonry, whose membership is enshrined in the records of the ancient Lodge of "Scoon and Perth No. 3" and others. A venerable document, lovingly cared for by No. 3, bears date 1658, and recites how John Mylne came to Perth from the "North Countrie," and was the king's master mason and W.M. of the Lodge, his successor being his son, who entered "King James the sixt as ffreemam meassone and fellow craft"; his third son John was a member of Lodge No. 1 and master mason to Charles I., 1631-36, and his eldest son was a deacon of No. 1 eleven times during 30 years. To him was apprenticed his nephew, who was warden in 1663-64 and deacon several times. William Mylne was a warden in 1695, Thomas (eldest son) was master in 1735, and took part in the formation of the Grand Lodge of Scotland. Others of the family continued to join the Lodge No. 1., until Robert, the last of the Mylnes as Freemasons, was initiated in 1754, died in 1811, and "was buried in St. Paul's cathedral, having been surveyor to that edifice for fifty years," and the last of the masonic Mylnes for five generations. The "St. John's Lodge," Glasgow (No. 3 *bis*), has some

valuable old record and a "Charter Chest," with the words carved thereon, "God save the King and Masons Craft 1684." *Loyalty and Charity* are the watchwords of the society.

The craft gilds (*Corps d'État*) of France, and their progeny the *Companionage* have been fully described by Gould, and the *Steinmetzen* of Germany would require too detailed notice if we were to particularize its rules, customs and general character from about the 12th century onward. Much as there was in common between the Stonemasons of Germany and the Freemasons of Great Britain and Ireland, it must be conceded that the two societies never united and were all through this long period wholly separate and independent; a knowledge of Freemasonry and authority to hold lodges in Germany being derived from the Grand Lodge of England during the first half of the 18th century. The theory of the derivation of the Freemasons from the *Steinmetzen* was first propounded in 1779, by the Abbé Grandidier, and has been maintained by more modern writers; but such a theory is now generally discredited.

Whether the *Steinmetzen* had secret signs of recognition or not, is not quite clear, but that the Freemasons had, for centuries, cannot be doubted, though precisely what they were may be open to question, and also what portions of the existing ceremonies are reminiscent of the craft anterior to the revival of 1717. Messrs. Speth and Gould favour the notion that there were two distinct and separate degrees prior to the third decade of the 18th century (*Ars Q.C.*, 1898 and 1903), while other authorities have either supported the *one degree* theory, or consider there is not sufficient evidence to warrant a decision. Recent discoveries, however, tend in favour of the first view noted, such as the *Trinity college ms.*, Dublin ("Free Masonry, Feb. 1711"), and the invaluable *Chetwode Crawley ms.* (Grand Lodge Library, Dublin); the second being read in connection with the Haught-foot Lodge Records, beginning 1702 (*Hist. of Freemasonry*, by W. F. Vernon, 1893).

Two of the most remarkable lodges at work during the period of transition (1717-23), out of the many then existing in England, assembled at Alnwick and at York. The origin of the first noted is not known, but there are minutes of the meetings from 1703, the rules are of 1701, signed by quite a number of members, and a transcript of the *Old Charges* begins the volume. In 1708-1709 a minute provided for a masonic procession, at which the brethren were to walk "with their aprons on and Common Square." The lodge consisted mainly of operative "free brothers," and continued for many years, a code of by-laws being published in 1763, but it never united with the grand lodge, giving up the struggle for existence a few years further on.

The other lodge, the most noteworthy of all the English predecessors of the grand lodge of England, was long held at York, the Mecca of English Freemasons. Its origin is unknown, but there are traces of its existence at an early date, and possibly it was a survival of the Minster lodge of the 14th century. Assuming that the *York ms. No. 4 of 1693* was the property of the lodge in that year (which roll was presented by George Walker of Wetherby in 1777), the entry which concludes that scroll is most suggestive, as it gives "The names of the Lodge" (members) and the "Lodge Ward(en)." Its influence most probably may be also noted at Scarborough, where "A private Lodge" was held on July 10, 1705, at which the president "William Thompson, Esq., and severall others brethren ffree Masons" were present, and six gentlemen (named) "were then admitted into the said fraternity." These particulars are endorsed on the *Scarborough ms.* of the *Old Charges*, now owned by the Grand Lodge of Canada at Toronto. "A narrow folio manuscript Book beginning 7th March 1705-1706" which was quoted from in 1778, has long been missing, which is much to be regretted, as possibly it gave particulars of the lodge which assembled at Bradford, Yorkshire, "when 18 Gentlemen of the first families in that neighbourhood were made Masons." There is, however, another roll of records from 1712 to 1730 happily preserved of this "Ancient Honble. Society and Fraternity of Free Masons," sometimes styled "Company" or "Society of Free and Accepted Masons."

Not to be behind the London *fratres*, the York brethren formed

a grand lodge on Dec. 27, 1725 (the "Grand Lodge of all England" was its modest title), and was flourishing for years, receiving into their company many county men of great influence. Some twenty years later there was a brief period of somnolence, but in 1761 a revival took place, with Francis Drake, the historian, as grand master, ten lodges being chartered in Yorkshire, Cheshire and Lancashire, 1762-90, and a Grand Lodge of England, south of the Trent, in 1779, at London, which warranted two lodges. Before the century ended all these collapsed or joined the Grand Lodge of England, so there was not a single representative of "York Masonry" left on the advent of the next century.

The premier grand lodge of England soon began to constitute new lodges in the metropolis, and to reconstitute old ones that applied for recognition, one of the earliest of 1720-21 being still on the roll as No. 6, thus having kept company ever since with the three "time immemorial lodges," Nos. 2, 4 and 12. Applications for constitution kept coming in, the provinces being represented from 1723 to 1724, before which time it is likely that the Grand Lodge of Ireland had been started, about which the most valuable *Caementaria Hibernica* by Dr. Chetwode Crawley may be consulted with absolute confidence. The celebrated "Lady Freemason," the Hon. Mrs. Aldworth (*née* Miss St. Leger, daughter of Lord Doneraile), was initiated in Ireland, but at a much earlier date than popularly supposed; certainly not later than 1713, when the venturesome lady was twenty. All early accounts of the occurrence must be received with caution, as there are no contemporary records of the event.

Provincial grand lodges were formed to ease the authorities at headquarters, and, as the society spread, also for the Continent, and gradually throughout the civilized globe. Owing to the custom prevailing before the 18th century, a few brethren were competent to form lodges on their own initiative anywhere, and hence the registers of the British grand lodges are not always indicative of the first appearance of the craft abroad. In North America lodges were held before what is known as the first "regular" lodge was formed at Boston (Mass.), in 1733, and probably in Canada likewise. The same remark applies to Denmark, France, Germany, Holland, Italy, Portugal, Russia, Spain, Sweden and other countries. Of the many scores of military lodges, the first warrant was granted by Ireland in 1732. To no other body of Freemasons has the craft been so indebted for its prosperity in early days as to their military brethren. There were rivals to the grand lodge of England during the 18th century, one of considerable magnitude being known as the Ancients or Atholl Masons, formed in 1751, but in Dec. 1813 a junction was effected, and from that time the prosperity of the united grand lodge of England, with few exceptions, has been extraordinary.

Nothing but a volume to itself could possibly describe the main features of the English craft from 1717, when Anthony Sayer was elected the first grand master of a brilliant galaxy of rulers. The first nobleman to undertake that office was the duke of Montagu in 1721, the natural philosopher, J. T. Desaguliers being his immediate predecessor who has been credited (and also the Rev. James Anderson) with the honour of starting the premier grand lodge; but like the fable of Sir Christopher Wren having been grand master, evidence is entirely lacking. Irish and Scottish peers share with those of England the distinction of presiding over the grand lodge, and from 1782 to 1813, their royal highnesses the duke of Cumberland, the prince of Wales, or the duke of Sussex occupied the masonic throne. From 1753 to 1813 the rival grand lodge had been busy, but ultimately a desire for a *united* body prevailed, and under the "ancient" grand master, the duke of Kent, it was decided to amalgamate with the original ruling organization, the duke of Sussex becoming the grand master of the united grand lodge. On the decease of the prince in 1843 the earl of Zetland succeeded, followed by the marquess of Ripon in 1874, on whose resignation the prince of Wales became the grand master. Soon after succeeding to the throne King Edward VII. ceased to govern the English craft, and was succeeded by the duke of Connaught. From 1737 to 1907 some 16 English princes of the royal blood joined the brotherhood.

Distribution and Organization.—The advantage of the

cosmopolitan basis of the fraternity generally (though some grand lodges still preserve the original Christian foundation) has been conspicuously manifested and appreciated in India and other countries where the votaries of numerous religious systems congregate; but the unalterable basis of a belief in the Great Architect of the Universe remains, for without such a recognition there can be no Freemasonry. The vast increase of late years, both of lodges and members, however, calls for renewed vigilance and extra care in selecting candidates, that numbers may not be a source of weakness instead of strength.

In its internal organization, the working of Freemasonry involves an elaborate system of symbolic ritual, as carried out at meetings of the various lodges, uniformity as to essentials being the rule. The members are classified in numerous degrees of which the first three are "Entered Apprentice," "Fellow Craft" and "Master Mason," each class of which after initiation can only be attained after passing a prescribed ordeal or examination, as a test of proficiency, corresponding to the "essays" of the operative period. The lodges have their own by-laws for guidance, subject to the *Book of Constitutions* of their grand lodge, and the regulations of the provincial or district grand lodge if located in counties or held abroad.

On the continent of Europe Freemasonry has often developed on different lines from that of the "Mother Grand Lodge" and Anglo-Saxon grand lodges generally, and through its political and anti-religious tendencies has come into contact or conflict with the State authorities or the Roman Catholic Church. The "Grand Orient of France" (but not the Supreme Council 33°, and its grand lodge) is an example of this, having eliminated the paragraph referring to a belief in the "Great Architect of the Universe" from its *Statuts et règlements généraux*. This action has led to the withdrawal of all "regular" grand lodges from association with that body.

The Grand Lodge of England constituted its first lodge in Paris in the year 1732, but one was formed still earlier on the Continent at Gibraltar 1728-29. Others were also opened in Germany 1733, Portugal 1735, Holland 1735, Switzerland 1740, Denmark 1745, Italy 1763, Belgium 1765, Russia 1771, and Sweden 1773. In most of these countries grand lodges were subsequently created and continue to this date, save in those countries, such as Italy, where no masonic lodges are permitted. There is a union of grand lodges of Germany, and an annual diet is held for the transaction of business affecting the several masonic organizations in that country, which works well. Lodges were constituted in India from 1730 (Calcutta), 1752 (Madras) and 1758 (Bombay); in Jamaica 1742, Antigua 1738, and St. Christopher 1739; soon after which period the grand lodges of England, Ireland and Scotland had representatives at work throughout the civilized world.

There are many additional degrees which may be taken or not (being quite optional), and dependent on a favourable ballot; the difficulty, however, of obtaining admission increases as progress is made, the numbers accepted decreasing rapidly with each advancement. The chief of these are arranged in separate classes and are governed either by the "Grand Chapter of the Royal Arch," the "Mark Grand Lodge," the "Great Priory of Knights Templars" or the "Ancient and Accepted Rite," these being mutually complementary and intimately connected as respects England, and more or less so in Ireland, Scotland, North America and wherever worked on a similar basis; the countries of the continent of Europe have also their own *Hautes Grades*.

(W. J. H.)

Progress of Freemasonry Since 1910.—The number of Freemasons probably doubled between 1910 and 1928 and in Aug. 1928 stood at about 4,400,000. In addition there are at least 1,000,000 "unrecognized" masons, the most important group being the "Negro" masons of the United States of America. Of the "regular" masons, all save 300,000 belong to the various grand lodges of the U.S.A. and of the British empire, which indicates that Freemasonry is essentially an Anglo-Saxon institution. Freemasonry in the Dominion of Canada is believed to date from 1740. The grand lodges are all of comparatively recent organiza-

tion, the oldest and largest being in Ontario. There are some seven grand lodges in Australasia; South Australia coming first as a "sovereign body," followed closely by New South Wales and Victoria (of 1884-89 constitution).

In the U.S.A. and Holland, the most noticeable change has been a tendency to take a more active part in the social betterment of the nation. This tendency is less marked in the British grand lodges, owing to their anxiety to avoid any appearance of interfering as *Masons* in politics.

Among British masons one of the most noticeable changes has been the rise of a new school of masonic research, which aims at tracing the history of Freemasonry anterior to 1717. Faced by the paucity of documentary evidence, due to the nature of the obligations taken by mediaeval masons, this school has adopted the principles used in the study of anthropology. It has discovered that figures carved or painted by mediaeval masons are often depicted making certain signs still known to Freemasons, and that in the scenes represented these clearly convey the same inner meaning as to-day.

Examples of such secret messages have been found in mediaeval and Comacine work and also in that done by members of the Roman Collegia. There also exists documentary evidence connecting these three groups of builders. A similar use of signs in ancient Egypt, in the Hung Society of China and among savage races when initiating a boy into manhood, has also been demonstrated. On the basis of these facts the theory is being developed that speculative Freemasonry is descended via the Comacines, the Roman Collegia, and the Mysteries from primitive rites once universal in the dawn of history, survivals of which are to be found to this day in Central Africa and Australia. Concurrent with this work has been the careful study of the modern rituals, and the comparison of certain peculiar features in them with similar incidents in the ancient mysteries and in savage rites. The facts so far disclosed suggest that in modern Freemasonry we may have an intellectualised survival of the cult of the Dying God and of the Fertility rites. Although this school has produced much interesting data, its conclusions are not yet universally accepted by the older or "documentary" school, the members of which consider that coincidence may explain the similarities to which their attention has been directed. If, however, the views of the Anthropological school are ultimately accepted, the result will be that the origin of Freemasonry will be pushed back thousands of years.

Quite as important has been the rise of a distinctly spiritual school of thought, which endeavours to interpret the meaning of the ceremonies, and considers that in the rituals of the various degrees we have an allegory of the quest of the soul after mystic union with the Supreme Being. While often differing in detail, since they approach the subject from different angles, all the exponents of this school agree in the main principles, although in historical research they are often sharply divided, some belonging to the documentary school and others to the anthropological. Perhaps, however, the most important fact is the ever increasing interest among the rank and file in a subject which, even a few years ago, would have been treated with complete indifference.

Masonic Relations.—Since 1910 events have proved that the breach between Latin and Anglo-Saxon masonry was based on a fundamental divergence of opinion as to the basic principles on which the order rests, and this breach tends to grow wider year by year. The disastrous results of interfering in politics has been shown by the fact that the Italian and Hungarian Governments have declared Freemasonry to be a danger to the State and have suppressed it within their jurisdictions. In France opposition to the political activities of the Grand Orient culminated in 1914 in the formation of a new body "Grande Loge Nationale Indépendante et Régulière pour la France" which avoids politics and insists on belief in God. This body, which has increased rapidly in numbers, is recognized by the Grand Lodge of England. At the same time, one by one, most of the American grand lodges which were still in fraternal relations with the Grand Orient have felt compelled to sever relations.

UNITED STATES

Freemasonry was planted in the American colonies by English masons during the first three decades of the 18th century. The oldest existing written record is a minute book of a lodge in Philadelphia containing entries dated in 1730 and presupposing a yet earlier date. Benjamin Franklin became a member of this lodge. It is believed that it may have been a "time immemorial" lodge, that is, one formed by a group of masons without a written charter. The earliest lodge known to have been constituted on written authority of the Mother Grand Lodge of England was the First Lodge of Boston, organized in 1733, by Henry Price, deputized by Viscount Montague, Grand Master, to be "Provincial Grand Master of New England and Dominions and Territories thereunto belonging."

During the colonial period a majority of the lodges worked under English Constitutions, with here and there a few receiving their charters from the Grand Lodges of Scotland and Ireland. Their governing bodies were provincial grand lodges, the provincial grand masters being authorized or appointed by the grand masters of the Grand Lodges of England, of which there were two (the first was organized in London, 1717) from 1751 to the end of the colonial period. At the culmination of the Revolutionary War these grand bodies set themselves up as independent grand lodges, their sovereignty becoming everywhere recognized within a few years. Each of these grand lodges confined itself within a jurisdiction coincident with the political boundaries of its corresponding State, a custom followed by all grand lodges subsequently organized in the United States. This was the origin of the now famous American doctrine of exclusive territorial jurisdiction, the point of which is that a grand lodge is sole and sovereign within its own acknowledged territory, any violation of this exclusive jurisdiction being considered grounds for the discontinuance of fraternal recognition. Accordingly there are 49 independent grand lodges in the United States, including that of the District of Columbia. Statistics at the beginning of 1928 showed these to have 16,605 constituent lodges on their rolls, with a total membership of 3,248,518 master masons in good standing, approximately three-fourths of the total number of master masons in the world, estimated at 4,400,000.

The presence of the Holy Bible on the altar, belief in God, the forbidding of political activity or discussion, and non-sectarianism in religion are among the fundamentals adhered to by all grand lodges in the nation. It is because of their insistence on these as a *sine qua non* of regular masonry that American grand lodges are unable to extend fraternal recognition to a few grand bodies abroad which do not consider them as necessary landmarks.

The lodges and grand lodges here referred to stand in a line of direct descent from the operative masons of mediaeval England and Europe; their members look upon the ancient manuscripts, old charges and traditions left behind by those operative masons as the fountainhead of doctrine and practice, however much the present system may have become modified during some six or seven centuries of development. The masonry exemplified by them is variously described as Symbolic Masonry, as Ancient Craft Masonry, as Emblematic Masonry and as Blue Lodge Masonry. The technically learned in craft lore have frowned upon the use of the last named appellation as being little more than a nickname, but it has become deeply rooted in popular use nevertheless. This masonry is conferred in the form of the three degrees of Entered Apprentice, Fellow of the Craft, and

Master Mason. It is a fixed principle in the American craft that grand lodges, and grand lodges only, have sovereign jurisdiction over the three degrees. Since membership in any of the concordant bodies of the Capitular, Cryptic, Chivalric and Scottish rites requires that a man be and remain in good standing in a regular lodge, it will be seen that grand lodges are the foundation of the masonic system in the United States.

Royal Arch Masonry, otherwise known as the Capitular rite, has flourished in the United States since the middle of the 18th century. Its chapters are organized under the authority of grand chapters, one to a State; all of these, with the exception of Pennsylvania, Virginia and Texas, are linked together in a general grand chapter for the United States of America, which meets triennially.

The councils of Royal and Select Masters, comprising the Cryptic rite, are organized under grand councils in the States and are federated under a general grand council, meeting triennially. The Cryptic degrees were introduced into America during the latter half of the 18th century. Columbian Council, No. 1, of New York city, organized in 1810, is the oldest existing Council in the United States.

Knight Templarism or Chivalric rite, was introduced during the same period. Its commanderies confer three orders, Red Cross, Temple and Malta. They are organized under a grand commandery in each State; these grand commanderies are federated under the Grand Encampment of the United States, which holds triennial conclaves.

The Mother Supreme Council of the Scottish rite was organized in Charleston, S.C., in 1801. Until 1813, this was the supreme Scottish rite authority in the United States; when, in the latter year, a Supreme Council for the Northern Jurisdiction was formed, with territory north of the Ohio river and east of the Mississippi river, it became the Supreme Council for the Southern Jurisdiction, comprising all U.S. territory not included in that of the Northern Jurisdiction. The Scottish rite system consists of 30 degrees, beginning with the fourth and culminating in the thirty-third. Each Jurisdiction is governed by a supreme council composed of the "active" members of this degree. The seat of the Northern Jurisdiction is at Boston, Mass., of the Southern, at Washington, D.C. At the head of each of the two supreme councils is a sovereign grand commander.

The Craft lodge, together with the bodies of the Capitular, Cryptic and Chivalric rites, are together often referred to as the "York rite"; while this is a misnomer it is in general use and is likely so to continue. The York and Scottish rites together do not, in any strict sense, comprise a "system"; nevertheless they work harmoniously together and may be viewed in the large as a single fraternity, the bodies of which alone have the right to describe themselves as masonic. Alongside of these, independent but often basing their membership on membership in good standing in some regular masonic body, usually a Craft lodge, are a number of social organizations, the so-called "Side Orders." Notable among these are the Order of the Eastern Star, with a mixed membership; the Ancient Arabic Order, Nobles of the Mystic Shrine for North America; Mystic Order of Veiled Prophets of the Enchanted Realm; the Ancient Egyptian Order of Sciots; the Tall Cedars of Lebanon; the Order of De Molay for Boys; and a number of others of less importance. In addition to these are some hundreds of masonic clubs, most of them local and social in character, some being directly connected with masonic bodies, others being independently organized. Many of these hold memberships in the National League of Masonic Clubs, the province of which is sufficiently indicated by its title. While most of these organizations require of every candidate that he be a member, or the close relative of a member, of some masonic body, these appendant societies are not to be confused with masonic bodies properly so called. FREEPORT, a city of north-western Illinois, U.S.A., on the Pecatonica river; the county seat of Stephenson county. It is on Federal highway 20, and is served by the Chicago and North Western, the Chicago, Milwaukee, St. Paul and Pacific, and the Illinois Central railways. The population in 1920 was 19,669 (88% native white), and was 22,045 in 1930 by the Federal census. It is the trade centre of a farming and dairying district, and has many and varied manufactures, with an output in 1927 valued at \$12,170,637. The Illinois Central has extensive repair shops and division headquarters here. A granite boulder marks the historic spot where the famous debate between Abraham Lincoln and Stephen A. Douglas took place (Aug. 27, 1858) in which Douglas took the position that the people of a territory could exclude slavery through "unfriendly" legislation, and that therefore "it matters not what way the Supreme Court may hereafter decide on the abstract question" of the introduction of slavery into free territory. This "Freeport doctrine" greatly weakened Douglas's candidacy for the presidency in the election of 1860. Freeport was settled in 1835; laid out and named Winneshiek in 1836; renamed and made the county seat in 1837; incorporated as a town in 1850, and as a city in 1855.

FREEPORT, a village of Nassau county, New York, U.S.A., on the south shore of Long Island, 5m. E. of the city limits of Brooklyn. It is served by the Long Island railroad. The population in 1930 was 15,467. Oyster and other fisheries and truck-gardening are important industries, and there is some manufacturing, but the village is chiefly a suburban residential community. It was incorporated in 1892.

FREE PORTS. A term applied to ports, or more usually zones within ports, in which vessels can load or unload, and commercial and even manufacturing businesses can be carried on, without any active control by the fiscal authorities. In a free port no import or export duties are levied, the only charges being for services rendered, *i.e.*, wharf dues, etc.; it is only when goods pass from the free port area into the hinterland for consumption that import duty is payable. But when goods have been worked up in the free zone, duty is in some cases only payable on the raw material as originally imported and not on the finished product as crossing the customs frontier.

During the middle ages certain cities granted foreign merchants various privileges which approached freedom of trade. With the rise of the mercantile system, however, such restrictions were in general laid on foreign imports that some device was found necessary to prevent the entire collapse of foreign commerce. With this object certain maritime towns were exempted from the restrictions and were placed outside the customs frontier of the country in which they were situated. Thus Leghorn was made a free port in 1547 and became an important centre for the Levantine trade, while other Italian cities were afterwards granted similar privileges. In the north the Hanse towns, including Hamburg, Bremen and Lübeck, had from very early times maintained such a system, and they became the trading centres in the north of Europe corresponding to Venice and Genoa in the Mediterranean.

With the movement towards national unity in the first half of the 19th century, the existence of these extra-territorial units became increasingly inconvenient. Other maritime towns in the country complained of the unfair advantages possessed by the free ports, while the State considered that customs revenue was lost, not only by the duty-free facilities of the port, but by smuggling from the free port into the customs area. On the other hand, in some cases the products of the free ports had to pay duties on crossing the customs frontier, thus penalizing manufacturers in the free port as compared with competitors within the customs territory.

Thus the privileges were gradually withdrawn, although in some cases the creation of a free zone, as at Hamburg and Bremen, served an entrepôt trade. Recourse was now had to the bonded warehouse system for the ordinary re-export trade, and to systems of "drawback" or "temporary importation" under

which duties paid (or covered by bond) were refunded, wholly or in part, on the exportation of goods composed of dutiable imported raw materials.

In Europe the principal free ports are Copenhagen, Danzig and Hamburg.

Copenhagen.—The free port of Copenhagen was opened in Nov. 1894 and has since been extended till, in 1927, the area of the land territory is 51.8 hectares and the water area 33.4 hectares, while the quays total 4,773 metres. The owning company undertakes the warehousing, storing and transport of goods within the limits of the port, at rates controlled by the Danish Government. Merchants can rent sites for offices, warehouses and factories, the only stipulation being that manufacturing can only be carried out in the free port with the sanction of the minister of public works; such sanction, however, is readily obtained, though the available space at the end of 1927 was nearly all occupied. Warehouse warrants are issued by the free port company free of stamp duty, thus facilitating the financing of the re-export trade. Owing to the installation of up-to-date machinery and appliances, it is claimed for the free port of Copenhagen that it is the quickest and cheapest port of call in northern Europe and forms the most convenient centre for the Baltic trade, consignments to the smaller ports being transhipped there and goods from those ports concentrated for shipment thence on ocean-going vessels.

Danzig.—The free zone at Danzig was established in 1898 to compete with Copenhagen as a centre for the Baltic trade. The existence of this free zone was continued by the Treaty of Versailles, which provided for the incorporation of the free city and territory of Danzig (*q.v.*), apart from this free zone, in the Polish customs union. The unloading, loading, warehousing, repacking, sorting, etc., of goods takes place within the free zone without any customs control, and there is no limit to the time the goods may remain stored. Manufacturing or any process which changes the form of the goods is, however, prohibited. Customs examination is only required if and when goods leave the free zone for the customs territory, and customs offices are situated in the free zone to facilitate the clearance of such goods. Before the World War the principal use of the free zone was the storage of excisable goods of German origin prior to export, a drawback being payable on arrival in the zone without waiting till the goods were actually shipped. A considerable portion of Polish trade passes through the zone, both inwards and outwards, while there is an important re-export trade. The existence of the free zone enables importers to send goods into Poland or to reship them, as market conditions may dictate without any customs formalities.

Hamburg.—The free port at Hamburg is a survival of the freedom of trade which existed under the Hanseatic League. Hamburg is a sovereign State, and as such entered the German empire when this was formed in 1871, but stipulated that the port should not enter the customs union. However, in 1888, in view of the fact that goods manufactured in Hamburg had to pay duty on entering the customs area, while those from other German towns were only charged with the duty, if any, on the raw materials used, the city joined the customs union. At the same time, however, the larger portion of the port was fenced off and established as a free port. This extra-territorial free port includes land on both banks of the Elbe and the main river itself for a considerable distance and is surrounded by a customs line guarded by customs officials. Merchandise can be brought into the free port free of duty and customs examination, and stored, repacked, sorted, etc., at will, and then either reshipped or sent into Germany as the conditions of the market may suggest. In Hamburg alone among German free ports is manufacturing permitted, but this is no great advantage except for ship-repairing and certain trades working almost entirely for re-export (as rice-milling and oil-milling), for which the situation of the works in the immediate neighbourhood of the waterway reduces costs. As no one is allowed to live in the free port, the transport of workers involves special arrangement. The total area of the free port is 2,500ac. of which 1,576ac. are water.

The bulk of the trade of Hamburg passes through the free port, where freedom from customs control makes the handling of goods

much simpler and speedier than under a bonded warehouse system. The issue of warehouse warrants by the free port warehouse company enables trade to be financed if necessary. At the same time the rapidity of handling and the concentration of shipping, both sea and river, makes the free port an exceptionally advantageous centre for the transshipment trade.

Other Free Ports.—Other free ports or free zones exist in Germany at Bremen, Bremerhaven, Brake, Cuxhaven, Geestmünde, Emden and Stettin. Since the War free harbours have been established in Sweden at Stockholm (1919), Gothenburg (1922) and Malmö (1922), while in Finland a free harbour was in course of construction at Hangö in 1927. Trieste was a free port from 1719 to 1891, since when a free zone has existed. When Trieste passed to Italy this zone was continued.

Fiume was also a free port till 1891, since when a free zone has existed. When under the Peace Treaties, Fiume formed a free State, the only duties levied were on spirits, tobacco and similar luxuries, but on the establishment of the Italian sovereignty over the port, the Italian customs tariff was applied from March 1, 1924. The free zone, however, was continued, although a portion of it was allocated to Yugoslavia. Since then an extension has been authorized to accommodate the timber trade, the old timber harbour at Porto Barros having passed to Yugoslavia. Proposals were afoot in 1928 to provide free zones in other principal Italian ports.

Sulina at the mouth of the Danube is a free port, but consumption duties are levied on articles of "colonial produce," etc., landed at the town for local consumption. As the town is inaccessible by land owing to marshes, smuggling into the customs territory is impossible; all vessels proceeding up the Danube to inland ports are treated as coming from abroad.

In the British empire, Hong-kong, Singapore and Penang are free ports and are important transshipment centres, while the Portuguese have a free port at Macao, off the Chinese coast.

(H. CR.)

FREE REED VIBRATOR, in musical instruments, a thin metal tongue fixed at one end and vibrating freely either in surrounding space, as in the accordion and concertina, or enclosed in a pipe or channel, as in certain reed stops of the organ or in the harmonium.

We have to deal with air under three different conditions in considering the acoustics of the sound produced by free reeds: (1) The stationary column in pipe or channel containing the reed, which is normally at rest; (2) The wind or current of air fed from the bellows with a variable velocity and pressure, which is broken up into periodic air puffs as its entrance into

of an additional stationary column or stratum of air. Free reed instruments are therefore classified according to the nature of the resonant medium provided: (1) Free reeds vibrating in pipes, as in organs; (2) Free reeds vibrating in reed compartments and reinforced by air chambers of various shapes and sizes, as in the harmonium (*q.v.*); (3) free reeds set in vibration through a valve, but having no reinforcing medium, as in the accordion and concertina.

The quality of tone of free reeds is due to the tendency of air set in periodic pulsations to divide into aliquot vibrations or loops, producing the phenomenon known as harmonic overtones or upper partials, which may, in the highly composite tone of free reeds, be discerned as far as the 16th or 20th of the series.

For the history of the application of the free reed to keyboard instruments, see **HARMONIUM**.

FREESIA, in botany, a genus of plants belonging to the Iris family (Iridaceae), and containing three species, all natives of S. Africa. The plants grow from a corm (a solid bulb, as in *Gladialis*) which sends up a tuft of long narrow leaves and a slightly branched stem bearing a few leaves and loose one-sided spikes of fragrant narrowly funnel-shaped flowers. Several varieties are known in cultivation, differing in the colour of the flower, which is white, cream or yellow. They form pretty greenhouse plants which are readily increased from seed. They are extensively grown for the market in Guernsey, England and America. By potting successively throughout the autumn a supply of flowers is obtained through winter and spring.

FREE SOIL PARTY, a political party in the United States, which was organized in 1847-48 to oppose the extension of slavery into the Territories. It was a combination of the political abolitionists—many of whom had formerly been identified with the more radical Liberty Party—the anti-slavery Whigs, and the faction of the Democratic Party in the State of New York, called "Barnburners," who favoured the prohibition of slavery, in accordance with the "Wilmot Proviso" (see **WILMOT, DAVID**), in the territory acquired from Mexico. The party was prominent in the presidential campaigns of 1848 and 1852. At the national convention held in Buffalo, N.Y., on Aug. 9-10, 1848, they secured the nomination to the presidency of ex-president Martin Van Buren, who had failed to secure nomination by the Democrats in 1844 because of his opposition to the annexation of Texas, and of Charles Francis Adams, of Massachusetts, for the vice-presidency, taking as their "platform" a declaration that Congress, having "no more power to make a slave than to make a king," was bound to restrict slavery to the slave states, and concluding, "we inscribe on our banner 'Free Soil, Free Speech, Free Labor and Free Man,' and under it we will fight on and fight ever, until a triumphant victory shall reward our exertions." The Liberty Party had previously, in Nov. 1847, nominated John P. Hale and Leicester King as president and vice-president respectively, but in the spring of 1848 it withdrew its candidates and joined the "free soil" movement. Representatives of 18 States, including Delaware, Maryland and Virginia, attended the Buffalo convention. In the ensuing presidential election Van Buren and Adams received a popular vote of 291,263, of which 120,510 were cast in New York. They received no electoral votes, all these being divided between the Whig candidate, Zachary Taylor, who was elected, and the Democratic candidate, Lewis Cass. The "free soilers," however, succeeded in sending to Congress two senators and 14 representatives, who by their ability exercised an influence out of proportion to their number.

Between 1848 and 1852 the "Barnburners" and the "Hunkers," their opponents, became partially reunited, the former returning to the Democratic ranks, and thus greatly weakening the Free Soilers. The party held its national convention at Pittsburgh, Pa. (Aug. 11, 1852), delegates being present from all the free states, and from Delaware, Maryland, Virginia and Kentucky; and John P. Hale, of New Hampshire, and George W. Julian of Indiana, were nominated for the presidency and the vice-presidency respectively, on a platform which declared slavery "a sin against God and a crime against man," denounced the Compromise measures of 1850, the fugitive slave law in particular, and again

FROM DUFF, "TEXT-BOOK OF PHYSICS" AND HELMHOLTZ, "THE SENSATIONS OF TONE"
DIAGRAM ILLUSTRATING ACTION OF THE FREE REED VIBRATOR (ABOVE) SHOWING DIRECTION OF AIR CURRENT WHICH CAUSES VIBRATION OF FREE END OF REED; AND (BELOW) PERSPECTIVE OF ORGAN REED

pipe or channel is alternately checked or allowed by the vibrator; (3) The disturbed condition of No. 1 when acted upon by the metal vibrator and by No. 2, whereby the air within the pipe is forced into alternate pulses of condensation and rarefaction.

The most valuable characteristic of the free reed is its power of producing all the delicate gradations of tone between forte and piano by virtue of a law of acoustics governing the vibration of free reeds, whereby increased pressure of wind produces a proportional increase in the volume of tone. The sound produced by the free reed itself is weak and requires to be reinforced by means

opposed the extension of slavery in the Territories. These candidates, however, received no electoral votes and a popular vote of only 156,149, of which but 25,329 were polled in New York. By 1856 they abandoned their separate organization and joined the movement which resulted in the formation of the powerful Republican Party (*q.v.*), of which the Free Soil Party was the legitimate precursor.

See Theodore Clarke Smith, "The Liberty and Free Soil Parties in the Northwest," *Harvard Historical Studies*, vol. vi. (1897).

FREE-STONE, stone used in architecture for mouldings, tracery and other work required to be worked with the chisel. The oolitic stones (*i.e.*, limestones) are generally so called, although in some countries soft sandstones are used; in some churches an indurated chalk called "clunch" is employed for internal lining and for carving.

FREETHINKER denotes any one who considers problems of religion and religious history in a purely rational manner, without regard to the authority of a Church. The term is applied more especially to the Deists of the 18th century.

See L. Stephen, *English Thought in the 18th Century* (2 vols., 1876).

FREETOWN, capital of the British colony and protectorate of Sierra Leone, West Africa, on the south side of the Sierra Leone estuary, about 5 m. from the cape of that name, in 8° 29' N., 13° 10' W. Pop. (1921) 44,142. Freetown is picturesquely situated on a plain, closed in behind by a succession of wooded hills, Sugar Loaf mountain being 2,494 ft. high. There are many fine stone-built business premises and public buildings, including an Anglican cathedral, Wilberforce Hall, courts of justice and the governor's residence. Several of these institutions are built on the slopes of the hills. The botanic gardens form a pleasant and favourite place of resort. Freetown possesses an abundant and pure water-supply, drawn from the adjacent hills but the climate is enervating and was notoriously unhealthy. It was particularly to Freetown, often spoken of as Sierra Leone, that the designation "White Man's Grave" applied. Since the beginning of the 20th century successful efforts have been made to improve the sanitary condition notably by a new system of drainage, and the filling up of marshes wherein the malarial mosquito breeds. A light railway 6 m. long, opened in 1904, was built to Hill Station (900 ft. high), where, on a healthy site, are the residences of the government officials and of other Europeans. In 1929 this railway was closed to public traffic, and a motor bus service substituted. The town is governed by a municipality (created in 1893) with a mayor and councillors, the large majority being elective. Freetown was the first place in British West Africa granted local self-government.

Both commercially and strategically Freetown is a place of importance. Its harbour, the best in West Africa, affords ample accommodation for the largest fleets and is a port of call for all steamers serving West Africa. Freetown is also the ocean terminus of the Sierra Leone railways. Its inhabitants who include a number of Syrians are noted as very keen and successful traders.

In consequence of the character of the original settlement (see SIERRA LEONE), many of the inhabitants are descended from non-indigenous Negro races. These form a distinct class, known as creoles. Their language is English and they are mainly Christians. A large proportion of them are highly educated and they occupy a prominent part in the life of the town, as lawyers, medical men, clergy, teachers, civil servants, traders and clerks. Census returns show however that their numbers are diminishing.

Since 1861-1862 there has been an independent Episcopal Native Church; but the Church Missionary Society, which in 1804 sent out the first missionaries to Sierra Leone, maintains various agencies. Furah Bay college, built by the society on the site of General Charles Turner's estate (1½ m. E. of Freetown), and opened in 1828 with six pupils, one of whom was Bishop Crotcher, was affiliated in 1876 to Durham university. Other institutions are the C.M.S. Grammar School (opened 1845), the Wesleyan Boys' and Girls' High Schools, the Annie Walsh (girls) school and the Prince of Wales secondary school (opened by the Prince in 1925).

FREE TRADE, the term commonly reserved for the policy of trade regulation that makes no discrimination between imported and domestic products. It does not exclude the possibility of import duties, but restricts them to the purpose of raising revenue, and supplements them by a countervailing excise duty in cases in which the commodity taxed is produced in the country as well as imported. In the past the term was applied with different significations, varying with the circumstances and controversies of the time. In the 17th century it was used to describe their policy by the opponents of the monopolistic privileges of trading companies, such as the Merchant Adventurers. The free trade bills of 1604 were designed, not to establish freedom of trade in the modern sense, but to throw open the companies, to which was reserved the trade with different regions, and to check the practice of restricting entry, and so making of them monopolistic corporations. Later in the century the same description was applied to the claim that individuals should be free to engage in the different branches of foreign trade without being members of any company. In the 18th century the term was popularly used as a euphemism for smuggling. Its present signification may be dated from the generation following the publication of Adam Smith's *Wealth of Nations* in 1776.

The *Wealth of Nations*, by its patient and detailed examination of the actual effects of existing commercial restrictions, destroyed the authority of the theories on which those restrictions had been based, and so closed an epoch; by demonstrating the true nature of international trade and showing the falsity of the traditional view that the commercial prosperity of one country is at the expense of, and incompatible with, that of another, it prepared the way for the freer trade and more liberal regulations of the modern age. The advantages of exchange, the necessity of freedom if these advantages were to be secured and the evils of restrictions, particularly upon the corn trade, had been urged for a generation by the French economists or Physiocrats (*q.v.*), and other writers associated with that school. Condillac formulated the new theory of commerce even more succinctly than Adam Smith in the sentence "every nation in its exchanges wants to have the whole of the profit of the trade; they do not see that by the very nature of the exchange there is bound to be some profit on both sides, since each on his side gives less than he receives"; while Mercier and Le Trosne anticipated the crucial doctrine that free trade would benefit a country even if other countries did not follow its example. No other work, however, had the influence of the *Wealth of Nations*.

The Free Trade Movement.—The first important achievement of the free trade movement was Pitt's commercial treaty with France in 1786, which removed many of the prohibitions and duties that had previously obstructed legitimate trade between the two countries. Further progress was checked by war. The circumstances of the generation that followed the Napoleonic War were, however, in England not unfavourable to the new movement. The growth of population created a demand for imported foodstuffs, and at the same time the new manufactures favoured the freeing of trade as likely to assist them in finding export markets. The reform of the old tariff was begun by Huskisson in 1823. In 1837 an anti-corn law association was formed, reconstituted as the National Anti-Corn Law League in 1839, which, under the leadership of Cobden and Bright, organized an active propaganda against the protection of agriculture. Sir Robert Peel took further the reform of the tariff in his budgets of 1842 and 1845, and in 1846 carried the repeal of the corn laws. Gladstone completed the work of simplifying the customs tariff and eliminating from it any protectionist element in the budgets of 1853 and 1860, the latter giving effect to the British undertakings in the negotiation of a commercial treaty with France by Cobden. A new protectionist movement was launched by Joseph Chamberlain in 1903, which, however, was without legislative effect before the war. During and after the war, a protectionist element was introduced into the British tariff, particularly by the Safeguarding of Industries Acts (1921 and 1925).

In other countries the circumstances were not so favourable as in England; the Free Trade movement was, however, not with-

out effect. In Germany the influence of Adam Smith was shown in the reform of the Prussian tariff in 1818. Free trade ideas combined with the nationalist economic propaganda of Friedrich List and the practical exigencies of trade to form the German Zollverein in 1833, by which freedom of trade was established between seventeen German states, a number subsequently increased. In the middle of the century an active free trade movement developed, particularly in northern Germany, influenced by the writings of Prince Smith; and during the period of Bismarck's co-operation with the Liberal Party, Prussia and Germany moved rapidly in the direction of free trade. A network of commercial treaties brought protectionist duties lower and lower, and the tariff law of 1873 approached complete free trade. However, before it came into force, a combination of circumstances brought about a reaction. A commercial crisis in 1873 was followed by a long period of trade depression; the high protection of the United States provoked a desire to retaliate; with improvement in transport, first Russian and then American competition began to affect agriculture, which had hitherto been sympathetic to free trade; the war of 1870 excited nationalist feeling and put a strain on national finance; finally Bismarck broke with his Liberal allies.

The French Treaty, 1860.—In France there was a strong intellectual movement in favour of free trade, which produced in Frederic Bastiat one of the foremost propagandists of that policy. The only considerable reform was, however, due to Napoleon III., who used his administrative powers to reduce the tariff, and in 1860 negotiated a commercial treaty with England. The influence of this treaty was extensive, since, by making a distinction between the "autonomous" tariff, which was imposed in the absence of special agreement, and the "conventional" tariff, which was granted by special agreement, or in accordance with a general agreement to accord a country "most favoured nation" treatment, it led to the negotiation of a network of commercial treaties, covering most of the countries of Europe, and to the establishment of "conventional" tariffs, much lower than the nominal tariffs. After 1870, however, influences the same as, or similar to, those which brought about a change in Germany produced a protectionist reaction in France. In the United States also, there has always been a strong intellectual movement in favour of free trade, which at times (e.g., in Secretary of the Treasury Walker's Report of 1845) found official expression. Moreover, sentiment in the South was in favour of free trade, and tended to counteract the protectionist claims of the North until the Civil War. The high taxation on imports, imposed to meet the expenses of that struggle, was, however, continued when that reason for them no longer held, and the United States was highly protectionist in its policy until the end of the century. Outside the United Kingdom and the smaller maritime countries with a large transit trade, commercial policy was increasingly protectionist after the '70s of the last century. The gains of the reforming decade that followed Cobden's commercial Treaty with France were not lost; but the growth of international commerce, which the cheapening of transport and the development of manufacturing technique made inevitable, was hampered and qualified by a new growth of restrictions and obstructions. There was, as yet, no return to the absolute prohibitions of import that were normal before the free trade reforms; but an interference with the freedom of exchange that in itself was slight might have grave effects in the new circumstances of commerce. The improvements in transport not only increased the volume of trade, but reduced the margins of profit on which trade was conducted; a very small addition to costs by a protective duty or other interference might, therefore, have a very large influence. As has been indicated, this improvement in transport, by exposing new interests, and particularly European agriculture, to foreign competition, and the growth of nationalist feeling produced a reaction after 1871. It was the counterpart in the field of commercial policy of the growth of armaments in the field of military policy. The United Kingdom escaped it, in part because the political influence of agriculturalists was less than in Continental countries, in part because an established system of direct taxation of incomes provided an alternative source of revenue from which expenditure on armaments could be financed. For a time the reaction

was obstructed by the commercial treaties negotiated before 1871; these, however, served not so much to check the protectionist tendency as to turn it into other directions. If duties could not be raised during the currency of a treaty other methods of protecting the home produce could be devised.

Protection is defined by Grünzel as "the totality of those measures by which the national economy seeks to promote its interests in the world economy field," and its end as "the securing of the domestic market to the business of a country by political means." Tariffs are not the only means by which this end can be secured. Freight rates in nationalized railway systems were manipulated to favour the domestic and to hamper the foreign producer; not only were they used to provide protection against imports, but also to give a concealed bounty on exports. Other bounties became common, particularly on sugar and shipping, originating in drawbacks designed to compensate native producers in their export trade for the increase in their costs imposed by protective duties on their materials. The difficulty of varying tariff laws led to other forms of administrative protection; sanitary provisions were used to stop the import of live stock and so protect the native grazier; food inspection was perverted to the same end. The practice of confining public contracts to native contractors, and seeking to influence the governments of dependencies to confine their contracts to firms of the mother country, was an effective substitute for a tariff in certain industries. Restrictions on immigration, especially the prohibition by the United States of America of the immigration of contract labour, were inspired by the same economic philosophy, and sought to reconcile the manual working class to a protectionist régime. The Congress of the United States introduced a further complication by providing for special duties on the imports of countries that levied "unfair taxes" on American goods and giving the President power to vary rates of duty, or suspend free entry, by administrative act in certain cases.

Free Trade and the War.—International trade before the war in spite of these obstacles continued to grow; moreover, as Grünzel demonstrates statistically (*Economic Protectionism*, p. 73-4), it took the form predominantly of exchange between industrialized countries, all of which except England were protectionist in policy, much more than exchange between industrialized and agricultural countries. The policy of free trade was maintained by England in spite of the propaganda launched by Joseph Chamberlain in 1903 and the last tariff revision before the war in the United States, the Underwood tariff of 1913, was a revision downwards in the direction of free trade. The war, however, and the peace that closed it, confirmed the governments of the world in their protectionist tendencies. By exciting nationalist feelings, establishing new national frontiers, and creating new fiscal needs, it encouraged a revival of protection that made it impossible to secure a hearing for the coldly rational arguments for international free trade. Even the British Government moved away from the strict free trade position, imposing duties and prohibitions on imports of certain "key industry" products, supposed to be essential in war, providing administrative protection against imports from countries with depreciating currencies, continuing the protection afforded during the special circumstances of the war to a miscellaneous group of industries of which motor manufacturing was the most important, and reciprocating the preference accorded to imports from the United Kingdom by the Dominions. In other countries the tendency was to higher and more elaborate tariffs. The American tariff of 1922, the Fordney Tariff, is described by Professor H. Parker Willis as "both actually and potentially the highest general tariff law ever enacted in the history of protection." Absolute prohibitions and duties at a prohibitive height were common in the policies of the succession states constituted out of the Austro-Hungarian empire. Certain incidents of post-war trade assisted the same tendency. The instability of the foreign exchanges, due to the vicious currency policies of most European countries, added a new uncertainty to industry, and cancelled the protection afforded by pre-war tariffs which imposed specific, not *ad valorem*, duties. The latter difficulty was met in some cases, e.g., France, by a system of "co-efficients," factors by which the duties in the tariffs were to be multiplied, varying with the depre-

ciation of the local currency; in others, *e.g.*, Germany, by requiring the payment of duties in gold or its equivalent. The war, by obstructing normal interchange of commodities, had led to the establishment or expansion of industries serving a local or national market, which demanded and usually obtained protection, when the circumstances that made them necessary passed away. Most serious of all, in the uncertainty it introduced into industry, was the general shortening of the terms for which protective duties were fixed, and the general extension of the practice of varying and extending tariffs by administrative action. Whereas before the World War tariffs were normally enacted by legislation for a term of years, and imposed settled conditions to which industry could accommodate itself, since the war they have been a field of incessant and unpredictable change to which industry has the greatest difficulty in adjusting itself.

The persistence of a war-time psychology prevented both governments and peoples from perceiving that the economic distress caused by the war was general and could be alleviated only by joint action. Gradually, however, a perception of this truth gained ground. The results of the new protection were so serious, in the obstacles it opposed to the economic recovery of Europe, that a new movement for the freeing of trade gathered strength, which found expression in the so-called "Bankers' Manifesto," published on Oct. 20, 1926, and culminated in the international economic conference, convened by the League of Nations in Geneva in May 1927. The words that the President, M. Theunis, prefaced to the report of that conference, if they are the latest statements of the free trade principle, are also an echo of the earliest and classic statement of Adam Smith:

"The exchange of products between persons of the same country or of different countries is normally to the advantage of both parties; the greater the range of exchange of different products between those who by their resources and capacities are best fitted to produce them, the greater is the general economic advantage . . . that international trade is normally and properly not a matter of victory and defeat, of profit of one at the expense of the other, but of mutual benefit, has necessarily been the basis of this international conference."

The Free Trade Doctrine.—The basis of free trade is a belief in the benefits of exchange. International trade is regarded as only one branch of exchange, differing in certain incidentals to it, but not in its essential benefits, from exchange within the limits of a single state; the free trade doctrine, therefore, regards the economic progress of different countries not as conflicting, but as mutually beneficial. The benefits of exchange are, firstly, cheapness; a country does not import a commodity, unless by so doing it gets it cheaper than it could by producing it for itself; and, secondly, the most economical distribution of productive resources among the different industries and services of the country. In Ricardo's words: "Under a system of perfectly free commerce, each country naturally devotes its capital and labour to such employments as are most beneficial to each. This pursuit of individual advantage is admirably connected with the universal good of the whole. By stimulating industry, by rewarding ingenuity, and by using most efficaciously the peculiar powers bestowed by nature, it distributes labour most effectively and most economically; while, by increasing the general mass of productions, it diffuses general benefit, and binds together, by one common tie of interest and intercourse, the universal society of nations throughout the civilized world" (*Principles of Political Economy and Taxation*, ch. vii. 1817).

It is an important part of the free trade doctrine that the forms under which international trade is carried on obscure the reality. If trade could be carried on on terms of barter, its nature as an exchange between producers would be obvious; since it takes the form of sales and purchase for money, this reality is not recognized. Moreover, since the currencies of two or more countries are involved, transactions in foreign exchange are necessary. Either the importer has first to acquire in exchange for currency of his own country currency of the country from which he wishes to import; or the exporter has to accept payment for his export in a currency which he cannot use to meet his ordinary expenses

in his own country, and he has to sell this foreign currency. Such exchange transactions do not, however, alter the economic character of trade. International trade, like domestic trade, is an exchange of goods and services, which must in the long run balance. Exports create credits in other countries, which are used to pay for imports; imports create debits, which are liquidated by exports. A country's credits and debits in relation with the rest of the world, however, are not exhausted by the imports and exports of merchandise that are all that customs administrations record; the balance of indebtedness is affected also by such "invisible exports" as interest on foreign investments, services of shipping and financial agencies, services to tourists, and receipt of remittances from emigrants. When everything is taken into account, the debits and credits in any period may still not balance; the difference may be adjusted by a movement of gold, but before this takes place, a temporary difference will be met by short loans or by the transfer of Stock Exchange securities. In the long run they must balance the movement of the exchanges and of gold under the gold standard automatically setting forces in motion that will correct any divergence; this statement is, however, subject to one qualification, the effect of the import and export of capital. A country's exports, visible and invisible combined, will exceed its imports if it is lending capital to the rest of the world; its imports will exceed its exports if it is borrowing capital.

Fundamental Relation of Imports and Exports.—Thus the cost of a country's imports is the cost of the exports with which it buys them; and the gain from foreign trade is the difference between the value to a country of its imports and the value to it of the exports, which it sends to other countries in exchange for those imports. Since imports are paid for by exports, to prevent by protection an import is to reduce by the amount of that import the purchases by foreigners in the country, and therefore to reduce exports. Therefore the expansion of production in a protected trade that follows the grant of protection, is not a net addition to employment and production, but merely a diversion of resources from other employments in which protection was unnecessary.

This statement requires elaboration by reference to two criticisms which have been directed against it. The first (urged, *e.g.*, by R. Schüller, *Schutzzoll und Freihandel*, 1905) is a denial of the proposition that, since imports are paid for by exports, any increase in imports will give rise to a corresponding increase in exports, maintaining production in the aggregate unimpaired or increased. Competitive imports may, it is argued, compel a native industry to close down; the imports will, it is true, have to be paid for by exports, but payment will be made by a diversion to export of a portion of the country's produce previously consumed at home. The result is that imports and exports still balance, but the aggregate of the importing country's production is reduced by the amount of the output of the industry that has been ruined. It is urged that the productive resources of a country are not necessarily exploited to the full; at any moment there may be land under-cultivated, seams of minerals not being worked, capital idle, and labour unemployed.

In answer to this objection, free trade doctrine draws a distinction between the immediate and temporary effects of a change in fiscal policy, and the ultimate and lasting effects. It may be admitted that the sudden admission of a hitherto excluded export might destroy a native industry, if the native industry was, as its collapse implies, unsuited to the country; but the labour and enterprise so displaced do not remain permanently unemployed. As the pre-war experience of a country that admitted free imports like the United Kingdom showed, in time the displaced labour finds its way into other occupations, in which it can maintain itself in competition with other countries. The argument depends on isolating the immediate effect upon the industry that suffers and ignoring the indirect effects of the change; free trade doctrine treats both the immediate dislocation and the ultimate benefit as on a par with any other economic improvement. The effect of a new invention may equally be to displace and render obsolete the specialized labour and capital of an industry; equally, therefore, the threatened industry might claim protection—as in the past

has been done.

It is true that there always are unemployed, or under-employed, land, labour and capital, not only in free trade but in protectionist countries; but that condition is not necessarily connected with fiscal policy. Economic production does not consist in the production of material output, irrespective of its cost and its value, but of the production of those commodities and services only, the value of which, when produced, exceeds the cost of producing them; and unemployment, whether of labour or capital occurs under all fiscal systems, and is attributable to causes that operate independently of fiscal systems. Tariff changes, whether in the direction of restricting or enlarging freedom of trade, are likely to cause unemployment, since they cause dislocation of the existing adjustment of production to markets; but they do not figure largely in the modern scientific analysis of unemployment.

Harmonious Development and Tariff Policy.—The other criticism to which it is necessary to refer is more fundamental. It may be summed up in the statement that, while the monetary advantage may lie in taking things where they can be got cheapest, in the long run the national advantage lies in the harmonious development of all the country's resources. The advantages of free trade are represented as advantages only on a short view; the cheapness that is secured at the expense of the sacrifice of national industry may be dear in the long run. As List, who first formulated systematically this criticism, said, "The power of producing wealth is infinitely more important than wealth itself." This is supported by a rather different proposition. Cheapness, it is argued, depends on large-scale production; this in turn is economical only if the industry runs full; protection by giving the native industry a secure home market enables it to run full, and so secures to the consumer the benefits of large-scale production. Since the surplus over home needs on this system are liable to be dumped abroad, protection is also needed against such dumping by other countries.

The answer given by free trade doctrine to this objection is partly practical and partly theoretical. In practice, it is urged, tariff systems seldom show the influence of a balanced and well-considered scheme for developing a country's resources; rather they represent an indiscriminating and unscientific response to the pressure of the interests that seek protection; a response commonly described as "treating each case upon its merits." The policy that List himself based upon his criticism of free trade was a system of duties that should be moderate in amount, temporary in character, and confined to manufactures; no protectionist country has observed these limits. Governments do not, in fact, necessarily take a long view of a country's needs; they are as liable to influence by transient passions, illusions and pecuniary difficulties, as the individuals who compose them; so that the free play of economic intercourse is in practice much better calculated to direct a country's activities into the permanent channels in which its natural and social advantages lie than are the shifting and uncertain policies of democratic governments or bureaucrats.

The theoretical objection is that the criticism involves a misunderstanding of the nature of production. It is admitted that fiscal policy should take account of the future as well as of the immediate present, that the power of producing wealth should not be sacrificed to a transient cheapness. But it is denied either that the policy of free trade makes the mistake of sacrificing the present to the future, or that protection is any more successful in increasing the power of producing wealth. Under any fiscal system a country will produce some wealth; under a system of unrestricted trade it will be compelled to concentrate on those branches of production for which it has comparative advantages. A policy of protection may divert a portion of its resources to other channels, and so perhaps widen the range of industrial processes in which the country engages; but this is not to increase its power of making wealth. The argument that it does is vitiated by the same materialist misconception of production that was noticed above; not the ability to perform processes or produce material products, but the ability to produce values in excess of the costs of production, in other words, to satisfy human wants with a

minimum of real cost, constitutes economic production. A country is not richer, but poorer for the diversion into a variety of fields, in which it has no special advantages, of resources, which under free trade would be employed in the fields in which it has special advantages. A policy of protection will have the advantage over free trade that is assumed for it only if a governmental direction of the development of industry through tariffs can be shown to be successful in discerning a country's comparative advantages and directing industry to them. List attempted an elaborate historical argument to prove this; but subsequently investigation has made it necessary to re-write his history.

The modern argument, that the cheapness that comes from large-scale production is available only if an industry has the home market secured to it, attributes to protection the results of monopoly. A protective tariff may increase the volume of domestic production in the protected industry; but the increase may just as well take the form of a multiplication of concerns without increase of scale, as of an increase of scale of existing concerns. Only if the home producers combine will they be able to pursue the policy suggested. Protection merely gives them an additional incentive and opportunity to combine and exploit the home consumer.

Generalizing upon Special Cases.—The effectiveness of the objections to the free trade doctrine just considered is in large measure due to the fact that they generalize special cases, which were recognized by Adam Smith, and have always been recognized since, as exceptions to the rule of free imports. Protection may be necessary to enable an industry, for which a country has the necessary advantages, to establish itself against the competition of the mature industries of foreign countries; in that case, the object of free trade, the direction of the country's resources to those activities for which it is best fitted, will be attained by a departure from the rule of free trade. In practice, however, cases are rare, if any exist, in which such infant industries have justified the foresight of the statesmen who nursed them, by relinquishing protection on attaining maturity; and such examples as the industrial development of the Middle West, and more recently of the Southern States of America, in the face of the competition of the mature industries of the Eastern States, or the parallel and equal development before federation of manufacturing industry in free trade, New South Wales and protectionist Victoria, are cited to show that enterprise and capital, even without protection, will not be lacking if natural and social conditions favour the establishment of an industry.

The argument that imports cause unemployment and reduce national production is similarly, in the free trade view, a generalization from an exceptional case. If a competitive import succeeds in displacing a native product—whether in a free trade or a protectionist country makes no difference—and owes its success not to any lasting or basic advantage over the native industry, but solely to transient or accidental advantages, or to a policy which it will be impossible for the foreign exporter to persist in, then there is a case on free trade principles for affording temporary protection to the threatened industry. Thus it was not inconsistent with free trade doctrine to afford protection during the war to industries which were prevented by war-time requirements from carrying on their normal activities; or, after the war, to industries that were suffering from abnormal competition from countries with depreciating exchanges. Again, dumping, being essentially a temporary expedient, falls under the head of the same exception: "If the free trade doctrine be regarded as the positive doctrine that commerce and industry should be kept in their natural channels and not merely that nothing should be done by legislatures to force them out of their natural channels, it would not merely be invalid to cite the doctrine as opposed to restrictions on dumping, but it would be valid to argue that it calls for such restrictions" (J. Viner, *Dumping: a Problem of International Trade*, p. 147, Chicago, 1923). In noting this exception it is, however, necessary to add, that the attitude of free trade partisans to any particular proposal will usually be influenced by the evidence brought forward to prove that the competition, against which provision is to be made, is really abnormal and transient, by the

assurances afforded that the protection will, in fact, be only temporary, and by the form and content of the measure by which the protection will be given.

While the grounds on which the policy of free trade has usually been urged are economic, considerations of a purely political character have played an important part in the movement toward free trade; and the opposition to it has been motivated even more decisively by political considerations. Between the early advocates and opponents of the policy there was a profound cleavage over the functions of Government in relation to industry, which still influences the controversy. Free trade was in its origin a special application of the general principle of *laissez-faire*. It was, however, based also on empirical grounds, and is now dissociated from a policy of non-interference in general, deriving much of its support from Socialists, who in general favour the extension of State interference or participation in industry. The political ground, on which the policy of free trade is supported by those who are supporters neither of *laissez-faire* nor of Socialism, is the unsuitability of governments, as at present constituted, for the special work of directing the currents of international trade. In their internal relations they are unsuitable, because they are liable to interested pressure, whatever constitutional form they take; discrimination between industries (and therefore between localities) is inevitable in the framing or amendment of a protective tariff, since, unlike factory acts and similar legislation designed to safeguard the conditions of labour, a tariff does not press uniformly on all branches of industry, but inevitably favours certain industries at the expense of others. They are unsuitable in their external relations, since they are merely local authorities in a world economy; they represent territories the boundaries of which have in most cases no economic *rationale*, while the commerce they propose to regulate and direct is the commerce of the world. The encouragement of commercial relations that, cutting across political frontiers and establishing international communities of interest, might counteract nationalist jealousies and repair the breaches which diplomacy has failed to prevent, has underlain the advocacy of free trade, even when the arguments put forward have been mainly economic. Towards the end of his argument on the unwisdom of restraints upon trade Adam Smith remarked: "To expect, indeed, that freedom of trade should ever be entirely restored in Great Britain is as absurd as to expect that an Oceana or Utopia should ever be established in it. Not only the prejudices of the public, but, what is much more unconquerable, the private interests of many individuals irresistibly oppose it." The change that has taken place in the fiscal and other regulation of foreign commerce between his age and the present, not only in Great Britain but in the world as a whole, is a measure of the achievement of the free trade movement, of which he was the father.

BIBLIOGRAPHY.—In addition to the works to which reference is made in the text, the following may be mentioned:—C. F. Bastable, *Commerce of Nations*, new edition by T. E. Gregory (1923)—an excellent popular account of the subject; F. W. Taussig *Selected Readings in International Trade and Tariff Problems* (Boston, 1921)—a very convenient collection of important and representative statements upon the chief theoretical problems involved in international trade and the chief positions that have been taken up in fiscal policy; the same author's *Tariff History of the United States* (8th ed., 1923), *Some Aspects of the Tariff Question* (2nd ed., 1916), and *International Trade* (1927), are all important, the last as the most recent and careful restatement of the economic theory underlying fiscal policy; J. Grünzel *Economic Protectionism* (1916)—a detailed analysis and description from the protectionist standpoint.

For the post-war situation the documents and reports of the International Economic Conference of 1927 should be consulted; *The Economic Consequences of the League* (1927) is a good introduction and guide to them.

For the "Free Trade" agitation of the early 17th century, see G. Unwin's *Industrial Organization of the 16th and 17th Centuries* (1904); and for the error of attributing the growth of English industry to the far-sighted policy of English Governments, the same author's *Studies in Economic History* (1923) and L. Brentano's *Eine Geschichte der wirtschaftlichen Entwicklung Englands*, 3 vols. (Jena, 1927).

FREE VERSE. No exact definition of this form of poetry has yet been reached. Indeed its very nature makes it difficult to define except by exclusion. Thus it is verse which discards tradi-

tional rhyme, metre, and form in favour of cadence. The theory, upon which it rests, is that poetry depends upon the substance rather than the form. The free-verse writer seeks to isolate the essential, and convey it to the reader stripped and absolute. The result will be differentiated from prose not so much by its quality of song as by reality captured in a lightning-flash.

In all European countries since the war free verse has found many adherents. In Great Britain and the United States it has achieved such a vogue that it has for the moment almost displaced the traditional. But it must not be supposed that it is in fact an innovation in the English tongue. The Song of Solomon, for example, is plainly free verse in the modern acceptance of the term, and many passages in Sir Thomas Browne are entitled to the same description. This may be accidental, but in the Victorian era Matthew Arnold deliberately, and with great success, wrote general poems that depended wholly on cadence.

Among the principal exponents of this form of verse in Great Britain have been the Imagists—F. S. Flint, Richard Aldington and T. S. Eliot. In the United States we have had Ezra Pound, H. D., Conrad Aiken, Carl Sandburg and Archibald Macleish. The movement at the moment is still increasing in strength and popularity. But it has yet to prove that, when it succeeds, it succeeds by methods different from those used by Matthew Arnold.

(H. Wo.)

FREE-WILL. The Scope of the Problem.—The problem of free-will, or of the freedom of the will, is complicated for various reasons. In the first place, the traditional formulation of the problem, its very name, is misleading. To ask whether the will is free seems to assume that there is such a thing as a will, which may or may not be free in its activities. This is a relic of the old, and now generally discredited, faculty psychology (*q.v.*). As Spinoza pointed out, will is a general concept derived from particular processes of volition, just as the concept of colour is derived from particular colours, blue, green, yellow, etc. And to think of will as exercising acts of volition is just like thinking of colour as the cause of blue, green, yellow, etc. Locke likewise ridiculed the conception, remarking that "we may as properly say that the singing faculty sings, and the dancing faculty dances, as that the will chooses" (*Essay on the Human Understanding*, book 2, chap. xxi., § 17). It would be best to avoid this hypostasis of an abstraction, and to speak of the freedom of the self, that is of the concrete personality, rather than of an abstract will. But the term, free-will, is too well established to be dislodged. Moreover, the expression, freedom of the self or of the person, might suggest the problem of political freedom rather than the philosophical and psychological problems traditionally associated with the term free-will.

In the second place, the problem is unduly complicated by the fact that it can be, and has been, approached from very different points of view. The psychologist is mainly interested in the right explanation of the experience of freedom of choice, which seems to challenge the usual scientific assumption that all things, including mental experiences, are subject to law and necessity. The moral philosopher is primarily interested in the free-will as a postulate of the moral life. For how can there be any significance in the moral "ought" or "ought not" if human life moves to the tune of an inevitable "must"? The jurist is concerned with the problem of free-will in its bearing on personal responsibility. For the whole penal system seems meaningless if people are not free agents in their actions, good and evil. Lastly, the theologian has an interest in the problem, since it seems to involve either the denial of God's omniscience or of His justice. If man is truly free, then it would appear that God cannot fore-know his actions; if man is not free, then his prosperity or his suffering seem to be governed by caprice rather than by justice.

Such are the chief ways of approaching the problem of free-will. The discussion of the problem is also beset by the peculiar difficulty involved in having to use terms which have rather different meanings in different antithesis, such as there are bound to be when a question is approached from several different points of view. This applies especially to the terms freedom and necessity, round which the whole problem turns. How serious this last

difficulty is, may be indicated briefly by pointing out that whereas most people regard freedom and necessity as opposed terms, Spinoza (one of the greatest thinkers) actually identified them! And he did so for good reasons, as will be shown later.

The Scientific Problem.—The aim of science, and therefore of psychology as one of the sciences, is to describe and, as far as possible, to explain the phenomena which it investigates. Correct description (involving, of course, correct observation on which it is based) is of the utmost importance, for if the data furnished by observation and description are inaccurate, the explanations are bound to be futile. And explanation in modern science takes the form of indicating some kind of order to which the facts observed belong. The most usual kind of order sought consists of the laws (that is, uniformities) of the phenomena under investigation. In the history of modern science the most important laws first discovered and established were those of mechanics, and their fruitfulness in the domain of astronomy and physics was such that every other science attempted to approximate to the mechanical model. Even psychology, in the hands of the associationist school (*see* ASSOCIATIONISM) has, indeed, attempted to explain mental experiences in terms of sensations and laws of association, as though sensations were analogous to the corpuscles, and the laws of association to the laws of motion, in mechanics. Under the circumstances it seemed natural to think of mental life as essentially mechanical in character, with as little freedom as is to be found in a mechanical engine. Under the influence of the materialism that was prevalent in the age of classical mechanics, even those who could not reconcile themselves to a materialistic conception of mental experiences such as "secretions of the brain" were sufficiently influenced by the known correlation between neural and psychical processes to suppose that the mental processes were at least in some sense, and indirectly, as mechanically determined as the neural processes were then commonly believed to be.

Strictly speaking, however, all this was a violation of the real spirit of science, inasmuch as it did violence to actual observation. Except in the very last resort, observations should not be repudiated, or dismissed as deceptive, merely because they cannot as yet be explained in a way analogous to the explanations in vogue in sciences dealing with other phenomena. Now, the evidence of observation is clear enough. There certainly are cases in which we appear to have the experiences of deliberately or freely choosing one course of action in preference to others. Moreover we also have other experiences in which we appear to be coerced in deciding or doing as we then do. If all our experiences were really of a quasi-mechanical character, it would be necessary to account for this difference between some of our mental experiences and others. As a matter of fact, recent psychology, indeed recent biology, has found it necessary to abandon the mechanistic model, and to assume an element of spontaneity or freedom in all living organisms in order to account for facts of observation. And some have gone so far as to repudiate the possibility of purely mechanistic explanation even in some of the purely physical sciences, such as chemistry. This revolt has found expression in the now familiar conceptions of "emergence" (*q.v.*) and "creative evolution" (*q.v.*). It seems to be an entirely unwarranted assumption to suppose that the kind of order studied in mechanics is the only kind of order applicable to all phenomena, organic and inorganic, mental and physical. And it seems to be equally unwarranted to suppose that mechanical energy is the sole producer of all kinds of events, living and lifeless, mental and physical. Granted that the principle of the conservation of energy has its perfectly legitimate and extensive domain, there is no reason for doing violence to *prima facie* facts of observation merely for the sake of applying the principle universally. As Bergson has pointed out "no one can tell whether the study of physiological phenomena in general, and of neural phenomena in particular, will not reveal to us, besides the *vis viva* or kinetic energy of which Leibniz spoke and the potential energy which was a later and necessary adjunct, some new kind of energy which may differ from them" (*Time and Free Will*, pp. 151, *seq.*). Moreover, the principle of conservation of energy really affects the whole question of the

relation between body and mind, and has no more a special bearing on the problem of free-will than on that, say, of the expression of the emotions (*q.v.*).

Nay, more. It may be urged not only that science has no *prima facie* justification for dismissing the possibility of a measure of human freedom, but that science itself really postulates such freedom. In a world of thorough-going determinism, in which all things were mechanically or quasi-mechanically pre-determined, in which even men of science were not free to think as they thought fit in the light of the evidence before them, how could science lay any claim to truth, universally valid truth? There could be nothing but individual opinion, the opinion of each individual being as necessary, and probably as far from the truth, as that of any other. It may be, of course, that our world is such a world. But in such a world there could be no science. And to insist upon maintaining such a deterministic view of the world in the name, and on behalf of, science, is simply to stultify oneself. The real question, from the point of view of science in general and psychology in particular, is not whether there is such a thing as human freedom, but rather how much of it there is, and wherein it consists.

The Psychology of Free-will.—The older psychology tended to treat the human mind as essentially passive and receptive. The mind was thought of as a blank tablet (*tabula rasa*) on which external stimuli made "impressions" which eventually resulted in more or less mechanical responses. Recent psychology has entirely abandoned this wax tablet conception of the human mind, and even of the mind of lower animals. It has been found necessary to assume from the very outset an element of spontaneous activity or self-assertion on the part of the mind. For not all external stimuli make an impression on the mind; there is a process of selection going on all the time. The familiar phenomenon of attention is essentially such a process of selection, and in some degree attention is always present throughout waking life. The stress now laid on the conational side of mental life is only another aspect of the present tendency in psychology to bring out the factor of spontaneity in the life of mind. This is not surprising in view of the fact that biologists have been led to assume such a factor even in the case of micro-organisms. The evidence of consciousness itself, as we have remarked above, seems to give direct support to the belief in the existence of such a factor, even if it be granted that the direct evidence of introspection is only available in the higher stages of mental development.

It would seem, then, that in the absence of cogent reasons to the contrary, such as have not been made out hitherto, we are justified in maintaining that there are elements of spontaneity or self assertion in human life. And if by freedom or free-will we mean, as we usually do mean, these elements of spontaneity and self-expression, then it may be said that a case has been made out for the view that man normally enjoys a measure of freedom or free-will.

This admission or contention is, however, a long way from the extreme claims of what is commonly known as *libertarianism*, the opposite extreme to the thorough-going determinism or mechanism dealt with above. According to extreme libertarians, every human being, no matter what his past may have been, no matter what his present character may be, is at every moment of his life absolutely free to choose any one of the alternative courses of conduct that may confront him. If this view were true, then there would be no connection between an individual's choice at any moment and the rest of his mental life and being. Mental life would have to be conceived as something essentially discontinuous, a mere sequence of discrete experiences. Such a view is entirely inconsistent with the evidence, to say nothing about the fact that, if true, it would make a science of psychology, or indeed any science, impossible. The accumulation of evidence which has led to the theory of evolution in biology *prima facie* tends all the other way, namely, in the direction of supporting a view of a continuity of influences that extend even beyond the life of the individual. And in psychology it has similarly been found increasingly necessary to take into account not only the whole past life and education of the individual but also various inherited char-

acters. The libertarian position would reduce life to, it may be a miraculous, but at the same time a lawless and disorderly sequence of events such as would render impossible a science of mental life. For it is the function of science as such, and of psychology as a science, to discover law and order in its investigated facts.

If, now, we dismiss the two extremes, namely, absolute determinism and absolute libertarianism, we are left with a view which may commend itself as a compromise, that is to say, the view that man is partly free and partly determined. This is the view actually adopted by most thinkers, because all the evidence is in favour of it, as we shall now indicate briefly.

In its primary and most usual meaning the term freedom is contrasted with coercion. If a man feels hungry and takes food of his own accord, his eating is spontaneous, voluntary or free; if his food is forcibly taken from him so that he goes hungry, then his hunger is involuntary or forced upon him. If, on the other hand, he adopts the hunger-strike and is forcibly fed, then the cases are reversed—his hunger is voluntary or free, whereas his feeding is involuntary or forced upon him. This is the primary contrast, which it is well to observe if one is to avoid the confusion common in discussions about free-will. Human actions have, of course, a great range of complexity into which all sorts of considerations enter. Take, for example, the case of a move in a game of chess. The chess-player, under normal conditions, is free to make any move he thinks fit. In a sense he is more free when he makes the first move in the game than later on when the game has developed and his permissible movements are restricted by the position of the various pieces; and he is never entirely free, because there are rules to be observed which restrict his movements in various ways. But he is free to a very large extent, for there is nearly always a choice of movements (good and bad) from which he may select, at least until he is checkmate or stalemate. But now suppose we consider differences in the degree of different people's skill in the game. It is clear that a good player will often see possible movements which the inferior player, confronted by the same position, does not see. When comparing the two players one is tempted to say that the inferior player was forced to make a bad move, or at least an inferior move, because he could not see the better move. His ignorance, or insufficient skill, thus comes to be regarded as a hindrance to a better move, indeed, as a coercion to an inferior move, and one is inclined to say that the more skilled player has greater freedom than the less skilled player. But to do so is really to confuse the issue; it confuses *better* play with *freer* play. In reality the two players are equally free, inasmuch as each plays of his own accord, and in conformity with the same rules. The fact that one of them plays better than the other is irrelevant to the question of freedom. One might play better and yet not so freely, e.g., when he simply carries out the instructions of another person. In the same kind of way the conduct of one person may be morally or artistically more valuable than that of another, yet both are equally free, so long as they act of their own accord, and each according to his light, under the same circumstances. It is a widespread view among moral philosophers that only good conduct is really free.

But this view is based on the very confusion between the value and the freedom of conduct to which attention has just been drawn. One curious consequence of the view under consideration is that wicked actions are never free. This is unwarranted psychologically, and contrary to common sense. There are plenty of people who of their own accord behave immorally under circumstances in which others act morally. Both are equally free, and the moral difference in their conduct is not relevant to the question of their freedom. Freedom consists essentially in self-determination, as distinguished from external coercion or restraint; and the value of the resulting conduct, however important it may be in various other respects, does not affect the psychological question of its freedom.

Degrees of freedom, of course, there are, and have to be recognized on purely psychological grounds. Only God (in Spinoza's sense) is free. Human conduct is always influenced to some extent by external factors which are beyond control. And the

relative weight of these external influences varies from case to case. A precise estimate of the proportion of freedom is impossible; but in practical life common sense allows for differences in the degree of freedom in its own rough and ready way.

Perhaps the most serious difficulty in this connection is caused by the fact that the relative effect of external circumstances varies with the general condition of the person who has to face them, and no one is always at the height of his powers, or at his best. The degree of external coercion may thus vary very considerably although the circumstances are the same, or essentially similar, and although the agent concerned is to all appearances also the same. One way of dealing with such cases is to say that even a normal individual is to some extent a multiple personality, consisting of selves of different orders of merit and power. There is the habitual self; there is the highest self to which a man rises at his best; and there is the sub-normal self to which he sometimes sinks. The same, or essentially similar circumstances will coerce these several selves to a very different extent, and the same individual may in each case be said to have a different degree of freedom, the freedom being greatest for the highest self, and lowest for the sub-normal self. There is no great harm in expressing the facts in this way, except that it may tend to encourage the above-mentioned confusion between value and freedom. Another way of describing the facts is to say that each of these selves is as free as it can be, but that in judging an individual we rightly take into account his whole personality rather than a fragmentary self, and that we have special regard for what is best in him. And to that extent whatever is done by the sub-normal self is not judged as typical of the real personality (the habitual or even the highest self) of the agent. It is true, of course, that assuming circumstances to remain constant, an individual's freedom will increase as his powers develop. But this is not to say that his greater freedom will necessarily make him morally better; it may make him more wicked, as appears from the cases of better educated crooks. Those who entertain the metaphysical faith in a moral world-order may urge that with still further self-development, and therefore with still greater freedom, there will eventually come greater moral goodness. That may be so; but this consideration of it falls outside the psychological consideration of the problem of free-will.

The Ethical Problem.—Moral life is usually characterized by devotion to some ideal end (*summum bonum*) such as happiness or perfection, or by a sense of duty (the categorical imperative). In the former case moral conduct is guided by the will to realize, or at least to approximate to, what is believed to be the highest good; in the latter case it is prompted by an imperious sense of duty which dictates what "ought" or "ought not" to be done. But if human life were completely determined by external circumstances, there would be nothing but delusion in either of these attitudes. Both imply a certain spontaneous power on the part of the moral agent. Ideals are mere will-o'-the-wisps for those who cannot pursue them; and "ought" has no significance except for those who "can." The moral life thus postulates, as Kant insisted, the freedom of the will. But the freedom which it requires is not the kind of freedom maintained by the extreme libertarians, for the "freedom of indifference" (as it is sometimes called), the absolute freedom to choose any possible course of action, entirely uninfluenced by the past and the character of the agent, would be just as fatal to real morality as its opposite extreme, thorough-going determinism, would be. An action carried out under conditions of "freedom of indifference" could not be described as the agent's act in any real sense of the term; it would be essentially accidental and therefore non-moral, in the sense that it would not be a suitable object or occasion of moral judgment. Moral judgment is primarily a judgment passed on the agent of the act under consideration, and how could one justly pass moral judgment on an agent for an act that is not really his, though associated with him as a chance product? To justify a moral judgment the action must be the agent's, in the sense that it was, in part at least, determined by his habits, his character, his self, under certain external circumstances which, of course, must also be taken into account

before passing moral judgment.

Thus partial self-determination is the only kind of free-will that ethics really postulates; and that much, as has already been shown, psychology justifies us in assuming. On the assumption of either thorough-going determinism or extreme libertarianism the only kind of ethics that would be possible would be a merely descriptive, natural-history ethics, as contrasted with a normative, philosophical ethics, which strictly speaking is the only real ethics, to which the other kinds of ethical studies are only subordinate. (See ETHICS.)

The Juridical Problem.—Law and morals are so closely connected that one need not be surprised to find that philosophical lawyers as well as moral philosophers are interested in the problem of free-will. The juridical problem turns mainly round the justification of punishment—the penal side or sanction of law. In a civilized society unmerited punishment (to a lesser extent also undeserved reward) offends the general sense of justice, in the interests of which law is assumed to exist. Yet punishment cannot, it is felt, be merited unless the offender committed the offence freely, of his own accord. And so the whole penal system would appear to be based on the assumption that man is free in his actions, and therefore responsible for them.

In the case of the philosophy of law, however, as in the case of moral philosophy, what is required is not the "freedom of indifference" urged by extreme libertarianism. Such freedom would be as fatal to law as to ethics, and partly for the same reasons, which therefore need not be repeated. In the case of law there is the additional objection that, on the extreme libertarian view, punishment could only be regarded as vindictive, for it could not possibly help to improve the future conduct of the offender or deter others, since past experience is assumed not to influence future conduct. Again, in law and in ethics the conception of freedom as partial self-determination furnishes an equally satisfactory basis, and for the same reasons, which also need not be repeated. But there is a great difference between legal and ethical requirements in relation to the theory of thorough-going determinism. It has already been shown above that thorough-going determinism would be fatal to the moral life. But it could be made a more or less satisfactory basis of the penal code. For the needs of social security may be regarded as justifying the "punishment" of those who endanger it, even if the offenders do not deserve punishment, because they are not really responsible for their "offences." A mad dog may have to be killed, and a person suffering from a communicable disease may have to be isolated and virtually imprisoned, even if neither is responsible for his condition. Nevertheless the view of thorough-going determinism, though possible, is not altogether satisfactory. And the view of freedom as partial self-determination offers a sound basis both for the deterrent and the corrective theory of punishment, as well as for that humane conception of the partly preventive and partly curative treatment of offenders which advancing civilization increasingly favours.

The Theological Problem.—During the middle ages the problem of human freedom, or freedom of the will, was felt to be urgent on account of its seeming conflict with the omniscience of God, of whom foreknowledge was regarded as an essential attribute. If man is really free to do as he thinks fit, how can God foretell what man will do? The solutions offered have been, and are, various. One familiar solution, if it may be called a solution, is to maintain at once both the foreknowledge of God and the freedom of man, in spite of their apparent irreconcilableness. Some attempt to make this position plausible by pointing out that, after all, foreknowledge does not really determine the anticipated result. No one, e.g., supposes that a forecast of the weather, when it turns out to be correct, actually determines or helps to determine, the coming weather. In the same way, it is argued, God's foreknowledge of human conduct does not determine it, and consequently is compatible with human freedom. But the argument, though very popular, is really fallacious, or at least beside the point. The question is not whether the forecast itself determines the coming event, but whether any real foreknowledge (as distinguished from a random guess) is pos-

sible except in a more or less deterministic system. A legitimate forecast is based upon a knowledge of certain causal relationships and on the observation of the assembling of the conditions which, when completed, will produce the event in question (say, rain, etc.). So that strictly speaking Divine omniscience would not appear to be compatible with human freedom, certainly not with that extreme freedom advocated by the libertarians.

Another solution of this problem is to abandon the belief in Divine omniscience in order to save human freedom, just as some theologians are ready to forego their belief in Divine omnipotence in order to save His goodness in the face of so much apparent evil in the world.

Generally speaking, one may distinguish two main types of theological thought; one which lays the greatest stress on the *goodness* of God, the other on the *power* (including the omniscience) of God. The former type of religious philosophy tends to regard *morality* as *autonomous*. It holds that God does what He does, or decrees what He decrees, because it is good; not that it is good merely because He does or decrees it. And consequently it attaches such value to the moral life of man (which as we have seen, postulates a measure of free-will) that it is ready to forgo the belief in the omnipotence (including the omniscience) of God. On the other hand, the second type of theology is mainly obsessed with the omnipotence of God, and is so jealous on behalf of God (so conceived) that it tends to deny every sort of independence of Him, even such as free-will would appear to suggest, or the autonomy of goodness. According to this type what God does or decrees is good just because He does or decrees it; He does not do or decree it because it is good. And rather than conceive of man as sufficiently free and independent to pursue an autonomous morality, it prefers a doctrine of thorough-going determinism, or predestination, in spite of its apparent reduction of human life and endeavour to a mere puppet show.

The present-day theological tendency is predominantly in favour of an autonomous morality, and consequently of such a measure of human freedom as this postulates. And incidentally the conception of free-will as being essentially a measure of self-determination by the agent also helps to mitigate to some extent the difficulty of reconciling human freedom with Divine foreknowledge as based on a knowledge of the character of the agent.

Historical Note on the Problem of Free-will.—The problem first appears, in a rather obscure way, in Plato's *Republic* (book 10), where it already has a theological complexion. Plato there endeavours to vindicate the ways of God to men, and he does this by attributing to men the responsibility for the choice of their several destinies. Plato must have assumed, therefore, the freedom of the will, or rather the freedom of man, for strictly speaking he, like Socrates, believed that the will is determined by our knowledge. Still, within the limits of his knowledge, man, according to Plato, is free. In *Aristotle* the question is raised in connection with the problem of human responsibility. He laid great stress on the difference between the voluntary actions of men and their involuntary actions, and held men responsible for their voluntary actions. The state, according to him, is primarily concerned with the voluntary actions of the citizens, for which alone they can be held responsible. Hence Aristotle regarded man as partly free, and insisted on his responsibility for all his voluntary actions, good and bad alike.

The problem of free-will received fuller attention from the Stoics and Epicureans. The *Stoics* believed in a world-soul which they regarded as controlling everything, and this belief naturally led to a thorough-going determinism. The *Epicureans*, on the other hand, were materialists; but as they did not believe in any kind of cosmic order, and attributed everything to chance, they inclined to the belief in free-will. *Chrysippus*, the Stoic, is noteworthy for his endeavour to reconcile determinism with moral responsibility. He distinguished between the principal causes of human conduct and its contributory causes. By identifying character with the principal cause of conduct he upheld the view that man is responsible for his actions.

Christianity, from the beginning, was faced with the problem of reconciling human freedom with Divine government—the old Stoic problem in fact. *St. Augustine* was not particularly consistent in his views concerning our problem. He professed to see no inconsistency between the belief in Divine foreknowledge and that in human freedom, and tended to restrict human freedom to the solitary case of Adam, whose fall has condemned to necessary evil the rest of mankind, except those who by Divine grace are predestined to good. *Thomas Aquinas* and *Duns Scotus* see no difficulty in reconciling the free-will of man with the foreknowledge of God, and the latter emphasizes the will's complete power of self-determination, even when guided by the intellect.

Turning to modern philosophy, we find the three principal answers to the problem of free-will given by the three more or less contemporary philosophers, Hobbes, Descartes and Spinoza. *Hobbes'* thorough-going determinism was the logical consequence of his materialism. Mental experiences, according to him are in the last resort merely motions of brain particles, and all human conduct is determined partly by such brain motions and partly by external material causes. *Descartes*, on the other hand, endowed the human will with absolute power of self-determination. All evil and all error can be avoided by withholding our consent by a sheer act of will. So far is knowledge or belief from determining our will that it is really our will that determines what we shall believe. *Spinoza* is commonly described as a thorough-going determinist; but that is only one of the many injustices done to him by incompetent interpreters. In reality he was the first to identify freedom with self-determination, and to attribute to man partial freedom. The confusion has arisen from his somewhat peculiar use of the term "necessity"; *Spinoza* distinguished between (external) coercion and (inner) necessity. What is coerced, of course, is not free—the two terms are opposed to each other. The term "necessary" however, is not used by *Spinoza* as synonymous with "coerced" or as the contradictory of "free," but as synonymous with "what is in accordance with law and order" (in the scientific sense), as the contradictory of what is merely "accidental" or "a matter of chance." If, as has been maintained above, human freedom is partial self-determination, and human conduct is not a matter of mere chance, but is determined by the whole character and mentality of the agent, then human conduct is at once "free" and "necessary" in *Spinoza's* sense, and only partly "coerced." *Leibniz*, in consequence of his doctrine of a pre-established harmony among the windowless monads which are controlled by God, was to all intents and purposes a thorough-going determinist. *Locke*, like *Spinoza*, corrected the misconception underlying the expression "freedom of the will," which should really be "freedom of man" and he supported the theory of free-will in that sense. *Hume* in so far as he was a consistent opponent of the objective reality of the causal nexus (which he was not) could of course attach no real meaning to determinism in conduct. Consistently with his radical scepticism he could neither hold a definite view on one problem nor regard human conduct as merely accidental. *Kant* is no doubt the best known philosopher in relation to the problem of free-will. He was the first to insist on freedom as a postulate of morality. "I ought, therefore I can." His next problem was to reconcile this postulated freedom with the thorough-going determinism which the scientific explanation of all phenomena seemed to demand, as he thought. He solved this difficulty in a characteristic way. He distinguished between phenomena and noumena, that is, between the world as it appears to us and the world as it is in itself. Human experiences as parts of the world of appearances are subject to the thorough-going determinism that characterizes all natural phenomena. But man is also part of the world of noumena, and as such he is free to obey the categorical imperative, or highest moral law, which is really only an expression of his noumenal self.

This brief and inadequate historic note only indicates the origin of the leading ideas in the history of the problem of free-will. For an adequate study of the history of the subject it is necessary to study carefully the works of the philosophers named, as well as those of many post-Kantians, who have not even been mentioned here.

FREGATIDAE: see FRIGATE-BIRD.

FREGELLAE, an ancient town of Latium on the Via Latina, 11 m. W.N.W. of Aquinum, near the left branch of the Liris. It was destroyed by the Samnites a little before 330 B.C., and in 328 B.C. a Latin colony was established there. It continued faithful to Rome; by breaking the bridges over the Liris it interposed an obstacle to Hannibal in 212 B.C., and it was a native of Fregellae who headed the deputation of the non-revolting colonies in 209 B.C. It flourished owing to its command of the crossing of the Liris, and to its position in a fertile territory, and here a revolt against Rome broke out in 125 B.C. It was captured by treachery and destroyed; but in 124 Fabratia Nova was founded 3 m. to the S.E. on the opposite bank of the Liris, and a post station Fregellanum (mod. Ceprano) grew up; Fregellae itself, however, continued to exist as a village even under the empire. The site is about $\frac{1}{2}$ m. E. of Ceprano, but the remains are very scanty. See G. Colasanti, *Fregellae, storia e topografia* (1906).

FREIBERG or FREYBERG, a town of Germany in the republic of Saxony, on the Mülnzbach, near its confluence with the Mulde, 19 m. S.W. of Dresden by rail. Pop. (1925) 34,742. It owes its origin to the discovery of silver mines (c. 1163). The town, with the castle of Freudenstein, was built in 1175, and its name, which first appears in 1221, is derived from the extensive mining franchises granted to it about that time. From the end of the 13th century until 1485 Freiberg remained common property. The Reformation was introduced in 1536 by Henry the Pious, who resided here. The town suffered severely during the Thirty Years' War, and again during the French occupation from 1806 to 1814. A part of its ancient walls still remains; the other portions have been converted into public walks and gardens. Freiberg is the seat of the general administration of the mines throughout the republic, and its mining academy (*Bergakademie*), founded in 1765, is famous. Among its distinguished scholars were Werner (1750–1817), who was also a professor there, and Alexander von Humboldt. Freiberg has manufactures of gold and silver lace, woollen cloths, iron-wares, china, sugar and cigars. In the vicinity are its famous silver and lead mines, of which the principal ones became state property in 1886. The castle of Freudenstein or Freistein, rebuilt by the elector Augustus in 1572, has been used as a military magazine. The cathedral, rebuilt in late Gothic style after its destruction by fire in 1484 and restored in 1893, was founded in the 12th century. Of the original church a German Romanesque doorway, known as the Golden Gate (*Goldene Pforte*), survives. Henry the Pious and several of his successors are buried here. The town-hall dates from the 15th century.

Posse, *Urkundenbuch der Stadt Freiberg*, in *Codex diplom. Sax. reg.* (3 vols., Leipzig, 1883–91); *Freibergs Berg- und Hüttenwesen*, published by the Bergmännischer Verein (Freiberg, 1883); Ledebur, *Über die Bedeutung der Freiburger Bergakademie* (ib. 1903); Steche, *Bau- und Kunstdenkmäler der Amtshauptmannschaft Freiberg* (Dresden, 1884).

FREIBERG, a town of Germany in Prussian Silesia, on the Polnitz, 35 m. S.W. of Breslau, by rail. Pop. (1925) 9,458. Its industries include watch-making, linen-weaving and glass-making. In the neighbourhood are the old and modern castles of the Fürstenstein family, whence the town is sometimes distinguished as Freiberg unter dem Fürstenstein.

FREIBURG IM BREISGAU, archiepiscopal see and city of Germany in the republic of Baden, situated on the Dreisam at

the foot of the Schlossberg, 40 m. N. of Basle by rail. Pop. (1925) 90,475.

In 1120 Freiburg became a free town, with privileges similar to those of Cologne; but in 1219 it fell into the hands of a branch of the family of Urach. It purchased its freedom in 1366; but, unable to reimburse its creditors, it was, in 1368, obliged to recognize the supremacy of the house of Hapsburg. In the 17th and 18th centuries it played a considerable part as a fortified town. Since 1821 it has been the seat of an archbishop with jurisdiction over the sees of Mainz, Rottenberg and Limburg. The waters of the river flow through the streets in open channels; and the old fortifications have been replaced by public walks and vineyards. It possesses a famous university, the Ludovica Albertina, founded by Albert VI., archduke of Austria, in 1457. The Freiburg minster is considered one of the finest Gothic churches in Germany. It was probably erected between 1122 and 1252; but the choir was not built till 1513. The tower is 386 ft. in height. In the interior of the church are some beautiful stained glass windows and paintings by Holbein and by Hans Baldung (c. 1470-1545). The palaces of the grand duke and the archbishop, the old town-hall and the *Kaufhaus* or merchants' hall, a 16th-century building with a handsome façade, are noteworthy. On the Schlossberg above the town there are ruins of two castles destroyed by the French in 1744; and about 2 m. N.E. stands the castle of Zähringen. Situated on the ancient road which runs by the Höllenpass between the valleys of the Danube and the Rhine, Freiburg early acquired commercial importance, and it is still the principal centre of the trade of the Black Forest. It manufactures buttons, tobacco, silk thread, paper, sugar, surgical and musical instruments.

See Schreiber, *Geschichte und Beschreibung des Münsters zu Freiburg* (1820 and 1825); *Geschichte der Stadt und Universität Freiburgs* (1857-59); *Der Schlossberg bei Freiburg* (1860); and Albert, *Die Geschichtsschreibung der Stadt Freiburg* (1902).

Battles of Freiburg, Aug. 3, 5 and 10, 1644.—During the Thirty Years' War the neighbourhood of Freiburg was the scene of a series of engagements between the French under Louis de Bourbon, duc d'Enghien (afterwards called the great Condé), and Henri de la Tour d'Auvergne, vicomte de Turenne, and the Bavarians and Austrians commanded by Franz, Freiherr von Mercy. At the close of the campaign of 1643 the French "Army of Weimar," having been defeated and driven into Alsace by the Bavarians, had there been reorganized under the command of Turenne, then a young general of 32 and newly promoted to the marshalate. In May 1644 he opened the campaign by recrossing the Rhine and raiding the enemy's posts as far as Überlingen on the lake of Constance and Donaueschingen on the Danube. The French then fell back with their booty and prisoners to Breisach, a strong garrison being left in Freiburg. The Bavarian commander, however, revenged himself by besieging Freiburg (June 27), and Turenne's first attempt to relieve the place failed. During July, as the siege progressed, the French Government sent the duc d'Enghien, who was ten years younger still than Turenne, but had just gained his great victory of Rocroy, to take over the command. Enghien brought with him a veteran army, called the "Army of France," Turenne remaining in command of the Army of Weimar. The armies met at Breisach on Aug. 2, by which date Freiburg had surrendered. At this point most commanders of the time would have decided not to fight, but to manoeuvre Mercy away from Freiburg; Enghien, however, was a fighting general, and Mercy's entrenched lines at Freiburg seemed to him a target rather than an obstacle. A few hours after his arrival, therefore, without waiting for the rearmost troops of his columns, he set the combining armies in motion for Krozingen, a village on what was then the main road between Breisach and Freiburg. The total force immediately available numbered only 16,000 combatants. Enghien and Turenne had arranged that the Army of France was to move direct upon Freiburg by Wolfenweiler, while the Army of Weimar was to make its way by hillside tracks to Wittnau and thence to attack the rear of Mercy's lines while Enghien assaulted them in front. Turenne's march (Aug. 3, 1644) was slow and painful as had been anticipated, and late in the afternoon, on passing Wittnau, he encountered the enemy. His

men carried the outer lines of defence without much difficulty, but as they pressed on towards Merzhausen the resistance became more and more serious. Turenne's force was little more than 6,000, and these were wearied with a long day of marching and fighting on the steep and wooded hillsides of the Black Forest. Thus the turning movement came to a standstill far short of Uffingen, the village on Mercy's line of retreat that Turenne was to have seized, nor was a flank attack possible against Mercy's

PLAN OF THE BATTLE OF FREIBURG, AUGUST 3RD, 5TH AND 10TH, 1644

main line, from which he was separated by the crest of the Schönberg. Meanwhile, Enghien's army had at the prearranged hour (4 P.M.) attacked Mercy's position on the Ebringen spur. A steep slope, vineyards, low stone walls and abatis had all to be surmounted, under a galling fire from the Bavarian musketeers, before the Army of France found itself, breathless and in disorder, in front of the actual entrenchments of the crest. A first attack failed, as did an attempt to find an unguarded path round the shoulder of the Schönberg. The situation was grave in the extreme, but Enghien resolved on Turenne's account to renew the attack although only a quarter of his original force was still capable of making an effort. He himself and all the young nobles of his staff dismounted and led the infantry forward again, the prince threw his baton into the enemy's lines for the soldiers to retrieve, and in the end, after a bitter struggle, the Bavarians, whose reserves had been taken away to oppose Turenne in the Merzhausen defile, abandoned the entrenchments and disappeared into the woods of the adjoining spur. Enghien hurriedly re-formed his troops, fearing at every moment to be hurled down the hill by a counterstroke; but none came. The French bivouacked in the rain, Turenne making his way across the mountain to confer with the prince, and meanwhile Mercy quietly drew off his army in the dark to a new set of entrenchments on the ridge on which stood the Loretto Chapel. On Aug. 4 the Army of France and the Army of Weimar met at Merzhausen, the rearmost troops of the Army of France came in, and the whole was arranged by the major-generals in the plain facing the Loretto ridge. This position was attacked on the 5th. Enghien had designed his battle even more carefully than before, but as the result of a series of accidents the two French armies attacked prematurely and straight to their front, one brigade after another, and though at one moment Enghien, sword in hand, broke the line of defence with his last intact reserve, a brilliant counterstroke, led by Mercy's brother Kaspar (who was killed), drove out the assailants. It is said that Enghien lost half his men on this day and Mercy one-third of his, so severe was the battle. But the result could not be gainsaid; it was for the French a complete and costly failure.

For three days after this the armies lay in position without fighting, the French well supplied with provisions and comforts from Breisach, the Bavarians suffering somewhat severely from want of food, and especially forage, as all their supplies had to be hauled from Villingen over the rough roads of the Black Forest. Enghien then decided to make use of the Glotter Tal to interrupt altogether this already unsatisfactory line of supply, and thus to force the Bavarians either to attack him at a serious disadvantage, or to retreat across the hills with the loss of their artillery and baggage and the disintegration of their army by famine and desertion. With this object, the Army of Weimar was drawn off on the morning of Aug. 9 and marched round by Betzenhausen and Lehen to Langen Denzling. The infantry of the Army of France, then the trains, followed, while Enghien with his own cavalry faced Freiburg and the Loretto position.

Before dawn on the 10th the advance guard of Turenne's army was ascending the Glotter Tal. But Mercy had divined his adversary's plan, and leaving a garrison to hold Freiburg, the

Bavarian army had made a night march on the 9–10th to the Abbey of St. Peter, whence on the morning of the 10th Mercy fell back to Graben, his nearest magazine in the mountains. Turenne's advanced guard appeared from the Glotter Tal only to find a stubborn rearguard of cavalry in front of the abbey. A sharp action began, but Mercy hearing the drums and fifes of the French infantry in the Glotter Tal broke it off and continued his retreat in good order. Enghien thus obtained little material result from his manoeuvre. Only two guns and such of Mercy's wagons that were unable to keep up fell into the hands of the French. Enghien and Turenne did not continue the chase farther than Graben, and Mercy fell back unmolested to Rothenburg on the Tauber.

The moral results of this sanguinary fighting were, however, important and perhaps justified the sacrifice of so many valuable soldiers. Enghien's pertinacity had not achieved a decision with the sword, but Mercy had been so severely punished that he was unable to interfere with his opponent's new plan of campaign. This, which was carried out by the united armies and by reinforcements from France, while Turenne's cavalry screened them by bold demonstrations on the Tauber, led to nothing less than the conquest of the Rhine Valley from Basle to Coblenz, a task which was achieved so rapidly that the Army of France and its victorious young leader were free to return to France in two months from the time of their appearance in Turenne's quarters at Breisach.

FREIDANK (VRĪDANC), the name by which a Middle High German didactic poet of the early 13th century is known. It has been disputed whether the word, which is equivalent to "free-thought," is to be regarded as the poet's real name or only as a pseudonym; the latter is probably the case. Little is known of Freidank's life. He accompanied Frederick II. on his crusade to the Holy Land, where, in 1228–29, a portion of his work was composed; and it is said that on his tomb at Treviso there was inscribed, with allusion to the character of his style, "he always spoke and never sang." Wilhelm Grimm originated the hypothesis that Freidank was to be identified with Walther von der Vogelweide; but this is no longer tenable. Freidank's work, *Bescheidenheit*, i.e., "practical wisdom," consists of a collection of proverbs, and moral and satirical reflections, arranged under general heads. Its popularity till the end of the 16th century is shown by the great number of mss. extant.

Sebastian Brant published the *Bescheidenheit* in a modified form in 1508. Wilhelm Grimm's edition appeared in 1834 (2nd ed. 1860), H. F. Bezzenberger's in 1872. A later edition is by F. Sandvoss (1877). The old Latin translation, *Fridangi Discretio*, was printed by C. Lemcke in 1868; and there are two translations into modern German, A. Bacmeister's (1861) and K. Simrock's (1867). See also F. Pfeiffer, *Über Freidank* (*Zur deutschen Literaturgeschichte*, 1855), and H. Paul, *Über die ursprüngliche Anordnung von Freidanks Bescheidenheit* (1870).

FREIENWALDE, a town of Germany in the Prussian province of Brandenburg, on the Oder, 28 m. N.E. of Berlin by rail. Pop. (1925) 8,800. It has a small palace, built by the Great Elector, and manufactures machinery and pianos. It is a favourite summer resort of the inhabitants of Berlin. Freienwalde, as distinguished from the smaller town of the same name in Pomerania, first appears as a town in 1364.

FRIESLEBENITE, a rare mineral consisting of sulphantimonite of silver and lead ($\text{PbAg}_2\text{Sb}_4\text{S}_{11}$). The monoclinic crystals are prismatic in habit, with deeply striated prism and dome faces. The colour is steel-grey, and the lustre metallic; hardness $2\frac{1}{2}$, specific gravity 6.2. It occurs with argentite, chalybite and galena in the silver veins at Freiberg, Saxony, where it has been known since 1720. The species was named after J. K. Freiesleben, who had earlier called it *Schulz-Glasersz*. Groups of large crystals have come from Hiendelaencina near Guadalajara in Spain.

FREIGHT: see AFFREIGHTMENT.

FREILIGRATH, FERDINAND (1810–1876), German poet, was born at Detmold on June 17, 1810. He was educated for a commercial career. The years from 1831 to 1836 he spent in a bank at Amsterdam, and 1837 to 1839 in a business house

at Barmen. In 1838 his *Gedichte* appeared, and he abandoned commerce. His repudiation of the political poetry of 1841 and its revolutionary ideals induced Frederick William IV., to give him a pension of 300 thalers a year. He married, and, to be near his friend Emanuel Geibel, settled at St. Goar. Before long, however, Freiligrath was himself carried away by the rising tide of liberalism. In the poem *Ein Glaubensbekenntnis* (1844) he avowed his sympathy with the political movement led by his old adversary, Georg Herwegh; the day, he declared, of his own poetic trifling with romantic themes was over; romanticism itself was dead. He sacrificed his pension, went to Switzerland, and then after the publication of his *ça ira!* (1846), for greater safety, to London, where he resumed the commercial life he had broken off seven years before. When the revolution of 1848 broke out, it seemed to Freiligrath, as to all the liberal thinkers of the time, the dawn of an era of political freedom; and in his *Politische und soziale Gedichte* (1849–1851), he welcomed it with unbounded enthusiasm. He returned to Germany and settled in Düsseldorf; but the publication of his poem, *Die Toten an die Lebenden* (1848) led to his arrest on a charge of *lèse-majesté*. He was acquitted, but his association with the democratic movement rendered him suspect, and in 1851 he returned to London, where he lived for 17 years. In 1868 he returned to Germany, settling first in Stuttgart and in 1875 in the neighbouring town of Cannstatt, where he died on March 18, 1876.

Literary Significance.—Freiligrath was the most gifted poet of the German revolutionary group. His own purely lyric poetry re-echoes for the most part the familiar thoughts and imagery of his romantic predecessors; but at an early age he had been attracted by the work of French contemporary poets, and he reinvigorated the German lyric by grafting upon it the orientalism of Victor Hugo. In this reconciliation of French and German romanticism lay Freiligrath's significance for the development of the lyric in Germany. Freiligrath, when he is at his best, displays a vigour and strength, a power of direct and cogent poetic expression, not to be found in any other political singer of the age. He translated many English and Scottish ballads, and much contemporary English verse (*Englische Gedichte aus neuerer Zeit*, 1846; *The Rose, Thistle and Shamrock*, 1853, 6th ed. 1887); he also translated Shakespeare's *Cymbeline*, *Winter's Tale* and *Venus and Adonis*, as well as Longfellow's *Hiawatha* (1857).

Freiligrath's *Gedichte* have passed through some 50 editions and his *Gesammelte Dichtungen*, first published in 1870, have reached a considerable number. *Nachgelassenes* (including a translation of Byron's *Mazeppa*) was published in 1883. A selection of Freiligrath's best-known poems in English translation was edited by his daughter, Mrs. Freiligrath-Kroecker, in 1869; also *Songs of a Revolutionary Epoch* were translated by J. L. Joynes in 1888. Cf. E. Schmidt-Weissenfels, *F. Freiligrath, eine Biographie* (1876); W. Buchner, *F. Freiligrath, ein Dichterleben in Briefen* (2 vols., 1881); G. Freiligrath, *Erinnerungen an F. Freiligrath* (1889); P. Besson, *Freiligrath* (Paris, 1899); K. Richter, *Freiligrath als Übersetzer* (1899); E. G. Gudde, *Freiligrath Entwicklung als politischer Dichter* (Berlin, 1922).

FREISCHÜTZ, in German folklore, a marksman who by a compact with the devil has obtained a certain number of bullets destined to hit without fail whatever object he wishes. As the legend is usually told, six of the *Freikugeln* or "free bullets" are thus subservient to the marksman's will, but the seventh is at the absolute disposal of the devil himself. Stories about the Freischütz were especially common in Germany during the 14th, 15th and 16th centuries; but the first time that the legend was turned to literary profit is said to have been by Apel in the *Gespenserbuch* or "Book of Ghosts." It formed the subject of Weber's opera *Der Freischütz* (1821). The name by which the Freischütz is known in French is Robin des Bois.

See Kind, *Freyschütz* (Leipzig, 1843); *Revue des deux mondes* (Feb. 1855); Grässe, *Die Quelle des Freischütz* (Dresden, 1875).

FREISING, a town of Germany, in the republic of Bavaria, on the Isar, 16 m. by rail N.N.E. of Munich. Pop. (1925) 14,972. The cathedral, which dates from about 1160 is famous for its crypt. Noteworthy also are the old palace of the bishops, now a clerical seminary, and the town-hall. Near the town is the site of the Benedictine abbey of Weihenstephan, which existed from 725 to 1803. Freising is said to have been founded by the Romans.

Destroyed by the Hungarians in 955, it was fortified by the emperor Otto II. in 976 and by Duke Welf of Bavaria in 1082. A bishopric was established here in 724 by St. Corbinianus, whose brother Erimbert was consecrated second bishop by St. Boniface in 739. In the 17th century the bishops became princes of the Empire. In 1802 the see was secularized, the bulk of its territories being assigned to Bavaria and the rest to Salzburg, of which Freising had been a suffragan bishopric. There are iron-foundries and trade is in corn and cattle.

FRÉJUS, a town in the department of the Var in S.E. France. Pop. (1926) 3,577. It is 18 m. S.E. of Draguignan. It has fine Roman remains. Since the 4th century it has been a bishop's see, in the ecclesiastical province of Aix en Provence. In modern times the neighbouring fishing village at St. Raphaël ($\frac{1}{2}$ m. by rail S.E., and on the seashore) has become a town of 5,627 inhabitants (1926). In 1799 Napoleon disembarked there on his return from Egypt, and re-embarked for Elba in 1814, while nowadays it is much frequented as a health resort, as is also Valescure (2 m. N.W. on the heights above). The cathedral church in part dates from the 12th cent., and small portions of the mediaeval episcopal palace are now visible, as it was rebuilt about 1823. The ramparts of the old town can still be traced for a long distance, and there are fragments of two moles, of the theatre and of a gate. The amphitheatre, which seated 12,000 spectators, is better preserved. The ruins of the great aqueduct which brought the waters of the Siagnole, an affluent of the Siagne, to the town, can still be traced for a long distance. The town of Forum Iulii was founded by Julius Caesar on this site, formerly the capital of the Oxybii, to secure a harbour independent of Marseilles. The buildings, of which ruins exist, were mostly built by Caesar or by Augustus, and show that it was an important naval station and arsenal. But the town suffered much at the hands of the Arabs and Barbary pirates, and its inhabitants have used the ruined Roman buildings as a quarry. The old harbour (really a portion of the lagoons) is now completely silted up.

Corks, bricks, tiles and fine pottery are made, and rushes are woven. There are mines of coal and bituminous shale.

FRELINGHUYSEN, FREDERICK THEODORE (1817-1885), American lawyer and statesman, of Dutch descent, was born at Millstone, N.J., on Aug. 4, 1817. His grandfather, Frederick Frelinghuysen (1753-1804), was an eminent lawyer, a soldier in the American Revolution, and a member (1778-79 and 1782-83) of the continental congress, and in 1793-96 of the U.S. Senate; and his uncle, Theodore (1787-1862), was a U.S. senator from New Jersey in 1829-35, the Whig candidate for vice-president on the Clay ticket in 1844, chancellor of the University of New York in 1839-50 and president of Rutgers college in 1850-62. Frederick Theodore, left an orphan at the age of three, was adopted by his uncle, graduated at Rutgers in 1836 and studied law in Newark with his uncle, to whose practice he succeeded in 1839. He became attorney for the Central railroad of New Jersey, the Morris Canal and Banking company and other corporations, and from 1861 to 1867 was attorney-general of New Jersey. In 1861 he was a delegate to the peace congress at Washington, and in 1866 was appointed by the governor of New Jersey, as a republican, to fill a vacancy in the U.S. Senate. In the winter of 1867 he was elected to fill the unexpired term, but a democratic majority in the legislature prevented his re-election in 1869. From 1871 to 1877 he was again a member of the U.S. Senate, in which he was prominent in debate and in committee work, and was chairman of the committee on foreign affairs during the Alabama claims negotiations. He was a strong opponent of the reconstruction measures of President Johnson, for whose conviction he voted in the impeachment trial. He was a member of the joint committee which drew up and reported (1877) the Electoral Commission bill, and subsequently served as a member of the commission. In 1881 he was appointed secretary of State by President Arthur to succeed James G. Blaine, and served until the inauguration of President Cleveland in 1885. He died in Newark, May 20, 1885.

See John F. Hageman, "The Life, Character and Services of Frederick T. Frelinghuysen," *New Jersey Hist. Proc.*, 2nd ser., vol. ix.,

p. 45-75 (1887).

FRÉMANTLE, a seaport of Swan county, Western Australia, at the mouth of the Swan river, 12 m. by rail S.W. of Perth. It is the terminus of the State and Australian Trans-Continental railways, and is a town of some industrial activity, shipbuilding, soap-boiling, saw-milling, smelting, iron-founding, furniture-making, flour-milling, brewing and tanning being its chief industries. The harbour, by the construction of two long moles and the blasting away of the rocks at the bar, has been rendered secure. Mail steamers call at the port. Fremantle became a municipality in 1871, and its population in 1925 was 29,168.

FRÉMIET, EMMANUEL (1824-1910), French sculptor, born in Paris, was a nephew and pupil of Rude; he chiefly devoted himself to animal sculpture and to equestrian statues in armour. His earliest work was in scientific lithography (osteology), and for a while he served in the gruesome office of "painter to the Morgue." In 1843 he sent to the Salon a study of a "Gazelle." His "Wounded Bear" and "Wounded Dog" were produced in 1850 (Luxembourg Museum). He produced the following equestrian statues: "Chef Gaulois" in 1864 (Museum at St. Germain); "Louis d'Orléans" in 1869 (at the Château de Pierrefonds); "Joan of Arc," in 1874 (Place de Rivoli, Paris); this he afterwards (1889) replaced with another version; "Velasquez" in 1891 (Gardens of the Louvre); "Duguesclin" in 1902 (Dinan); "Colonel Howard" in 1903 (Baltimore). His masterly "Gorilla and Woman" won him a medal of honour at the Salon of 1887. Of the same character is his "Ourang-Outangs and Borneo Savage" of 1895, at the Paris Museum of Natural History. He became a member of the Académie des Beaux Arts in 1892, and of the Royal Academy in London in 1904, and succeeded Barye as professor of animal drawing at the Natural History Museum of Paris. He died in Paris on Sept. 10, 1910.

FRÉMONT, JOHN CHARLES (1813-1890), American explorer, soldier and political leader, was born in Savannah, Georgia. His father, a native of France, died when the boy was in his sixth year, and his mother, a member of an aristocratic Virginia family, removed to Charleston, S.C., where Frémont's youth was spent. In 1828 he entered the junior class of the College of Charleston, where he displayed marked ability, especially in mathematics. His degree was withheld because of irregular attendance but finally conferred in 1836. Joel R. Poinsett's influence secured his appointment in 1833 as teacher of mathematics on board the sloop-of-war "Natchez" and Frémont sailed with that vessel on a cruise along the South American coast which lasted two and a half years. Upon his return he declined an appointment as professor of mathematics in the United States navy and chose instead to serve as assistant engineer of a survey undertaken to find the best pass for a proposed railway from Charleston to Cincinnati. Following this Poinsett secured for him an appointment as second lieutenant of topographical engineers in the United States army, and for the next three years he was an assistant to the French explorer, Jean Nicholas Nicollet, employed by the war department to survey and map a large part of the country lying between the upper waters of the Mississippi and Missouri rivers. In 1841 Frémont alone headed an expedition to survey the Des Moines river to complete Nicollet's map. These years under Nicollet furnished invaluable training and experience for use in his later career and gave him a desire for further western adventure. Upon his return he married Jessie Benton, daughter of Senator Thomas Hart Benton of Missouri, and it was in no small measure Benton's great interest in the West and his influence with the Government that enabled Frémont to accomplish within the next few years the exploration of much of the territory between the Mississippi valley and the Pacific ocean.

When emigration over the Oregon trail to the Oregon country began to be important in 1842, Frémont was sent at the head of a party to explore the route beyond the Mississippi as far as South pass in Wyoming. He surveyed the trail thoroughly and his excellent descriptions greatly aided the emigrants of following years. He ascended to the summit of the second highest peak of the Wind River mountains, since known as Frémont's peak. The year following he was sent to complete the survey of the trail to the

mouth of the Columbia. His guide on this as well as on the previous expedition was the famed and picturesque Kit Carson. The Oregon settlements were quickly reached, and then Frémont turned south and east via the Klamath lakes to north-western Nevada, continuing to the Truckee and Carson rivers. This portion of the journey over hitherto untravelled country added greatly to geographical knowledge of the West. Frémont then accomplished with his entire expedition an extremely difficult and rash crossing of the Sierra Nevada mountains in midwinter—an exploit which added greatly to his fame—and spent the winter near Sutter's Fort on the Sacramento river in California. His return was round the southern end of the Sierra Nevada range and across to Great Salt lake mainly via the old Spanish trail from Santa Fé to California.

Thousands of copies of his report of this expedition were printed and eagerly read. War with Mexico over the annexation of Texas seemed imminent and in the spring of 1845 Frémont was again despatched on a third expedition for the professed purpose of further exploring the Great basin and Pacific coast, but with secret instructions for action in case of a war with Mexico. He and his party of 62, after traversing the Great basin by a new route directly west from Great Salt lake and down the valley of the Humboldt, reached California, in Jan. 1846, after a second winter crossing of the Sierras. The Mexican authorities became suspicious and ordered Frémont out of the province. Frémont refused to leave at once and fortified his position, but later thought better of this indiscreet action and led his party toward the Oregon border. He was overtaken by a messenger direct from Washington and at once turned about and led his force back into California. The official documents delivered gave Frémont no excuse for hostile actions, but what orders the private letters and verbal instructions contained is unknown. While Frémont's men were in camp the Americans in northern Mexico revolted from Spain and created the Bear-Flag republic. Frémont took no part in the hostilities but certainly gave his moral support. When news of the declaration of war with Mexico did reach California all the northern region was already in American hands. Frémont was appointed by Commodore Stockton major of a battalion made up mainly of American volunteers, and by Jan. 1847 he and Stockton had completed the conquest of the future State. Gen. Stephen W. Kearney, in the meantime, entered California from the south-east with orders similar to those of Stockton, namely to conquer the region and establish a government. This conflict of orders led to a conflict of authorities between which Frémont was caught. Stockton had already appointed him governor of California, but Kearney would not recognize the appointment. Frémont, obeying the officer from whom he had received his commission, disregarded Kearney's contradictory orders and was arrested by the latter, who by this time, unknown to Frémont, had received later orders from Washington establishing his authority without contradiction. Frémont was tried by court martial in Washington, found guilty of mutiny, disobedience and conduct prejudicial to military discipline, and sentenced to be dismissed. President Polk approved of the verdict except as to mutiny, but remitted the penalty. Frémont, in a bitter mood, resigned.

The explorer now intended to establish his home on an estate which he had purchased in California, and on his way thither decided to lead, at his own and Senator Benton's expense, a fourth expedition to find passes for a Pacific railroad which he was eager to see built. Kit Carson not being available, Frémont employed the eccentric "Bill" Williams as guide. Westward from the headwaters of the Rio Grande the party tried to penetrate the massive San Juan range in December. Williams led them into a high, unknown pass where they were caught by a blizzard. After weeks of intense cold and the loss of 11 men and the entire outfit, the exhausted party in retreat reached the first settlements in the upper Rio Grande. Frémont continued by the southern route to California and was greeted with news of the discovery of gold. Rich veins were discovered on his great 40,000ac. estate on the Mariposa river at the base of the Sierras, and he spent the next few years developing mines which quickly made him a multi-millionaire. In Dec. 1849 he was elected one of the first two sena-

tors from California, but drawing the short term he served only from Sept. 1850 to March 1851. He was defeated for re-election by the pro-slavery party. His opposition to slavery, however, together with the popularity his explorations and his part in the conquest of California had won for him, led to his nomination for the presidency in 1856 by the newly formed Republican Party. In the ensuing election he was defeated by James Buchanan by 174 to 114 votes.

Soon after the Civil War began, Frémont was appointed major-general and placed in command of the western department with headquarters at St. Louis. The task of organizing an effective army with insufficient arms, insufficient supplies and but a few thousand untrained men in a slave State which needed policing at all points proved too much of a task for Frémont's ability. Political and military enemies made the most of his failures, and he was blamed for several distressing defeats, though it is doubtful if they could have been avoided. Furthermore, on Aug. 30, 1861, he issued a proclamation in which he declared the property of Missourians in rebellion confiscated and their slaves emancipated. President Lincoln regarded this proclamation as premature, fearing that it might alienate the border States whose loyalty he still hoped to keep. The adverse reports of agents sent by Lincoln to investigate Frémont's management led to his removal by the president. Out of consideration for the "radicals" who backed Frémont, he was placed in command of the mountain department of Virginia, Kentucky and Tennessee in 1862 but was ineffective and seemingly dazed by the rapid manoeuvres of "Stonewall" Jackson, his opponent. When his army was united with the army of the Potomac to form the army of Virginia which was placed under the command of his old enemy in Missouri, Gen. John Pope, Frémont resigned. He was still popular enough to be nominated for the presidency in 1864 by the radical wing of the Republican Party, but when he saw that he had no chance and would possibly only split the party to defeat Lincoln, he withdrew. He retired from public life and devoted himself to building a railroad by the southern route to the Pacific. The finances of the enterprise were unsound and in the collapse in 1870 Frémont lost the fortune he had made in California. In his embarrassment he welcomed the relief and change of occupation that came with an appointment as governor of Arizona territory in 1878, an office which he occupied until 1881. He died in New York city on July 13, 1890.

It is for the splendid achievements of his early life as an explorer that Frémont will be most gratefully remembered by the American people. It is true that trappers had long before travelled where he followed, but he first surveyed and described the routes. If he was not a "pathfinder" he was a "path-marker." "From the ashes of his campfires have sprung cities."

See his *Report of the Exploring Expedition to the Rocky Mountains, 1842, and to Oregon and North California, 1843-44* (1845), and *Memories of My Life* (1887). The best biography is Allan Nevins, *Frémont, the West's Greatest Adventurer* (1927). See also H. Bashford and H. Wagner, *A Man Unafraid, the Story of John C. Frémont* (San Francisco, 1927). Frémont's own account of "The Conquest of California" is in the *Century Magazine* for April, 1890.

FREMONT, a city of eastern Nebraska, U.S.A., on the Platte river, 37m. N.W. of Omaha, at an altitude of 1,196ft.; the county seat of Dodge county. It is on the Lincoln highway and Number 77, and is served by the Burlington, the Chicago and North Western and the Union Pacific railways. The population was 9,605 in 1920, of whom 1,252 were foreign-born white, and was 11,407 in 1930 by the Federal census. Picturesque bluffs, wooded islands and beautifully shaded streets give charm to the city. It is an important grain and live stock market, and has poultry-packing plants, creameries, incubator and refrigerator factories, and many smaller industries. Midland college (Lutheran), founded at Atchison, Kan., in 1887, was moved here in 1919. Fremont was founded in 1856 (incorporated 1871) and was named after Gen. John C. Frémont. It was on the old Overland Trail, the main route of pioneer travel from the Missouri river to California and Oregon.

FREMONT, a city of northern Ohio, U.S.A., 25m. from Lake Erie, at the head of navigation on the Sandusky river; the county seat of Sandusky county. It is on Federal highway 20,

and is served by the New York Central railroad and by steamers to ports on Lake Erie. The population was 12,468 in 1920; 1930 it was 13,422. Fremont is surrounded by a rich agricultural and oil-producing region. Natural gas is abundant. Its manufactures were valued in 1927 at \$10,927,467. Ft. Stephenson, built during the war of 1812, and gallantly defended on Aug. 2, 1813, by Major George Croghan, with 160 men, against 1,000 British and Indians, still stands in the heart of the city. Fremont was named in 1849 after J. C. Frémont. Before that it had been called Lower Sandusky.

FRÉMY, EDMOND (1814-1894), French chemist, was born at Versailles on Feb. 28, 1814. He entered Gay-Lussac's laboratory in 1831, and became *préparateur* at the École Polytechnique in 1834 and at the Collège de France in 1837; he was *répétiteur* at the École Polytechnique, where in 1846 he became professor. In 1850 he succeeded Gay-Lussac in the chair of chemistry at the Muséum d'Histoire Naturelle, of which he was director, in succession to M. E. Chevreul, from 1879 to 1891. He died at Paris on Feb. 3, 1894. His work included investigations of osmic acid, of the ferrates, stannates, plumbates, etc., and of ozone, attempts to obtain free fluorine by the electrolysis of fused fluorides, and the discovery of anhydrous hydrofluoric acid and of a series of *acides sulphasotés*, the precise nature of which long remained a matter of discussion. He also studied the colouring matters of leaves and flowers, the composition of bone, cerebral matter and other animal substances, and the processes of fermentation, in regard to the nature of which he was an opponent of Pasteur's views. In the field of technical chemistry he contributed to our knowledge of the manufacture of iron and steel, sulphuric acid, glass and paper, and in particular worked at the saponification of fats with sulphuric acid and the utilization of palmitic acid for candle-making. In the later years of his life he applied himself to the problem of obtaining alumina in the crystalline form, and succeeded in making rubies identical with the natural gem not merely in chemical composition but also in physical properties. He wrote a *Traité de chimie générale* in 6 vols.

FRENCH, DANIEL CHESTER (1850-), American sculptor, was born at Exeter (N.H.), on April 20, 1850, the son of Henry Flagg French, a lawyer, who for a time was assistant secretary of the U.S. Treasury. After a year at the Massachusetts Institute of Technology, French spent a month in the studio of John Q. A. Ward, then began to work on commissions, and at the age of 23 received from the town of Concord, Mass., an order for his well-known statue, "The Minute Man," which was unveiled (April 19, 1875) on the centenary of the battle of Concord. Previously French had gone to Florence, Italy, where he spent a year with Thomas Ball. French's best-known work is "Death Staying the Hand of the Sculptor," a memorial for the tomb of the sculptor Martin Milmore, in the Forest Hills cemetery, Boston.

Among French's early works are: a monument to John Boyle O'Reilly, Boston; "Gen. Cass," National hall of statuary, Washington; "Dr. Gallaudet and his First Deaf-Mute Pupil" (Washington); the colossal "Statue of the Republic," for the Columbian exposition at Chicago; statues of Rufus Choate (Boston), John Harvard (Cambridge, Mass.), and Thomas Starr King (San Francisco, Calif.); a memorial to the architect Richard M. Hunt, New York; and a large "Alma Mater," near the approach to Columbia university, New York. His important recent works are the four groups, Europe, America, Asia and Africa, for the New York custom-house; the Melvin memorial at Concord, Mass. (1916); the 1st Division war memorial, Washington, D.C. (1924); and the statue "Memory" (1911) in the Metropolitan Museum of Art. In 1920 he completed his statue of Lincoln for the Lincoln memorial, Washington, D.C., and in 1922 his statue of Lafayette.

See LORADO TAIT, *The History of American Sculpture* (1903, 2nd ed., 1924); MRS. W. H. FRENCH, *Memories of a Sculptor's Wife* (1928).

FRENCH, NICHOLAS (1604-1678), bishop of Ferns, Ireland, was an Irish political pamphleteer, born at Wexford. He was educated at Louvain, and before 1646 was appointed bishop of Ferns. His political activities made it prudent for him to leave Ireland in 1651. He acted as coadjutor to the archbishops of Santiago de Compostella and Paris, and to the bishop of Ghent,

and died at Ghent on Aug. 23, 1678.

The *Historical Works* of Bishop French, comprising three pamphlets and some letters, were published by S. H. Bindon at Dublin in 1846. See T. D. McGee, *Irish Writers of the 17th Century* (Dublin, 1846); Sir J. T. Gilbert, *Contemporary History of Affairs in Ireland, 1641-1652* (Dublin, 1879-1880); and T. Carte, *Life of James, Duke of Ormond* (new ed., Oxford, 1851).

FRENCH AFRICAN LITERATURE. The outbreak of the World War brought home to France her need for man power, and she then began to turn her attention towards a race which sent her its men by thousands. In the midst of the madness and destruction that overwhelmed Europe, she was forced to recognize that, in spite of solid, imposing and well-documented volumes, the theories with regard to the natural superiority of the Aryan races, set forth by Count Gobineau in his *Essai sur l'inégalité des races humaines* (1853-5), had received an unpleasant shock. Moreover, the ideas which Dr. Cureau, a former Governor of French Equatorial Africa, and a follower of Gobineau, expressed in his learned and interesting *Sociétés primitives de l'Afrique équatoriale* (1912) have, after much discussion, been strongly attacked, first by Jean Finot, in his widely known work *Le préjugé des races* (1905), and by Doctor Huot, in *L'âme noire*.

The soul of the negro, as compared with that of the white man, is emotional, unstable, variable and incomprehensible. It cannot be fathomed either in the tales of the old navigators—they dealt too much in fable and fantasy—or in the journals of contemporary explorers. We cannot number among the initiated either Pierre Loti, impassioned admirer of the exotic, or even Fromentin, whose *Un été dans le Sahara* (1874) and *Une année dans le Sahel* (1859) conjure up before us burning sand and blinding light; but we must include Isabelle Eberhardt, the *bonne nomade*, whose whole work is a glorification of Islam; and a group of other writers of whom the most outstanding are Robert Randau, whose novels *Les Colons* (1907), *Les Algériens* (1912) and *Cassard le Berbère* are powerful and vivid; F. Duchene with *Au pas lent des caravanes* (1922), *Thamill'a* (1923) and *Le roman du Meddah* (1924); Maximilienne Heller with *La mer rouge* (1923) and many others. These works, however, have been inspired less by the influence of Africa than by that of the Mediterranean. In spite of such works as *Terres de soleil et de sommeil* (1916) and *Le voyage du centurion* (1916) by Lucien Psychari, *Visions congolaises* by Louis de Raulin and *Les explorateurs* (1909) and *Le commandant et les Foulbé* (1910) by Robert Randau the true African influence has only prevailed since 1919.

Since that time there has been a harvest of such literature, including the remarkable *Visage de la Brousse* by Pierre Bonardi (1920) and *l'isolement* by Dominique Combatte, which exude the stifling atmosphere of a tropical forest. *Des inconnus chez moi* (1920), by Lucie Cousturier, is a work profoundly true, profoundly human as well as infinitely pathetic. *Batouala* (1921) and *Djouma, chien de la Brousse*, by René Maran, *La randonnée de Samba Diouf* (1922) by the brothers Tharaud, *Koffi* (1922) by Gaston Joseph, *Diato*, a mine of Mandingo folk-lore, by André Demaison (1923), *Métempsychose* by Madeleine de Valcombe (1923), *Pellobellé, gentilhomme soudanais*, by Oswald Durand, *Ulyse, cafre* (1924) by the brothers Marius-Ary Leblond, *Les Chansons de Kou-Singa* by Jean Marville have also contributed to the researches of such men as Delafosse, Bruel and missionaries of all classes, lay, military, commercial and religious. These works may not perhaps have the lyric character which runs through *A travers l'Afrique* (1910) by Captain Baratier, nor the humour of that caustic adventurer to whom Pierre Mille, the French Kipling, has given the name Barnavaux. They are, however, a valuable contribution to the study of the negro mind, and as such increase our knowledge of humanity. André Gide has written *Le Voyage au Congo* (1927), in which he announces the sequel *Le Retour*, while the works of Jean d'Esme, *Thi-Ba* (1925) and *L'âme de la Brousse* (1925) should also be mentioned. J. F. Boeuf *La Soudanaise et son Amant* (1924) and *Sous le triste Soleil splendide* and Cl. Breton's *Bilali* (1927) are worthy of comment. One of the most remarkable recent works is Paul Morand's *Magie noire* (1928) which contains an exhaustive bibliography. (R. MN.)

FRENCH AND INDIAN WAR, THE (1754-60), some-

times called the Fourth Intercolonial War, was the last and most decisive of the conflicts in North America between France and England in their struggle for possession of the continent. It was the American counterpart to the Seven Years' War (*q.v.*) in Europe. Control of the Ohio valley was the issue which caused the reopening of hostilities. To the French the Ohio valley was the essential link between their colonies on the St. Lawrence and those on the Mississippi. To the English it represented room for westward expansion as an alternative to being surrounded by the French. Fighting began when the troops of Virginia under George Washington, which were sent to build a fort at the junction of the Monongahela and Allegheny rivers, were fired on by a detachment of French troops on the same mission. The first two years of the war brought only disaster to the English, chiefly because of poor organization and divided councils. Notable among the failures was the defeat of an expedition sent under Gen. Edward Braddock (*q.v.*) to capture Ft. Duquesne. With the assumption of the secretaryship of state in England by William Pitt (*q.v.*) the attack was renewed all along the line with such energy that the tide turned and success resulted. Louisburg surrendered to Amherst in July, 1758 and the fall of Ft. Frontenac followed soon after. In November Forbes occupied Ft. Duquesne and rebuilt the fort under the name of Ft. Pitt, the nucleus of the present city of Pittsburgh. In May, 1759, the French commandant, Bourlamaque, withdrew from Ticonderoga and Crown Point. Ft. Niagara surrendered to Amherst in July. The decisive victory for the English was the daring and successful assault on Quebec by Wolfe in September, 1759. On Sept. 8, 1760, after the fall of Montreal, the French signed terms of capitulation which ended the war in America. Final peace came only with the end of the war in Europe and the signing of the Treaty of Paris (1763) by which the French transferred Canada and all its dependencies to the English crown, thus ending a rivalry in North America which had lasted a hundred and fifty years.

See F. Parkman, *Montcalm and Wolfe* (1884); H. R. Casgrain, *Wolfe and Montcalm* (1905); W. Wood, *The Fight for Canada* (1906); J. Windsor, *The Mississippi Basin* (1895); H. L. Osgood, *The American Colonies in the 18th Century* (1926).

FRENCH CONGO, the official name of the French possessions in Equatorial Africa from 1888 to 1910. In the last-named year these possessions were renamed *l'Afrique Équatoriale française*, abbreviated to A.É.F. (See FRENCH EQUATORIAL AFRICA.)

FRENCH EQUATORIAL AFRICA, the common name for the Gabun, Middle Congo, Ubangi-Shari and Chad colonies. The combined area of these colonies is approximately 982,000 sq.m.; the population (official estimates, 1926), 3,127,000 natives and 2,503 Europeans, of whom 2,113 were French.

Stretching across two-thirds of the width of Africa these colonies extend from the Lower Guinea coast, eastward to the Congo-Nile watershed and northward to Lake Chad and the central Sahara. No part of French Equatorial Africa lies south of the Congo river; for the greater part the southern frontier, separating it from the Belgian Congo colony, is the middle stretch of the Congo and the northern banks of the Ubangi and Mboma (the great northern affluents of the Congo). On the east, French Equatorial Africa adjoins the Anglo-Egyptian Sudan; on the north the hinterland of the Italian colonies of Tripolitania and Cyrenaica; north-west it is conterminous with French West Africa. On the west, north of the Gabun, it is bordered by Spanish Guinea and the Cameroons. The south-east part of the Cameroons comes within 130 m. of the Ubangi, so that French Equatorial Africa consists of two large areas joined by a comparatively narrow strip of land. As, since 1919, the Cameroons have been under French mandate (save for an area adjoining Nigeria), this restriction causes no difficulty.

Physical Features.—The country falls into divisions corresponding, roughly, to its river systems, of which there are three. These are: (1) The rivers which flow into the Atlantic; (2) those belonging to the Congo basin, and (3) those to the inland basin of Lake Chad. The coast extends from 1° N. to 5° S. At the northern end is Corisco bay, and not far south of that bay is the deep indentation of the Gabun (a large estuary fed, however, by

unimportant rivers). Still further south is Cape Lopez, at the delta of the Ogowé. Near the southern border are the roadstead of Loango and Pointe Noire. Behind the coast plains the Crystal and other mountains, with heights of 3,000 to 4,500 ft., form the western edge of a tableland, part of the plateau which covers the greater part of inner Africa. In the west and north-west this plateau has a general elevation of from 1,500 to 2,800 feet. Further east it marks the northern limit of the Congo basin; and, where it bounds the valley of the Ubangi, is undulating land 1,000 to 2,000 ft. high, falling rather steeply to the north towards Lake Chad. In the north-east a hilly region separates Wadai from the Nile basin.

The chief rivers flowing to the Atlantic are the Ogowé (*q.v.*), navigable from its mouth for some 250 m., the Nyanga (120 m. long), and the meandering Kwila (320 m. long). All these rivers are in the Gabun colony. Of rivers belonging to the Congo system are the Sanga—navigable for over 300 m. from its confluence with the Congo—smaller streams which also flow direct into the Congo and various tributaries and sub-tributaries of the Ubangi. The many rivers of the Chad basin in French Equatorial Africa join the Shari (*q.v.*) before reaching the lake.

Primeval forest, with trees 150 to 200 ft. high, covers a great part of the Gabun, Middle Congo and Ubangi regions. In the Gabun, besides dense forests, are open lagoons, mangrove swamps, park-like stretches, grass-covered prairies and patches of cultivation. The rivers, as they descend from the plateau in rapids and cataracts, form deep and often narrow valleys. By none of them is there any navigable route to the higher ground. The plateau, scored in the west by rivers going north to Lake Chad and south to the Congo, as well as west to the Atlantic, is in parts barren, but for the most part the apparently interminable forest continues. As the great rivers are in flood nearly half the year, and various channels connect the Sanga and the Ubangi, the valleys present a picture of forest and swamp. The Ubangi-Shari plateau is largely savannah land; the dividing line between the southern forests and the open country being, roughly, 7° N. lat. About 14° N. is "the strip of herbage strown that just divides the desert from the sown" and this gives place to sand dunes and sandy wastes where wind erosion has carved the rocks into fantastic shapes. Borku and Ennedi are typical Saharan regions, and altogether fully 140,000 sq.m. of the Chad colony are pure desert, with here and there small oases. The contrast between these regions and the almost impenetrable forests of the south is complete.

Geology.—The geological formations are imperfectly known. The coast zone, covered with alluvium and superficial deposits is underlain by Tertiary and Cretaceous rocks; the Crystal mountains zone is composed of granite, metamorphic and ancient sediments; the plateau of the Congo basin is occupied by Karroo sandstones. These plateau sandstones lie horizontally—a lower red sandstone group and an upper white sandstone group; alluvial deposits cover considerable areas. A superficial iron-cemented sandstone, erroneously termed laterite, covers a large part of the littoral zone, the flanks of the mountains and the high plateau. Copper deposits are found in the Crystal mountains. The northern zone has great plains of lacustrine origin (indicating the former extent of Lake Chad) from which rise hills and ridges of older rocks. East of this region of recent deposits is a sandstone plateau, from which again granitic rocks emerge.

Climate.—Over the greater part of French Equatorial Africa temperature is high and the air moist throughout the year. In the Gabun and Middle Congo the mean annual rainfall is from about 80 to nearly 100 in., being greater in the north than in the south; the heaviest rainfall is between September and December, when the sun is moving southward; as the sun moves northward there is a second rainy season, from mid-February to mid-May. But there is no month without rain. The average temperature at Libreville, on the Gabun estuary, is 79° F, with a very limited range (75° F. to 80° F.). It is somewhat cooler on the plateau. At Brazzaville, on Stanley Pool, the mean temperature is about 77° F.

In Ubangi-Shari there are only one wet and one dry season in the year, the wet season—which comes when the sun is in the north—lasting from May to October. In the south the average

rainfall is about 70 in., decreasing in the north to 50 and 40 inches. Here November–February inclusive are often rainless. Temperature increases from south to north, but is uniformly high, the monthly mean varying from 74° F to 83° F. In the Chad colony the air is dry and the heat great, rising to an average of 90° F in May and June. Here the variation in temperature between night and day is marked. There is only one wet season—July, August and September.

Flora and Fauna.—The forests contain many species of trees growing side by side. The tree most used for export is *okume*, a kind of light mahogany; there are also the true mahogany, ebony and walnut trees. The wood of the silk-cotton and tulip trees is also exported. The silk-cotton and the baobab, the screw-pines and palms are all characteristic forest trees. Of palms, there are in the forest region the raphai, a fan-palm (*Hypanae guineensis*), the oil palm, and the *Attalea funifera* from which piassava fibre is obtained. "Wild" rubber trees (*Funtumea*) are abundant in the forests, as are also rubber vines and other lianas, which twine round the undergrowth in an altogether baffling manner. Along the rivers, papyrus grows to a height sometimes of 20 ft.; and by the banks of the streams are the cottony *Hibiscus tiliaceus* and fragrant jasmynes. The kola nut tree is common in various regions as is also the gum-copal. In Ubangi-Shari are species of wild coffee trees, and here also the cotton plant grows wild, as also in Chad colony. Negro-pepper, a variety of capsicum, and ginger are found, and among fruit trees are the mango and the papaw, the orange and the lemon. The date palm grows freely in the northern regions. The natives in the southern regions cultivate maize, manioc, bananas and sweet potatoes; in the north millet is the staple food of the people.

The fauna of the forest belt is notable for the gorilla (first found in the Gabun by Paul du Chaillu in 1856), chimpanzees and many varieties of monkeys, some with startling coloration. Elephants are still numerous, as are leopards, especially the forest leopard. The lion is not so common and does not inhabit the dense forest. The spotted hyena is found in the north-easterly regions. The golden cat (many varieties), lemurs and galago, forest pigs, the wild dog and a giant squirrel are all met with. There are red-buffaloes, the rare okapi; various species of antelope and, in the north, gazelles. Hippopotami and crocodiles abound in the rivers. The snakes are very numerous. They include the cobra, python, puff-adder and several species of viper. Insects are innumerable and include disease-carrying mosquitoes, the tsetse fly, ants, termites, fireflies and sandflies. The mason wasp (and other wasps) and bees are common in many regions. There are birds in infinite variety, from the ostrich (in the north) to the dwarfish *Alcedo cristata*.

Inhabitants.—The great majority of the natives are negroes; in the south speaking Bantu, in the north Sudanese. Among the forest tribes are the Okande, the Fiot and the Fang—all found in the Gabun. The Bateka and the Banda dwell further east, and the Zandeh (Niam Niam) live toward the Nile watershed. The Sara cover a wide area in the middle Shari region; by Lake Chad are tribes of mixed negroid and Semitic strains, as well as Arabs proper and Hausa and Fula immigrants from West Africa. There are also (in Chad colony) Tibbu, probably a negro-Berber mixture. Pigmy tribes are found in the forests—it was in 1865, in the middle Ogowé country, that Paul du Chaillu definitely proved the existence of these dwarfish people. The northern tribes are Mohammedans, and had organized states and a fair degree of culture. The Fang and the Zandeh were cannibals.

Neither the dense forests nor the semi-arid regions in the north favour a large population; the country is, indeed, even for Africa, very sparsely inhabited, and up to 1921, at least, the population tended to decrease. This was due to the poor stamina of many of the forest tribes, among whom malaria, dysentery, leprosy, sleeping sickness and other serious scourges are rife. The demands for labour for Europeans also told heavily upon them. The French administration devoted much attention to hygiene, and to seeing that natives were not taken to labour for whites at a time when they had to attend to their own affairs, such as getting in their harvest. These measures met with some success,

and the 1926 census showed a slight upward trend in numbers.

Towns.—The largest town and the seat of government is Brazzaville (pop. 40,000) on Stanley Pool. The ports are Libreville (pop. 20,000) on the Gabun estuary, Port Gentil (Cape Lopez), at the mouth of the Ogowé, the roadstead of Loango and Pointe Noire, the last named developed since 1925 as the ocean terminus of a railway to Brazzaville. Other centres are Bangui on the Ubangi and Fort Lamy (pop. 10,000) on the lower Shari. The natives have few large towns; the largest is Abeshr, the capital of Wadai.

Economic Conditions.—For a considerable period the energies of the French were given mainly to the acquisition of territory and the establishment of authority, and this delayed serious efforts at economic development. In 1899 the French Government, despite the opposition of the local authorities, introduced the concession system, allotting a huge area to various companies, and giving them the sole right for 30 years to the natural products of the territory. The companies helped to make known the riches of the country and developed transport on the rivers, but the system worked badly, and from 1910 onward the administration restricted the area and powers of the concession companies, and by 1920 the concession system was moribund, while the activity of private traders increased. A serious obstacle to development was the small number and backward character of the natives of the forest belt; a still greater obstacle was the lack of an outlet to the sea for all regions except the Gabun. There are in all over 1,200 m. of navigable waters on the Congo, Ubangi, Sanga and Shari rivers within French Equatorial Africa, but the cataract region of the Lower Congo prevents access by water to the Atlantic. Road transport was excessively costly, but after 1898, when the railway from Leopoldville, on Stanley Pool, to Matadi was completed by the Congo Free State, the French took advantage of that route as far as possible—schemes for building a railway of their own from Stanley Pool to the Atlantic were propounded, but nothing was done. Thus, apart from timber from the Gabun, only goods which could afford to pay high transport rates were exported. In the early days these exports were "wild" rubber and ivory. In 1905, after 20 years occupation of the Middle Congo the total external trade was valued at £850,000 (annual exports and imports nearly equal). By 1913 the value had risen to £2,320,000. During the World War trade almost ceased and recovery was slow. In 1926 the figures were, in francs, exports 104 million; imports 164 million; roughly (taking a mean rate of exchange), about the value of trade in 1913.

Post-war exports were timber—everyone, white and black, on the Ogowé, lives upon and thinks and dreams of timber—palm kernels and palm oil, and cocoa (a growing industry). "Wild" rubber has been supplanted by plantation rubber, grown elsewhere than in French Equatorial Africa. The imports are miscellaneous, cotton goods figuring largely. Of internal trade no figures are available; the Chad colony has a developing trade in live-stock and ostrich feathers. A small caravan trade exists between Wadai and Kufra; in the east, after 1915, trade with Darfur developed, and in the north-west there was some trade between the districts adjoining Lake Chad and Nigeria.

At length, in 1921, the building of a line on a gauge of 1.06 metres and some 340 m. long, to connect Pointe Noire with Brazzaville was begun, together with harbour works at Pointe Noire, though it was not till 1925 that the work was seriously taken in hand. In 1927 the line was open to Minduli (75 m.), where copper is worked. This line replaced a Decauville line, built 1908–11 by the company which owns the copper mines.

The financial position of French Equatorial Africa may be gauged from the increase in the general budget—services common to all colonies—from 4,200,000 fr. in 1919 to 28,550,000 in 1926. In the last named year the public debt was 492,000,000 francs. Of this amount 300,000,000 francs was authorized in Sept. 1926 for public works, an indication that a more rapid development of the riches of the country might be expected.

HISTORY

French interest in equatorial Africa began with settlements on the Gabun estuary. It was not until after H. M. Stanley's dis-

covery (1876-77) of the course of the Congo that the ambition arose to extend French influence far inland; later, efforts to acquire a footing in the Upper Nile basin led to the occupation of another large area, stretching to the frontier of the Anglo-Egyptian Sudan.

The ports of the Gabun had been centres of the slave trade and, to a lesser degree, of other commerce, and various European firms had factories on the coast. No rights of sovereignty were, however, acquired by any European Power. In 1839 Captain (afterwards Admiral) Bouët-Willaumez obtained for France the right of residence on the south bank of the Gabun estuary, and in 1842 he secured better positions on the north bank. The primary object of the French settlement was to secure a port where-in men-of-war could revictual. The chief establishment, Libreville, was founded in 1849, with negroes taken from a slave ship. The settlement grew, Cape Lopez was ceded to France in 1862, and the colony's coast-line extended, nominally, to a length of 200 miles. In consequence of the Franco-Prussian War, the colony was practically abandoned in 1871, Libreville being maintained as a coaling depot merely. In 1875, however, France again turned her attention to the Gabun estuary, the hinterland of which had already been partly explored by Paul du Chaillu and an English merchant named Walker. In 1872-73 Alfred Marche, a French naturalist, and the marquis de Compiègne¹ explored a portion of the Ogowé basin, but it was not until the expedition of 1875-78 that the country east of the Ogowé was reached. This expedition, which was led by Savorgnan de Brazza (*q.v.*) ascended the Ogowé over 400m., and beyond the basin of that stream discovered the Alima, which was, though the explorers were ignorant of the fact, a tributary of the Congo. Returning to Europe, de Brazza learned that H. M. Stanley had revealed the mystery of the Congo, and in his next journey, begun Dec. 1879, de Brazza found a way to the Congo above the rapids via the Ogowé. In Sept. 1880 he reached Stanley Pool, on the north side of which Brazzaville was subsequently founded. Returning to the Gabun by the lower Congo, de Brazza met Stanley. Both explorers were nominally in the service of the International African Association (which became the Congo Free State), but de Brazza in reality acted solely in the interests of France and concluded treaties with Makoko, "king of the Batekas," and other chieftains, placing very large areas under the protection of that country. The conflicting claims of the Congo Free State and France in the Stanley Pool and lower Congo regions were adjusted by a convention signed in Feb. 1885.

The Marchand Expedition.—Much energy was shown in the establishment of posts on the Ubangi river and elsewhere and disputes arose with the Congo Free State, which was pushing north and east in territory claimed by France. Both France and the Congo State had their eyes on the Upper Nile basin; finally in Aug. 1894 an agreement was reluctantly signed by the Congo State conceding the French claims. This left the road to the Nile open to the French. The story of these international rivalries is told in the article *AFRICA: History*. Here it need only be recalled that the Marchand expedition, despatched to the support of Victor Liotard, the lieutenant-governor of the upper Ubangi, reached Tambura in July 1897 and Fashoda in July 1898. Great Britain at once raised objections to the presence of a French force on the Nile, and it was decided that the expedition should evacuate Fashoda. The declaration of March 21, 1899, ended the dispute and fixed the eastern frontier of the French colony except for a region on the borders of Wadai and Darfur. This area was finally divided (1919), and in 1923 the frontier was demarcated.

Besides expanding eastwards the authority of France was extended northwards to Lake Chad, and over the countries of the central Sudan between Lake Chad and Darfur and, lastly, north again, the French occupied Tibesti and other Saharan regions. Here French territory adjoins the backland of the Italian colonies of Tripolitania and Cyrenaica. Reaching out to Lake Chad the French had to meet the rivalry of Germany, which country desired

a share of the Chad region for its Cameroons protectorate. In the end Germany obtained part of the south shore of the lake. (For the French conquests between Chad and the Nile basin see BAGIRMI, RABAH ZOBEIR, and WADAI.)

Development and Administration.—France had thus possession of a very large territory, rich in resources, but with a very sparse (and decreasing) population of, for the most part, a very primitive type. The seaboard served only the Gabun, for the es-carpment of the inner plateau shut off the inland river systems, and in fact most of the country was almost cut off from the world's markets. The Gabun made fair progress and had a large timber trade. But with the acquisition of part of the Congo basin French expectations ran high; Brazzaville was founded and made the seat of government and de Brazza himself, as commissioner-general, took charge of affairs. In 1888 the Gabun and the newly acquired territories were officially declared to be one "colony" under the style of Congo français. The country in 1904 was divided into four parts, corresponding to geographical and ethnological differences; the northern divisions, Ubangi-Shari and Chad, were for years under military rule, but by 1920 all had attained the status of colonies. The first commissioner-general under the scheme put in force in 1904 was Emile Gentil, the explorer of the Shari and Chad. In 1905 de Brazza was sent out from France to investigate charges of cruelty and maladministration brought against officials of the colony, several of which proved well founded. De Brazza died at Dakar when on his way home. Gentil, who was free from any personal blame, devoted the next two years to the reorganization of the finances of the country and the development of its commerce, resigning his post in Feb. 1908. He was succeeded by M. Merlin, whose title was changed (June 1908) to that of governor-general. In 1910 the name of the country was, appropriately, changed to *l'Afrique Equatoriale française* or A.E.F.

With a view to rapid development the Government had by 1899 granted very large land concessions to French citizens, after the manner of Leopold II. in the Congo State, and with similar results. The system worked to the detriment of the natives and of non-concessionnaire traders and, as de Brazza's 1905 mission showed, led to abuses. Reforms followed and M. Merlin and his successors devoted their energies mainly to improving the condition of the natives, witchcraft-ridden and ravaged by many diseases, including sleeping sickness, dysentery and leprosy. (There were 52,000 lepers in the country in 1927—one in 60 of the whole population.) The employment of large numbers of natives as porters, a necessary but wasteful proceeding, kept them from land work, and the local authorities repeatedly asked for funds for transport purposes. But the French parliament was hard to move and slow to grant funds, so that A.E.F. came to be regarded as the Cinderella of the colonies. And it was made to suffer for French projects elsewhere. To obtain German consent for a free hand for France in Morocco two large areas of the Middle Congo colony were in 1911 added to the German Cameroons colony; these areas stretching south, tongue-like, to the Congo and Ubangi rivers respectively. However, as the result of the World War, these "tongues" were restored to France. The building of a railway to connect the Congo at Brazzaville (Stanley Pool) with the Atlantic was at length begun in 1921, its completion being fixed for 1932. At the same time a new harbour, Pointe Noire (near Loango), was built to serve the railway.

The governor-general has control over the whole country. For administrative purposes the separate colonies are under lieutenant-governors, the governor-general himself being lieutenant-governor of the Middle Congo colony. The Gabun colony includes the Gabun estuary and most of the coast-line, together with the basin of the Ogowé river. The inland frontier is so drawn that no part of the Gabun is within the Congo free-trade zone. The Middle Congo colony, which has access to the sea at Pointe Noire, extends inland to the easterly bend of the Ubangi river. There is a general budget for the whole country; each colony has also a separate budget and administrative autonomy. The legislative power is in the French chambers only. There is a judicial service independent of the executive. Educational facilities are

¹Louis Eugène Henri Dupont, marquis de Compiègne (1846-77), on his return from the West coast replaced Georg Schweinfurth at Cairo as president of the geographical commission. Arising out of this circumstance de Compiègne was killed in a duel by a German named Mayer.

deficient; while there are Government schools, teaching is done mainly by missionaries, Roman Catholic and Protestant. The converts to Christianity are comparatively few, but the missionaries, who care for the body as well as the soul of the people, exercise a considerable and beneficent influence.

BIBLIOGRAPHY.—Fernand Rouget, *L'Expansion coloniale au Congo français* (1906), a valuable monograph, with bibliography and maps. For history, see also J. Ancel, "Étude historique. La formation de la colonie du Congo français, 1843-82," containing an annotated bibliography, in *Bull. Com. l'Afrique française*, vol. xii. (1902); G. Bruehl, *L'Afrique Équatoriale Française* (1918) and C. Guy, "L'Avenir de l'A.E.F." in *L'Afrique Française* (Jan. 1926). Annual reports are issued by the French Colonial office. (F. R. C.)

FRENCH GUINEA, a French colony in West Africa. It is bounded west by the Atlantic, north by Portuguese Guinea and Senegal, east by the French Sudan and the Ivory Coast, and south by Liberia and Sierra Leone. With a sea-board running N.N.W. and S.S.E. from 10° 50' N. to 9° 2' N., a distance, without reckoning the indentations, of 170 m., the colony extends eastward 450 m. in a straight line and attains a maximum width north to south of nearly 300 m., covering fully 242,000 sq.km. and containing a population of 2,096,000.

Physical Features.—Though in one or two places rocky headlands jut into the sea, the coast is in general sandy, low, and much broken by rivers and deep estuaries, dotted with swampy islands, giving it the appearance of a vast delta. In about 9° 30' N., off the promontory of Konakry, lie the Los islands (*q.v.*), forming part of the colony. The coast plain, formed of alluvial deposits, is succeeded about 30 m. inland by a line of cliffs, the Susu hills, which form the first step in the terrace-like formation of the interior, culminating in the mass of Futa Jallon, composed chiefly of Archaean and granite rocks. While the coast lands are either densely forested or covered with savannas or park-like country, the Futa Jallon tableland is mainly covered with short herbage. This tableland, the hydrographic centre of West Africa, is most elevated in its southern parts, where heights of 5,000 ft. are found. Near the Sierra Leone frontier this high land is continued westward to within 20 m. of the sea, where Mount Kakulima rises over 3,300 ft. East and south of Futa Jallon the country slopes to the basin of the upper Niger, the greater part of which is included in French Guinea. The southern frontier is formed by the escarpments which separate the Niger basin from those of the coast rivers of Liberia. Besides the Niger, Gambia and Senegal, all separately noticed, a large number of streams running direct to the Atlantic rise in Futa Jallon. Among them are the Great and Little Scarries, whose lower courses are in Sierra Leone, and the Rio Grande which enters the sea in Portuguese Guinea. Those whose courses are entirely in French Guinea include the Cogon (or Componi), the Rio Nuñez, the Fatalla (which reaches the sea through an estuary named Rio Pongo), the Konkure, whose estuary is named Rio Bramaya, the Forekaria and the Melakori. The Cogon, Fatallah and Konkure are all large rivers which descend from the plateaux through deep, narrow valleys in rapids and cataracts, and are only navigable for a few miles from their mouth.

Climate.—The climate of the coast district is hot and moist, with a season of heavy rain lasting from May to November, during which time variable winds, calms and tornadoes succeed one another. The mean temperature in the dry season, when the *harmattan* is frequent, is 62° Fahr., in the wet season 86°. Throughout the year the humidity of the air is very great. There is much rain in the Futa Jallon highlands, but the Niger basin is somewhat drier.

Flora and Fauna.—The seashore and the river banks are lined with mangroves, but the most important tree of the coast belt is the oil-palm. The dense forests also contain many varieties of lianas or rubber vines and bamboos. Gum-producing trees are abundant, and there are many fruit trees, the orange and citron growing well in the Susu and Futa Jallon districts. The cotton and coffee plants are indigenous; banana plantations surround the villages. The baobab and the karite (shea butter tree) are found only in the Niger districts. The fauna is not so varied as was formerly the case, large game having been to a great extent driven

out of the coast regions. The lion is now only found in the northern parts of Futa Jallon; leopards, hyenas and wild cats are more common and the civet is found. Hippopotamus and wild boar are numerous; a species of wild ox of small size with black horns and very agile is also found. Antelope are widespread but rather rare. Serpents are very common, both venomous and non-venomous; the pythons attain a great size. Crocodiles infest all the rivers. Birds are very numerous; they include the egret, the marabout and the pelican; turacos and parrots are common.

Inhabitants.—On the banks of the Cogon dwell the Tendas and Iolas, primitive Negro tribes allied to those of Portuguese Guinea (*q.v.*). The Baga, the Nalu, the Landuman and the Timni, regarded as typical Negroes (*q.v.*) migrated southward before the 17th century. To-day the Baga occupy the coast land between the Cogon and the Rio Pongo, and the Landuman the country immediately behind that of the Baga. The coast region south of the Nuñez and all the interior up to Futa Jallon is occupied by the Susu, a tribe belonging to the great Mandingan race, which forced its way seaward about the beginning of the 18th century and pressed back the Timni into Sierra Leone. Futa Jallon is peopled principally by Fula (*see* FULANI), and the other districts by Malinké and other tribes of Mandingo (*q.v.*). The Mandingo, the Fula and the Susu are Mohammedans, though the Susu retain many of their ancient rites and beliefs—those associated with spirit worship and fetish, still the religion of the Baga and other tribes. In the north-west part of Futa Jallon are found remnants of the aborigines, such as the Tiapi, Koniagui and the Bassari, all typical Negro tribes. Thus at the Rio Pongo there are numerous mulattos. South of that river the coast tribes speak largely pidgin English.

Towns.—The principal towns are Konakri the capital, Boké, on the Rio Nuñez, Dubreka, on the coast, a little north of Konakri, Benty, on the Melakori, Timbo and Labe, the chief towns of Futa Jallon, Heremakono and Kindia, on the main road to the Niger, Kurussa and Siguiri, on a navigable stretch of that river, and Bissandugu, formerly Samory's capital, an important military station east of the Niger. Konakri, in 9° 30' N., 13° 46' W., (pop. 8,866), is the one port of entry on the coast. It is built on the little island of Tombo which lies off the promontory of Konakri, the town being joined to the mainland by an iron bridge. During the administration of Noël Ballay (1848-1902), governor of the colony 1890-1900, Konakri was transformed from a place of small importance to one of the chief ports on the west coast of Africa. It has since grown considerably, and is provided with wharves and docks and a jetty 1,066 ft. long. Konakri is a port of call for French, British and German steamship companies, and is in telegraphic communication with Europe. It is the starting-point of a railway 662 km. long, completed in 1914, to Kurussa on the Niger and Kankan.

Products and Industry.—French Guinea possesses a fertile soil, and is rich in tropical produce. The chief products are rubber, brought from the interior, and palm oil and palm kernels, obtained in the coast regions. Cotton is cultivated in the Niger basin. Gum copal, ground-nuts and sesame are largely cultivated, partly for export. Large herds of cattle and flocks of sheep are raised in Futa Jallon; these are sent in considerable numbers to Sierra Leone, Liberia and French Congo. The trade in hides is also of considerable value. The chief grain raised is millet, the staple food of the people.

The principal imports are cotton goods, of which 80% come from Great Britain, rice, kola nuts, chiefly from Liberia, spirits, tobacco, building material, and arms and ammunition, chiefly "trade guns." The great bulk of the trade of the colony is with France and Great Britain, the last-named country taking about 45% of the total; Germany comes third. Since April 1905 a surtax of 7% has been imposed on all goods of other than French origin. (X.)

History.—This part of the coast was made known by the Portuguese voyagers of the 15th century. In consequence, largely, of the dangers attending its navigation, it was not visited by the European traders of the 16th-18th centuries so frequently as other regions north and east, but in the Rio Pongo, at Matakong

(a diminutive island near the mouth of the Forekaria), and elsewhere, slave traders established themselves, and ruins of the strongholds they built, and defended with cannon, still exist. When driven from other parts of Guinea the slavers made this difficult and little known coast one of their last resorts, and many barracoons were built in the late years of the 18th century. It was not until after the restoration of Goree to her at the close of the Napoleonic wars that France evinced any marked interest in this region. At that time the British, from their bases at the Gambia and Sierra Leone, were devoting considerable attention to these Rivières du Sud, *i.e.*, south of Senegal, and also to Futa Jallon. René Caillié, who started his journey to Timbuktu from Boké in 1827, did much to quicken French interests in the district, and from 1838 onward French naval officers, Bouët-Willamez and his successors, made detailed studies of the coast. General Faïdherbe was appointed governor of Senegal in 1854 and under his direction vigorous efforts were made to consolidate French influence in the region. Already in 1848 treaty relations had been entered into with the Nalu, and between that date and 1865 treaties of protectorate were signed with several of the coast tribes. During 1876-80 new treaties were concluded with the chief tribes, and in 1881 the almany (or emir) of Futa Jallon placed his country under French protection, the French thus effectually preventing the junction, behind the coast lands, of the British colonies of the Gambia and Sierra Leone. The right of France to the littoral as far south as the basin of the Melakori was recognized by Great Britain in 1882; Germany (which had made some attempt to acquire a protectorate at Konakry) abandoned its claims in 1885, while in 1886 the northern frontier was settled in agreement with Portugal, which had ancient settlements in the same region. (*See PORTUGUESE GUINEA.*) In 1904 the Los Islands (off the coast of French Guinea) were ceded by Great Britain to France, in part return for the abandonment of French fishing rights in Newfoundland waters. (*See also SENEGAL: History.*)

Until 1890 the newly gained territories were administratively part of Senegal; they were then formed into a separate colony called Rivières du Sud, a name changed some five years later to Guinée Française. In 1895 the colony came under the supreme authority of the newly constituted governor-generalship of French West Africa. It retained administrative and financial autonomy and was administered by a lieutenant-governor assisted by a nominated council. The Fula, Mandingo and other tribes were encouraged to develop the resources of the country. For a number of years the mainstay, economically, of the country was rubber; after a period of retrogression during and in the years following the World War, a partial recovery was noted in 1925. Other resources, such as banana and pineapple plantations, were developed. These plantations were by the railway line, the building (1900-10) of the railway from Konakry to the Niger being the most important work undertaken for the benefit of agriculture and trade. The promotion of education and hygiene occupied much attention. If after 40 years of French rule the country was still largely undeveloped the colony had remained tranquil and progress had been made.

See André Arcin, *La Guinée française* (1906), a valuable monograph, and *Histoire de la Guinée française* (1911); J. Machat, *Les Rivières du Sud et la Fouta-Diallon* (1906); *French Guinea* (1920), a British Foreign Office handbook. (F. R. C.)

FRENCH LANGUAGE. After the period during which Vulgar Latin, as spoken in Gaul, was acquiring a specific character (*see* ROMANCE LANGUAGES), the history of French is divisible into three periods: (1) Old French (9th to 14th century), (2) Middle French (15th and 16th centuries), (3) Modern French (17th century to the present day). The outstanding features of (A) the External History, (B) the Internal History of French during these three periods are as follows.

A. EXTERNAL HISTORY

The Mediaeval Period.—During the Old French period the name "French" is applied to the Romance language spoken in the north of France in contradistinction to that spoken in the south.

Old French is divided into numerous dialects which may be classified: (1) Bourguignon, Franc-comtois, Lorrain, Champenois, in eastern France, (2) Picard and Wallon in north-eastern France, (3) Normand in north-western France, (4) Poitevin, Angevin, Saintongeais in western France, (5) Français (or Francien, as it is now usually termed, to distinguish it from French *lato sensu*) in the Ile-de-France. The French dialects have converted into *é* the free tonic *a* of Latin conserved by the Provençal dialects. Thus Latin *amare* becomes in French *amer* (later *aimer*), but in Provençal *amar* (later *ama*). In the Lyons region, Savoy and "romande" Switzerland in an intermediary dialect called Franco-provençal, because it blended French and Provençal characteristics, Latin *portare* yielded *portar* as in Provençal, whilst Vulgar Latin *tagliare* gave *taillier* (mod. *tailler*) as in French. Despite their common points these dialects differed so widely that (as is still the case with the patois) the Frenchman speaking one of them was often unable to understand those who spoke another. Roger Bacon, who travelled in France in 1260, testifies to this state of affairs in his *Opus Majus*. Till the beginning of the 13th century the French dialects are known by literary monuments only, with the single exception of the *Strasbourg Oaths*, the most ancient documentary evidence of French. The text of the oaths sworn on Feb. 14, 842, is preserved in the *Historiarum libri IV.* (lib. III., cap. 5) of the historian Nithard (*q.v.*) (d. 844), who copied them very carefully in their original language. In the course of the 13th century purely literary texts are supplemented by documents from archives, the oldest from northern and eastern France being in Picard, Wallon and Lorrain; for Anjou, Touraine and Berry the earliest documents date from the middle of the 13th century. French was not used for recording acts of the royal chancery till Louis IX. The ratification of the Treaty of Paris in 1259, the original of which is in London (*cf.* Rymer, *Foedera*, Hague ed. tome. i., pt. 2, p. 50) is among the earliest acts of royal chancery in French. Under Philip le Bel, French begins to preponderate and is used for administrative correspondence and for more solemn deeds. From the 14th century French steadily gains in such documents till during the 15th Latin becomes the exception. (*See* A. Giry, *Manuel de diplomatique* [2nd ed., 1924].) In literary texts the progress of Francien is similar, all other dialects sinking into the shade by the beginning of the 15th century. This triumph of Francien has been attributed to the high level of the literary productions of the Ile-de-France, but a review of the literary output of the various dialects down to the close of the 12th century shows that for quality Francien could as yet claim no superiority over, say, Norman or Picard. Francien owed its preponderance to a series of social factors starting with the accession of Hugh Capet, son of Hugh the Great, to the throne of France. By the creation, extension and consolidation of the royal domain, by the rise of the royal family to the first rank among the great families of the realm, and of France, under Louis IX., to the first rank among the nations of Europe, by the continuous development of political and administrative institutions, the descendants of the duke of France had become sovereigns of France. The unity of the kingdom created by them between 987 and 1328 resulted in the predominance of the language of Paris, their capital; and as Paris became the king's settled abode, all scientific, artistic and literary movements centred increasingly about the king's court and were intensified by the prestige of the University of Paris. A further consequence of Capetian policy was to weaken the feudal system to which the political and social shocks of the Hundred Years War administered the death-blow. The decadence of the feudal system, which was not, however, utterly abolished till 1789, involved the decadence of the provincial dialects and French entered upon a new period of transformation the close of which coincides with the dawn of absolute monarchy.

The 16th Century.—Since the 15th century the dialects have ceased to be means of literary expression, and survive only as patois. (*See* PROVENÇAL.) In the 16th century the use of French was made compulsory throughout the royal jurisdiction, from which it ousted Latin in virtue of the Ordinance of Lyons (Louis XII., 1520) and the Ordinance of Villers-Cotterets (Francis I.,

1539). Charles IX. by the Edict of Paris decreed that all "*vérifications de nos cours de Parlement sur nos édits, ordonnances ou lettres patentes et les réponses sur requestes seront faites dorénavant en langage françois et non en latin, comme ci-devant on avait accoutumé faire en nostre cour de Parlement de Paris; ce que voulons et entendons estre pareillement gardé par nos procureurs généraux.*" French invades the theological domain with Calvin's translations (1541) of his *Institutio christianae religionis*, written by him in Latin in 1536; in 1550 it becomes the language of the Protestant Church; scientists begin to employ it; the Pléiade issues its manifesto, the *Défense et Illustration de la langue françoise*, and certain humanists, drawn towards the study of the origin and development of the vernacular, expound the results of their research in treatises composed in the vernacular. The efforts of the writers of the 16th century had for result the concoction of a language thick with provincialisms, a hotchpotch of terms raked together from all dialects or coined on Greek and Latin models. Against these excesses reaction was inevitable.

From the 17th Century to the Present Day.—Centres of influence such as the French Academy, founded by Richelieu in 1635, the court of Louis XIV., focusing the whole life of the kingdom, intellectual and artistic as well as political, the "*salons*" typified by the Hôtel de Rambouillet (if men are not strong enough, come women to the rescue!), poets like Malherbe, critics like Chapelain, stylists like Guez de Balzac, grammarians like Vaugelas, united to secure the triumph of "*le bon usage*," which Vaugelas, prefacing his *Remarques*, defined as "that way of speaking used by the healthiest portion of the Court, conformably with that way of writing used by the healthiest portion of living authors." Thus was the reign of "Reason" set up and the masterpieces of Descartes, Racine, La Fontaine, Pascal, Bossuet, etc., contributed to fix the characters of the classical spirit and concurrently of the classical language: naturalness, simplicity, clarity. In the 18th century that language acquired such prestige through great authors like Rousseau, Voltaire and Diderot, that in 1783 the Berlin Academy proposed as subjects for a prize essay: "What has made French the universal tongue? To what does it owe this prerogative? Is it to be surmised that it will retain it?" and awarded the prize to Rivarol for his "*De l'universalité de la langue française*" (1784). Then came the romantic school, with Victor Hugo at its head, by whom lyric poetry was lifted to heights hitherto unattained in France; whilst French prose, enriched in vocabulary and syntactical resources, became a tool of wondrous strength and pliancy. Such indeed was its quality that with but little modification the most diverse branches of literature found in it ample means of expression, and scientists like Pasteur, H. Poincaré, J. H. Fabre; philosophers like Bergson; poets like Heredia, Verlaine, Mallarmé, Rostand, Valéry; novelists like Anatole France, André Gide, Marcel Proust; critics like Jules Lemaitre, Brunetière, Faguet and Thibaudet had at their disposal an instrument admirably fitted to their most exacting needs. Such was the metal that, despite the superadded alloy of the last 20 years, it still rings true and its secular repute stands unimpaired. This literary prestige greatly furthered the diffusion of French in France, but this diffusion was yet more potently accelerated by various social causes, most important amongst which were the French Revolution, increasing political and administrative centralization, the multiplication of means of communication, more developed commercial and industrial life, the spread of schools, compulsory elementary education, conscription, the power of the press, and the bringing together as soldiers, during the World War, of natives from every part of the republic. The special idioms and patois have been affected by repercussion, the patois being so weakened that they may be now regarded as having abandoned their secular struggle against French, notwithstanding the transient lustre regained by a few.

The French Language in Foreign Countries.—If parts of the territory of France have been and still are occupied by non-French idioms, Corsican, Biscayan, Breton, Flemish, Alsatian, all of which are, moreover, gradually disappearing, French has been and still is spoken beyond the French frontiers. Even before the

invasion of William the Conqueror it had won firm foothold in England and from 1066 till the close of the 14th century was spoken and written in England as one of the chief languages. (See *ANGLO-NORMAN LITERATURE*.) For many generations it was current in Piedmont, where Italian became the official idiom as late as 1577. There were besides important focuses of French influence in many other parts of western and central Europe and, during the crusades, in the Morea, the Holy Land and especially the island of Cyprus. In the 16th century French crossed the Atlantic to North America. Under Louis XIV. it became the official language of diplomacy and as such was used up to the Treaty of Versailles. It was carried to numerous parts of Europe and America by the 200,000 French Huguenots whom the revocation of the Edict of Nantes (1685) drove from their native land. It is now spoken by some 48,000,000 persons, about 3,000,000 in Belgium, 3,000 in the Duchy of Luxembourg, 800,000 in Switzerland (cantons of Geneva, Vaud, Neuchâtel and parts of those of Fribourg, Valais and Berne), 140,000 in Italy (in part of the Pô Valley and especially in the Val d'Aosta), 90,000 in the Channel Islands, 1,600,000 in Canada, and the rest in the French colonies, particularly Tunisia, Algeria, the island of Réunion, Tonkin, Cochinchina or in colonies now lost to France (Mauritius, Haïti, Louisiana). French is spoken by many educated persons in central and eastern Europe, Egypt and Asia Minor. In the islands of Réunion, Mauritius, Cayenne, Martinique, Trinidad, Haïti and in Louisiana the Creoles speak mixed idioms, known as French Creole, in which the indigenous tongues are fused with the dialects or patois imported by the French settlers.

B. INTERNAL HISTORY

Vocabulary.—The primitive word stock examined in *ROMANCE LANGUAGES* was increased by an intense system of derivation and composition and a supply of words coming from (1) foreign languages, (2) French dialects and patois, and idioms special to some classes or professions. The figures between parenthesis indicate the number of words which the *Dictionnaire Général*, the best authority in the matter, states to be still in use in the French language of the 20th century.

Latin and Greek. From the 9th to the 14th centuries French borrowed from these languages a few words, chiefly substantives, relating to religion and law, e.g., *apostle, diable, pape, paradis, prophète, criminel, héritage, justice*. Such loans increased in number from the 14th century (beginning of the classical revival), multiplied enormously in the 15th and during the 16th century became overwhelming. Many of the words which then appeared still live, e.g., *anarchie, aristocratie, démocratie, économie, poème, politique, abstrait, caduc, patrie, patriote*, but many have perished, e.g., *angustie, experiment, extoller, mulièbre, pristin*. During the 17th century new coinages from Greek continued: *anachronisme, anecdote* were introduced by G. de Balzac, *anonyme, apologiste* by d'Aubigné. Since the 18th century science in its progress has turned increasingly to Greek for terminology as in the terms of the decimal system (established Dec. 11, 1799), in physics and chemistry, in medicine neologisms abound, such as *euphorie* for good health. Most new inventions receive Greek names by a system, not always very sound, which borrows single Greek words, compounds them with other Greek words or welds with them non-Greek elements, e.g., *cycle, téléphone, télégraphe, taximètre, cinématographe, graphophone, phonographe, aéroplane, hélicoptère, autobus, automobile*, etc.

German. (About 450 words.) Until the 10th century French borrowed a large number of words from various Germanic dialects; among those still surviving are: the substantives *aigrette, balafre, balle, ban, bannière, beffroi, bourg, brèche, brique, canif, coiffe, écharpe, échelle, échine, gant, guerre, hameau, hanche, hareng, hâte, honte, maréchal, nord, ouest, sud, tache, trêve*, etc.; the adjectives *blafard, blanc, bleu, brun, fauve, franc, gris, laid, riche*, etc.; the verbs *avachir, bannir, bâtir, choisir, haïr*, etc.; one adverb, *guère*. To these a few were added later, in the 15th century, e.g., *blocus, boulevard, lansquenet*; in the 16th, e.g., *arquebuse, bière, cauchemar, coche, espigle, huguenot, hutte, rosse, trinquer*; in the 17th, e.g., *bivouac, calèche, havresac, obus*,

sabre, vaguemestre, valse; in the 18th, e.g., *glacure, loustic, nouilles, vampire, vermout*; in the 19th, e.g., *blague, bock, choucroute, dolman, gamin, képi, schlague*. Two further points may be noticed: (a) a few French words have modified their pronunciation under the influence of peculiarly German sounds, thus Lat. *altus* became in French *haut*, but owes aspiration to O.G. *hōh*; Lat. *vespa* should have yielded French *vêpe* but gave *guespe* (later *guêpe*) with *gu* due to German *wespe*, O.G. *wefsa*. (b) Many French proper names are of Germanic origin; the very name *France* is from *Francia*, i.e., German *Franc* and Lat. suffix *-ia*.

Scandinavian. (About 60 words.) As a result of the settlement of the Vikings in that portion of Neustria which received the name of Normandy (9th century) certain Scandinavian words, chiefly relating to the sea and seafaring, were absorbed into French, e.g., *bâbord, bateau, cingler, étrave, guichet, goupillon, hanter, hauban, hisser, rade, villac, tribord, vague*. During the O.F. period Scandinavian contributed to the formation of certain names: of persons, e.g., *Anquetil, Burnouf, Toutain*, to quote names still in use, or of towns, e.g., *Blainville, Sotteville, Trouville*. Of more recent Scandinavian origin are, e.g., *édredon, fiord, geyser, nickel, rutabaga, saga, ski*.

Netherlandish. (About 100 words.) Netherlandish has contributed a certain number of words which, like those from Scandinavian, mostly concern the sea, e.g., *amarrer, bac, digue, dock, dune, foc, gréer, marsouin, matelot, quille, vase, vrac*, or relate to commerce, trade or peculiar customs, e.g., *brandevin, brodequin, cliver, colza, frelater, houblon, kermesse, vacarme, vilebrequin*.

English. (About 300 words.) During the middle ages the influence of English was to all intents negligible. From the 16th century onwards and especially during the 19th and 20th centuries it became very considerable, owing to the active social intercourse between England, the United States of America and France. The following may be cited as illustrating the wide diversity of matters involved, e.g., *abolitionniste, albatros, banknote, bébé, bifteck, bol, bouledogue, boulingrin, boxer, cabine, châte, chèque, clown, comité, confort, contredanse, dandy, dancing, derby, détective, dogue, dollar, essayiste, franc-maçon, gentleman, gigue, grog, guinée, hurra, humoriste, jockey, jury, lord, lunch, meeting, paquebot, record, snob, tramway, tunnel*. Some like *budget, humour, sport, tunnel* are words of French origin borrowed by English and then reborrowed by French with altered form and meaning.

Italian. (About 1,000 words.) Italian words begin to appear in French from the 14th century, becoming particularly numerous in the 16th. They stand for ideas pertaining to manifold categories, e.g., *accaparer, accolade, accort, accoster, adagio, affidé, affront, agio, agrouper, alarme, alerte, alpiou, altesse, altier, alto*.

Spanish. (About 300 words.) A few Spanish words entered the French vocabulary from the 11th to the 15th centuries, and between the 18th and the 20th. The second half of the 16th century and the 17th are the Hispanizing period par excellence. As examples may be cited: *abaca, abricot, accastiller, adjudant, alcade, alcarazas, alcôve, alezan, alfange, algarade, alguazil*.

Provençal. (About 350 words.) A few Provençal words found their way into French between the 11th and 13th centuries, and again from the 17th century to the present day; the influx was considerable only during the 16th because Henry IV. and a few greater writers, notably Monluc, du Bartas and Montaigne, were natives of the south. Amongst those retained by modern French may be mentioned: *amadou, asperge, aubade, badaud, bague, ballade, bastide, bastille, béret, bourrique, brancard, câble, cabri, cadastre, cadeau, cadenas, cadet, cargaison*.

Arabic. (About 260 words.) These words were obtained partly during the middle ages from scientific treatises translated from Arabic into Latin, partly from contact with the Arabs inhabiting Spain down to the 15th century, or with the Arabs encountered during the crusades. A few more were introduced during the 19th and 20th centuries as a consequence of the French colonization of north Africa. Among those still in use in modern French are: *alambic, alcali, alchimie, alcôve, alfa, algèbre, almée, amiral, arsenal, artichaut, assassin, azur, babouche, café, chiffre, coton, épinard, fez*. In addition, Hebrew, Celtic, Portuguese, Franco-

Provençal, Rumanian, Finnish, Hungarian, Slavonic, Turkish, Persian, the languages of India and the Far East, Oceania, and various native African and American tongues have supplied a contingent totalling about 500 words.

French dialects and patois. (About 250 words.) Francien till the 14th century borrowed only a very limited number of dialect words. The dialect and patois terms found in considerable number in the present-day French vocabulary are importations of the modern period. They denote local objects, products, customs, etc. They are still felt to be imperfectly naturalized in the common language. Such are: *affûtiau, bèquebois, catiche, champis, chouquet, écobuer, escarbille, esquipot, étoquiau, hachotte, margoulette, triqueballe, varaigne, yole*.

Slang. The *Dictionnaire Général* records as still in use in Modern French only 20 words belonging to this category. This element is indeed extremely variable; at all periods French has contained slang-words in fair number. They are to be found in Jean Bodel's *Jeu de Saint Nicolas* (about A.D. 1200), and in some of Villon's ballads (15th century). The "argot des coquillars" also of the 15th century is notable. The World War created or revived a number of slang words, some of which are likely to live on for many years, e.g., *amochoer* (to injure), *chéer* (to overstep, overdo), *embusqué* (shirker), *marmite* (heavy shell), *boche* (Hun, German), *Paname* (Paris).

Finally onomatopoeia has enriched French with a certain number of words; about 100 belong to this category, says the *Dictionnaire Général*, e.g., *chuchoter, coquerico, craquer, cricri, crin-crin, dada, dodo, tictac, toutou*, but the advance of etymology may whittle down the number of these terms, some of which perhaps figure in this class for want of better knowledge.

Phonetics, Pronunciation and Orthography.—The phonetic system of Vulgar Latin comprised only seven pure vowels, *a, é, è, î, ò, o, u*; one diphthong, *au*; 15 consonants, *b, p, d, t, g, c, f, v, s, j, h, l, m, r, n*; 2 semi-consonants, *j* (pronounced *y*) and *u* (pronounced *w*). In the 10th century French possessed:

(a) nine pure vowels *a, è, é, ê, e, i, ò, ó, ü*.

(b) ten diphthongs *ai, éi, ôi, ôi, üi, éu, ou, ou, ié, uó*.

(c) two triphthongs *ièu, uòu*.

(d) 22 consonants *b, p, d, t, v, f, g* (as in M.F. *gant*), *c* (as in M.F. *camp*), *u* (as in M.F. *luà*), *s* (as in M.F. *son*), *z* (as in M.F. *aise*), *tch, ts, dj, j* (as in M.F. *bien*), *h, l, r, m, n, ñ, ò*.

From the 11th century onwards this was transformed into the modern phonetic system definitely constituted since the 17th century as follows: 11 vowels, *a, è, é, ê, ò, ó, ou, ü, èu, éu, e*; four nasal vowels *ā, ē, ō, ū*, and 22 consonants *b, p, f, v, t, d, s* (as in French *son*), *z* (as in French *aise*) or *z, k, g, ch, j, l, r, m, n, ñ, ò*, aspirate *h, i* (as in French *bien*), *ou* (as in French *oui*), *u* (as in French *cuivre*).

The chief differences between the phonetic system of the 11th century and that of the 17th are: (1) The genesis of the nasal vowels *ā, ē*, and the nasal diphthongs *āi, ēi* (11th century), *ō, ōi* (12th), *iē* (13th), *ī, ū* (16th). In the 17th century confusion took place between *ē* and *ī*, both of which came to be pronounced *ē*, as in M.F. *faim* and *fin*, and *ū* became *oe* as in M.F. *à jeun* and *parfum*. (2) Vocalization of *l* (12th century), which became *u* in the groups *al, el, òl, òl, eul* (*altre, autre; bel, beau; mols, mous; dols, dous; aieuls, aieus*), and as a sequel the genesis of four new diphthongs *au, eu, ou, ou* and of two new triphthongs *eau, ieu*. (3) Reduction of all diphthongs and triphthongs to one diphthong *au*, which itself disappears at the close of the 16th century, and to one triphthong *eau*, which vanishes in the course of the 17th. Modern French contains no diphthongs or triphthongs. (4) Reduction of *tch* to *ch*, *ts* to *s*, final *z* to *s*, *dj* to *j*. (5) Loss of intervocalic *d*, e.g., *armedure* becomes *armeure, armure*, and final *t*, e.g., *vertut* becomes *vertu*, both taking place during the 11th and 12th centuries. (6) Loss of *s* before *j, f, v, b, d, g, l, m, n, r* (first half of 11th century), before *p, t, c* (12th and 13th centuries).

From the reign of Louis XIV. the pronunciation of the aristocracy evolved with extreme slowness and with the French Revolution the pronunciation of the third estate won complete predominance. The main developments since the 17th century have been:

—(1) Dropping of the "feminine *e*," e.g., *pâle, prête, forte, soulever*, which in some cases leads to the dropping of the final of a consonantal group, e.g., *peup'* fort instead of *peuple fort*, *semb'-t-il* instead of *semble-t-il*. (2) Substitution of *y* for *l*, a special character indicating *l* mouillé, e.g., *faillir* pronounced *fayir* instead of *faïr*. (3) Loss of the aspirate *h*, which has now become a mere isolating sign, e.g., *le haut, la haine, les haies*. (4) Substitution of "*r* grasseyé" for "*r* roulé," a feature to be found among the Parisian third estate during the 18th century. (5) Loss of final consonants, which popular pronunciation is now completing, replacing *il* by *i*, for instance, in *il dit, ils disent, dit-il*, etc. (pronounced *i di, i diz, dit i*).

Till the 16th century spelling corresponded more or less adequately to pronunciation. During that century, through the influence of the humanists, learned spelling was introduced and has since prevailed despite attempts such as those of Meygret and Ramus, in the 16th century, Poisson, Ménage in the 17th, Dumaïsais, de Wailly in the 18th, Marle in the 19th century. Some apostles of reformed spelling would have liked to change the very form of the letters and confound the entire alphabet. How little their attempts succeeded may be judged from the successive editions of the *Dictionnaire de l'Académie Française* since that of 1740. After adopting the so-called "etymological" spelling in the first and second editions (1694, 1718) of its dictionary, the Academy altered the spelling of 5,000 words in the third edition (1740), but since then has made only insignificant modifications (1762, 1795, 1835, 1878). The reaction of spelling upon pronunciation has increased apace with the spread of public education, and in consequence letters come to be pronounced which completely distort the phonetic physiognomy of many words, introducing into them sounds that either never had existed or had disappeared for generations, e.g., a *p* is now frequently heard in *dompter*; the double consonant is by many distinctly articulated double in *assemblée, illustre, innocent*.

Morphology.—The essential feature of Old French morphology was its declension of substantives and adjectives, which reached its highest development in the 12th century, and, after successive mutilations in the 13th and 14th, disappeared in the 15th. It was restricted to the two cases, nominative and accusative, which had been preserved by Vulgar Latin. In the 12th century all masculine substantives as well as feminine substantives originally of the Latin 3rd, 4th and 5th declensions followed an identical paradigm: sing. nom. *murs, prestres, cuens, mains*; acc. *mur, prestre, conte, main*. Feminine substantives primitively of the Latin 1st declension possessed one form only for each number, e.g., sing. nom. acc. *rose*, plur. nom. acc. *roses*. Certain proper names (masc. from Germanic *-o, -un*; fem. from Germanic *-a, -an*) were declined: nom. *Charle*, acc. *Charlon*; nom. *Berte*, acc. *Bertain*. A few feminine nouns such as *ante, nonne*, were declined similarly, and had a single form for the plural, nom. acc. *antains, nonnains*. This system of declensions (except in Anglo-Norman) still flourished in the 13th century. By the 15th only one case survived for each number respectively, viz., the accusative: sing. *mur, main, rose, nonne*; plur. *murs, mains, roses, nonnes*, these forms serving both as subject and object.

French preserved, here and there, relics of old declensions and traces of genitives and ablatives. Thus, the nominative forms are preserved in *filz, soeur, prêtre, pâtre, chantré, vierge, Jules, Jacques, Georges*, etc.; nom. and acc. forms in *sire, seigneur; gars, garçon; nonne, nonnain*, etc.; gen. sing. in the names of days: *lundi* (O.F. *lunsdi* from *lunis diem*), *mardi* (*Martis diem*), etc. gen. plur. in names such as *vavasseur, la Chandeleur*, etc.; ablat. in some proper names: *Aix* (O.F. *Ais* from Lat. *Aquis*), *Reims, Londres*, etc. Ancient feminine adjectival forms (of the *grandis* type) are still found in *grand' mère, grand' route; fort* (in the phrase *se faire fort*), *Rochefort, raïfort* (fem. in O.F., masc. in Mod. F.); and in all adverbs in *-ement, -amment*, e.g., *prudemment, constamment*. The personal, relative and demonstrative pronouns of O.F. preserved a few nom., acc. and dat. cases, most of which survive in Mod. F., e.g., *je, tu, il, ils, elle, elles, me, te, le, les, moi, toi, soi, lui, leur; qui, que* (O.F. *cuī* has perished); *celui* (O.F. dat.), *autrui* (formed by analogy with *celui*).

As to conjugation, until the 14th century the laws of phonetic evolution apply rigorously. Lat. *amo, amas, amat, amant*, with their free tonic initial, yielded regularly *aim, aimes, aiment, aiment*; whereas *amare, amabam, amavi, amaraio* (Vulg. Lat. future), *amarea* (Vulg. Lat. conditional), protonic *a* remaining unaltered, gave *amer, ameie* (later *amoie, amoïs, amaïs*), *amai, ameraï, ameroie* (later *amerois, ameraïs*). In the 16th century force of analogy reduced this duality of the stem-vowels *a-, ai-* to uniform *ai-*. As analogy preferred now the tonic stem, now the protonic, the final result is that while some verbs generalize the former, others generalize the latter, whilst a few entirely escape its levelling effects. Thus verbs like *jouer, prouver, courir*, etc., have throughout adopted the protonic stem: *joue, jouons, prouve, prouvons; cours, courons*, etc.; whereas in verbs like *demeurer, pleurer*, etc., the tonic stem everywhere prevails: *demeure, demeurons; pleure, pleurons*, etc.; finally in verbs like *devoir, pouvoir*, etc., the stem-system of the mediaeval period is still perpetuated: *dois, devons; peux, pouvons*, etc. By strange irony of fate the grammarians style verbs of this last category "irregular," whilst to the philologist they alone are "regular." Although, during the Renaissance, the conjugational forms were fixed, as regards the written language, by the 17th century analogy was actively modifying conjugation on the lips of the masses. Forms like *boivons* (instead of *buivons*), *moudons* (for *moulons*), *bouera* (for *bouillira*), *sentu* (for *senti*), etc., are of common occurrence.

Syntax.—From the 9th to the 14th century wonderful variety was possible in the order of words. The subject could follow the verb (*Dist li rois*, said the king); the object could head the sentence (*Lo rei veït*, the king he saw) or could intervene between subject and verb (*Cist om lo rei veït*, this man saw the king), or, in compound tenses, between auxiliary and past participle (*Jo ai lo rei veït*, I have the king seen), or between verb and dependent infinitive (*Il cuida lo rei veoir*, he thought the king to see), a noun could even figure before a noun dependent upon it (*Jo sui de France chiés*, I am of France the head). All these constructions were perfectly intelligible, thanks to the case-flexions then still accurately applied in most dialects, certainly in Francien. With the decay of these flexions in the course of the 14th century (as early as the middle of the 12th in Anglo-Norman) a new word-order gradually established itself after a period of about two centuries, during which the influence of Latin was sufficiently strong to induce all kinds of syntactical anomalies. By the 17th century, however, the normal order had definitely become what it is now: (1) subject, (2) verb, (3) object. Variations from this form are thenceforth (17th century to present day) rare save in poetical diction which is prone to archaism. So, too, with the personal tenses of the verbs. As long as the personal flexions remained distinct and characteristic in pronunciation no need existed for any further sign indicating person; thus *aim, aimes, aime, aiment* were sufficiently explicit as long as the sounds *s*, feminine *e* and *nt* were audible, but when all these forms came to be pronounced in one and the same way, *èm*, as in Modern French, the use with them of *je, tu, il, ils* became an absolute necessity. Such are the two features fundamentally differentiating the Old French sentence, which was naturally variable, from the modern, which, in order to escape the almost inevitable monotony consequent on the rigid order prevailing since the 17th century, has been obliged at times to resort to cumbrous devices. Let one example suffice. Instead of "*Veït lo rei*" and "*Lo rei veït*" Modern French has "*Il a vu le roi*"; to emphasize the object it constructs "*Le roi, il l'a vu*" or "*C'est le roi qu'il a vu*," thus multiplying words uselessly.

Since the 17th century there have been but slight changes in syntax. Three tendencies should, however, be noted: (1) the subjunctive is more and more declining in use, especially the imperf. subj. of the first conjugation; (2) the past simple is more and more giving place to the past compound, e.g., "*Il est venu hier*" has supplanted, except in southern France, the form "*Il vint hier*"; (3) new over-compound tenses are taking over functions of the past and future compound, e.g., *il a eu vite fait de se taire; il aura eu facilement compris la raison de mon silence*. The main characteristic of the French language and its syntax is its "clarity," which rendered French popular both in the middle ages,

when Brunetto Latino and Martino Canale proclaimed it "most delectable of all languages to read and to hear," and in the 18th century, when Rivarol accounted for its universality by stating: "French syntax is incorruptible. From it results that admirable clearness, the eternal basis of our syntax. What is not clear is not French." This instinct for clarity is as lively as ever.

FRENCH LAW AND INSTITUTIONS. In the historical evolution of French institutions, those of the Celts of Gaul are of little importance. None of them are known to have survived in later law. It was Roman rule which really formed Gaul. The institutions of Roman Gaul became identical with those of the Roman empire, provincial and municipal government undergoing the same evolution as in the other parts of the empire. The law for the Gallo-Romans was, that which was administered by the *coventus* of the magistrate; there are only a few peculiarities, mere Gallicisms, resulting from usage, which are pointed out by Roman juriconsults of the classical age. The administrative reforms of Diocletian and Constantine applied to Gaul as to the rest of the empire. The Gallo-Romans became Christian with the other subjects of the empire; the Church extended thither her organization framed on the administrative model, each *civitas* having a bishop, just as it had a *curia* and municipal magistrates. The church had the right of acquiring property, of holding councils, subject to the imperial authority, and of the free election of bishops. But only the first germs of ecclesiastical jurisdiction are to be traced in the bishop's powers of arbitration, and in his disciplinary supervision of the morals of clergy and laity. After the fall of the Western empire, there was left to the Gallo-Romans a body of written law which consisted of the imperial constitutions and the writings of the five jurists (Gaius, Papinian, Paulus, Ulpian and Modestinus), to which Valentinian III. had in 426 given the force of law.

The invasions and settlements of the barbarians open a new period. The various barbarian kingdoms in Gaul were established under different conditions. Under the Burgundians and Visigoths, the owners of the great estates, which had been the prevailing form of landed property in Roman Gaul, suffered partial dispossession, according to a regular system. It is doubtful whether a similar process took place in the case of the Frankish settlements, for their first conquests in the north and east seem to have led to the extermination or total expulsion of the Gallo-Roman population. In each case, however, the barbarian king wished to use rather than destroy the existing Roman administrative systems. The kings of the Visigoths and Burgundians were at first actually representatives of the Western empire, and Clovis himself was ready to accept from the emperor Anastasius the title of consul.

The Merovingians.—The first administrative change which followed the Merovingian conquest was the replacement of the *provincia* by the *civitas* as the fundamental unit. The *civitas*, generally known under the name *pagus*, was placed under a count (*comes*), and several *pagi* could be united under a *dux*. The *pagus* was generally divided into "hundreds" (*centenae*). But the Roman administrative machinery was too delicate to be handled by barbarians. Thus the Merovingians tried to levy the same direct taxes as the Romans had done, but they ceased to be imposts reassessed periodically and became fixed annual taxes on lands or persons. They disappeared at last as general imposts, continuing to exist only as personal or territorial dues. In the same way the Roman municipal organization survived for a considerable time under the Merovingians but was used only for the registration of written deeds; under the Carolingians it disappeared, and with it the old senatorial nobility which had been that of the Empire. The administration of justice seems to have been organized on a system borrowed partly from Roman and partly from Germanic institutions. Justice is administered by the count (*comes*) or his deputy (*centenarius* or *vicarius*), but on the verdict of notables called in the texts *boni homines* or *rachimburgii*. This takes place in an assembly, the *mallus*, at which every free man is bound to attend a

certain number of times a year, and in which are promulgated the general acts emanating from the king. The latter could issue commands or prohibitions, the violation of which entailed a fine of 60 *solidi*; he also administered justice, assisted by the officers of his household, his jurisdiction being unlimited and undefined. He could hear all causes, but was not bound to hear any, except, apparently, accusations of deliberate failure of justice and breach of trust on the part of the *rachimburgii*.

But what proved the great disturbing element in Gallo-Roman society was the fact that the conquerors were all warriors, whose normal state was that of war. It is true that under the Roman empire all the men of a *civitas* had been obliged, in case of necessity, to march against the enemy, and under the Frankish monarchy the count still called together his *pagenses* for this object. But the condition of the barbarian was very different; he lived essentially for fighting. Moreover, this military class, though not an aristocracy (for among the Franks the royal race alone was noble), was to a large extent independent, and the king had to attach these *leudes* or *fideles* to himself by gifts and favours. At the same time the authority of the king gradually assumed the personal character which, among the Germans, marked most of the relations between men. The household of the king gained in political importance, because the chief officers in the palace became also high public officials and the king's bodyguard, the *antrustions*, remained a class apart.

The Frankish monarch had also the power of making laws, after consulting the chief men of the kingdom, both lay and ecclesiastical, in *placita*, meetings apparently modelled on the councils of the Church. But throughout the kingdom in many places the direct authority of the king over the people ceased to make itself felt. The *immunitates*, granted chiefly to the great ecclesiastical landowners, limited this authority in a curious way by forbidding public officials to exercise their functions in the precinct of land which was *immunis*. Judicial and fiscal rights frequently passed to the landowner, who became of necessity the intermediary between the supreme power and the people. Other principles contributed towards the weakening of the royal power. The monarch considered the kingdom to be his property and this gave rise to the concessions of royal rights to individuals, and later to partitions of the kingdom between the sons of the king, as in the division of an inheritance in land. This proved one of the chief weaknesses of the Merovingian monarchy.

In order to rule the Gallo-Romans, the barbarians had sought the help of the Church, the representative of Roman civilization. Further, the Merovingian monarch and the Catholic Church had come into close alliance in their struggle with the Arians. The Church therefore gained new privileges, but at the same time became to a certain extent dependent. Under the Merovingians the election of the bishop by clergy and people is only valid if it obtains the assent of the king, who often directly nominates the prelate. But the Church retains her full right of acquiring property, and her jurisdiction is partially recognized. She not only exercises more freely than ever a disciplinary jurisdiction, but the bishop, in place of the civil power, administers civil and criminal justice over the clergy. The councils had for a long time forbidden the clergy to cite one another before secular tribunals; they had also, in the 6th century, forbidden secular judges under pain of excommunication to cite before them and judge the clergy, without permission of the bishop. A decree of Clotaire II. (614) acknowledged, if only partially, the validity of these claims.

Carolingian Period.—The Merovingian dynasty perished amid increasing anarchy. The crown passed, with the approval of the papacy, to an Austrasian mayor of the palace and his family, who had been the last support of the preceding dynasty. Under these conditions there developed a number of institutions, which were in reality the direct precursors of feudalism. One was the royal benefice (*beneficium*), of which the Church provided both the model and, in the first instance, the material. The model was the *precaria*, a form of concession by which it was customary for the Church to grant the possession of her lands to free men; this practice she herself had copied from the five-years leases granted by the Roman exchequer. Gradually, however, the *precaria* had

become a grant made, in most cases, freely and for life. As regards the material, when the Austrasian mayors of the palace wished to secure the support of the *fideles* by fresh benefits, the royal treasury being exhausted, they turned to the Church and took lands from her to give to their warriors. In order to disguise the robbery it was decided that these lands should be held as *precariae* from the Church which had furnished them. Later, when the royal treasury was reorganized, grants of land made by the kings naturally took a similar form, the *beneficium*, as a free grant for life. The *beneficium* inevitably crystallized into a perpetual and hereditary right. Another institution akin to the *beneficium* was the *senioratus*. By the *commendatio*, a form of solemn contract, a man swore absolute fidelity to another man, who became his *senior*. It became the generally received idea that it was natural and normal for every free man to have a *senior*. At the same time a benefice was never granted unless accompanied by the *commendatio* of the beneficiary to the grantor. As the most important *seniores* were thus bound to the king and received from him their benefices, he expected through them to command their men; but in reality the king disappeared little by little in the *senior*. The king granted as benefices not only lands, but public offices such as those of count or *dux*, which thus became possessions, held, first for life, and later as hereditary properties.

Charlemagne, while sanctioning these institutions, reorganized the administration of justice, fixing the respective jurisdictions of the count and the *centenarius*, substituting for the *rachimburgii* permanent *scabini*, chosen by the count in the presence of the people, and defining the relations of the count, as the representative of the central authority, with the *advocati* or *judices* of *immunitates* and *potestates*. He reorganized the army, determining the obligations and the military outfit of free men according to their means. Finally, he established those regular inspections by the *missi dominici* which are the subject of so many of his capitularies and founded two general assemblies in the year, one in the autumn, the other in the spring, which were attended by the chief officials, lay and ecclesiastical. It was here that the capitularies (*q.v.*) and all important measures were first drawn up and then promulgated. The revenues of the Carolingian monarch consisted chiefly in the produce of the royal lands. There were also the free gifts which the great men were bound, according to custom, to bring to the *conventus*, the regular personal or territorial dues into which the old taxes had resolved themselves; the profits arising from the courts and numberless requisitions in kind, a usage which had without doubt existed continuously since Roman times. The Church added a fresh prerogative to her former privileges, namely, the right of levying a real tax in kind, the *tithe*. Since the 3rd century she had tried to exact the payment of tithes from the faithful, and from the reign of Pippin the Short onwards the civil law recognized and sanctioned this obligation. Ecclesiastical jurisdiction extended farther and farther, but Charlemagne, the protector of the papacy, maintained firmly his authority over the Church. He nominated its dignitaries, both bishops and abbots, who were true ecclesiastical officials, parallel with the lay officials. In each *pagus*, bishop and count owed each other mutual support, and the *missi* on the same circuit were ordinarily a count and a bishop. In the first collection of capitularies, that of Ansegisus, two books out of four are devoted to ecclesiastical capitularies.

The Law Under the Frank Monarchy.—What then, was the private and criminal law of this Frankish monarchy which had come to embrace so many different races? Men of Roman descent remained under Roman law, and the conquerors could not hope to impose their customs upon them. As to the barbarians, they had hitherto had nothing but customs, and these customs, of which the type nearest to the original is to be found in the oldest text of the *Lex Saliica*, were nothing more than a series of tariffs of compensations, that is to say, sums of money due to the injured party or his family in case of crimes committed against individuals. They also introduced barbarous systems of trial, that by compurgation, *i.e.*, exculpation by the oath of the defendant supported by a certain number of *cojurantes*, and that by ordeal, later called *judicium Dei*. In each new kingdom the barbarians natur-

ally kept their own laws, and when these men of different races all became subject to the Frankish monarchy, there evolved itself a system (called the *personnalité des lois*) by which every subject had, in principle, the right to be tried by the law of the race to which he belonged. When the two adversaries were of different race, it was the law of the defendant which had to be applied. The customs of the barbarians had been drawn up in Latin. At this period only these written documents bear the name of "law" (*leges romanorum; leges barbarorum*), and at least the tacit consent of the people seems to have been required for these collections of laws, in accordance with an axiom laid down in a later capitulary; *lex fit consensu populi et constitutione regis*. It is noteworthy, too, that in the process of being drawn up in Latin, most of the *leges barbarorum* were very much Romanized.

In the midst of this diversity, a certain number of causes tended to produce a partial unity. The capitularies, which had themselves the force of law, when there was no question of modifying the *leges*, constituted a legislation which was the same for all; often they inflicted corporal punishment for grave offences, which applied to all subjects without distinction. The Gallo-Romans, and even the Church itself, to a certain extent, adopted the barbarous methods of trial introduced by the Germans. On the other hand, written acts became prevalent among the barbarians, and at the same time they assimilated a certain amount of Roman law; for these acts continued to be drawn up in Latin, after Roman models. During this period, too, the Gallican Church adopted the collection of councils and decretals by Dionysius Exiguus, which was sent to Charlemagne in 774 by Pope Adrian I.

All the subjects of the Frankish monarchy were not of equal status. There was, strictly speaking, no nobility, both the Roman and the Germanic nobility having died out; but slavery continued to exist. The Church, however, was transforming the slave into the serf, by giving validity to their marriages, at least, when the master had approved of them, and by protecting the slave's *peculium*. But between the free man and the slave lay many persons of intermediate status. There was, to begin with, the Roman colonist (*colonus*), a class of which there is no clear mention in the laws before the 4th century; they and their children after them were attached perpetually to a certain piece of land, which they were allowed to cultivate on payment of a rent. There were, further, the *liti*, a similar class of Germanic origin. Many free men who had fled to the great landowners for protection accepted a similar position. Under the Merovingian régime, and especially under the Carolingians, the occupation of land tended to assume the character of tenure; but free ownership of land continued to exist under the name of *alod*, and the capitularies contain numerous complaints and threats against the counts, who endeavoured by the abuse of their power to obtain the surrender of small properties held by free men.

PERIOD OF ANARCHY AND THE RISE OF FEUDALISM

The 8th and 11th centuries were a period of profound anarchy, during which feudalism took a more definite shape. The sovereigns no longer made laws, the old capitularies and *leges* fell into disuse and in their place territorial customs arose which were at first ill-defined and strictly local. Apart from the influence of the church, government rested on brute force. In this anarchy, men drew together and formed themselves into groups for mutual defence. A nucleus was formed which was to become the new social unit, that is to say, the feudal group. Of this the centre was a chief, around whom gathered men capable of bearing arms, who commended themselves to him according to the old form of vassalage. They owed him fidelity, assistance and the support of their arms; while he owed them protection. Some of them lived in his castle or fortified house, receiving their equipment only and eating at his table. Others received lands from him, which became the fiefs of a later time. The fief was generally held for life and did not become universally hereditary till the second half of the 11th century. All these conditions had already existed previously in much the same form; but the new development is that the chief was no longer, as before, merely an intermediary between his men and the royal power. The group had become in effect

independent, so organized as to be socially and politically self-sufficient. It constituted a small army, led, naturally, by the chief, and composed of his feudatories, supplemented in case of need by the *rustici*. It also formed an assembly in which common interests were discussed, the lord, according to custom, being bound to consult his feudatories and they to advise him to the best of their power. It also formed a court of justice, in which the feudatories gave judgment under the presidency of their lord; and all of them claimed to be subject only to the jurisdiction of this tribunal composed of their peers. Generally they also judged the villeins (*villani*) and the serfs dependent on the group, except in the rare cases where the latter obtained as a favour judges of their own status. Under these conditions a nobility was formed, those men becoming nobles who were able to devote themselves to the profession of arms and this nobility was not a caste but could be indefinitely recruited by the granting of fiefs and admission to knighthood (see KNIGHTHOOD AND CHIVALRY).

Private War.—The state of anarchy was by now so far advanced that the custom of private war arose. Every man claimed the right of making war to defend his rights or to avenge his wrongs. Later on, this was a privilege of the noble but the texts defining the limits which the Church endeavoured to set to this abuse, namely, the Peace of God and the Truce of God, show that at the outset it was a power possessed by men of all classes. Even a man who had appeared in a court of law and received judgment had the choice of refusing to accept the judgment and of making war instead.

In this state of political disintegration each part of the country which had a homogeneous character tended to form itself into a higher unit. In this unit there arose a powerful lord, generally a duke, a count or a viscount, either a former official of the monarchy, whose function had become hereditary, or a usurper who had formed himself on this model. He laid claim to an authority other than that conferred by the possession of real property. His court of justice was held in the highest honour, and to it were referred the most important affairs. But in such a district there were generally a number of more or less powerful lords, with as yet no particular feudal title who had generally commended themselves to this duke or count by doing homage.

The Royal Power.—On the other hand, the royal power continued to exist. Under the last Carolingians it had in fact become elective, as is shown by the elections of Odo and Robert before that of Hugh Capet. The electors were the chief lords and prelates of the *regnum Francorum*. But each king during his lifetime secured the coronation of his eldest son so that the first of the Capetians revived the principle of heredity in favour of the eldest son, while establishing the hereditary indivisibility of the kingdom. But the only real authority of the king lay where his own possessions were, or where there had not arisen a duke, a count or lord of equal rank with them. He maintained, however, a court, the jurisdiction of which seems to have been universal, though the parties in a suit could accept or reject the judgment given. The king dispensed justice surrounded by the officers of his household, who formed a permanent council. Periodically, at the great yearly festivals, he called together the chief lords and prelates of his kingdom, thus carrying on the tradition of the Carolingian *placita* or *conventus*; but little by little the character of the gathering changed; it was no longer an assembly of officials but of independent lords. This was the origin of the *curia regis*.

The Church.—While the power of the State was almost disappearing, that of the Church continued to grow. Her jurisdiction gained ground, since her procedure was reasonable and comparatively scientific. Not only was the privilege of clergy, by which accused clerks were brought under her jurisdiction, almost absolute, but she had cognizance of a number of causes in which laymen only were concerned, marriage and everything nearly or remotely affecting it, wills, crimes and offences against religion and even contracts, when the two parties wished it or when the agreement was made on oath. The Church, moreover, remained in close connection with the crown, while the royal prerogatives with regard to the election of bishops were maintained more successfully than other rights of the crown, though in many of the great fiefs

they none the less passed to the count or the duke. It was at this time too that the Church tried to break the last ties which still kept her more or less dependent on the civil power (see INVESTITURE AND CHURCH HISTORY).

Roman Law and Feudalism.—The period of the true feudal monarchy is embraced by the 12th and 13th centuries. It was at this time that the crown again assumed real strength and authority, but so far it had no organs and instruments save those which were furnished by feudalism, now organized under a regular hierarchy, of which the king was the head. This new position of affairs was the result of three great factors: the revival of Roman Law, the final organization of feudalism and the rise of the privileged towns. Roman law spread rapidly in the French schools and universities, except that of Paris, which was closed to it by the papacy; and the influence of this study was so great that it transformed society. On the one hand it contributed largely to the reconstitution of the royal power, modelling the rights of the king on those of the Roman emperor. On the other hand it wrought a no less profound change in private law. From this time dates the division of old France into the *Pays de droit écrit*, in which Roman law, under the form in which it was codified by Justinian, was received as the ordinary law; and the *Pays de coutume*, where it played only a secondary part, being generally valid only as *ratio scripta* and not as *lex scripta*. In this period the customs also took definitive form, and over and above the local customs properly so called there were formed customs known as *general*, which held good through a whole province or *bailliage*, and were based on the jurisprudence of the higher jurisdictions. (For the privileged towns of France see COMMUNE, MEDIAEVAL.)

In the final organization of feudalism, the chief lord, the duke or count, had beneath him a whole hierarchy, and was himself a part of the feudal system of France (see FEUDALISM). Doubtless in the case of lords like the dukes of Brittany and Burgundy, the king could not actually demand the strict fulfilment of feudal obligations; but the principle was established. Free and absolute property, the ancient *allodium*, continued to exist in most districts, though by way of exception. In the administration of justice, the feudal hierarchy had absolute sway. The fiefs themselves became hereditary, and the rules of succession were established. The most salient features of feudal succession were the right of primogeniture and the preference given to heirs-male; but from the 13th century onwards the right of primogeniture, which had at first involved the total exclusion of the younger members of a family, tended to be modified, except in the case of the chief lords, the eldest son obtaining the preponderant share or *préciput*. Non-noble (*roturier*) tenancies followed a similar development, except that in their case there was no right of primogeniture nor any privilege of males.

Great Officers of the Crown.—The chief instruments of the crown in government were its great officers, the seneschal, butler, constable and chancellor, who were to become irremovable officials. But this period saw the rise of a special college of dignitaries, that of the Twelve Peers of France, consisting of six laymen and six ecclesiastics, which took definitive shape at the beginning of the 13th century. We cannot yet discern with any certainty by what process it was formed, why those six prelates and those six great feudatories in particular were selected rather than others equally eligible. But there is no doubt that we have here a normal feudal development; the formation of a similar assembly of 12 peers occurs also in some of the great fiefs. Besides the part which they played at the consecration of kings, the peers of France formed a court in which they judged one another under the presidency of the king, their overlord, according to feudal custom. But the *cour des pairs* in this sense was not separate from the *curia regis*, nor yet, later, from the *parlement* of Paris, of which the peers of France were by right members. From this time, too, dates another important institution, that of the *maîtres des requêtes*.

Growth of the Royal Power.—The legislative power of the crown again began to be exercised during the 12th century, and in the 13th century had full authority over all the territories subject to the crown. The kings of this century were able narrowly to limit

the custom of private war. But the most appreciable progress took place in the administrative and judicial institutions. Under Philip Augustus arose the royal *baillis* (see BAILIFF), and seneschals (*q.v.*), who were the representatives of the king in the provinces, and superior judges. At the same time the form of the feudal courts tended to change, as they began more and more to be influenced by the Romano-canonical law. Saint Louis had striven to abolish trial by combat, and the Lateran Council of 1216 condemned other forms of ordeal. Of the seigniorial jurisdictions there soon remained only the *hautes* or *basses justices* (in the 14th century arose an intermediate grade, the *moyenne justice*), all of which were considered to be delegations of the royal power. As a result of the application of Roman and canon law, there arose the practice of appeal from seigniorial justice to the royal court. In the 13th century too appeared the theory of crown cases (*cas royaux*) which were reserved for the royal court. Finally, the *curia regis* was gradually transformed into a regular court of justice, the *parlement* (*q.v.*), as it was already called in the second half of the 13th century. At this time the king no longer appeared in it regularly, and before each session (for it was not yet a permanent body) a list of properly qualified men was drawn up in advance to form the *parlement*, only those whose names were on the list being capable of sitting in it. Its main function had come to be that of a final court of appeal. At the various sessions, which were regularly held at Paris, appeared the *baillis* and seneschals, who were called upon to answer for the cases they had judged and also for their administration. The accounts were received by members of the *parlement* at the Temple, and this was the origin of the *cour* or *chambre des comptes*.

Nobles, Commons and the Church.—At the end of this period the nobility became an exclusive class. It became an established rule that a man had to be noble in order to be made a knight, and even in order to acquire a fief; but in this latter respect the king made exceptions in the case of *roturiers*, who were licensed to take up fiefs, subject to a payment known as the *droits de franc-fief*. The Church maintained her privileges; a few attempts only were made to restrain the abuse, not the extent, of her jurisdiction. This jurisdiction was, during the 12th century, to a certain extent regularized, the bishop nominating a special functionary to hold his court; this was the *officialis* (Fr. *official*), whence the name of *officialité* later applied in France to the ecclesiastical jurisdictions. On one point, however, her former rights were diminished. She preserved the right of freely acquiring personal and real property, but though she could still acquire feudal tenures she could not keep them; she must alienate the property again within a year and a day. The reason for this new rule was that the Church is a proprietor who does not die and in principle does not surrender her property; consequently, the lords had no longer the right of exacting the payments on the alienations of those tenures which she acquired. In this period the form of the episcopal elections underwent a change, the electoral college coming to consist only of the canons composing the chapter of the cathedral church.

Changes in Criminal Law.—Finally, it must be added that during the 13th century criminal law was profoundly modified. Under the influence of Roman law a system of arbitrary penalties replaced those laid down by the customs, which had usually been fixed and cruel. The criminal procedure of the feudal courts had been based on the right of accusation vested only in the person wronged and his relations; for this was substituted the inquisitorial procedure which had developed in the canon law at the very end of the 12th century, and was to become the *procédure à l'extraordinaire* of the *ancien régime*, which was conducted in secret and without free defence and debate. Of this procedure torture came to be an ordinary and regular part.

The customs, which at that time contained almost the whole of the law for a great part of France, were not fixed by being written down. In that part of France which was subject to customary law (*la France coutumière*) they were defined when necessary by the verdict of a jury in what was called the *enquête par turbes*; some of them, however, were, in part at least, authentically recorded in seigniorial charters, *chartes de ville* or *chartes de*

coutume. Their rules were also recorded by experts in private works or collections called *livres coutumiers*, or simply *coutumiers* (customaries). The most notable of these are *Les Coutumes de Beauvoisis* of Philippe de Beaumanoir; the *Très ancienne coutume de Normandie* and the *Grand Coutumier de Normandie*; the *Conseil à un ami* of Pierre des Fontaines; the *Établissements de Saint Louis*; the *Livre de justice et de plet*. At the same time the clerks of important judges began to collect in registers notable decisions; it is in this way that we have preserved to us the old decisions of the exchequer of Normandy, and the *Olîm* registers of the *parlement* of Paris.

THE LIMITED MONARCHY

The 14th and 15th centuries were the age of the limited monarchy. In this period certain rules for the succession to the throne were fixed by precedents: the exclusion of women and of male descendants in the female line, and the principle that a king could not by an act of will change the succession of the crown. The old *curia regis* disappeared. Its judicial functions were discharged by the *parlement*, while to fulfil its deliberative functions there was formed a new body, the royal council (*conseil du roi*), an administrative and governing council, which was in no way of a feudal character. The number of its members was at first small, but tended to increase; soon the brevet of *conseiller du roi en ses conseils* was given to numerous representatives of the clergy and nobility, the great officers of the crown becoming members by right. Side by side with these officials, whose power was then at its height, there were gradually evolved more subservient ministers who could be dispensed with at will; the *secrétaires des commandements du roi* of the 15th century, who in the 16th century developed into the *secrétaires d'état*, and were themselves descended from the *clercs du secret* and *secrétaires des finances* of the 14th century. The College of the Twelve Peers of France had not its full numbers at the end of the 13th century; the six ecclesiastical peerages existed; but several of the great fiefs to which six lay peerages had been attached had been annexed to the crown. To fill these vacancies, Philip the Fair raised the duchies of Brittany and Anjou and the countship of Artois to the rank of peerages of France. This really amounted to changing the nature of the institution; for the new peers owed their rank merely to the king's will, though the rank continued to be hereditary. Before long peers began to be created when there were no gaps in the ranks of the College, and there was a constant increase in the numbers of the lay peers.

The States General.—At the beginning of the 14th century appeared the States General (*états généraux*). Their power reached its height at the crisis of the Hundred Years' War during the reign of King John. At the same time there arose side by side with them, and from the same causes, the provincial estates, which were in miniature for each province what the states general were for the whole kingdom. Later it became a privilege for a province to have its own assembly; those which did so were never rightfully subject to the royal *taille*, and kept, at least formally, the right of sanctioning, by means of the assembly, the subsidies which took its place. Hence it became the endeavour of the crown to suppress these provincial assemblies, which in the 14th century were to be found everywhere; from the outset of the 15th century they began to disappear in central France.

Royal Taxation.—The most characteristic feature of this period was the institution of universal taxation by the Crown. Hitherto, the king's sole revenues were those which he exacted in his capacity of feudal lord together with the income arising from certain crown rights which he had preserved or regained. But these revenues, known later as the income of the royal domain and later still as the *finances ordinaires*, became insufficient in proportion as the royal power increased; it became a necessity for the monarch to be able to levy imposts throughout the whole extent of the provinces annexed to the Crown, even upon the subjects of the different lords. This he could only do by means of the co-operation of those lords, lay and ecclesiastical, who alone had the right of taxing their subjects; the co-operation of the privileged towns, which had the right to tax themselves, was also necessary.

It was in order to obtain this consent that the States General, in most cases, and the provincial assemblies, in all cases, were convoked. In some cases, however, the king adopted different methods; for instance, he sometimes utilized the principle of the feudal aids. In cases where his vassals owed him, as overlord, a pecuniary aid, he substituted for the sum paid directly by his vassals a tax levied by his own authority on their subjects. It is in this way that for 30 years the necessary sums were raised, without any vote from the States General, to pay the ransom of King John. But in principle the taxes were sanctioned by the States General in the 14th century. Whatever form they took, they were given the general name of Aids or *auxilia*, and were considered as occasional and extraordinary subsidies, the king being obliged in principle to "live of his own." Certain aids, it is true, tended to become permanent under the reign of Charles VI.; but the taxes subject to the consent of the States General were at first the sole resource of Charles VII. In the second half of his reign two chief taxes became permanent: in 1435 the *aids* (a tax on the sale of articles of consumption, especially on wine), with the formal consent of the States General, and the *taille* in 1439. These imposts were increased, on the royal authority, by Louis XI. and became permanent after his death.

Together with the taxes there was evolved the system of their administration. For the administration of the subsidies which they granted, the States General nominated from among their own numbers *surintendants généraux* or *généraux des finances*, and further, for each diocese or equivalent district, *élus*. Both had judicial as well as fiscal powers, the latter constituting courts of first instance and the former courts of final appeal. After 1360 both *généraux* and *élus* were nominated by the king. The *élus*, or *officiers des élections*, only existed in districts which were subject to the royal *taille*; hence the division, so important in old France, into *pays d'élections* and *pays d'états*. The *élus* kept both administration and jurisdiction; but in the higher stage a differentiation was made: the *généraux des finances*, who numbered four, kept the administration, while their jurisdiction as a court of final appeal was handed over to another body, the *cour des aides*, which had already been founded at the end of the 14th century. Besides the four *généraux des finances* there were four treasurers of France (*trésoriers de France*), who administered the royal domain; and these eight officials formed in the 15th century a kind of ministry of finance to the monarchy.

The Army.—The army also was reorganized. On the one hand, the military service attached to the fiefs was transformed for the profit of the king, who alone had the right of making war: it became the *arrière-ban*, a term which had formerly applied to the *levée en masse* of all the inhabitants in times of national danger. Before the 14th century the king had only had the power of calling upon his own immediate vassals for service. Henceforth all possessors of fiefs owed him, whether within the kingdom or on the frontiers, military service without pay and at their own expense. This was for long an important resource for the king. But Charles VII. organized an army on another footing. It comprised the *francs-archers* furnished by the parishes, a militia which was only summoned in case of war, and companies of *gendarmerie* or heavy cavalry, which were called *compagnies d'ordonnance*. It was chiefly to provide for the expense of this first nucleus of a permanent army that the *taille* itself had been made permanent.

The new army led to the institution of the governors of provinces, who were to command the troops quartered there. At first they were only appointed for the frontiers and fortified places, but later the kingdom was divided into *gouvernements généraux*. There were at first 12 of these, which were called in the middle of the 16th century the *douze anciens gouvernements*. Although, strictly speaking, they had only military powers, the governors, always chosen from among the great lords, became in the provinces the direct representatives of the king and caused the *baillis* and *seneschals* to take a secondary place.

Law Courts.—The courts of law continued to develop on the lines already laid down. The *parlement*, which had come to be a judicial committee nominated every year, but always consisting in fact of the same persons, changed in the course of the 14th cen-

tury into a body of magistrates who were permanent but as yet subject to removal (*see PARLEMENT*). The provincial *parlements* had arisen after and in imitation of that of Paris, and had for the most part taken the place of some superior jurisdiction which had formerly existed in the same district when it had been independent (like Provence) or had formed one of the great fiefs (like Normandy or Burgundy). It was during this period also that the *parlements* acquired the right of opposing the registration, that is to say, the promulgation of laws, of revising them, and of making representations to the king when they refused registration. The other royal jurisdictions were completed (*see BAILLIFF; CHÂTELET*). Besides them arose another of great importance, which was of military origin, but came to include all citizens under its sway. These were the provosts of the marshals of France (*prévôts des maréchaux de France*), who were officers of the *maréchaussée* (the gendarmerie of the time); they exercised criminal jurisdiction without appeal over crimes committed by vagabonds and fugitives from justice, and over a number of crimes of violence, whatever the rank of the offender. Further, another class of officers was created in connection with the law courts: the "king's men" (*gens du roi*), the *procureurs* and *avocats du roi*, who were at first simply those lawyers who represented the king in the law courts, or pleaded for him when his interests were involved. From the 14th century onwards the *procureurs du roi* had full control over public prosecutions. In this period, too, appeared what was afterwards called *justice retenue*, that is to say, the justice which the king administered, or was supposed to administer, in person. It was based on the idea that, since all justice and all judicial power reside in the king, he could not deprive himself of them by delegating their exercise to his officers and to the feudal lords. Consequently he could, if he thought fit, take the place of the judges and call up a case before his own council. He could reverse even the decisions of the courts of final appeal, and in some cases used this means of appealing against the decrees of the *parlements*. In these cases the king was supposed to judge in person; in reality they were examined by the *maîtres des requêtes* and submitted to the royal council (*conseil du roi*), at which the king was always supposed to be present and which had in itself no power of giving a decision. For this purpose there was soon formed a special committee of the council, which was called the *conseil privé* or *de justice*. The king frequently, by means of *lettres de justice*, intervened in the procedure of the courts, by granting *benéfices*, by which rules which were too severe were modified, and judgments were given in cases not covered by the common law. By *lettres de grâce* he granted reprieve or pardon in individual cases. The most extreme form of royal intervention was made by means of *lettres de cachet* (*q.v.*), which ordered a subject to go without trial into a state prison or into exile.

The Church.—The condition of the Church changed greatly during this period. The jurisdiction of the *officialités* was very much reduced, even over the clergy. The development of jurisprudence gradually removed from the *officialités* causes of a purely secular character in which laymen only were concerned, such as wills and contracts; and in matrimonial cases their jurisdiction was limited to those in which the *foedus matrimonii* was in question. For the acquisition of real property by ecclesiastical establishments the consent of the king was always necessary.

In ecclesiastical patronage, from the 14th century onwards the papacy encroached more and more upon the rights of the bishops over the inferior benefices, and of the electors, who usually conferred the superior benefices; at the same time it exacted from newly appointed incumbents heavy dues, which were included under the generic name of annates (*q.v.*). During the Great Schism these abuses grew, until by a series of edicts, promulgated with the consent and advice of the *parlement* and the clergy, the Gallican Church was restored to the possession of its former liberties, under the royal authority. Thus France was ready to accept the decrees of reform issued by the council of Basel (*q.v.*), which she did, with a few modifications, in the Pragmatic Sanction of Charles VII., adopted after a solemn assembly of the clergy and nobles at Bourges and registered by the *parlement* of Paris in 1438. It suppressed the annates and most of the means by which

the popes disposed of the inferior benefices. For the choice of bishops and abbots, it restored election by the chapters and convents. The Pragmatic Sanction, however, was never recognized by the papacy, nor was it consistently and strictly applied by the royal power.

THE ABSOLUTE MONARCHY

From the 16th century to the Revolution was the period of the absolute monarchy. The reigns of Francis I. and Henry II. clearly laid down the principle of the absolute power of the crown. The States General were not assembled under these two reigns, though they reappeared in the second half of the 16th century. They were summoned in 1560 at Orleans, in 1561 at Pontoise, and in 1576 and 1588 at Blois. The League even convoked one, which was held at Paris in 1593. But the states general of the 16th century, in spite of their good intentions and the great talents which were at their service, were dominated by religious passions, which made them powerless for any practical purpose. They were, however, to be called together yet again, as a result of the disturbances which followed the death of Henry IV.; but their dissensions and powerlessness were again strikingly exemplified and they did not reappear until 1789. Other bodies, however, which the royal power had created, were to carry on the struggle against it. There were the *parlements*, the political rivals of the States General. Thanks to the principle according to which no law came into effect so long as it had not been registered by them, they had won the right of refusing registration, explaining their reasons to the king by means of the *remonstrances*. Before the end of the 17th century they had lost this power. The ordinance of 1667 on civil procedure, and above all a declaration of 1673, ordered the *parlement* to register the laws as soon as it received them and without any modification. It was only after this registration that they were allowed to draw up remonstrances, which were henceforth futile. The nobles, as a body, had also become politically impotent. At the same time the central government underwent changes. The great officers of the crown disappeared one by one. Of those in the first rank only the chancellor survived till the Revolution. Apart from him, the king's real ministers were the secretaries of State, generally four in number, who were always removable and were not chosen from among the great nobles. For purposes of internal administration, the provinces were divided between them, each of them corresponding by despatches with the areas which were assigned to him. Any other business (with the exception of legal affairs, which belonged to the chancellor, and finance, of which we shall speak later) was divided among them according to convenience. At the end of the 16th century, however, were evolved two regular departments, those of war and foreign affairs. Under Francis I. and Henry II., the chief administration of finance underwent a change; for the four *généraux des finances*, who had become too powerful, were substituted the *intendants des finances*, one of whom soon became a chief minister of finance, with the title *surintendant*. The *généraux des finances*, like the *trésoriers de France*, became provincial officials, each at the head of a *généralité* (a superior administrative district for purposes of finance); under Henry III. the two functions were combined and assigned to the *bureaux des finances*. The fall of Fouquet led to the suppression of the office of *surintendant*; but Colbert soon again became practically a minister of finance, under the name of *contrôleur général des finances*, both title and office continuing to exist up to the Revolution.

The *conseil du roi* was an important organ of the central government, and for a long time included among its members representatives of the nobility and clergy. Besides the councillors of State (*conseillers d'état*), its ordinary members, the great officers of the crown and secretaries of State, princes of the blood and peers of France were members of it by right. Further, the king was accustomed to grant the brevet of councillor to a great number of the nobility and clergy, who could be called upon to sit in the council and give an opinion on matters of importance. But in the 17th century the council tended to differentiate its functions, forming three principal sections, one for political, one for financial, and the third for legal affairs. Under Louis XIV. it took a definitely

professional, administrative and technical character. The *conseillers à brevet* were all suppressed in 1673, and the peers of France ceased to be members of the council. The political council, or *conseil d'en haut*, had no *ex officio* members, not even the chancellor; the secretary of State for foreign affairs, however, necessarily had entry to it; it also included a small number of persons chosen by the king and bearing the title of ministers of state (*ministres d'état*). The other important sections of the *conseil du roi* were the *conseil des finances*, organized after the fall of Fouquet, and the *conseil des dépêches*, in which sat the four secretaries of State, where everything concerned with internal administration (except finance) was dealt with, including the legal business connected with this administration.

Provincial Administration.—The chief authority in the provincial administration belonged in the 16th century to the governors of the provinces. But at the end of this century were created the intendants of the provinces, who, after a period of conflict with the governors and the *parlements*, became absolute masters of the administration in all those provinces which had no provincial estates, and the instruments of a complete administrative centralization (*see* INTENDANT).

The towns having a municipal organization, preserved in the 16th century a fairly wide autonomy. Under Louis XIV. their dependence rapidly declined. They were placed under the tutelage of the intendants, whose sanction, or that of the *conseil du roi*, was necessary for all acts of any importance. In the closing years of the 17th century, the municipal officials ceased, even in principle, to be elective. Their functions ranked as offices which were, like royal offices, saleable and heritable.

The sale of royal offices is one of the characteristic features of the *ancien régime*. In the 16th century, under Francis I. at the latest, the crown itself began officially to sell offices, taking a fee from those upon whom they were conferred. In the judicial system, the practice had a favourable result, assuring security of office to the judges; for the king could not reasonably dismiss an official arbitrarily without refunding the fee which he had paid. On the other hand, it contributed to the development of the dues paid by litigants to the judges. The system of sale, and with it irremovability, was extended to all official functions, even to financial posts. The process was completed by the recognition of the rights in the sale of offices as hereditary, *i.e.*, the right of resigning the office on payment of a fee, either in favour of a competent descendant or of a third party, passed to the heirs of an official who had died without having exercised this right himself. Through this development there arose a class of men who, though bound in many ways to the crown, were actually independent. Hence the tendency in the 18th century to create new and important functions under the form, not of offices, but of simple commissions.

Fundamental Laws of France.—In this period the essential principles of public law were defined. There were, in the first place, the *fundamental laws of the realm*, which were true constitutional principles, considered as binding the king himself; so that, although he was sovereign, he could neither abrogate, nor modify, nor violate them. There was, however, some discussion as to what rules actually came under this category, except in the case of two series about which there was no doubt. These were, on the one hand, those which dealt with the succession to the crown and forbade the king to change its order, and those which proclaimed the inalienability of the royal domain, against which no title by prescription was valid. This last principle admitted only two exceptions: the formation of appanages (*q.v.*), and the sale of land to meet the necessities of war, with a perpetual option of redemption.

There was in the second place the theory of the rights, franchises and liberties of the Gallican Church. This body of doctrine rested chiefly on three principles: firstly, that the temporal power was absolutely independent of the spiritual power; secondly, that the pope had authority over the clergy of France in temporal matters and matters of discipline only by the consent of the king; thirdly, that the king had authority over and could legislate for the Gallican Church in temporal matters and matters of discipline. The old public law provided a safeguard against the violation of these

rules in the process known as the *appel comme d'abus*, definitely established during the 16th century. It was heard before the *parlements*, but could, like every other case, be evoked before the royal council. Its effect was to annul any act of the ecclesiastical authority due to abuse or contrary to French law. The Pragmatic Sanction had been abrogated and replaced by the Concordat of 1515, which remained in force until suppressed by the Constituent Assembly, and preserved many of the enactments of the Pragmatic Sanction, notably those which protected the collation of the inferior benefices from the encroachments of the papacy. The *parlement* of Paris was unwilling to register the Concordat, but the crown easily overcame its resistance.

In the 16th century also, contributions to the public services drawn from the immense possessions of the clergy were regularized. Since the second half of the 12th century at least, the kings had in times of urgent need asked for subsidies from the church, and ever since the Saladin tithe of Philip Augustus this contribution had assumed the form of a tithe. Such tithes were fairly frequently granted by the clergy of France. After the conclusion of the Concordat, Leo X. granted the king a tithe (*décime*) under the pretext of a projected war against the Turks. The concession was several times renewed, until, by force of custom, the levying of these tithes became permanent. But in the middle of the 16th century the system changed. The crown was heavily in debt, and its needs had increased. The property of the clergy having been threatened by the States General of 1560 and 1561, the king proposed to them to remit the bulk of the tithes and other dues, in return for the payment by them of a sum equivalent to the proceeds of the taxes which he had mortgaged. A formal contract to this effect was concluded at Poissy in 1561 between the king and the clergy of France. In 1580 a new assembly of the clergy renewed the agreement, which was henceforward always renewed every ten years. Thus every ten years a great elective assembly of the clergy became necessary. There were two stages in the election, a preliminary one in the dioceses and a further election in the ecclesiastical provinces, each province sending four deputies to the general assembly, two of the first rank, that is to say, chosen from the episcopate, and two of the second rank, which included all the other clergy. The *dons gratuits* (benevolences) voted by the assembly comprised a fixed sum equivalent to the old tithes together with supplementary sums levied for some particular occasion. The church, on her side, profited by this arrangement in order to obtain the commutation or redemption of the taxes affecting ecclesiastics considered as individuals. This settlement only applied to the "clergy of France," that is to say, to the clergy of those districts which were united to the crown before the end of the 16th century. The provinces annexed later, called *pays étrangers*, or *pays conquis*, had in this matter, as in many others, an arrangement of their own.

At the end of the 16th century a reasonable balance had been established among the Christians of France. The Edict of Nantes, in 1598, granted the Protestants full civil rights, liberty of conscience and public worship in many places, and notably in all the royal *bailliages*. The Catholics, whose religion was essentially a state religion, had never accepted this arrangement as final, and at last, in 1685, under Louis XIV., the Edict of Nantes was revoked and the Protestant pastors expelled from France. Their followers were forbidden to leave the country, but many succeeded nevertheless in escaping abroad. The position of those who remained behind was peculiar. Laws passed in 1715 and 1724 established the legal theory that there were no longer any Protestants in France, but only *vieux catholiques* and *nouveaux convertis*. The result was that henceforth they had no longer any regular civil status, the registers containing the lists of Catholics enjoying civil rights being kept by the Catholic clergy.

The form of government established under Louis XIV. was preserved without any fundamental modification under Louis XV. The *parlements* had regained their ancient rights in consequence of the *parlement* of Paris having, in 1715, set aside the will of Louis XIV. as being contrary to the fundamental laws of the kingdom, in that it laid down rules for the composition of the council of regency, and limited the power of the regent. This

newly revived power they exercised freely, and all the more so since they were the last surviving check on the royal authority. They became at this period the avowed representatives of the nation; they contested the validity of the registration of laws in the *lits de justice*, asserting that laws could only be made obligatory when the registration had been freely endorsed by themselves. Before the registration of edicts concerning taxation they demanded a statement of the financial situation and the right of examining the accounts. Finally, by the theory of the *classes*, which considered the various *parlements* of France as parts of one and the same body, they established among them a political union. These pretensions the crown refused to recognize. Louis XV. solemnly condemned them in a *lit de justice* of Dec. 1770, and in 1771 the chancellor Maupeou took drastic measures against them. The magistrates of the *parlement* of Paris were removed, and a new *parlement* was constituted, including the members of the *grand conseil*, which had also been abolished. The *cour des aides* of Paris, which had made common cause with the *parlement*, was also suppressed and many of the provincial *parlements* were reorganized. These actions, the *coup d'état* of the chancellor Maupeou, as they were called, produced an immense sensation. The repeated conflicts of the reign of Louis XV. had already given rise to a whole literature in which the rights of the crown were discussed. At the same time the political philosophy of the 18th century was disseminating new principles, and especially those of the supremacy of the people. Thus men's minds were being prepared for the Revolution.

The Army.—The permanent army was developed and organized during the *ancien régime*. The *gendarmerie* or heavy cavalry was continuously increased in numbers. On the other hand, the *francs archers* fell into disuse after Louis XI.; and, after a fruitless attempt had been made under Francis I. to establish a national infantry, a system of voluntary enlistment was introduced. The system of purchase underlay the whole military organization. Each regiment was the property of a great lord; the captain was, so to speak, owner of his company, or rather a contractor, who, in return for the sums paid him by the king, recruited his men and gave them their uniforms, arms and equipment. In the second half of the reign of Louis XIV. appeared the militia (*milices*). To this force each parish had to furnish one recruit. The militia was very rarely raised from the towns. The purpose for which these men were employed varied from time to time. Sometimes, as under Louis XIV., they were formed into special active regiments. Under Louis XV. and Louis XVI. they were formed into *régiments provinciaux*, which constituted an organized reserve. But their chief use was during the war, when they were individually incorporated into various regiments to fill up the gaps.

Under Louis XV., the duc de Choiseul suppressed what he called the "farming of companies" (*compagnie-ferme*); recruiting became a function of the State, and voluntary enlistment a contract between the recruit and the State. Arms, uniform and equipment were furnished by the king. Choiseul also equalized the numbers of the military units, and his reforms, together with a few others effected under Louis XVI., produced the army which fought the first campaigns of the Revolution.

Taxation.—One of the most distinctive features of the *ancien régime* was excessive taxation. The taxes imposed by the king were numerous, and, moreover, hardly any of them fell on all parts of the kingdom. To this territorial inequality was added the inequality arising from privilege. Ecclesiastics, nobles and many of the crown officials were exempted from the heaviest imposts. In the 17th and 18th centuries certain important new taxes were established: between 1695 and 1698 the *capitation*, and in 1710 the tax of the *dixième*, which became under Louis XV. the tax of the *vingtièmes*. These two imposts had been intended to affect every subject in proportion to his income; but so strong was the system of privilege, that as a matter of fact the chief burden fell upon the roturiers. The income of a roturier who was not exempt was thus subject in turn to three direct imposts: the *taille*, the *capitation* and the *vingtièmes*, and the apportioning or assessment of these was extremely arbitrary. In addition to indirect taxation strictly so called, France under the *ancien régime* was subject to

the *traites*, or customs, which were not only levied at the frontiers on foreign trade, but also included many internal custom-houses for trade between different provinces. Their origin was generally due to historical reasons; thus, among the *provinces réputées étrangères* were those which in the 14th had refused to pay the aids for the ransom of King John, also certain provinces which had refused to allow customs offices to be established on their foreign frontier. Colbert had tried to abolish these internal duties, but had only succeeded to a limited extent.

The indirect taxes, the *traites* and the revenues of the royal domain were farmed out by the crown. At first a separate contract had been made for each impost in each *élection*, but later they were combined into larger blocks, as is shown by the name of one of the customs districts, *l'enceinte des cinq grosses fermes*. From the reign of Henry IV. on the levying of each indirect impost was farmed *en bloc* for the whole kingdom, a system known as the *fermes générales*; but the real *ferme générale*, including all the imposts and revenues which were farmed in the whole of France, was only established under Colbert. The *ferme générale* was a powerful company, employing a vast number of men, most of whom enjoyed various privileges. Besides the royal taxes, seigniorial imposts survived under the form of tolls and market dues. The lords also often possessed local monopolies, e.g., the right of the common bakehouse (*four banal*), which were called the *banalités*.

Ecclesiastical Courts.—The organization of the royal courts of justice underwent but few modifications during the *ancien régime*. The ecclesiastical jurisdictions survived to the end, but with diminished scope. A series of ingenious legal theories had gradually deprived them of most of the cases which they had formerly entertained. In the 18th century civil suits in which the clergy were defendants were normally taken before secular tribunals, and ever since the first half of the 17th century, for all grave offences, the royal judge could pronounce a sentence of corporal punishment on a guilty cleric without this necessitating his previous degradation. The inquiry into the case was, it is true, conducted jointly by the royal and the ecclesiastical judge, but each of them pronounced his sentence independently. All cases concerning benefices came before the royal judges. Finally, the *officialités* only possessed a very limited jurisdiction over laymen, even in the matter of marriage. The parish priests, however, continued to enter declarations of baptisms, marriages and burials in registers kept according to the civil laws.

The "Customs."—The general customs of the *pays coutumiers* were almost all officially recorded in the 16th century. Drafts were prepared by the officials of the royal courts in the chief town of the district in which the particular customs were valid, and were then submitted to the Government. The king then appointed commissioners to visit the district and promulgate the customs on the spot. For the purpose of this *publication* the lords, lay and ecclesiastical, of the district, with representatives of the towns and of various bodies of the inhabitants, were summoned for a given day to the chief town. In this assembly each article was read, discussed and put to the vote. Those which were approved by the majority were thereupon decreed (*décrits*) by the commissioners in the king's name; those which gave rise to difficulties were put aside for the *parlement* to settle when it registered the *coutume*. The *coutumes* in this form became practically written law; henceforward their text could only be modified by a formal revision carried out according to the same procedure as the first version.

Legislation by *ordonnances*, *édits*, *déclarations* or *lettres patentes*, emanating from the king, became more and more frequent; but the character of the *grandes ordonnances*, which were of a far-reaching and comprehensive nature, underwent a change during this period. In the 14th, 15th and 16th centuries they had been mainly *ordonnances de réformation* (i.e., revising previous laws), which were most frequently drawn up after a sitting of the States General, in accordance with the suggestions submitted by the deputies. The last of this type was the ordinance of 1629, promulgated after the States General of 1614 and the assemblies of notables which had followed it. In the 17th and 18th centuries

they became essentially *codifications*, comprising a systematic and detailed statement of the whole branch of law. There are two of these series of codifying ordinances: the first under Louis XIV., inspired by Colbert and carried out under his direction. The chief ordinances of this group are that of 1667 on civil procedure; that of 1670 on the examination of criminal cases; that of 1673 on the commerce of merchants, and that of 1681 on the regulation of shipping, which form between them a complete code of commerce by land and sea. The second series of codifications was made under Louis XV., through the action of the chancellor d'Aguesseau. Its chief result was the regulation, by the ordinances of 1731, 1735 and 1747, of deeds of gift between living persons, wills, and property left in trust. Under Louis XVI. some mitigation was made of the criminal law, notably the abolition of torture.

The system of land tenure which prevailed in the 18th century preserved many features which descended from the feudal régime. The fief, although it still implied homage from the vassal, no longer involved any service on his part (excepting that of the *arrière-ban* due to the king); but when a fief changed hands the lord still exacted his *profits*. Tenures held by *roturiers* were generally subject to periodical and fixed contributions for the profit of the lord. Serfdom had disappeared from most of the provinces of the kingdom; among all the *coutumes* which were officially codified, not more than ten or so still recognized this institution. An edict of Louis XVI. of 1779 abolished serfdom on crown lands, and mitigated the condition of the serfs who still existed on the domains of individual lords.

THE REVOLUTION

The Revolution entirely abolished the *ancien régime*, and with it whatever remained either of serfdom or of feudal privilege. The Legislative Assembly declared the abolishment, without indemnity, of all feudal rights for which the original deed of concession could not be produced. The Convention entirely abolished all feudal rights, though it maintained, subject to redemption, those tenures and charges which were solely connected with landed property and not feudal. The Constituent Assembly suppressed nobility; and forbade any one to bear its titles, emblems and arms.

Administrative Reorganization.—The Constituent Assembly gave to France a new administrative division, into departments, districts, cantons and communes; and this division, which was intended to make the old provincial distinctions disappear, had to serve all purposes, the department being the unit for all public services. Apart from certain changes in detail, this settlement was definitive and exists to the present day. But there was a peculiar administrative organism depending on this arrangement. The constitution of 1791, it is true, made the king the titular head of the executive power; but the internal administration of the kingdom was not actually in his hands. It was deputed, under his orders, to bodies elected in each department, district and commune. The municipal bodies were directly elected by citizens duly qualified; other bodies were chosen by the method of double election. Each body consisted of two parts: a council, for deliberative purposes, and a *bureau* or *directoire* chosen by the council from among its numbers to form the executive. These were the only instruments for the general administration and for that of the direct taxes. The king could, it is true, annul the illegal acts of these bodies, but not dismiss their members; he could merely suspend them from exercising their functions, but the matter then went before the Legislative Assembly, which could maintain or remit the suspension as it thought fit. The king had not a single agent chosen by himself for general administrative purposes. This was a reaction, though a very exaggerated one, against the excessive centralization of the *ancien régime*, and resulted in an absolute administrative anarchy. The organization of the revolutionary Government partly restored the central authority; the councils of the departments were suppressed; the Committee of Public Safety and the "representatives of the people on mission" were able to remove and replace the members of the elected bodies; and also, by an ingenious arrangement, national agents were established in the districts. The constitution of the year III. continued on these lines, simplifying the organization established by the Constituent Assembly, while

maintaining its principle. The department had an administration of five members, elected as in the past, but having executive as well as deliberative functions. The district was suppressed. The communes retained only a municipal agent elected by themselves, and the actual municipal body, the importance of which was considerably increased, was removed to the canton, and consisted of the municipal agents from each commune, and a president elected by the duly qualified citizens of the canton. The Directory was represented in each departmental and communal administration by a commissary appointed and removable by itself, and could dismiss the members of these administrations.

Judicial System.—The Constituent Assembly decided on the complete reorganization of the administration of justice. This was accomplished on a very simple plan, which realized that ideal of the two degrees of justice which, as we have noticed, was that of France under the *ancien régime*. In the lower degrees it created in each canton a justice of the peace (*juge de paix*), the idea and name of which were borrowed from England, but which differed very much from the English justice of the peace. He judged, both with and without appeal, civil cases of small importance; and, in cases which did not come within his competency, it was his duty to try to reconcile the parties. In each district was established a civil court composed of five judges. This completed the judicial organization, except for the court of cassation, which had functions peculiar to itself, never judging the facts of the case but only the application of the law. For cases coming under the district court, the Assembly had preserved the right of appeal in cases involving sums above a certain figure. With regard to criminal prosecutions, there was in each department a court which judged crimes with the assistance of a jury; it consisted of judges borrowed from district courts, and had its own president and public prosecutor. Correctional tribunals, composed of *juges de paix*, dealt with misdemeanours. The Assembly preserved the commercial courts, or consular jurisdictions, of the *ancien régime*. There was a court of cassation, the purpose of which was to preserve the unity of jurisprudence in France; it dealt with matters of law and not of fact, considering appeals based on the violation of law, whether in point of matter or of form, and if such violation were proved, sending the matter before another tribunal of the same rank for re-trial. All judges were elected for a term of years. The Constituent Assembly required proof of professional qualifications from all judges except the *juges de paix*. But the system was really the same as that of the administrative organization. The king appointed the *commissaires du roi* attached to the district courts, criminal tribunals and the court of cassation; but could not revoke an appointment once made. The Convention did not change this general organization; but it suppressed the professional guarantees required in the case of candidates for a judgeship, so that henceforth all citizens were eligible; and it also caused new elections to take place. Moreover, the Convention not infrequently removed and replaced judges without further election. The constitution of the year III. preserved this system, but introduced one considerable modification. It suppressed the district courts, and in their place created in each department a civil tribunal consisting of 20 judges. The idea was a happy one, for it gave the courts more importance, and therefore more weight and dignity.

The Army.—The Constituent Assembly suppressed the militia and maintained the standing army, essentially according to the old type. The Assembly proclaimed, however, the principle of compulsory and personal service, under the particular form of the National Guard, to which all qualified citizens belonged, and in which almost all ranks were conferred by election. This was an institution which, with many successive modifications, and after various long periods of inactivity followed by a revival, lasted more than three-quarters of a century, and was not suppressed till 1871. For purposes of war the Convention, in addition to voluntary enlistments and the resources furnished by the National Guard, and apart from the forced levy of 200,000 men in 1793, decided on the expedient of calling upon the communes to furnish men, a course which revived the principle of the old militia. But the Directory drew up an important military law, that of the 6th Fructidor of the year VI., which established compulsory military

service for all, under a strict form of conscription. Thus, Frenchmen aged from 20 to 25 (*défenseurs conscrits*) were divided into five classes, each including the men born in the same year, and were liable until they were 25 years old to be called up for active service, the whole period of service not exceeding four years. No class was called upon until the younger classes had been exhausted, and the sending of substitutes was forbidden. This law, with a few later modifications, provided for the French armies up to the end of the empire.

Taxation.—The Constituent Assembly abolished nearly all the taxes of the *ancien régime* except the stamp duty and that on the registration of acts (the old *contrôle* and *centième denier*). The customs were maintained only at the frontiers for foreign trade. In the establishment of new taxes the Assembly did away with indirect taxation on objects of consumption, and made the principal direct tax the tax on land. Next in importance were the *contribution personnelle et mobilière* and the *patentes*, which, though considerably modified later, are still essentially the basis of the French system of direct taxation. Under the Directory there was a partial reappearance of indirect taxation in the *octrois* of the towns, which had been suppressed by the Constituent Assembly.

Religious Liberty.—The Constituent Assembly gave the Protestants liberty of worship and full rights; it also gave Jews the status of citizen, and political rights. With regard to the Catholic Church, the Assembly placed at the disposal of the nation the property of the clergy, which had already, in the course of the 18th century, been regarded by most political writers as a national possession; at the same time it provided for salaries for the members of the clergy and pensions for those who had been monks. It abolished tithes and the religious orders, and forbade the re-formation of the latter in the future. The ecclesiastical districts were next reorganized, the department being always taken as the chief unit, and a new church was organized by the civil constitution of the clergy, the bishops being elected by the electoral assembly of the department, and the curés by the electoral assembly of the district. This was an unfortunate piece of legislation, inspired partly by the old Gallican spirit, partly by the theories on civil religion of J. J. Rousseau and his school, and, together with the civic oath imposed on the clergy, it was a source of endless troubles. The constitutional church established in this way was, however, abolished as a state institution by the Convention. By laws of the years III. and IV. the Convention and the Directory, in proclaiming the liberty of worship, declared that the republic neither endowed nor recognized any form of worship.

Civic and Criminal Law.—The Assemblies of the Revolution, besides the laws which, by abolishing feudalism, altered the character of real property, passed many others concerning civil law. The most important are those of 1792, passed by the Legislative Assembly, which organized the registers of the *état civil* kept by the municipalities, and laid down rules for marriage as a purely civil contract. Divorce was admitted to a practically unlimited extent; it was possible not only for causes determined by law, and by mutual consent, but also for incompatibility of temper and character proved, by either husband or wife, to be of a persistent nature. Next came the laws of the Convention as to inheritance, imposing perfect equality among the natural heirs and endeavouring to ensure the division of properties. Illegitimate children were considered by these laws as on the same level with legitimate children. In criminal law their work was still more important. In 1791 the Constituent Assembly gave France her first penal code. It was inspired by humanitarian ideas, still admitting capital punishment, though accompanied by no cruelty in the execution; but none of the remaining punishments was for life. Long imprisonment with hard labour was introduced. Finally, as a reaction against the former system of arbitrary penalties, there came a system of fixed penalties determined, both as to its assessment and its nature, for each offence, which the judge could not modify. The Constituent Assembly also reformed the procedure of criminal trials, and taking English law as model, introduced the jury, with the double form of *jury d'accusation* and *jury de jugement*.

THE CONSULATE AND THE EMPIRE

The constitutional changes of the consulate and Empire, though all, either in their full text or in principle, were submitted to popular vote by means of a *plébiscite*, had all the same object: to assure absolute power to Napoleon, while preserving the forms and appearance of liberty. Popular suffrage became universal; but the citizens in effect merely nominated the candidates, and it was the senate which chose from among them the members of the various so-called elected bodies, even those of the political assemblies. According to the constitution of the year VIII., the first consul possessed the executive power in the widest sense of the word, and he alone could initiate legislation. There were three representative assemblies in existence, but one of them, the *corps législatif*, passed laws without discussing them, and without the power of amending the suggestions of the Government. The tribunate, on the contrary, discussed them, but its vote was not necessary for the passing of the law. The senate was the guardian and preserver of the constitution; its chief function was to annul laws and acts submitted to it by the tribunate as being unconstitutional. This original organization was naturally modified during the course of the consulate and the empire; and a whole body, the tribunate, which was the only one which could preserve some independence, disappeared, without resort to a plebiscite. The importance of another body, on the contrary, the *conseil d'état*, which consisted of members appointed by Napoleon, continually increased. It was this body which really prepared and discussed the laws; and it was its members who advocated them before the *corps législatif*, to which the tribunate also sent orators to speak on its behalf. The ministers, who had no relation with the legislative power, were merely the agents of the head of the state, freely chosen by himself. Napoleon, however, found these powers insufficient, and arrogated to himself others, a fact which the senate did not forget when it proclaimed his downfall. Thus he frequently declared war upon his own authority, in spite of the provisions to the contrary made by the constitution of the year VIII.; and similarly, under the form of *décrets*, made what were really laws. They were afterwards called *décrets-lois*, and those that were not indissolubly associated with the political régime of the Empire, and survived it, were subsequently declared valid by the court of cassation, on the ground that they had not been submitted to the senate as unconstitutional, as had been provided by the constitution of the year VIII.

Administrative Changes.—This period saw the rise of a whole new series of great organic laws. For administrative organization, the most important was that of the 28th Pluviôse in the year VIII. It established as chief authority for each department a prefect, and side by side with him a *conseil général* for deliberative purposes; for each *arrondissement* (corresponding to the old *district*) a sub-prefect (*sous-préfet*) and a *conseil d'arrondissement*; and for each *commune*, a mayor and a municipal council. But all these officials, both the members of the councils and the individual agents, were appointed by the head of the state or by the prefect, so that centralization was restored more completely than ever. Together with the prefect there was also established a *conseil de préfecture*, having administrative functions, and generally acting as a court of the first instance in disputes and litigation arising out of the acts of the administration; for the Constituent Assembly had removed such cases from the jurisdiction of the civil tribunals, and referred them to the administrative bodies themselves. The final appeal in these disputes was to the *conseil d'état*, which was supreme judge in these matters. In 1807 was created another great administrative jurisdiction, the *cour des comptes*, after the pattern of that which had existed under the *ancien régime*.

Judicial Changes.—Judicial organization had also been fundamentally altered. The system of election was preserved for a time in the case of the *juges de paix* and the members of the court of cassation, but finally disappeared there, even where it had already been no more than a form. The magistrates were in principle appointed for life, but under the empire a device was found for evading the rule of irremovability. For the judgment of civil cases there was a court of first instance in every *arrondissement*, and

above these a certain number of courts of appeal, each of which had within its province several departments. The separate criminal tribunals and the *jury d'accusation* were abolished in 1809 by the *Code d'Instruction Criminelle*, and the right of pronouncing the indictment was transferred to a chamber of the court of appeal. The correctional tribunals were amalgamated with the civil tribunals of the first instance. The *tribunal de cassation*, which took under the Empire the name of *cour de cassation*, consisted of magistrates appointed for life, and still kept its powers. The *ministère public* (consisting of imperial *avocats* and *procureurs*) was restored in practically the same form as under the *ancien régime*.

The former system of taxation was preserved in principle, but with one considerable addition: Napoleon re-established indirect taxation on articles of consumption, which had been abolished by the Constituent Assembly; the chief of these were the duties on liquor (*droits réunis*, or excise) and the monopoly of tobacco.

The Concordat.—The Concordat concluded by Napoleon with the papacy on the 26th Messidor of the year IX. re-established the Catholic religion in France as the form of worship recognized and endowed by the State. It was in principle drawn up on the lines of that of 1516, and assured to the head of the French State in his dealings with the papacy the same prerogatives as had formerly been enjoyed by the kings; the chief of these was that he appointed the bishops, who afterwards had to ask the pope for canonical institution. The territorial distribution of dioceses was preserved practically as it had been left by the civil constitution of the clergy. The State guaranteed the payment of salaries to bishops and curés; and the pope agreed to renounce all claims referring to the appropriation of the goods of the clergy made by the Constituent Assembly. Later on, a decree restored to the *fabriques* (vestries) such of their former possessions as had not been alienated, and the churches which had not been alienated were restored for the purposes of worship. The law of the 18th Germinal in the year X., ratifying the Concordat, reasserted, under the name of *articles organiques du culte catholique*, all the main principles contained in the old doctrine of the liberties of the Gallican Church. The Concordat did not include the restoration of the religious orders and congregations; Napoleon sanctioned by decrees only a few establishments of this kind.

The University.—One important creation of the Empire was the university. The *ancien régime* had had its universities for purposes of instruction and for the conferring of degrees; it had also, though without any definite organization, such secondary schools as the towns admitted within their walls, and the primary schools of the parishes. The Revolution suppressed the universities and the teaching congregations. The constitution of the year III. proclaimed the liberty of instruction and commanded that public schools, both elementary and secondary, should be established. Under the Directory there was in each department an *école centrale*, in which all branches of human knowledge were taught. Napoleon, developing ideas which had been started in the second half of the 18th century, founded by laws and decrees of 1806, 1808 and 1811 the Université de France, which provided and organized higher, secondary and primary education; this was to be the monopoly of the state, carried on by its *facultés*, *lycées* and primary schools. No private educational establishment could be opened without the authorization of the State.

The Codes.—But chief among the documents dating from this period are the codes, which still give laws to France. These are the Civil Code of 1804, the *Code de Procédure Civile* of 1806, the *Code de Commerce* of 1807, the *Code d'Instruction Criminelle* of 1809, and the *Code Pénal* of 1810. These monumental works, in the elaboration of which the *conseil d'état* took the chief part, contributed, to a greater or less extent, towards the fusion of the old law of France with the laws of the Revolution. It was in the case of the *Code Civil* that this task presented the greatest difficulty (see CODE NAPOLEON). The *Code de Commerce* was scarcely more than a revised and emended edition of the *ordonnances* of 1673 and 1681; while the *Code de Procédure Civile* borrowed its chief elements from the *ordonnance* of 1667. In the case of the *Code d'Instruction Criminelle* a distinctly new departure was

made; the procedure introduced by the Revolution into courts where judgment was given remained public and oral, with full liberty of defence; the preliminary procedure, however, before the examining court (*juge d'instruction* or *chambre des mises en accusation*) was borrowed from the *ordonnance* of 1670; it was the procedure of the old law, without its cruelty, but secret and written, and generally not in the presence of both parties. The *Code Pénal* maintained the principles of the Revolution, but increased the penalties. It substituted for the system of fixed penalties, in cases of temporary punishment, a maximum and a minimum, between the limits of which judges could assess the amount. Even in the case of misdemeanours, it admitted the system of extenuating circumstances, which allowed them still further to decrease and alter the penalty in so far as the offence was mitigated by such circumstances. (See further under NAPOLEON I.)

THE RESTORED MONARCHY

The Restoration and the Monarchy of July, though separated by a revolution, form one period in the history of French institutions. It was a period of constitutional monarchy, with a parliamentary body consisting of two chambers, a system imitated from England. The revolution of 1830 took place in defence of the charter granted by Louis XVIII. in 1814, which Charles X. had violated by the *ordonnances* of July. The two chambers then acquired the initiative in legislation, which had not been recognized as theirs under the Restoration, but from this time on belonged to them equally with the king. The sittings of the house of peers were henceforth held in public; but this chamber underwent another and more fundamental transformation. The peers were nominated by the king, with no limit of numbers, and according to the charter of 1814 their appointment could be either for life or hereditary. Under Louis XVIII., during the Restoration they were always appointed under the latter condition, but under the July Monarchy their tenure of office was for life, and the king had to choose them from among 22 classes of notables fixed by law. The franchise for the election of the chamber of deputies had been limited by a system of money qualifications; but while, under the Restoration, it had been necessary, in order to be an elector, to pay 300 francs in direct taxation, this sum was reduced in 1831 to 200 francs, while in certain cases even a smaller amount sufficed. In order to be elected as a deputy it was necessary, according to the charter of 1814, to pay 1,000 francs in direct taxation, and according to that of 1830, 500 francs. From 1817 onwards there was direct suffrage, the electors directly electing the deputies. The idea of those who had framed the charter of 1814 had been to give the chief influence to the great landed proprietors; in 1830 the chief aim had been to give a preponderating influence to the middle and lower middle classes.

In another respect also the Restoration and the July Monarchy were at one, viz. in maintaining in principle the civil, legal and administrative institutions of the empire. The preface to the charter of 1814 sanctioned and guaranteed most of the legal rights won by the Revolution; even the alienation of national property was confirmed. Judicial and administrative organization, the system of taxation, military organization, the relations of church and state, remained the same, and the university also continued to exist. The Government did, it is true, negotiate a new concordat with the papacy in 1817, but did not dare even to submit it to the chambers. The most important reform was that of the law concerning recruiting for the army. The charter of 1814 had promised the abolition of conscription, in the form in which it had been created by the law of the year VI. The law of March 10, 1818, established a new system. The contingent voted by the chambers for annual incorporation into the standing army was divided up among all the cantons; and, in order to furnish it, lots were drawn among all the men of a certain class, that is to say, among the young Frenchmen who arrived at their majority that year. Those who were not chosen by lot were definitely set free from military service. The sending of substitutes, a custom which had been permitted by Napoleon, was recognized. This was the type of all the laws on recruiting in France up to 1867.

The Restoration produced a code, the *Code forestier* of 1827, for the regulation of forests (*eaux et forêts*). In 1816 a law had abolished divorce, making marriage indissoluble, as it had been in the old law. But the best laws of this period were those on finance. Now, for the first time, was introduced the practice of drawing up regular budgets, voted before the year to which they applied, and divided since 1819 into the budget of expenditure and budget of receipts.

Together with other institutions of the empire, the Restoration had preserved the exaggerated system of administrative centralization established in the year VIII. It was only relaxed under the July Monarchy. The municipal law of March 21, 1831, made the municipal councils elective, and extended widely the right of voting in the elections for them; the *maires* and their assistants continued to be appointed by the Government, but had to be chosen from among the members of the municipal councils. The law of June 22, 1833, made the general councils of the departments also elective, and brought the *adjonction des capacités* into effect for their election. The powers of these bodies were enlarged in 1838, and they gained the right of electing their president. In 1833 was granted another liberty, that of primary education; but in spite of violent protestations, coming especially from the Catholics, secondary and higher education continued to be a monopoly of the state. A law of June 11, 1842, established the great railway lines. In 1832 the *Code Pénal* and *Code d'Instruction Criminelle* were revised, with the object of lightening penalties; the system of extenuating circumstances, as recognized by a jury, was extended to the judgment of all crimes. There was also a revision of Book III. of the *Code de Commerce*, treating of bankruptcy. Finally, from this period date the laws of May 3, 1841, on expropriation for purposes of public utility, and of June 30, 1838, on the treatment of the insane. Judicial organization remained substantially unaltered.

THE SECOND REPUBLIC

From the point of view of constitutional law, the Second Republic and the Second Empire were each in a certain sense a return to the past. The former revived the tradition of the Assemblies of the Revolution; the latter was obviously and avowedly an imitation of the consulate and the First Empire.

Republican Constitution of 1848.—The provisional government set up by the revolution of Feb. 24, 1848, proclaimed universal suffrage, and by this means was elected a Constituent Assembly, which sat till May 1849, and passed the Republican constitution of Nov. 4, 1848. This constitution gave the legislative power to a single permanent assembly, elected by direct universal suffrage, and entirely renewed every three years. The executive authority, with very extensive powers, was given to a president of the Republic, also elected by the universal and direct suffrage of the French citizens. On the other hand, the president was not immediately eligible for re-election on giving up his office. Now Louis Napoleon, who was elected president on Dec. 10, 1848, by a huge majority, wished to be re-elected. The result was the *coup d'état* of Dec. 2, 1851. A detail of some constitutional importance is to be noticed in this period. The *conseil d'état*, which had remained under the Restoration and the July Monarchy an administrative council and the supreme arbiter in administrative trials, acquired new importance under the Second Republic. The ordinary *conseillers d'état* (*en service ordinaire*) were elected by the Legislative Assembly, and consultation with the *conseil d'état* was often insisted on by the constitution or by law. During its short existence the Second Republic produced many important laws. It abolished the penalty of death for political crimes, and suppressed negro slavery in the colonies. The election of *conseillers généraux* was thrown open to universal suffrage, and the municipal councils were allowed to elect the *maires* and their colleagues. The law of March 15, 1850, established the liberty of secondary education, but it conferred certain privileges on the Catholic clergy, a clear sign of the spirit of social conservatism which was the leading motive for its enactment. Certain humanitarian laws were passed, applying to the working classes.

Constitution of 1852.—With the *coup d'état* of Dec. 2, 1851,

began a new era of constitutional plebiscites and disguised absolutism. The proclamations of Napoleon on Dec. 2 contained a criticism of parliamentary government, and formulated the wish to restore to France the constitutional institutions of the consulate and the empire, just as she had preserved their civil, administrative and military institutions. Napoleon asked the people for the powers necessary to draw up a constitution on these principles; the plebiscite issued in a vast majority of votes in his favour, and the constitution of Jan. 14, 1852, was the result. It bore a strong resemblance to the constitution of the First Empire after 1807. The executive power was conferred on Louis Napoleon for ten years, with the title of president of the Republic and very extended powers. Two assemblies were created. The conservative senate was charged with the task of opposing the promulgation of unconstitutional laws, and of receiving the petitions of citizens; it had also the duty of providing everything not already provided but necessary for the proper working of the constitution. The second assembly was the *corps législatif*, elected by direct universal suffrage for six years, which passed the laws, the Government having the initiative in legislation. Its powers were very limited, and it could only discuss and put to the vote amendments approved by the *conseil d'état*; the ministers did not in any way come into contact with it and could not be members of it, being responsible only to the head of the State, and only the senate having the right of accusing them before a high court of justice. The *conseil d'état* was composed in the same way and had the same authority as it had possessed from the year VIII. to 1814; and it was the members of it who supported projected laws before the *corps législatif*. To this was added a Draconian press legislation; press offences were judged not by a jury but by the correctional tribunals; and political papers could not be founded without an authorization. They were subject to a regular administrative discipline and could be warned, suspended or suppressed without a trial, by a simple act of the administration. The constitution of Jan. 1852 was still Republican in name, though less so than that of the year VIII. The period corresponding with the consulate was also shorter in the case of Louis Napoleon. The year 1852 had not come to an end before a *senatus consulte*, that of Nov. 10, ratified by a plebiscite, re-established the imperial rank in favour of Napoleon III.

(J. P. E.; X.)

THE SECOND EMPIRE

Numerous legislative reforms were introduced by the Second Empire, aiming at the development of commerce, industry and agriculture, and the material prosperity of the country in general. Such were the decrees and laws of 1852 and 1853 relating to land-banks (*établissements de crédit foncier*), that of 1857 on trademarks, that of 1858 on general stores (*magasins généraux*) and warrants, those of 1863 and 1867 on commercial companies, that of 1865 on cheques and that of 1866 on the mercantile marine. Economic treaties were also concluded by the emperor with foreign Powers, the chief of these being concluded with Great Britain on Jan. 23, 1860. In another direction, the law of May 25, 1864, recognized for the first time the right of strikes among workmen and employees, while the superannuation fund (*caisses des retraites pour la vieillesse*) created by the law of June 18, 1850, was reorganized and perfected, and a law of July 11, 1868, established, under the guarantee of the State, two funds for voluntary insurance, one in case of death, the other against accidents occurring in industrial or agricultural employment.

Criminal law was the subject of important legislation. Thus the total loss of civil rights which hitherto accompanied condemnation to imprisonment for life was abolished in 1854, and in the same year transportation to the colonies was substituted for the system of Continental convict prisons. The law of July 17, 1856, increased the power of independence of the *juges d'instruction*, and useful improvements were introduced by the laws of 1856 and 1865 as regards precautionary detention and provisional release with or without bail. Finally a general revision of the Code Pénal took place in 1863.

In civil legislation may be noted the law of March 23, 1855, on *hypothèques*; that of July 22, 1857, which abolished seizure

of the person (*contrainte par corps*) for civil and commercial debts; and finally the law of July 14, 1866, on literary copyright.

The system of taxation was hardly modified at all, except for the establishment of a tax on the income from investments (shares and bonds of companies) in 1857, and a tax on carriages (1862). In Feb. 1868 an important military law was promulgated which asserted the principle of universal compulsory military service in time of war, but preserved the system of drawing lots to determine the annual contingent to be incorporated in the standing army. The term of service was fixed at five years, and it was still permissible to send a substitute. Able-bodied men who were not included in the annual contingent formed a reserve force, called the *Garde Nationale Mobile*, which took part in the war of 1870-71.

THE THIRD REPUBLIC

The Third Republic had at first a provisional Government set up by the people of Paris. But immediately after the capitulation of the capital and in order to treat with Germany, a national assembly was elected in accordance with the electoral law of 1849, which had been revived for the occasion with a few modifications, and met at Bordeaux on Feb. 13, 1871. Its majority was frankly monarchist, though divided as to the choice of a monarch, and pending a settlement of this question it ruled the country until 1875, with one man elected by it as head of the executive power. Thiers was the first to be elected in 1871; after his fall on May 24, 1873, he was succeeded by Marshall MacMahon, on whom the assembly later conferred, in the month of November following, the position of president of the republic for seven years when the refusal of the Comte de Chambord to accept the tricolor in place of the white flag of the Bourbons had made any attempt to restore the monarchy impossible. However, the recognition of the republic by the assembly did not become definitive until Jan. 30, 1875, when an amendment was adopted providing for the election of an indefinite succession of presidents of the republic. Shortly afterwards, two constitutional laws were passed and promulgated, that of Feb. 24, 1875, on the organization of the senate, and that of Feb. 25, 1875, on the organization of the public powers. In the middle of the year they were supplemented by a third, that of July 16, 1875, on the relations between the public powers.

The French Constitution.—Thus was built up the actual constitution of France. It differs fundamentally both in form and content from previous constitutions. As to its form, instead of a single methodical text divided into an uninterrupted series of articles, it consisted of three distinct laws. As to matter, it is obviously a work of an essentially practical nature, the result of compromise and reciprocal concessions. It does not lay down any theoretical principles and its provisions confine themselves strictly to what is necessary to ensure the proper working of the Governmental machinery. The result is a compromise between Republican principles and the rules of constitutional and parliamentary monarchy.

Its composition is as follows: The legislative power is given to two elective chambers, the vote of both of which is necessary for legislation; both have the right of initiating and amending laws. One house, the chamber of deputies, is elected by direct universal suffrage and is entirely renewed every four years; the other, the senate, consists of 300 members, whom the law of Feb. 27, 1875, divides into two categories. Seventy-five of the senators are elected for life, the senate itself holding elections to fill up the vacancies. The 225 remaining senators are elected in each department by an electoral college which includes the deputies, the members of the general council of the department and of the councils of the *arrondissements*, and one delegate elected by each municipal council, whatever the importance of the commune. They are elected for nine years, a third of the house being renewed every three years.

The executive power is entrusted to a president elected for seven years by the chamber and the senate combined into a single body under the name of national assembly. He is always eligible for re-election and is independent except in case of high treason. His powers are of the widest, including the initiative in legisla-

tion jointly with the two chambers, the appointment to all civil and military offices, the disposition and, if he wish it, the leadership of the armed forces, the right of pardon, the right of negotiating treaties with foreign Powers and in principle of ratifying them on his own authority, the consent of the two chambers being required only in certain cases defined by the constitution. But these powers he can only exercise through the medium of a Ministry, politically and jointly responsible to the chambers and forming a council over which the president usually presides. The right of dissolving the chamber of deputies before the expiration of its term of office also belongs to him, but in order to do so he must have, besides a Ministry which will take the responsibility for it, the preliminary sanction of the senate. The senate is at the same time a high court of justice which can judge the president of the republic and ministers accused of crimes committed in the exercise of their functions. In 1884 the 75 senators for life were suppressed for the future by a process of extinction, their seats being divided amongst the most populous departments, and on Aug. 14 of the same year a law was passed declaring that no proposition for a revision of the constitution could be accepted which aimed at changing the republican form of Government. Since 1871 the mode of election of the chamber of deputies, which was not fixed by the constitution, has oscillated between the *scrutin de liste* for the departments and the *scrutin uninominal* for the arrondissements. The latter system was established by the organic law of Nov. 30, 1875; superseded in 1885 by the *scrutin de liste*, it was restored in 1889. The law of July 12, 1919, re-established the *scrutin de liste* combined with proportional representation, but the old system of *scrutin d'arrondissement* was finally reverted to in view of the elections of 1928.

Reforms Under the Third Republic.—The legislative reforms carried out under the Third Republic are very numerous. As to public law, it is only possible to mention here those of a really organic character, chief among which are those which safeguard and regulate the freedom of the individual. The law of June 30 modified by that of March 28, 1907, established the right of holding public meetings, whether for ordinary or electoral purposes, without preliminary authorization; they must not be held, however, in the public highway, but in an enclosed space. The law of July 29, 1881, on the press, as subsequently modified in 1882, 1889, 1895, 1908 and 1919, is one of the most liberal in the world; by it, all offences committed by any kind of publication are submitted to a jury, and only slander, libel, defamation, incitement to crime, and in certain cases the publication of false news, are punished. The law of July 1, 1901, established the right of forming associations, the objects of which are not contrary to law or to public order or morality. On the condition of a simple declaration to the administrative authority, it grants them a civil status in a wide sense of the term. Religious congregations on the contrary, which are not authorized by a law, are forbidden by this law.

A law passed in 1875 by the national assembly established the liberty of higher education: that of primary education was confirmed and reorganized by the law of Oct. 30, 1886, which simply deprived the clergy of the privileges granted them by the law of 1850, though the latter remains in force with regard to the liberty of secondary education. The law of March 22, 1882, made primary education obligatory, though it allowed parents to send their children either to private schools or to those of the State; the law of June 16, 1881, established secular (*laïque*) education in the case of the latter. Secondary education was also organized for girls in lycées or special colleges (*collèges de filles*). Finally, a law of July 10, 1896, dealing with higher education and the faculties of the State, reorganized the universities, which form distinct bodies, enjoying a fairly wide autonomy.

A law of Dec. 19, 1905, abrogating that of the 18th Germinal in the year X., which had sanctioned the Concordat, proclaimed the separation of the church from the State. It is based on the principle of the secular State (*état laïque*) which recognizes no form of religion, though it respects the right of every citizen to worship according to his beliefs, and it aimed at organizing associations of citizens, the object of which was to collect the funds

and acquire the property necessary for the maintenance of worship, under the form of *associations cultuelles*, differing in certain respects from the associations sanctioned by the law of July 1, 1901, but having a wider scope. It also handed over to these regularly formed associations the property of the ecclesiastical establishments formerly in existence, while taking precautions to ensure their proper application, and allowed the associations the free use of the churches and places of worship belonging to the State, the departments or the communes. If no *association cultuelle* was founded in a parish, the property of the former *fabrique* should devolve to the commune. But this law was condemned by the papacy, as contrary to the church hierarchy; and almost nowhere were *associations cultuelles* formed, except by Protestants and Jews, who complied with the law. After many incidents, but no church having been closed, a new law of Jan. 2, 1907, was enacted. It permits the public exercise of any cult, by means of ordinary associations regulated by the law of July 1, 1901, and even of public meetings summoned by individuals. Failing all associations, either cultuelles or others, churches, with their ornaments and furniture, are left to the disposition of the faithful and ministers, for the purpose of exercising the cult; and, on certain conditions, the long use of them can be granted as a free gift to ministers of the cult.

Among the organic laws concerning administrative affairs, there are two of primary importance, that of Aug. 10, 1871, on the *conseils généraux* considerably increased the powers and independence of these elective bodies, which have become important deliberative assemblies. The law of 1871 also created a new administrative organ for the departments, the *commission départementale* elected by the *conseil général* of the department and associated with the administration of the prefect. The other law is the municipal law of April 5, 1884, which effected a widespread decentralization; the *maires* and their adjoints are elected by the municipal council.

Reorganization of the Army.—The war of 1870–71 had necessarily led to a modification of the military organization. The law of July 25, 1872, established the principle of compulsory service for all, first in the standing army, the period in which was fixed at five years, then in the reserve and finally in the territorial army. But the application of this principle was by no means absolute, and only held good in time of war, the former exemptions still being allowed in time of peace. Moreover the system of conditional engagement for a year allowed young men for the purposes of study or apprenticeship to their professions to serve only a year with the active army in time of peace. A new law of July 15, 1889, reduced the term of service in the active army to three years, and the exemptions which were still preserved merely reduced the period to a year in time of peace. The same reduction was also granted to those who were pursuing important scientific, technical or professional studies. Later, the law of March 21, 1905, reduced the term of service in the active army to two years but made it equal for all, admitting of no exemption, but only certain facilities as to the age at which it had to be accomplished. In 1913, as an answer to the extensive armaments carried out by the German Government, the chamber voted the return to the former term of service of three years which was just being put into force when the War broke out. After the War, the law of April 1, 1923, reduced the term in the active army to one year and a half, and a law of July 14, 1927, completely reorganized the army for time of peace and for time of war.

In 1883 the judicial personnel was reorganized and reduced in number, and except for a few modifications the main lines of judicial organization remained the same until the law of Sept. 3, 1926, which, for purposes of economy, suppressed the *tribunaux d'arrondissements*, and replaced them by departmental tribunals.

The system of taxation remained practically unaltered until the War, with the exception of the financial law of 1901 which re-arranged and increased the transfer fees and established a system of progressive taxation. A law of July 15, 1914, created income-tax; after the War, a tax on turnover and a tax on commercial and industrial profits were also imposed, whilst the rate

of the taxes themselves and stamp duties were increased all round. Owing to the rapid growth of fiscal legislation it was felt necessary to codify the various texts, which was done through a decree of Dec. 28, 1926.

Labour Legislation.—The labour laws, which generally partook of the nature both of public and private law, are a sign of our times. Under the Third Republic they have been numerous, the most notable being the law of March 21, 1884, on professional syndicates, which introduced the liberty of association in matters of this kind before it became part of the common law (*see* TRADE UNIONS); the law of Dec. 22, 1892, on conciliation and arbitration in the case of collective disputes between employers and workmen; that of June 29, 1893, on the hygiene and safeguarding of workers in industrial establishments, and the laws which regulate the work of children and women in factories; that of July 15, 1893, on free medical attendance; and that of April 9, 1898, on the liability for accidents incurred during work, with those which have completed it. On Dec. 30, 1910, a *Code du Travail et de la Prévoyance Sociale* was promulgated, codifying the previous legislation, dealing particularly with contracts for work, imposing special rules and regulations as to conditions of work, Sunday rest, precautions to be taken for the safety of workmen, industrial diseases; etc., and creating work inspectors. A law of June 21, 1924, added a new part to this code, organizing special courts of law, called *conseils prud'hommes*, before which disputes between employers and workmen have to be taken.

As to criminal law there have been more than 50 enactments mostly involving important modifications due to more scientific ideas of punishment, so that we may say that it has been almost entirely recast since the establishment of the Third Republic. The chief results of this legislation were the separate system applied in cases of preventive detention and imprisonment for short periods; liberation before the expiry of the term of sentence, subject to the condition that no fresh offence shall be committed within a given time; transportation to the colonies of habitual offenders; remission of the penalty in the case of first offenders; greater facilities for the rehabilitation of condemned persons. Finally the law of Dec. 8, 1897, made the examination before the *juge d'instruction* a real hearing on both sides, and the appearance of counsel for the defence practically compulsory.

Private Law.—As to private law, both civil and commercial, hundreds of laws have been passed between 1871 and 1928 modifying it, sometimes profoundly. Amongst the more important there was the law of July 27, 1884, and those which re-established divorce, prohibited since 1816, but only permitted it for certain definite causes determined by law. On the other hand the law of Feb. 6, 1893, increased the liberty and independence of a woman who was simply judicially separated, in order to encourage separation as opposed to divorce, when the conditions allowed it. The law of March 25, 1896, on the succession of illegitimate children who were recognized by the parents did not treat them in the same way as legitimate children, but gave them the title of heirs in the succession of their father and mother together with much greater rights than they had hitherto possessed under the Code Civil. The law of July 24, 1899, on the protection of children who are ill-treated or morally neglected, also modified some of the provisions of the law as applied to the family, with a view to greater justice and humanity. The formalities of marriage were simplified and marriage itself made easier through the laws of June 20, 1896, and July 1, 1914. The law of Dec. 30, 1915, made the legitimation of adulterine children possible; that of March 20, 1917, allowed women, who had hitherto been debarred from so doing, to act as guardians of infant children. Consent to marriage was facultative by the law of Feb. 28, 1922, and under the law of April 28, 1922, ceased to be required for parties above 25 years of age. Finally the law of Aug. 10, 1927, codified the various dispositions concerning acquisition and loss of French nationality, and permitted French women marrying foreigners to retain their nationality of origin instead of acquiring as heretofore that of their husbands.

In commercial matters the law as to cheques was altered by laws of Dec. 30, 1911, and Aug. 12, 1926; a law of July 4, 1914,

completed that of July 10, 1885, on maritime mortgage. A law of March 18, 1919, created a commercial registry (*registre du commerce*), reinforcing the existing measures of publicity imposed on traders, and that of Aug. 25, 1919, created the *Office National du Commerce Extérieur*. Finally life-insurance companies were regulated and placed under strict supervision on the part of the State (law of March 17, 1905, as modified by that of May 21, 1921). (F. AL.)

FRENCH LITERATURE. Literature proper began to be cultivated in France, in the vernacular, during the 10th and 11th centuries. The earliest writings are *cantilenae*, or songs in the vulgar language (e.g., on St. Eulalia), a *Life of St. Leger* and a *Life of St. Alexis* (perhaps about 1050), but the first real monument of French Literature is the *Chanson de Roland*, which remains the greatest achievement of that literature until the Renaissance. The *Chanson de Roland* is the masterpiece of a flourishing type of epic poetry, the *chansons de geste*, of which we possess about 100 specimens.

Chansons de geste.—These deal with subjects of traditional French history. The line generally used is of ten syllables, and in later poems of 12; there is a regular caesura. The lines are arranged in *laissez* or *tirades* of very irregular numbers. The earlier poems are assonanced, only the vowel sound of the last syllables being identical. Later the poems are rhymed in a regular manner. In subject matter there are three chief groups: one dealing with Charlemagne, one with Doon of Mayence, one with Garin de Monglane. There are other groups, not so numerous, on the Lorrainers, on the crusades, etc.

The earliest versions alone of the various poems would amount to over 300,000 lines. The successive development of the *chansons de geste* may be illustrated by the fortunes of *Huon de Bordeaux*, one of the most lively, varied and romantic of the older epics, and one which is interesting from the use made of it by Shakespeare, Wieland and Weber. In the oldest form now extant, though even this is probably not the original, *Huon* consists of over 10,000 lines. A subsequent version contains 11,000 more, and lastly, in the 14th century, a later poet has amplified the legend to the extent of 30,000 lines. When this point had been reached *Huon* began to be turned into prose being, with many of its fellows, published and republished during the subsequent centuries, and retaining, in popular forms and garbs, the favour of the country districts and of the school children of France to the present day. But the best period of the *chanson de geste* was the 11th and 12th centuries. The *Chanson de Roland* is the earliest we possess and belongs in its present form to the early 12th century. Two classes of persons are chiefly associated with the *chansons de geste*. There was the *trouvère* who composed them, and the *jongleur* who carried them about in manuscript or in his memory from castle to castle and sang them intermixing frequent appeals to his audience for silence, declarations of the novelty and the strict copyright character of the *chanson*, revilings of rival minstrels and frequent requests for money in plain words. Not a few of the manuscripts which we now possess appear to have been actually used by the *jongleurs*. But the names of the authors are known only in very few cases, the names of copyists, continuators and mere owners of manuscripts having often been mistaken for them.

The characters of a *chanson* of the older style are somewhat uniform. There is the hero who is unjustly suspected of guilt or sore beset by Saracens, the heroine who falls in love with him, the traitor who accuses him or delays help. There are friendly paladins and the subordinate traitors. There is Charlemagne, in the later *chansons* an incapable and venal dotard, in the earlier still the great emperor; and with Charlemagne the Duke Naimes of Bavaria, invariably wise, brave, loyal and generous. In *La Chanson de Roland* the love interest does not appear at all except in the incident of Aude's death when she hears of Roland's fall. Even in the later *chansons* the love interest is very little marked. Fighting, counsels and religion hold the literary field. In a few *chansons* appears a very interesting class: the man of low birth or condition who rescues the high born hero from his enemies. Thus Rainvart in *Aliscans*, Gautier in *Gaydon*, Robastre in *Gaufrey*, etc. The subjects are handled with great uniformity and

even monotony of style, with constant repetitions. But the verse is generally harmonious and often stately. Some passages rise to high poetry. The most remarkable of the *chansons* are *Roland*, *Aliscans*, *Gérard de Roussillon*, *Ami et Amile*, *Raoul de Cambrai*, *Garin le Loherain*, *Les Quatre Fils Aymon*, *Les Saisnes*. The series of *le Chevalier au Cygne* deals with the first crusaders, and a remarkable group centres round William of Orange, dealing with the defence of the south of France against Mohammedan invasion.

Arthurian Romances.—The second class of early French epics consists of the Arthurian cycle, the *Matière de Bretagne*, the earliest known compositions of which are at least a century junior to the earliest *chanson de geste*, but which soon succeeded the *chansons* in popular favour, and obtained a vogue both wider and far more enduring. It is not easy to conceive a greater contrast in form, style, subject and sentiment than is presented by the two classes. In both the religious sentiment is prominent, but the religion of the *chansons* is of the simplest, not to say of the most savage character. To pray to God and to kill his enemies constitutes the whole duty of man. In the romances the mystical element becomes on the contrary prominent, and furnishes, in the Holy Grail, one of the most important features. In the Carlovingian knight the courtesy and clemency which we have learnt to associate with chivalry are almost entirely absent. The *gentix ber* contradicts, jeers at, and execrates his sovereign and his fellows with the utmost freedom. He thinks nothing of striking his *cartoise moullier* so that the blood runs down her *cler vis*. If a servant or even an equal offends him, he will throw the offender into the fire, knock his brains out, or set his whiskers ablaze. The Arthurian knight is far more of the modern model in these respects. But his chief difference from his predecessor is undoubtedly in his amorous devotion to his beloved, who, if not morally superior to Bellicent, Floripas, Esclairmonde and the other Carlovingian heroines, is somewhat less forward. Even in minute details the difference is strongly marked. The romances are in octosyllabic couplets or in prose, and their language is different from that of the *chansons*, and contains much fewer of the usual epic repetitions and stock phrases. The earliest romances, the *Saint Graal*, the *Quête du Saint Graal*, *Joseph d'Arimathie* and *Merlin* bear the names of Walter Map and Robert de Borron. *Artus* and part at least of *Lancelot du Lac* appear to be due to unknown authors. *Tristan* came later, and has a stronger mixture of Celtic tradition. At the same time as Walter Map, or a little later, Chrétien (or Chrestien) de Troyes turned the legends of the Round Table into octosyllabic verse of a singularly spirited and picturesque character. The chief poems attributed to him are the *Chevalier au Lyon* (Sir Ewain of Wales), the *Chevalier à la Charette* (one of the episodes of *Lancelot*) also *Erec*, *Tristan* and *Percivale*. These poems, independently of their merit, which is great, had an extensive literary influence. They were translated by the German minnesingers, Wolfram von Eschenbach, Gottfried of Strasbourg and others.

With the romances to which we have already referred Chrétien's poems complete the earlier forms of the Arthurian story, and supply the matter of it as it is best known to English readers in Malory's book. Nor does that book, though far later than the original forms, convey a very false impression of the characteristics of the older romances. Indeed, the Arthurian knight, his character and adventures, are so much better known than the heroes of the Carlovingian *chansons* that there is less need to dwell upon them. The romances had, as has been already pointed out, great influence upon their rivals, and their comparative fertility of invention, the much larger number of their *dramatis personae*, and the greater variety of interests to which they appealed, sufficiently explain their increased popularity. The ordinary attractions of poetry are also more largely present in them than in the *chansons*; there is more description, more life, and less of the mere chronicle. They have been accused of relaxing morality, and there is perhaps some truth in the charge. But the change is after all one rather of manners than of morals, and what is lost in simplicity is gained in refinement and the beginnings of a sense of literary form.

Romances of Antiquity.—There is yet a third class of early narrative poems, differing from the two former in subject, but agreeing, sometimes with one, sometimes with the other in form. These are the classical romances—the *Matière de Rome*—which are not much later than those of Charlemagne and Arthur. The chief subjects with which their authors busied themselves were the conquests of Alexander and the siege of Troy, though other classical stories come in. The most remarkable of all is the romance of *Alexandre* by Lambert le Tort and Alexander of Bernay.

Alexander is made in many respects a prototype of Charlemagne. He is regularly knighted, he has 12 peers, he holds tournaments, he has relations with Arthur, and comes in contact with fairies, he takes flights in the air, dives in the sea and so forth. There is perhaps more avowed imagination in these classical stories than in either of the other divisions of French epic poetry. Some of their authors even confess to the practice of fiction, while the *trouvères* of the *chansons* invariably assert the historical character of their facts and personages, and the authors of the Arthurian romances at least start from facts vouched for, partly by national tradition, partly by the authority of religion and the church. The classical romances, however, are important in two different ways. In the first place, they connect the early literature of France, however loosely, and with links of however dubious authenticity, with the great history and literature of the past. They show a certain amount of scholarship in their authors, and in their hearers they show a capacity for taking an interest in subjects which are not merely those directly connected with the village or the tribe. The *chansons de geste* had shown the creative power and independent character of French literature. There is, at least about the earlier ones, nothing borrowed, traditional or scholarly. They smack of the soil, and they rank France among the very few countries which, in this matter of indigenous growth, have yielded more than folksongs and fireside tales. The Arthurian romances, less independent in origin, exhibit a wider range of view, a greater knowledge of human nature, and a more extensive command of the sources of poetical and romantic interest. The classical epics superadd the only ingredient necessary to an accomplished literature—i.e., the knowledge of what has been done by other peoples and other literatures already, and the readiness to take advantage of the materials thus supplied.

Romans d'Aventures.—There remain to be mentioned a considerable number of narrative poems written after the 13th century, which cannot be brought into any one of the three previous categories. As literary taste spread, *romans* were written about any possible subject, and in many various forms. Thus *Guillaume de Palerme* deals with the adventures of a Sicilian prince who is befriended by a were-wolf; *Le Roman de l'escoufle* with a heroine whose ring is carried off by a sparrow-hawk; *Guy of Warwick*, *Meraugis de Portlèguez*, *Cléomadès*, *Partenopeu de Blois*, *Floire et Blanchefleur* are among the best known. To this category may be added a number of early romances and fictions in prose, the most celebrated of which is *Aucassin et Nicolette* (13th century).

Such was the literature produced for the enjoyment of the higher classes from the 11th to the 13th century. The habit of private wars and of insurrection against the sovereign supply the motives of the *chanson de geste*, the love of gallantry, adventure and foreign travel those of the romances, Arthurian and miscellaneous. None of these motives much affected the lower classes, who were, with the early developed temper of the middle- and lower-class Frenchman, already apt to think and speak cynically enough of tournaments, courts, crusades and the other occupations of the nobility. The communal system was springing up, the towns were receiving royal encouragement as a counterpoise to the authority of the nobles. The corruptions and maladministration of the church attracted the satire rather of the citizens and peasantry who suffered by them, than of the nobles who had less to fear and even something to gain. On the other hand, the gradual spread of learning, inaccurate and ill-digested perhaps, but still learning, not only opened up new classes of subjects, but opened them to new classes of persons. The thousands of students who flocked to the schools of Paris were not all princes

or nobles. Hence there arose two new classes of literature, the first consisting of the embodiment of learning of one kind or other in the vulgar tongue. The other, one of the most remarkable developments of sportive literature which the world has seen, produced the second indigenous literary growth of which France can boast, namely, the *fabliaux*, and the almost more remarkable work which is an immense conglomerate of *fabliaux*, the great beast-epic of the *Roman de Renart*.

Fabliaux.—There are few literary products which have more originality and at the same time more diversity than the *fabliau*. The epic and the drama, even when they are independently produced, are similar in their main characteristics all the world over. But there is nothing in previous literature which exactly corresponds to the *fabliau*. The story is the first thing, the moral the second, and the latter is never suffered to interfere with the former. These observations apply only to the *fabliaux*, properly so called, but the term has been used with considerable looseness. The collectors of those interesting pieces, *Barbazan*, *Méon*, *Le Grand d'Aussy*, have included in their collections large numbers of miscellaneous pieces such as *dits* (rhymed descriptions of various objects, the most famous known author of which was Baudouin de Condé, 13th century), and *débats* (discussions between two persons or contrasts of the attributes of two things), sometimes even short romances, farces and mystery plays. Not that the fable proper—the prose classical beast-story of “Aesop”—was neglected. Marie de France—the poetess to be mentioned again for her more strictly poetical work—is the most literary of not a few writers who composed what were often, after the mysterious original poet, named *Ysopets*. Aesop, Phaedrus, Babrius were translated and imitated in Latin and in the vernacular by this class of writer, and some of the best known of “fablers” date from this time. The *fabliau*, on the other hand, according to the best definition of it yet achieved, is “the recital, generally comic, of a real or possible incident occurring in ordinary human life.” The comedy, it may be added, is usually of a satiric kind, and occupies itself with every class and rank of men, from the king to the villein. There is no limit to the variety of these lively verse-tales, which are invariably written in eight-syllabled couplets. Now the subject is the misadventure of two Englishmen, whose ignorance of the French language makes them confuse donkey and lamb; now it is the fortunes of an exceedingly foolish knight, who has an amiable and ingenious mother-in-law; now the deserved sufferings of an avaricious or ill-behaved priest; now the bringing of an ungrateful son to a better mind by the wisdom of babes and sucklings. Not a few of the *Canterbury Tales* are taken directly from *fabliaux*; indeed, Chaucer, with the possible exception of Prior, is the nearest approach to a *fabliau*-writer in England. At the other end of Europe the prose novels of Boccaccio and other Italian tale-tellers are largely based upon *fabliaux*. But their influence in their own country was the greatest. They were the first expression of the spirit which has since animated the most national and popular developments of French literature. Simple and unpretending as they are in form, the *fabliaux* announce not merely the *Cent Nouvelles Nouvelles* and the *Heptameron*, *L'Avocat Patelin*, and *Pantagruel*, but also *L'Avare* and the *Roman comique*, *Gil Blas* and *Candide*. They indeed do more than merely prophesy the spirit of these great performances—they directly lead to them. The prose-tale and the farce are the direct outcomes of the *fabliau*, and the prose-tale and the farce once given, the novel and the comedy inevitably follow.

The special period of *fabliau* composition appears to have been the 12th and 13th centuries. It signifies on the one side the growth of a lighter and more sportive spirit than had yet prevailed, on another the rise in importance of other and lower orders of men than the priest and the noble, on yet another the consciousness on the part of these lower orders of the defects of the two privileged classes, and of the shortcomings of the system of polity under which these privileged classes enjoyed their privileges. There is, however, in the *fabliau* proper not so very much of direct satire, this being indeed excluded by the definition given above, and by the thoroughly artistic spirit in which that definition is

observed. The *fabliaux* are so numerous and so various that it is difficult to select any as specially representative. We may, however, mention, both as good examples and as interesting from their subsequent history, *Le Vair Palfrei*, treated in English by Leigh Hunt and by Peacock; *Le Vilain Mire*, the original consciously or unconsciously followed in *Le Médecin malgré lui*; *Le Roi d'Angleterre et le jongleur d'Éli*; *La houce partie*; *Le Sot Chevalier*, an indecorous but extremely amusing story; *Les deux bordeors ribaus*, a dialogue between two *jongleurs* of great literary interest, containing allusions to the *chansons de geste* and romances most in vogue; and *Le vilain qui conquist paradis par plaît*.

Roman de Renart.—If the *fabliaux* are not remarkable for direct satire, that element is supplied in more than compensating quantity by an extraordinary composition which is closely related to them. *Le Roman de Renart*, or *History of Reynard the Fox*, is a poem, or rather series of poems, which, from the end of the 12th to the middle of the 14th century, served the citizen poets of northern France, not merely as an outlet for literary expression, but also as a vehicle of satirical comment—now on the general vices and weaknesses of humanity, now on the usual corruptions in church and State, now on the various historical events which occupied public attention from time to time. The enormous popularity of the subject is shown by the long vogue which it had, and by the empire which it exercised over generations of writers who differed from each other widely in style and temper. Nothing can be farther from the allegorical erudition, the political diatribes and the sermonizing moralities of the authors of *Renart le Contrefait* than the sly naïveté of the writers of the earlier branches. Yet these and a long and unknown series of intermediate bards the fox-king pressed into his service, and it is scarcely too much to say that, during the two centuries of his reign, there was hardly a thought in the popular mind which, as it rose to the surface, did not find expression in an addition to the huge cycle of *Renart*.

The French poems which we possess on the subject amount in all to nearly 100,000 lines, independently of mere variations, but including the different versions of *Renart le Contrefait*. The separate branches are the work of different authors, hardly any of whom are known, and, but for their community of subject and to some extent of treatment, might be regarded as separate poems. The history of Renart, his victories over Isengrim the wolf, Bruin the bear, and his other unfortunate rivals, his family affection, his outwittings of King Noble the Lion and all the rest, are too well known to need fresh description here. It is perhaps in the subsequent poems, though they are far less known and much less amusing, that the hold which the idea of Renart had obtained on the mind of northern France, and the ingenious uses to which it was put, are best shown. The first of these is *Le Couronnement de Renart*, a poem of between 3,000 and 4,000 lines, attributed, on no grounds whatever, to the poetess Marie de France, and describing how the hero by his ingenuity got himself crowned king. This poem already shows signs of direct moral application and generalizing. These are still more apparent in *Renart le Nouvel*, a composition of some 8,000 lines, finished in the year 1288 by the Fleming Jacquemart Gélée. Here the personification, of which, in noticing the *Roman de la rose*, we shall soon have to give extended mention, becomes evident. Instead of or at least beside the lively personal Renart who used to steal sausages, set Isengrim fishing with his tail, or made use of Chanticleer's comb for a purpose for which it was certainly never intended, we have *Renardie*, an abstraction of guile and hypocrisy, triumphantly prevailing over other and better qualities. Lastly, as the *Roman de la rose* of William of Lorris is paralleled by *Renart le Nouvel*, so its continuation by Jean de Meung is paralleled by the great miscellany of *Renart le Contrefait*, which, even in its existing versions, extends to fully 50,000 lines. Here we have, besides floods of miscellaneous erudition and discourse, political argument of the most direct and important kind. The wrongs of the lower orders are bitterly urged.

Early Lyrics.—The song literature of mediaeval France is extremely abundant and beautiful. From the 12th to the 15th century it received constant accessions, some signed, some anony-

mous, some purely popular in their character, some the work of more learned writers, others again produced by members of the aristocracy. Of the latter class it may fairly be said that the catalogue of royal and noble authors boasts few if any names superior to those of Thibaut de Champagne, king of Navarre at the beginning of the 13th century, and Charles d'Orléans, the father of Louis XII., at the beginning of the 15th. Although much of this lyric poetry is anonymous, the most popular part of it almost entirely so, yet we are able to enumerate some hundreds of French *chansonniers* between the 11th and the 13th century.

The earliest song literature is mainly sentimental in character. The collectors divide it under the two heads of romances and *pastourelles*, the former being usually the celebration of the loves of a noble knight and maiden, and recounting how Belle Doette or Eglantine or Oriour sat at her windows or in the tourney gallery, or embroidering silk and samite in her chamber, with her thoughts on Gerard or Guy or Henry,—the latter somewhat monotonous but naïve and often picturesque recitals, very often in the first person, of the meeting of an errant knight or minstrel with a shepherdess, and his cavalier but not always successful wooing. With these, some of which date from the 12th century, may be contrasted, at the other end of the mediæval period, the more varied and popular collection dating in their present form from the 15th century, and published in 1875 by Gaston Paris. In both alike, making allowance for the difference of their age and the state of the language, may be noticed a charming lyrical faculty and great skill in the elaboration of light and suitable metres. Especially remarkable is the abundance of refrains of an admirably melodious kind. It is said that more than 500 of these exist.

Among the lyric writers of these four centuries whose names are known may be mentioned Audefrois le Bastard (12th century), the author of the charming song of *Belle Idoine*, and others no way inferior, Quesnes de Bethune, the ancestor of Sully, whose song-writing inclines to a satirical cast in many instances, the Vidame de Chartres, Charles d'Anjou, King John of Brienne, the châtelain de Coucy, Gace Brulé, Colin Muset, while not a few writers mentioned elsewhere—Guyot de Provins, Adam de la Halle, Jean Bodel and others—were also lyricists. But none of them, except perhaps Audefrois, can compare with Thibaut IV. (1201–53), who united by his possessions and ancestry a connection with the north and the south, and who employed the methods of both districts but used the language of the north only. Thibaut was supposed to be the lover of Blanche of Castille, the mother of St. Louis, and a great deal of his verse is concerned with his love for her. But while knights and nobles were thus employing lyric poetry in courtly and sentimental verse, lyric forms were being freely employed by others, both of high and low birth, for more general purposes. Blanche and Thibaut themselves came in for contemporary lampoons, and both at this time and in the times immediately following, a cloud of writers composed light verse, sometimes of a lyric, sometimes of a narrative kind, and sometimes in a mixture of both. By far the most remarkable of these is Rutebeuf.

Rutebeuf is among the earliest French writers who tell us their personal history and make personal appeals. But he does not confine himself to these. He discusses the history of his times, he composes pious poetry too, and in at least one poem takes care to distinguish between the church which he venerates and the corrupt churchmen whom he lampoons. Besides Rutebeuf the most characteristic figure of his class and time (about the middle of the 13th century) is Adam de la Halle, commonly called the Hunchback of Arras. The earlier poems of Adam are of a sentimental character, the later ones satirical and somewhat ill-tempered. Such, for instance, is his invective against his native city. But his chief importance consists in his *jeux*, the *Jeu de la feuillée*, the *Jeu de Robin et Marion*, dramatic compositions which led the way to the regular dramatic form. Indeed the general tendency of 13th century is to satire, fable and farce, even more than to serious or sentimental poetry. We should perhaps except the *lais*, the chief of which are known under the name of Marie de France. These lays are exclusively Breton in origin, though not in application, and the term seems originally to have had refer-

ence rather to the music to which they were sung than to the manner or matter of the pieces. The subjects of the *lais* are indifferently taken from the Arthurian cycle, from ancient story, and from popular tradition, and, at any rate in Marie's hands, they give occasion for some passionate, and in the modern sense really romantic, poetry. The most famous of all is the *Lay of the Honeysuckle*, traditionally assigned to Sir Tristram.

Satiric and Didactic Work.—Direct satire began early in the 13th century with Guyot de Provins and Hugues de Brégy. Travesties of the romances of chivalry were written in which the chief heroes and situations were mercilessly parodied. The disputes of Philippe le Bel with the pope and the Templars had an immense literary influence, partly in the concluding portions of the *Renart*, partly in the *Roman de la rose*, still to be mentioned, and partly in other satiric allegories of which the chief is the romance of *Fauvel*, attributed to François de Rues. The hero of this is an allegorical personage, half man and half horse, signifying the union of bestial degradation with human ingenuity and cunning. Fauvel (the name, it may be worth while to recall, occurs in Langland) is a divinity in his way. All the personages of State, from kings and popes to mendicant friars, pay their court to him.

But this serious and discontented spirit betrays itself also in compositions which are not parodies or travesties in form. One of the latest, if not absolutely the latest (for Cuvelier's still later *Chronique de Du Guesclin* is only a most interesting imitation of the *chanson* form adapted to recent events), of the *chansons de geste* is *Baudouin de Sebourc*, one of the members of the great romance of cycle of romances dealing with the crusades, and entitled *Le Chevalier au Cygne*. *Baudouin de Sebourc* dates from the early years of the 14th century. It is strictly a *chanson de geste* in form, and also in the general run of its incidents. The hero is dispossessed of his inheritance by the agency of traitors, fights his battle with the world and its injustice, and at last prevails over his enemy Gaufrois, who has succeeded in obtaining the kingdom of Friesland and almost that of France. Gaufrois has as his assistants two personages who were very popular in the poetry of the time,—viz. the Devil, and Money. These two sinister figures pervade the *fabliaux*, tales and fantastic literature generally of the time. The abuse of usury at the time, and the exactions of the Jews and Lombards, were severely felt, and Money itself, as personified, figures largely in the popular literature.

Roman de la Rose.—A work of very different importance from all of these, though with seeming touches of the same spirit, a work which deserves to take rank among the most important of the middle ages, is the *Roman de la Rose*. The author of the earlier part was Guillaume de Lorris, who lived in the first half of the 13th century; the author of the later part was Jean de Meung, who was born about the middle of that century, and whose part in the *Roman* dates at least from its extreme end. This great poem exhibits in its two parts very different characteristics, which yet go to make up a not inharmonious whole. It is a love poem, and yet it is satire. But both gallantry and raillery are treated in an entirely allegorical spirit. The lover meets all sorts of obstacles in his pursuit of the rose, though he has for a guide the metaphorical personage Bel-Accueil. The early part, which belongs to William of Lorris, is remarkable for its gracious and fanciful descriptions. Forty years after Lorris's death, Jean de Meung completed it in an entirely different spirit. He keeps the allegorical form, and indeed introduces two new personages of importance, Nature and Faux-semblant. In the mouths of these personages and of another, Raison, he puts the most extraordinary mixture of erudition and satire. At one time we have the history of classical heroes, at another theories against the hoarding of money, about astronomy, about the duty of mankind to increase and multiply. Accounts of the origin of loyalty, which would have cost the poet his head at some periods of history, and even communistic ideas, are also to be found here. In Faux-semblant we have a real creation of the theatrical hypocrite. All this miscellaneous and apparently incongruous material in fact explains the success of the poem. There are to be found in the *Roman de la rose* the characteristics of the later middle age, its

gallantry, its mysticism, its economic and social troubles and problems, its scholastic methods of thought, its naïve acceptance as science of everything that is written, and at the same time its shrewd and embracing criticism of much that the age of criticism has accepted without doubt or question. The *Roman de la rose*, as might be supposed, set the example of an immense literature of allegorical poetry, which flourished more and more until the Renaissance.

Didactic Verse.—An example of early didactic verse is the *Bestiary* of Philippe de Thaun, a Norman *trouvère* who lived and wrote in England during the reign of Henry Beaucherc. Besides the *Bestiary*, which from its dedication to Queen Adela has been conjectured to belong to the third decade of the 12th century, Philippe wrote also in French a *Liber de creaturis*, both works being translated from the Latin. These works of mystical and apocryphal physics and zoology became extremely popular in the succeeding centuries, and were frequently imitated. A moralizing turn was also given to them, which was much helped by the importation of several miscellanies of oriental origin, partly tales, partly didactic in character, the most celebrated of which is the *Roman des sept sages*, which, under that title and the variant of *Dolopathos*, received repeated treatment from French writers both in prose and verse. Art, too, soon demanded exposition in verse, as well as science. The favourite pastime of the chase was repeatedly dealt with, notably in the *Roi Modus* (1325), mixed prose and verse; the *Deduits de la chasse* (1387), of Gaston de Foix, prose; and the *Tresor de Venerie* of Hardouin (1394), verse. Very soon didactic verse extended itself to all the arts and sciences. Vegetius and his military precepts had found a home in French octosyllables as early as the 12th century; the end of the same age saw the ceremonies of knighthood solemnly versified, and *napes* (maps) *du monde* also soon appeared. In 1245, Gautier of Metz translated from various Latin works into French verse a sort of encyclopaedia, while another incongruous work, known as *L'Image du monde*, exists from the same century. Profane knowledge was not the only subject which occupied didactic poets at this time. Religious handbooks and commentaries on the scriptures were common in the 13th and following centuries, and, under the title of *Castoiments*, *Enseignements* and *Doctrinaux*, moral treatises become common. The most famous of these, the *Castoiment d'un père à sons fils*, falls under the class of works due to oriental influence, being derived from the Indian *Panchatantra*.

In the 14th century the influence of the *Roman de la rose* helped to render moral verse frequent and popular. The same century, moreover, which witnessed these developments of well-intentioned if not always judicious erudition witnessed also a considerable change in lyrical poetry. Hitherto such poetry had chiefly been composed in the melodious but unconstrained forms of the romance and the *pastourelle*. In the 14th century the writers of northern France subjected themselves to severer rules. In this age arose the forms which for so long a time were to occupy French singers—the ballade, the rondeau, the rondel, the triolet, the chant royal and others. These received considerable alterations as time went on. We possess not a few *Artes poeticae*, such as that of Eustache Deschamps at the end of the 14th century and that of Thomas Sibilet in the 16th, giving particulars of them, and these particulars show considerable changes. The earliest poets who appear to have practised them extensively were born at the close of the 13th and the beginning of the 14th centuries. Of these Guillaume de Machault (c. 1300–80) is the oldest. He has left us 80,000 verses. Eustache Deschamps (c. 1340–c. 1410) was nearly as prolific. Froissart the historian (1333–1410) was also an agreeable and prolific poet. Less known but not less noteworthy, and perhaps the earliest of all, is Jehannot de Lescurel, whose personality is obscure, and most of whose works are lost, but whose fragments are full of grace. Froissart appears to have had many countrymen in Hainault and Brabant who devoted themselves to the art of versification; and the *Livre des cent ballades* of the Marshal Boucicault (1366–1421) and his friends—c. 1390—shows that the French gentleman of the 14th century was as apt at the ballade as his Elizabethan peer in Eng-

land was at the sonnet.

Beginnings of Drama.—The mysteries (subjects taken from the sacred writings) and miracle plays (subjects taken from the legends of the saints and the Virgin) are of very early date. The mystery of the *Foolish Virgins* (partly French, partly Latin), that of *Adam* and perhaps that of *Daniel*, are of the 12th century, though due to unknown authors. Jean Bodel and Rutebeuf, already mentioned, gave, the one that of *Saint Nicolas* at the confines of the 12th and 13th, the other that of *Théophile* later in the 13th itself. But the later moralities, *soeties*, and farces seem to be also in part a very probable development of the simpler and earlier forms of the *fabliau* and of the *tenson* or *jeu-parti*, a poem in simple dialogue. Of the *jeux-partis* there are many examples, varying from very simple questions and answers to something like regular dramatic dialogue; even short romances, such as *Aucassin et Nicolette*, were easily susceptible of dramatization. But the *Jeu de la feuillie* (or *feuillée*) of Adam de la Halle seems to be the earliest piece, profane in subject, containing something more than mere dialogue. The poet has not indeed gone far for his subject, for he brings in his own wife, father and friends, the interest being complicated by the introduction of stock characters (the doctor, the monk, the fool), and of certain fairies—personages already popular from the later romances of chivalry. Another piece of Adam's, *Le Jeu de Robin et Marion*, also already alluded to, is little more than a simple throwing into action of an ordinary *pastourelle* with a considerable number of songs to music. Nevertheless later criticism has seen, and not unreasonably, in these two pieces the origin in the one case of farce, and thus indirectly of comedy proper, in the other of comic opera.

For a long time, however, the mystery and miracle plays remained the mainstay of theatrical performance, and until the 13th century actors as well as performers were more or less taken from the clergy. It has, indeed, been well pointed out that the offices of the church were themselves dramatic performances, and required little more than development at the hands of the mystery writers. The occasional festive outbursts, such as the Feast of Fools, that of the Boy Bishop and the rest, helped on the development. The variety of mysteries and miracles was very great. A single manuscript contains 40 miracles of the Virgin, averaging from 1,200 to 1,500 lines each, written in octosyllabic couplets, and at least as old as the 14th century, most of them perhaps much earlier. The mysteries proper, or plays taken from the scriptures, are older still. Many of these are exceedingly long. There is a *Mystère de l'Ancien Testament*, which extends to many volumes, and must have taken weeks to act in its entirety. The *Mystère de la Passion*, though not quite so long, took several days, and recounts the whole history of the gospels. The best apparently of the authors of these pieces, which are mostly anonymous, were two brothers, Arnoul and Simon Gréban (authors of the *Actes des apôtres*, and in the first case of the *Passion*), c. 1450, while a certain Jean Michel (d. 1493) is credited with having continued the *Passion* from 30,000 lines to 50,000. But these performances, though they held their ground until the middle of the 16th century and extended their range of subject from sacred to profane history—legendary as in the *Destruction de Troie*, contemporary as in the *Siège d'Orléans*—were soon rivalled by the more profane performances of the moralities, the farces and the *soeties*. The palmy time of all these three kinds is the 15th century, while the Confrérie de la Passion itself, the special performers of the sacred drama, only obtained the licence constituting it by an ordinance of Charles VI. in 1402. In order, however, to take in the whole of the mediaeval theatre at a glance, we may anticipate a little. The Confraternity was not itself the author or performer of the profaner kind of dramatic performance. This latter was due to two other bodies, the clerks of the Bazoche and the *Enfans sans Souci*. As the Confraternity was chiefly composed of tradesmen and persons very similar to Peter Quince and his associates, so the clerks of the Bazoche were members of the legal profession of Paris, and the *Enfans sans Souci* were mostly young men of family. The morality was the special property of the first, the *sotie* of the second. But as the moralities were sometimes decidedly tedious plays, though by no means brief, they were varied

by the introduction of farces, of which the *jeux* already mentioned were the early germ, and of which *L'Avocat Patelin*, dated by some about 1465 and certainly about 200 years subsequent to Adam de la Halle, is the most famous example.

The morality was the natural result on the stage of the immense literary popularity of allegory in the *Roman de la rose* and its imitations. The *sotie* was directly satirical, and only assumed the guise of folly as a stalking-horse for shooting wit. It was more Aristophanic than any other modern form of comedy, and like its predecessor, it perished as a result of its political application. Encouraged for a moment as a political engine at the beginning of the 16th century, it was soon absolutely forbidden and put down, and had to give place in one direction to the lampoon and the prose pamphlet, in another to forms of comic satire more general and vague in their scope. The farce, on the other hand, having neither moral purpose nor political intention, was a purer work of art, enjoyed a wider range of subject, and was in no danger of any permanent extinction. Farcical interludes were interpolated in the mysteries themselves; short farces introduced and rendered palatable the moralities, while the *sotie* was itself but a variety of farce, and all the kinds were sometimes combined in a sort of tetralogy. It was a short composition, 500 verses being considered sufficient, while the morality might run to at least 1,000 verses, the miracle play to nearly double that number, and the mystery to some 40,000 or 50,000.

Of the pieces represented one only, that of *Maître Patelin*, is now much known; but many are almost equally amusing. *Patelin* itself has an immense number of versions and editions. Other farces are too numerous to attempt to classify; they bear, however, in their subjects, as in their manner, a remarkable resemblance to the *fabliaux*, their source. Conjugal disagreements, the unpleasantness of mothers-in-law, the shifty or, in the earlier stages, clumsy valet and chambermaid, the mishaps of too loosely given ecclesiastics, the abuses of relics and pardons, the extortion, violence, and sometimes cowardice of the seigneur and the soldiery, the corruption of justice, its delays and its pompous apparatus, supply the subjects. The treatment is rather narrative than dramatic in most cases, as might be expected, but makes up by the liveliness of the dialogue for the deficiency of elaborately planned action and interest. All these forms, it will be observed, are directly or indirectly comic. Tragedy in the middle ages is represented only by the religious drama, except for a brief period towards the decline of that form, when the "profane" mysteries referred to above came to be represented. These were, however, rather "histories," in the Elizabethan sense, than tragedies proper.

History.—For a time the French chroniclers contented themselves with Latin prose or with French verse, after the fashion of Wace and the Belgian, Philippe Mousket (1215–83). These, after a fashion universal in mediaeval times, began from fabulous or merely literary origins; and just as Wyntoun later carries back the history of Scotland to the terrestrial paradise, so does Mousket start that of France from the rape of Helen. But soon prose chronicles, first translated, then original, became common. Then came French selections and versions from the great series of historical compositions undertaken by the monks of St. Denys, the so-called *Grandes Chroniques de France* from the date of 1274, when they first took form in the hands of a monk styled Primat, to the reign of Charles V., when they assumed the title just given. But the first really remarkable author who used French prose as a vehicle of historical expression is Geoffroi de Villehardouin, marshal of Champagne, who was born rather after the middle of the 12th century, and died in Greece in 1212. Under the title of *Conquête de Constantinople* Villehardouin has left us a history of the fourth crusade, which has been accepted by all competent judges as the best picture extant of feudal chivalry in its prime. The *Conquête de Constantinople* has been well called a *chanson de geste* in prose, and indeed in the surprising nature of the feats it celebrates, in the abundance of detail, and in the vivid and picturesque poetry of the narration, it equals the very best of the *chansons*. Even the repetition of the same phrases, which is characteristic of epic poetry, appears in this prose epic; and as in the *chansons* so in Villehardouin, few motives appear but religious fervour and the

love of fighting, though neither of these excludes a lively appetite for booty and a constant tendency to disunion and disorder.

The rhymed chronicles of Philippe Mousket and Guillaume Guiart belong to the next half-century; and in prose the most remarkable works are the *Chronique de Reims*, a well written history, having the interesting characteristics of taking the lay and popular side, and the great compilation edited (in the modern sense) by Baudouin d'Avesnes (1213–89). Joinville (1224?–1317), whose special subject is the Life of St. Louis, is far more modern than even the half-century which separates him from Villehardouin would lead us to suppose. There is nothing of the knight-errant about him personally, notwithstanding his devotion to his hero. He is an admirable writer, but far less simple than Villehardouin; the good King Louis tries in vain to make him share his own rather high-flown devotion. Joinville is shrewd, practical, has political ideas and antiquarian curiosity, and his descriptions are often very creditable pieces of deliberate literature.

What Villehardouin is to the 12th and Joinville to the 13th century, so Jean Froissart (1337–1410) is to the 14th. His picture is the most famous as it is the most varied of the three, but it has special drawbacks as well as special merits. Society is still to him all knights and ladies, tournaments, skirmishes and feasts. He depicts these, not like Joinville, still less like Villehardouin, as a sharer in them, but with the facile and picturesque pen of a sympathizing literary onlooker. As the comparison of the *Conquête de Constantinople* with a *chanson de geste* is inevitable, so is that of Froissart's *Chronique* with a *roman d'aventures*.

Poetry in the 15th Century.—First among the poets of the period falls to be mentioned the shadowy personality of Olivier Basselin. Modern criticism has attacked the identity of the jovial miller, who was once supposed to have written and perhaps invented the songs called *vaux de vire*, and to have also carried on a patriotic warfare against the English. But though Jean le Houx may have written the poems published under Basselin's name two centuries later, it is not unlikely that an actual Olivier wrote actual *vaux de vire* at the beginning of the 15th century. About Christine de Pisan (1363–1430) and Alain Chartier (1385–c. 1430) there is no such doubt. Christine was the daughter of an Italian astrologer who was patronized by Charles V. She was born in Italy but brought up in France, and she enriched the literature of her adopted country with much learning, good sense and patriotism. She wrote history, devotional works and poetry; and though her literary merit is not of the highest, it is very far from despicable. Alain Chartier, best known to modern readers by the story of *Margaret of Scotland's Kiss*, was a writer of somewhat similar character.

A very different person is Charles d'Orléans (1394–1465), one of the greatest of *grands seigneurs*, for he was the father of a king of France, and heir to the duchies of Orléans and Milan. Charles, indeed, if not a Roland or a Bayard, was an admirable poet. He is the best-known and perhaps the best writer of the graceful poems in which an artificial versification is strictly observed, and helps by its recurrent lines and modulated rhymes to give to poetry something of a musical accompaniment even without the addition of music properly so called. His ballades are certainly inferior to those of Villon, but his rondels are unequalled. For fully a century and a half these forms engrossed the attention of French lyrical poets. Exercises in them were produced in enormous numbers, and of an excellence which has only recently obtained full recognition even in France. Charles d'Orléans is himself sufficient proof of what can be done in them in the way of elegance, sweetness and grace which some have unjustly called effeminacy. But that this effeminacy was no natural or inevitable fault of the ballades and the rondeaux was fully proved by the most remarkable literary figure of the 15th century in France.

To François Villon (1431–63?), as to other great single writers, no attempt can be made to do justice in this place. His remarkable life and character especially lie outside our subject. But he is universally recognized as the most important single figure of French literature before the Renaissance. His work is very strange in form, the undoubtedly genuine part of it consisting

merely of two compositions, known as the great and little Testament, written in stanzas of eight lines of eight syllables each, with lyrical compositions in ballade and rondeau form interspersed. Nothing in old French literature can compare with the best of these, such as the "Ballade des dames du temps jadis," the "Ballade pour sa mère," "La Grosse Margot," "Les Regrets de la belle Heaulmière," and others; while the whole composition is full of poetical traits of the most extraordinary vigour, picturesqueness and pathos. Towards the end of the century the poetical production of the time became very large. The artificial measures already alluded to, and others far more artificial and infinitely less beautiful, were largely practised. The typical poet of the end of the 15th century is Guillaume Crétin (d. 1525), who distinguished himself by writing verses with punning rhymes, verses ending with double or treble repetitions of the same sound, and many other tasteless absurdities, in which, as Pasquier remarks, "il perdit toute la grâce et la liberté de la composition." The other favourite direction of the poetry of the time was a vein of allegorical moralizing drawn from the *Roman de la rose* through the medium of Chartier and Christine, which produced "Castles of Love," "Temples of Honour," and such like. The combination of these drifts in verse-writing produced a school known in literary history, from a happy phrase of the satirist Coquillart (*v. inf.*), as the "Grands Rhétoriqueurs."

The most remarkable representative of purely light poetry outside the theatre is Guillaume Coquillart (1450-1510), a lawyer of Champagne, who resided for the greater part of his life in Reims. This city, like others, suffered from the pitiless tyranny of Louis XI. The beginnings of the standing army which Charles VII. had started were extremely unpopular, and the use to which his son put them by no means removed this unpopularity. Coquillart described the military man of the period in his *Monologue du gendarme cassé*. Again, when the king entertained the idea of unifying the taxes and laws of the different provinces, Coquillart, who was named commissioner for this purpose, wrote on the occasion a satire called *Les Droits nouveaux*.

15th Century Prose.—This period produced, indeed, no prose writer of great distinction, except Comines; but it witnessed serious, if not entirely successful, efforts at prose composition. Christine de Pisan and Alain Chartier were at least as much prose writers as poets; and the latter, while he, like Gerson, dealt much with the reform of the church, used in his *Quadriloge invectif* really forcible language for the purpose of spurring on the nobles of France to put an end to her sufferings and evils. These moral and didactic treatises were but continuations of others, which for convenience sake we have hitherto left unnoticed. Though verse was in the centuries prior to the 15th the favourite medium for literary composition, it was by no means the only one; and moral and educational treatises already existed in pedestrian phrase. Certain household books (*Livres de raison*) have been preserved, some of which date as far back as the 13th century. These contain not merely accounts, but family chronicles, receipts and the like. Accounts of travel, especially to the Holy Land, culminated in the famous *Voyage* of Mandeville which, though it has never been of so much importance in French as in English, perhaps first took vernacular form in the French tongue. Of the 14th century, we have a *Menagier de Paris*, intended for the instruction of a young wife, and a large number of miscellaneous treatises of art, science and morality, while private letters, mostly as yet unpublished, exist in considerable numbers, and are generally of the moralizing character; books of devotion, too, are naturally frequent.

Froissart had been followed as a chronicler by Enguerrand de Monstrelet (c. 1390-1453) and by the historiographers of the Burgundian court, Chastelain, whose interesting *Chronique de Jacques de Lalaing* is much the most attractive part of his work, and Olivier de la Marche. The memoir and chronicle writers, who were to be of so much importance in French literature, also begin to be numerous at this period. Juvenal des Ursins (1388-1473), author of the *Chronique scandaleuse*, may be mentioned as presenting the characteristic of minute observation and record which has distinguished the class ever since. Jean Lemaire de Belges (1473-c. 1525) was historiographer to Louis XII. and

wrote *Illustrations des Gaules*. But Comines (1445-1509) is no imitator of Froissart or of any one else. The last of the quartette of great French mediaeval historians, he does not yield to any of his three predecessors in originality or merit, but he is very different from them. He fully represents the mania of the time for statecraft, and his book has long ranked with that of Machiavelli as a manual of the art, though he has not the absolutely non-moral character of the Italian. His memoirs, considered merely as literature, show a style well suited to their purport—not, indeed, brilliant or picturesque, but clear, terse and thoroughly well suited to the expression of the acuteness, observation and common sense of their author.

The best prose of the century, and almost the earliest which deserves the title of a satisfactory literary medium, was employed for the telling of romances in miniature. The *Cent Nouvelles Nouvelles* is undoubtedly the first work of prose *belles-lettres* in French, and the first, moreover, of a long and most remarkable class of literary work in which French writers may challenge all comers with the certainty of victory—the short prose tale of a comic character. The subjects of the *Cent Nouvelles Nouvelles* are by no means new. They are simply the old themes of the *fabliaux* treated in the old way. The novelty is in the application of prose to such a purpose, and in the crispness, the fluency and the elegance of the prose used. These tales have been attributed to Antoine de la Salle (1398-1461), who, if this attribution and certain others be correct, must be allowed to be one of the most original and fertile authors of early French literature. La Salle's one acknowledged work is the story of *Petit Jehan de Saintré*, a short romance exhibiting great command of character and abundance of delicate draughtsmanship. To this not only the authorship, part-authorship or editorship of the *Cent Nouvelles Nouvelles* has been added; the still more famous and important work of *Patelin* has been assigned by respectable, though of course conjecturing, authority to the same paternity. The generosity of critics towards La Salle has not even stopped here. A fourth masterpiece of the period, *Les Quinze Joies de mariage*, has also been assigned to him.

THE 16TH CENTURY

In no country was the literary result of the Renaissance more striking and more manifold than in France. The double effect of the study of antiquity and the religious movement produced an outburst of literary developments of the most diverse kinds, which even the fierce and sanguinary civil dissensions of the Reformation did not succeed in checking. While the Renaissance in Italy had mainly exhausted its effects by the middle of the 16th century, while in Germany those effects only paved the way for a national literature, and did not themselves greatly contribute thereto, while in England it was not till the extreme end of the period that a great literature was forthcoming—in France almost the whole century was marked by the production of capital works in every branch of literary effort. Not even the 17th century, and certainly not the 18th, can show such a group of prose writers and poets as is formed by Calvin, St. Francis de Sales, Montaigne, du Vair, Bodin, d'Aubigné, the authors of the *Satire Ménippée*, Monluc, Brantôme, Pasquier, Rabelais, des Periers, Herberay des Esarts, Amyot, Garnier, Marot, Ronsard and the rest of the "Pléiade," and finally Regnier. These great writers are not merely remarkable for the vigour and originality of their thoughts, the freshness, variety and grace of their fancy, the abundance of their learning and the solidity of their arguments in the cases where argument is required. Their great merit is the creation of a language and a style able to give expression to these great gifts.

The first note of the new literature was sounded by Clément Marot (1496/7-1544). The son of an older poet, Jehan des Mares called Marot (1463-1523), Clément at first wrote, like his father's contemporaries, allegorical and mythological poetry, afterwards collected in a volume with a charming title, *L'Adolescence clémentine*. It was not till he was nearly 30 years old that his work became really remarkable. From that time forward till his death he was much involved in the troubles and persecutions of the Huguenot party to which he belonged; nor was the protection of Marguerite d'Angoulême, the chief patroness of Huguenots and men

of letters, always efficient. But his troubles, so far from harming, helped his literary faculties; and his epistles, epigrams, *blasons* (descendants of the mediaeval *diits*), and *coq-à-l'âne* became remarkable for their easy and polished style, their light and graceful wit, and a certain elegance which had not as yet been even attempted in any modern tongue.

Around Marot arose a whole school of disciples and imitators, such as Victor Brodeau (1470?-1540), the great authority on rondeaux, Maurice Scève, a fertile author of *blasons*, Salel, Marguerite herself (1492-1549), of whom more hereafter, and Mellin de Saint Gelais (1491-1558). But the inventive vigour of the age was so great that one school had hardly become popular before another pushed it from its stool, and even of the Marotists just mentioned Scève and Salel are often regarded as chief and member respectively of a Lyonnese coterie, intermediate between the schools of Marot and of Ronsard, containing other members of repute such as Antoine Heroët and Charles Fontaine and claiming Louise Labé (*v. inf.*) herself.

The Pléiade.—Pierre de Ronsard (1524-85) was the chief poet of the period. At first a courtier and a diplomatist, physical disqualifications made him change his career. He began to study the classics under Jean Daurat (1508-88), and with his master and five other writers, Etienne Jodelle (1532-73), Rémy Belleau (1528-77), Joachim du Bellay (1525-60), Jean Antoine de Baif (1532-89), and Pontus de Tyard (d. 1605, bishop of Châlons-sur-Saône), composed the famous "Pléiade." The object of this band was to bring the French language, in vocabulary, constructions and application, on a level with the classical tongues by borrowings from the latter. They would have imported the Greek licence of compound words, though the genius of the French language is but little adapted thereto; and they wished to reproduce in French the regular tragedy, the Pindaric and Horatian ode, the Virgilian epic, etc. Both in du Bellay's famous manifesto, the *Deffense et illustration de la langue française*, and in Ronsard's own work, caution and attention to the genius and the tradition of French are insisted upon. Being all men of the highest talent, and not a few of them men of great genius, they achieved much that they designed, and even where they failed exactly to achieve it, they very often indirectly produced results as important and more beneficial than those which they intended. Doubtless they went too far and provoked to some extent the reaction which Malherbe led. Their importations were sometimes unnecessary. It is almost impossible to read the *Franciade* of Ronsard, and not too easy to read the tragedies of Jodelle and Garnier, fine as the latter are in parts. But the best of Ronsard's sonnets and odes, the finest of du Bellay's *Antiquités de Rome* (translated into English by Spenser), the exquisite *Varney* of the same author, and the *Avril* of Belleau, even the finer passages of d'Aubigné and du Bartas, are not only admirable in themselves, and of a kind not previously found in French literature, but are also such things as could not have been previously found, for the simple reason that the medium of expression was wanting. They constructed that medium for themselves, and no force of the reaction which they provoked was able to undo their work.

The effort of the "Pléiade" proper was continued and shared by a considerable number of minor poets, some of them, as has been already noted, belonging to different groups and schools. Olivier de Magny (d. 1560) and Louise Labé (b. 1526) were poets and lovers, the lady deserving far the higher rank in literature. There is more depth of passion in the writings of "La Belle Cordière," as this Lyonnese poetess was called, than in almost any of her contemporaries. Jacques Tahureau (1527-55) scarcely deserves to be called a minor poet. There is less than the usual hyperbole in the contemporary comparison of him to Catullus, and he reminds an Englishman of the school represented nearly a century later by Carew, Randolph and Suckling. The title of a part of his poem—*Mignardises amoureuses de l'admirée*—is characteristic both of the style and of the time. Jean Doublet (c. 1528-c. 1580), Amadis Jamyn (c. 1530-85), and Jean de la Taille (1540-1608) deserve mention at least as poets, but two other writers require a longer allusion. Guillaume de Salluste, seigneur du Bartas (1544-90), whom Sylvester's translation, Mil-

ton's imitation, and the copious citations of Southey's *Doctor*, have made known if not familiar in England, was partly a disciple and partly a rival of Ronsard. His poem of *Judith* was eclipsed by his better-known *La Divine Sepmaine* or epic of the Creation. Théodore Agrippa d'Aubigné (1552-1630), like du Bartas, was a Calvinist. His genius was of a more varied character. He wrote sonnets and odes as became a Ronsardist, but his chief poetical work is the satirical poem of *Les Tragiques*, in which the author brands the factions, corruptions and persecutions of the time, and in which there are to be found alexandrines of a strength, vigour and original cadence hardly to be discovered elsewhere, save in Corneille and Victor Hugo. Towards the end of the century, Philippe Desportes (1546-1606) and Jean Bertaut (1552-1611), with much enfeebled strength, but with a certain grace, continue the Ronsardizing tradition. Among their contemporaries must be noticed Jean Passerat (1534-1602), a writer of much wit and vigour and rather resembling Marot than Ronsard, and Vauquelin de la Fresnaye (1536-1607), the author of a valuable *Ars poetica* and of the first French satires which actually bear that title. Jean le Houx (*fl. c. 1600*) continued, rewrote or invented the *vaux de vire*, commonly known as the work of Olivier Basselin.

The nephew of Desportes, Mathurin Regnier (1573-1613), marks the end, and at the same time perhaps the climax, of the poetry of the century. A descendant at once of the older Gallic spirit of Villon and Marot, in virtue of his consummate acuteness, terseness and wit, of the school of Ronsard by his erudition, his command of language, and his scholarship, Regnier is perhaps the best representative of French poetry at the critical time when it had got together all its materials, had lost none of its native vigour and force, and had not yet submitted to the cramping and numbing rules and restrictions which the next century introduced.

16th Century Drama.—The change which dramatic poetry underwent during the 16th century was at least as remarkable as that undergone by poetry proper. The first half of the period saw the end of the religious mysteries, the licence of which had irritated both the parliament and the clergy. Under the patronage of Louis XIII. were produced the chief works of Gringore or Gringoire (c. 1480-1547), by far the most remarkable writer of this class of composition. His *Prince des sots* and his *Mystère de St. Louis* are among the best of their kind. An enormous volume of composition of this class was produced between 1500 and 1550. One morality by itself, *L'Homme juste et l'homme mondain*, contains some 36,000 lines. But in 1548, when the Confraternity was formally established at the Hôtel de Bourgogne, leave to play sacred subjects was expressly refused it. Moralities and *soties* dragged on under difficulties till the end of the century, and the farce, which is immortal, continually affected comedy. But the effect of the Renaissance was to sweep away all other vestiges of the mediaeval drama, at least in the capital. An entirely new class of subjects, entirely new modes of treatment, and a different kind of performers were introduced. The change naturally came from Italy. In the close relationship with that country which France had during the early years of the century, Italian translations of the classical masterpieces were easily imported. Soon French translations were made afresh of the *Electra*, the *Hecuba*, the *Iphigenia in Aulis*, and the French humanists hastened to compose original tragedies on the classical model, especially as exhibited in Seneca. It was impossible that the "Pléiade" should not eagerly seize such an opportunity of carrying out its principles, and one of its members, Jodelle (1532-73), devoting himself mainly to dramatic composition, fashioned at once the first tragedy, *Cléopâtre*, and the first comedy, *Eugène*, thus setting the example of the style of composition which for two centuries and a half Frenchmen were to regard as the highest effort of literary ambition. *Cléopâtre* was followed by *Didon*, which, unlike its predecessor, is entirely in alexandrines, and observes the regular alternation of masculine and feminine rhymes.

Robert Garnier (1534-1590) is the first tragedian who deserves a place not too far below Rotrou, Corneille, Racine, Voltaire and Hugo, and who may be placed in the same class with them. He chose his subjects indifferently from classical, sacred and mediaeval

CLASSIC AND CONTEMPORARY FRENCH AUTHORS

1. François Rabelais (1494–1553). 2. Jean-Baptiste Poquelin Molière (1622–73). 3. François Marie Arouet de Voltaire (1694–1778). 4. Denis Diderot (1713–84). 5. Stendhal (Marie Henri Beyle) (1783–1842). 6. Honoré de Balzac (1799–1850). 7. Victor Marie Hugo (1802–85). 8. Alexandre Dumas, père (1802–70). 9. Gustave Flaubert (1821–80). 10.

Guy de Maupassant (1850–93). 11. George Sand (Aurore Dupin Dudevant) (1804–76). 12. Madame de Staël (1766–1817). 13. Edmond Rostand (1868–1918). 14. Henri Bergson (1859–). 15. Anatole France (Jacques Anatole Thibault) (1844–1924). 16. Romain Rolland (1868–)

literature. *Sédécie*, a play dealing with the capture of Jerusalem by Nebuchadnezzar, is held to be his masterpiece, and *Bradamante* deserves notice because it is the first tragi-comedy of merit in French, and because the famous confidant here makes his first appearance. Garnier's successor, Antoine de Monchrétien or Montchrestien (c. 1576-1621), set the example of dramatizing contemporary subjects. His masterpiece is *L'Ecossoise*, the first of many dramas on the fate of Mary, queen of Scots. While tragedy thus clings closely to antique models, comedy, as might be expected in the country of the *fabliaux*, is more independent. Italy had already a comic school of some originality, and the French farce was too vigorous and lively a production to permit of its being entirely overlooked. The first comic writer of great merit was Pierre Larivey (c. 1550-c. 1612), an Italian by descent.

16th Century Prose Fiction.—Great as is the importance of the 16th century in the history of French poetry, its importance in the history of French prose is greater still. There can be no doubt of the precedence, in every sense of the word, of François Rabelais (c. 1490-1553), the one French writer (or with Molière one of the two) whom critics the least inclined to appreciate the characteristics of French literature have agreed to place among the few greatest of the world. With an immense erudition representing almost the whole of the knowledge of his time, with an untiring faculty of invention, with the judgment of a philosopher, and the common sense of a man of the world, with an observation that let no characteristic of the time pass unobserved, and with a tenfold portion of the special Gallic gift of good-humoured satire, Rabelais united a height of speculation and depth of insight and a vein of poetical imagination rarely found in any writer, but altogether portentous when taken in conjunction with his other characteristics. His great work has been taken for an exercise of transcendental philosophy, for a concealed theological polemic, for an allegorical history of this and that personage of his time, for a merely literary utterance, for an attempt to tickle the popular ear and taste. It is all of these, and it is none—all of them in parts, none of them in deliberate and exclusive intention. It may perhaps be called the exposition and commentary of all the thoughts, feelings, aspirations and knowledge of a particular time and nation put forth in attractive literary form by a man who for once combined the practical and the literary spirit, the power of knowledge and the power of expression. The work of Rabelais is the mirror of the 16th century in France, reflecting at once its comeliness and its uncomeliness, its high aspirations, its voluptuous tastes, its political and religious dissensions, its keen criticism, its eager appetite and hasty digestion of learning, its gleams of poetry, and its ferocity of manners. In Rabelais we can divine the "Pléiade" and Marot, the *Cymbalum mundi* and Montaigne, Amyot and the *Amadis*, even Calvin and Duperron.

In 1558 appeared two works of high literary and social interest. These are the *Heptaméron* of the queen of Navarre, and the *Contes et joyeux devis* of Bonaventure des Periers (c. 1500-44). Des Periers, who was a courtier of Marguerite's, has sometimes been thought to have had a good deal to do with the first-named work as well as with the second, and was also the author of a curious Lucianic satire, strongly sceptical in cast, the *Cymbalum mundi*. Indeed, not merely the queen's prose works, but also the poems gracefully entitled *Les Marguerites de la Marguerite*, are often attributed to the literary men whom the sister of Francis I. gathered round her. However this may be, some single influence of power enough to give unity and distinctness of savour evidently presided over the composition of the *Heptaméron*. Composed as it is on the model of Boccaccio, its tone and character are entirely different, and few works have a more individual charm. The *Tales* of des Periers are shorter, simpler and more homely; there is more wit in them and less refinement.

16th Century Historians.—As in the case of the tale-tellers, so in that of the historians, the writers of the 16th century had traditions to continue. It is doubtful indeed whether many of them can risk comparison as artists with the great names of Villehardouin and Joinville, Froissart and Comines. The 16th century, however, set the example of dividing the functions of the chronicler, setting those of the historian proper on one side, and

of the anecdote-monger and biographer on the other. The efforts at regular history made in this century were not of the highest value. But on the other hand the practice of memoir-writing, in which the French were to excel every nation in the world, and of literary correspondence, in which they were to excel even their memoirs, was solidly founded.

There are four collections of memoirs concerning this time which far exceed all others in interest and importance. The turbulent dispositions of the time, the loose dependence of the nobles and even the smaller gentry on any single or central authority, the rapid changes of political situations, and the singularly active appetite, both for pleasure and for business, for learning and for war, which distinguished the French gentleman of the 16th century, place the memoirs of François de Lanoue (1531-91), Blaise de Mon[t]luc (1503-77), Agrippa d'Aubigné and Pierre de Bourdeille[s] Brantôme (1540-1614) almost at the head of the literature of their class. The name of Brantôme is known to all who have the least tincture of French literature, and the works of the others are not inferior in interest, and perhaps superior in spirit and conception, to the *Dames Galantes*, the *Grands Capitaines* and the *Hommes illustres*. The commentaries of Montluc, which Henri IV. is said to have called the soldier's Bible, are exclusively military and deal with affairs only. Montluc was governor in Guienne, where he repressed the savage Huguenots of the south with a savagery worse than their own. He was, however, a partisan of order, not of Catholicism. He hung and shot both parties with perfect impartiality, and refused to have anything to do with the massacre of St. Bartholomew. Though he was a man of no learning, his style is excellent, being vivid, flexible and straightforward. Lanoue, who was a moderate in politics, has left his principles reflected in his memoirs. D'Aubigné gives the extreme Huguenot side as opposed to the royalist partisanship of Montluc and the *via media* of Lanoue. Brantôme, on the other hand, is quite free from any political or religious prepossessions, and, indeed, troubles himself very little about any such matters. He is the shrewd and somewhat cynical observer, moving through the crowd and taking note of its ways, its outward appearance, its heroisms and its follies. It is really difficult to say whether the recital of a noble deed of arms or the telling of a scandalous story about a court lady gave him the most pleasure, and impossible to say which he did best. Certainly he had ample material for both exercises in the history of his time.

16th Century Theologians.—In France, as in all other countries, the Reformation was an essentially popular movement, though from special causes, such as the absence of political homogeneity, the nobles took a more active part both with pen and sword in it than was the case in England. But the great textbook of the French Reformation was not the work of any noble. Jean Calvin's *Institution of the Christian Religion* is a book equally remarkable in matter and in form, in circumstances and in result. It is the first really great composition in argumentative French prose. Its severe logic and careful arrangement had as much influence on the manner of future thought, both in France and the other regions whither its wide-spread popularity carried it, as its style had on the expression of such thought. It was the work of a man of only 27, and it is impossible to exaggerate the originality of its manner when we remember that hardly any models of French prose then existed except tales and chronicles, which required and exhibited totally different qualities of style. It is indeed probable that had not the *Institution* been first written by its author in Latin, and afterwards translated by him, it might have had less dignity and vigour; but it must at the same time be remembered that this process of composition was at least equally likely, in the hands of any but a great genius, to produce a heavy and pedantic style neither French nor Latin in character. Something like this result was actually produced in some of Calvin's minor works, and still more in the works of many of his followers, whose lumbering language gained for itself, in allusion to their exile from France, the title of "style réfugié." Nevertheless, the use of the vulgar tongue on the Protestant side, and the possession of a work of such importance written therein, gave the Reformers an immense advantage which their adversaries

were some time in neutralizing. Even before the *Institution*, Lefèvre d'Étaples (1455-1537) and Guillaume Farel (1489-1565) saw and utilized the importance of the vernacular. Calvin (1509-64) was much helped by Pierre Viret (1511-71), who wrote a large number of small theological and moral dialogues, and of satirical pamphlets, designed to captivate as well as to instruct the lower orders. The more famous Beza (Théodore de Bèze) (1519-1605) wrote chiefly in Latin, but he composed in French an ecclesiastical history of the Reformed churches and some translations of the Psalms. Marnix de Sainte Aldegonde (1530-93), a gentleman of Brabant, followed Viret as a satirical pamphleteer on the Protestant side. On the other hand, the Catholic champions at first affected to disdain the use of the vulgar tongue, and their pamphleteers, when they did attempt it, were unequal to the task. Towards the end of the century a more decent war was waged with Philippe du Plessis Mornay (1549-1623) on the Protestant side, whose work is at least as much directed against free-thinkers and enemies of Christianity in general as against the dogmas and discipline of Rome. His adversary, the redoubtable Cardinal du Perron (1556-1618), who, originally a Calvinist, went over to the other side, employed French most vigorously in controversial works, chiefly with reference to the eucharist. Du Perron was celebrated as the first controversialist of the time, and obtained dialectical victories over all comers. At the same time the bishop of Geneva, St. Francis of Sales (1567-1622), supported the Catholic side, partly by controversial works, but still more by his devotional writings, the chief of which is the *Introduction to a Devout life*.

The literature of doubt has to receive its principal accession in the famous essays of Michel Eyquem, seigneur de Montaigne (1533-92). It would be a mistake to imagine the existence of any sceptical propaganda in this charming and popular book. Its principle is not scepticism but egotism; and, the author being profoundly sceptical, this quality automatically rather than intentionally appears. It expresses the mental attitude of the latter part of the century as completely as Rabelais expresses the mental attitude of the early part. There is considerably less vigour and life in this attitude. Inquiry and protest have given way to a placid conviction that there is not much to be found out, and that it does not much matter; the erudition though abundant is less indiscriminate, and is taken in and given out with less gusto; exuberant drollery has given way to quiet irony; and though neither business nor pleasure is decried, both are regarded rather as useful pastimes incident to the life of a man than with the eager appetite of the Renaissance. From the purely literary point of view, the style is remarkable for its absence of pedantry in construction, and yet for its rich vocabulary and picturesque brilliancy.

The greatest political writer of the age is Jean Bodin (1530-96), whose *République* is founded partly on speculative considerations like the political theories of the ancients, and partly on an extended historical inquiry. Bodin, like most lawyers who have taken the royalist side, is for unlimited monarchy, but notwithstanding this, he condemns religious persecution and discourages slavery. In his speculations on the connection between forms of government and natural causes, he serves as a link between Aristotle and Montesquieu. On the other hand, the causes which we have mentioned made a large number of writers adopt opposite conclusions. Etienne de la Boétie (1530-63), the friend of Montaigne's youth, composed the *Contre un or Discours de la servitude volontaire*, a protest against the monarchical theory. The foremost work against the League was the famous *Satire Ménippée* (1594), from a literary point of view one of the most remarkable of political books. The *Ménippée* was the work of no single author, but was due, it is said, to the collaboration of five, Pierre Leroi, who has the credit of the idea, Jacques Gillot, Florent Chrétien, Nicholas Rapin (1541-96) and Pierre Pithou (1539-96), with some assistance in verse from Passerat and Gilles Durand. The book is a kind of burlesque report of the meeting of the states-general, called for the purpose of supporting the views of the League in 1593. It gives an account of the procession of opening, and then we have the supposed speeches of the

principal characters—the duc de Mayenne, the papal legate, the rector of the university (a ferocious Leaguer) and others. But by far the most remarkable is that attributed to Claude d'Aubray, the leader of the *Tiers État*, and said to be written by Pithou, in which all the evils of the time and the malpractices of the leaders of the League are exposed and branded. The satire is extraordinarily bitter and yet perfectly good-humoured.

16th Century Savants.—One more division, and only one, that of scientific and learned writers pure and simple, remains. Much of the work of this kind during the period was naturally done in Latin, the vulgar tongue of the learned. But in France, as in other countries, the study of the classics led to a vast number of translations, and it so happened that one of the translators deserves as a prose writer a rank among the highest. Many of the authors already mentioned contributed to the literature of translation. Des Periers translated the Platonic dialogue *Lysis*, la Boétie some works of Xenophon and Plutarch, du Vair the *De corona*, the *In Ctesiphontem* and the *Pro Milone*. Salel attempted the *Iliad*, Belleau the false *Anacreon*, Baif some plays of Plautus and Terence. Besides these Lefèvre d'Étaples gave a version of the Bible, Saliat one of Herodotus, and Louis Leroi (1510-77), not to be confounded with the part author of the *Ménippée*, many works of Plato, Aristotle and other Greek writers. But while most if not all of these translators owed the merits of their work to their originals, and deserved, much more deserve, to be read only by those to whom those originals are sealed, Jacques Amyot (1513-93), bishop of Auxerre, takes rank as a French classic by his translations of Plutarch, Longus and Heliodorus. The admiration which Amyot excited in his own time was immense. Montaigne declares that it was thanks to him that his contemporaries knew how to speak and to write, and the Academy in the next age, though not too much inclined to honour its predecessors, ranked him as a model. His Plutarch, which had an enormous influence at the time, and coloured perhaps more than any classic the thoughts and writings of the 16th century, both in French and English, was considered his masterpiece.

On the other hand, Claude Fauchet (1530-1601) in two antiquarian works, *Antiquités gauloises et françoises* and *L'Origine de la langue et de la poésie française*, displays a remarkable critical faculty in sweeping away the fables which had encumbered history. Fauchet had the (for his time) wonderful habit of consulting manuscripts, and we owe to him literary notices of many of the *trouvères*. At the same time François Grudé, sieur de la Croix du Maine (1552-92), and Antoine Duverdiere (1544-1600) founded the study of bibliography in France. Pasquier's *Recherches* carries out the principles of Fauchet independently, and besides treating the history of the past in a true critical spirit, supplies us with voluminous and invaluable information on contemporary politics and literature. He has, moreover, the merit which Fauchet had not, of being an excellent writer. Henri Estienne [Stephanus] (1528-98) also deserves notice in this place, both for certain treatises on the French language, full of critical crotchets, and also for his curious *Apologie pour Hérodoté*. The famous potter, Bernard Palissy (1510-90), was not much less skilful as a fashioner of words than as a fashioner of pots, and his description of the difficulties of his experiments in enamelling, which lasted 16 years, is well known. The great surgeon Ambrose Paré (c. 1510-90) was also a writer, and his descriptions of his military experiences at Turin, Metz and elsewhere have all the charm of the 16th-century memoir. The only other writers who require special mention are Oliver de Serres (1539-1619), who composed, under the title of *Théâtre d'agriculture*, a complete treatise on the various operations of rural economy, and Jacques du Fouilloux (1521-80), who wrote on hunting (*La Venerie*). Both became extremely popular and were frequently reprinted.

THE 17TH CENTURY

We come now to the shaping of a literary doctrine that was to last for two centuries, and to determine, not merely the language and complexion, but also the form of French verse during the whole of that time. The tradition of respect for Malherbe, an elder and more gifted Boileau, was at one time all-powerful in

France, and, notwithstanding the Romantic movement, is still strong. In rejecting a large number of the importations of the Ronsardists, he certainly did good service. But it is difficult to avoid ascribing in great measure to his influence the origin of the chief faults of modern French poetry, and modern French in general, as compared with the older language. He pronounced against "poetic diction," as such, forbade the overlapping (*enjambement*) of verse, insisted that the middle pause should be of sense as well as sound, and that rhyme must satisfy eye as well as ear. The very influences which he despised and proscribed produced in him much tolerable and some admirable verse, though he is not to be named as a poet with Regnier, who had the courage, the sense and the good taste to oppose and ridicule his innovations. Of Malherbe's school, Honorat de Bueil, marquis de Racan (1589-1670), and François de Maynard (1582-1646) were the most remarkable.

But the vigour, not to say the licence, of the 16th century could not thus die all at once. In Théophile de Viau (1591-1626) the early years of the 17th century had their Villon. The later poet was almost as unfortunate as the earlier, and almost as disreputable, but he had a great share of poetical and not a small one of critical power. Racan and Théophile were followed in the second quarter of the century by two schools which sufficiently well represented the tendencies of each. The first was that of Vincent Voiture (1598-1648), Isaac de Benserade (1612-91), and other poets such as Claude de Maleville (1597-1647), author of *La Belle Matineuse*, who were connected more or less with the famous literary coterie of the Hôtel de Rambouillet. Théophile was less worthily succeeded by a class, it can hardly be called a school, of poets, some of whom, like Gérard Saint-Amant (1594-1660), wrote drinking songs of merit and other light pieces; others, like Paul Scarron (1610-60) and Sarrasin (1603? 4? 5?-1654), devoted themselves rather to burlesque of serious verse. Most of the great dramatic authors of the time also wrote miscellaneous poetry, and there was even an epic school of the most singular kind, in ridiculing and discrediting which Boileau did undoubtedly good service. The *Pucelle* of Jean Chapelain (1595-1674), the unfortunate author who was deliberately trained and educated for a poet, who enjoyed for some time a sort of dictatorship in French literature on the strength of his forthcoming work, and at whom from the day of its publication every critic of French literature has agreed to laugh, was the most famous and perhaps the worst of these. But Georges de Scudéry (1601-67) wrote an *Alaric*, the Père le Moyne (1602-71) a *Saint Louis*, Jean Desmarets de Saint-Sorlin (1595-1676), a dramatist and critic of some note, a *Clovis*, and Saint-Amant a *Moïse*, which were not much better. The *Précieuses* of the Hôtel Rambouillet, with all their absurdities, encouraged if they did not produce good literary work. In their society there is no doubt that a great reformation of manners took place, if not of morals, and that the tendency to literature elegant and polished, yet not destitute of vigour, which marks the 17th century, was largely developed side by side with much scandal-mongering and anecdote. The *Guirlande de Julie*, in which most of the poets of the time celebrated Julie d'Angennes, daughter of the marquise de Rambouillet, is perhaps the best of all such albums, and Voiture, the typical poet of the coterie, was certainly the best writer of *vers de société* who is known to us. The poetical war which arose between the Uranistes, the followers of Voiture, and the Jobistes, those of Benserade, produced reams of sonnets, epigrams and similar verses. This habit of occasional versification long continued. It led as a less important consequence to the rhymed *Gazettes* of Jean Loret (d. 1665), which recount in octosyllabic verse of a light and lively kind the festivals and court events of the early years of Louis XIV. It led also to perhaps the most remarkable non-dramatic poetry of the century, the *Contes* and *Fables* of Jean de la Fontaine (1621-95). No French writer is better known than la Fontaine, and there is no need to dilate on his merits. It has been well said that he completes Molière, and that the two together give something to French literature which no other literature possesses. La Fontaine continues the tradition of the writers of *fabliaux*, in the language and with the manners of his own century.

All the writers we have mentioned belong more or less to the first half of the century, and so do Valentin Conrart (1603-75), Antoine Furetière (1626-88), Chapelain (Claude Emmanuel) l'Huillier (1626-86), and others not worth special mention. The latter half of the century is far less productive, and the poetical quality of its production is even lower than the quantity. In it Boileau (1636-1711) is the chief poetical figure. Next to him can only be mentioned Madame Deshoulières (1638-94), Guillaume de Brébeuf (1618-61), translator of Lucan, and Philippe Quinault (1635-88), the composer of opera libretti. Boileau's satire, where it has much merit, is usually borrowed direct from Horace. He had a certain faculty as a critic of the slashing order and might have profitably used it if he had written in prose. But of his poetry it must be said, not so much that it is bad, as that it is not, in strictness, poetry at all, and the same is generally true of all those who followed him. Yet his importance is enormous. He elaborated, in the clearest possible manner of expression, those ideals of classicism, which are the soul of his period, and on which lived much greater poets than himself. What he condemned has disappeared, and we reap the profit of his activities without always realizing the great necessity there was for them.

17th Century Drama.—We have already seen how the mediaeval theatre was formed, and how in the second half of the 16th century it met with a formidable rival in the classical drama of Jodelle and Garnier. In 1588 mysteries had been prohibited, and with the prohibition of the mysteries the Confraternity of the Passion lost the principal part of its reason for existence. The other bodies and societies of amateur actors had already perished, and at length the Hôtel de Bourgogne itself, the home of the confraternity, had been handed over to a regular troop of actors, while companies of strollers, whose life has been vividly depicted in the *Roman comique* of Scarron and the *Capitaine Fracasse* of Théophile Gautier, wandered all about the provinces. The old farce was for a time maintained or revived by Tabarin, a remarkable figure in dramatic history, of whom but little is known. The great dramatic author of the first quarter of the 17th century was Alexandre Hardy (1569-1631), who surpassed even Heywood in fecundity, and very nearly approached the portentous productivity of Lope de Vega. From Hardy to Rotrou is, in point of literary interest, a great step, and from Rotrou to Corneille a greater. Jean de Rotrou (1610-50) has been called the French Marlowe, and there is a curious likeness and yet a curious contrast between the two poets. The best parts of Rotrou's two best plays, *Venceslas* and *St. Genest*, are quite beyond comparison in respect of anything that preceded them, and the central speech of the last-named play will rank with anything in French dramatic poetry.

The fertility of France at this moment in dramatic authors was immense; nearly 100 are enumerated in the first quarter of the century. The early plays of Pierre Corneille (1606-84) showed all the faults of his contemporaries combined with merits to which none of them except Rotrou, and Rotrou himself only in part, could lay claim. His first play was *Mélite*, a comedy, and in *Citandre*, a tragedy, he soon produced what may perhaps be not inconveniently taken as the typical piece of the school of Hardy. A full account of Corneille may be found elsewhere. It is sufficient to say here that his importance in French literature is quite as great in the way of influence and example as in the way of intellectual excellence. The *Cid* and the *Menteur* are respectively the first examples of French tragedy and comedy which can be called modern.

Beginning with mere farces of the Italian type, and passing from these to comedies still of an Italian character, it was in *Les Précieuses ridicules*, acted in 1659, that Molière (1622-73), in the words of a spectator, hit at last on "la bonne comédie." The next 15 years comprise the whole of his best known work, the finest achievement of a certain class of comedy that any literature has produced. The tragic masterpieces of Racine (1639-99) were not far from coinciding with the comic masterpieces of Molière, for, with the exception of the remarkable aftergrowth of *Esther* and *Athalie*, they were produced chiefly between 1667 and 1677. Both Racine and Molière are writers who require separate mention.

The French Academy was founded unofficially by Conrart in 1629, received official standing six years later, and continued the tradition of Malherbe in attempting constantly to school and correct, as the phrase went, the somewhat disorderly instincts of the early French stage. Even the *Cid* was formally censured for irregularity by it.

Among the immediate successors and later contemporaries of the three great dramatists we do not find any who deserve high rank as tragedians, though there are some whose comedies are more than competent. It is at least significant that the restrictions imposed by the academic theory on the comic drama were far less severe than those which tragedy had to undergo. Only Thomas Corneille (1625-1709), the inheritor of an older tradition and of a great name, deserves to be excepted from the condemnation to be passed on the lesser tragedians of this period. He was unfortunate in possessing his brother's name, and in being, like him, too voluminous in his compositions; but *Camma*, *Ariane*, *Le Comte d'Essex*, are not tragedies to be despised. On the other hand, the names of Jean de Campistron (1656-1723) and Nicolas Pradon (1632-98) mainly serve to point injurious comparisons; Joseph François Duché (1668-1704) and Antoine La Fosse (1653-1708) are of still less importance, and Quinault's tragedies are chiefly remarkable because he had the good sense to give up writing them and to take to opera. The general excellence of French comedy, on the other hand, was sufficiently vindicated. Besides the splendid sum of Molière's work, the two great tragedians had each, in *Le Menteur* and *Les Plaideurs*, set a capital example to their successors, which was fairly followed. David Augustin de Brueys (1640-1723) and Jean Palaprat (1650-1721) brought out once more the ever new *Avocat Patelin* besides the capital *Grondeur*. Quinault and Campistron wrote fair comedies. Florent Carton Dancourt (1661-1726), Charles Rivière Dufresny (c. 1654-1724), Edmond Boursault (1638-1701), were all comic writers of considerable merit. But the chief comic dramatist of the latter period of the 17th century was Jean François Regnard (1655-1709), whose *Joueur* and *Légataire* are comedies almost of the first rank.

17th Century Fiction.—In the department of literature which comes between poetry and prose, that of romance-writing, the 17th century, excepting one remarkable development, was not very fertile. *Polexandre* and *Cléopâtre*, *Clélie* and the *Grand Cyrus*, have been too heavy for all the industry and energy of literary antiquarians. The nearest ancestry which can be found for them is the romances of the *Amadis* type. Everybody knows the *Carte de Tendre* which originally appeared in *Clélie*, while most people have heard of the shepherds and shepherdesses who figure in the *Astrée* of Honoré D'Urfé (1568-1625), on the borders of the Lignon; but here general knowledge ends, and there is perhaps no reason why it should go much further. It is sufficient to say that Madeleine de Scudéry (1607-1701) principally devotes herself in the books above mentioned to laborious gallantry and heroism, La Calprenède (1610-63) in *Cassandre* et *Cléopâtre* to something which might have been the historical novel if it had been constructed on a less preposterous scale, and Marin le Roy de Gomberville (1600-47) in *Polexandre* to moralizings.

The form which the prose tale took at this period was that of the fairy story. Perrault (1628-1703) and Madame d'Aulnoy (d. 1705) composed specimens of this kind which have never ceased to be popular since. Hamilton (1646-1720), the author of the well-known *Mémoires du comte de Gramont*, wrote similar stories of extraordinary merit in style and ingenuity. There is yet a third class of prose writing which deserves to be mentioned. It also may probably be traced to Spanish influence, to the picaresque romances which the 16th and 17th centuries produced in Spain in large numbers. The most remarkable example of this is the *Roman comique* of the burlesque writer Scarron. The *Roman bourgeois* of Antoine Furetière (1619-88) also deserves mention as a collection of pictures of the life of the time, arranged in the most desultory manner, but drawn with great vividness, observation and skill. A remarkable writer who had great influence on Molière has also to be mentioned in this connection rather than in any other. This is Cyrano de Bergerac (1619-55), who, besides com-

posing doubtful comedies and tragedies, writing political pamphlets, and exercising the task of literary criticism in objecting to Scarron's burlesques, produced in his *Histoires comiques des états et empires de la lune et du soleil*, half romantic and half satirical compositions.

One other work, and in literary influence perhaps the most remarkable of its kind in the century, remains. Madame de Lafayette, Marie de la Vergne (1634-92), the friend of La Rochefoucauld and of Madame de Sévigné, though she did not exactly anticipate the modern novel, showed the way to it in her stories, the principal of which are *Zaïde* and still more *La Princesse de Clèves*. The latter, though a long way from *Manon Lescaut*, *Clarissa*, or *Tom Jones*, is a longer way still from *Polexandre* or the *Arcadia*. The novel becomes in it no longer a more or less fictitious chronicle, but an attempt at least at the display of character. *La Princesse de Clèves* has never been one of the works widely popular out of their own country, nor perhaps does it deserve such popularity, for it has more grace than strength; but as an original effort in an important direction its historical value is considerable. But with this exception, the art of fictitious prose composition, except on a small scale, is certainly not one in which the century excelled, nor are any of the masterpieces which it produced to be ranked in this class.

17th Century Prose.—If, however, this was the case, it cannot be said that French prose as a whole was unproductive at this time. On the contrary, it was now, and only now, that it attained the strength and perfection for which it has been so long renowned, and which has perhaps, by a curious process of compensation, somewhat deteriorated since the restoration of poetry proper in France. The prose Malherbe of French literature was Jean Guez de Balzac (1594-1654). The writers of the 17th century had practically created the literary language of prose, but they had not created a prose style. The charm of Rabelais, of Amyot, of Montaigne, and of the numerous writers of tales and memoirs whom we have noticed, was a charm of exuberance, of naïveté, of picturesque effect—in short, of a mixture of poetry and prose, rather than of prose proper. Sixteenth-century French prose is a delightful instrument in the hands of men and women of genius, but in the hands of those who have not genius it is full of defects, and indeed is nearly unreadable. Now, prose is essentially an instrument of all work. The poet who has not genius had better not write at all; the prose writer often may and sometimes must dispense with this qualification. He has need, therefore, of a suitable machine to help him perform his task, and this machine it is the glory of Balzac to have done more than any other person to create. He himself produced no great work, his principal writings being letters, a few discourses and dissertations, and a work entitled *Le Socrate chrétien*, a sort of treatise on political theology. But if the matter of his work is not of the first importance, its manner is of a very different value. Instead of the endless diffuseness of the preceding century, its ill-formed or rather unformed sentences, and its haphazard periods, we find clauses, sentences and paragraphs distinctly planned, shaped and balanced, a cadence introduced which is rhythmical but not metrical, and, in short, prose which is written knowingly instead of the prose which is unwittingly talked. It has been well said of him that he "*écrit pour écrire*"; and such a man, it is evident, if he does nothing else, sets a valuable example to those who write because they have something to say. Voiture seconded Balzac without really intending to do so. His prose style, also chiefly contained in letters, is lighter than that of his contemporary, and helped to gain for French prose the tradition of vivacity and sparkle which it has always possessed, as well as that of correctness and grace.

17th Century History.—In historical composition, especially in the department of memoirs, this period was exceedingly rich. At last there was written, in French, an entire history of France. The author was François Eudes de Mézeray (1610-83), whose work, though not exhibiting the perfection of style at which some of his contemporaries had already arrived, and though still more or less uncritical, yet deserves the title of history. At the end of the period, comes the great ecclesiastical history of Claude Fleury (1640-1723), a work which perhaps belongs more to the section of

erudition than to that of history proper. Three small treatises, however, composed by different authors towards the middle of the century, supply remarkable instances of prose style in its application to history. These are the *Conjurations du comte de Fiesque*, written by the famous Cardinal de Retz (1613-79), the *Conspiration de Walstein* of Sarrasin, and the *Conjuración des Espagnols contre Venise*, composed in 1672 by the abbé de Saint-Réal (1639-92), the author of various historical and critical works deserving less notice. Both this and earlier times found chronicle in the singular *Historiettes* of Gédéon Tallemant des Réaux (1619-90), a collection of anecdotes, frequently scandalous, reaching from the times of Henri IV. to those of Louis XIV., to which may be joined the letters of Guy Patin (1602-76).

From this time memoirs and memoir writers were ever multiplying. The queen of them all is Madame de Sévigné (1626-96), on whom, as on most of the great and better-known writers whom we have had and shall have to mention, it is impossible here to dwell at length. The last half of the century produced crowds of similar but inferior writers. The memoirs of Roger de Bussy-Rabutin (1618-93) (author of a kind of scandalous chronicle called *Histoire amoureuse des Gaules*) and of Madame de Maintenon (1635-1719) perhaps deserve notice above the others. Memoir-writing became the occupation not so much of persons who made history, as was the case from Comines to Retz, as of those who, having culture, leisure and opportunity of observation, devoted themselves to the task of recording the deeds of others. The efforts of Balzac and the Academy supplied a suitable language and style, and the increasing tendency towards epigrammatic moralizing, which reached its acme in La Rochefoucauld (1663-80) and La Bruyère (1639-96), added in most cases point and attractiveness to their writings.

17th Century Philosophers and Theologians.—René Descartes (1596-1650) was at once a master of prose style, the greatest of French philosophers, and one of the greatest metaphysicians, not merely of France and of the 17th century, but of all countries and times. Even before Descartes there had been considerable and important developments of metaphysical speculation in France. The first eminent philosopher of French birth was Pierre Gassendi (1592-1655). Gassendi devoted himself to the maintenance of a modernized form of the Epicurean doctrines, but he wrote mainly, if not entirely, in Latin. Another sceptical philosopher of a less scientific character was the physicist Gabriel Naudé (1600-53), who, like many others of the philosophers of the time, was accused of atheism. But as none of these could approach Descartes in philosophical power and originality, so also none has even a fraction of his importance in the history of French literature. Descartes stands with Plato, and possibly Berkeley and Malebranche, at the head of all philosophers in respect of style; and in his case the excellence is far more remarkable than in others, inasmuch as he had absolutely no models, and was forced in a great degree to create the language which he used. The *Discours de la méthode* is not only one of the epoch-making books of philosophy, it is also one of the epoch-making books of French style. The tradition of his clear and perfect expression was taken up, not merely by his philosophical disciples, but also by Blaise Pascal (1623-62) and the school of Port Royal, who will be noticed presently. The very genius of the Cartesian philosophy was intimately connected with this clearness, distinctness and severity of style; and there is something more than a fanciful contrast between these literary characteristics of Descartes, on the one hand, and the elaborate splendour of Bacon, the knotty and crabbed strength of Hobbes, and the commonplace and almost vulgar slovenliness of Locke. Of the followers of Descartes, putting aside the Port Royalists, by far the most distinguished, both in philosophy and in literature, is Nicolas Malebranche (1638-1715). His *Recherche de la vérité*, admirable as it is for its subtlety and its consecutiveness of thought, is equally admirable for its elegance of style. Malebranche cannot indeed, like his great master, claim absolute originality. But his excellence as a writer is as great as, if not greater than, that of Descartes, and the *Recherche* remains to this day the one philosophical treatise of great length and abstruseness which, merely as a book, is delight-

ful to read.

Yet, for all this, philosophy hardly flourished in France. It was too intimately connected with theological and ecclesiastical questions, and especially with Jansenism, to escape suspicion and persecution. Descartes himself was for much of his life an exile in Holland and Sweden; and though the unquestionable orthodoxy of Malebranche, the strongly religious cast of his works, and the remoteness of the abstruse region in which he sojourned from that of the controversies of the day, protected him, other followers of Descartes were not so fortunate. Holland, indeed, became a kind of city of refuge for students of philosophy, though even in Holland itself they were by no means entirely safe from persecution. By far the most remarkable of French philosophical sojourners in the Netherlands was Pierre Bayle (1647-1706), a name not perhaps of the first rank in respect of literary value, but certainly of the first as regards literary influence. Bayle, after oscillating between the two confessions, nominally remained a Protestant in religion. In philosophy he in the same manner oscillated between Descartes and Gassendi, finally resting in an equally nominal Cartesianism. Bayle was, in fact, both in philosophy and in religion, merely a sceptic. His style is hardly to be called good, being diffuse and often inelegant. But his great dictionary, though one of the most heterogeneous and unmethodical of compositions, exercised an enormous influence. It may be called the Bible of the 18th century, and contains in the germ all the desultory philosophy, the ill-ordered scepticism, and the critical but negatively critical acuteness of the *Aufklärung*.

Jansenius himself, though a Dutchman by birth, passed much time in France, and it was in France that he found most disciples. These disciples consisted in the first place of the members of the society of Port Royal des Champs, a coterie after the fashion of the time, but one which devoted itself not to sonnets or madrigals but to devotional exercises, study and the teaching of youth. This coterie early adopted the Cartesian philosophy, and the Port Royal *Logic* was the most remarkable popular hand-book of that school. In theology they adopted Jansenism, and were in consequence soon at daggers drawn with the Jesuits, according to the polemical habits of the time. The most distinguished champions on the Jansenist side were Jean Duvergier de Hauranne, abbé de St. Cyran (1581-1643), and Antoine Arnauld (1560-1619), but by far the most important literary results of the quarrel were the famous *Provinciales* of Pascal, or, to give them their proper title, *Lettres écrites à un provincial*. Their literary importance consists, not merely in their grace of style, but in the application to serious discussion of the peculiarly polished and quiet irony of which Pascal is the greatest master the world has ever seen. Pascal set the example of combining the use of the most terribly effective weapons with good humour, good breeding and a polished style. The example was largely followed, and the manner of Voltaire and his followers in the 18th century owes at least as much to Pascal as their method and matter do to Bayle. The Jansenists, attacked and persecuted by the civil power, which the Jesuits had contrived to interest, were finally suppressed. But the *Provinciales* had given them an unapproachable superiority in matter of argument and literature. Their other literary works were inferior, though still remarkable. Antoine Arnauld (the younger, often called "the great") (1612-94) and Pierre Nicole (1625-95) managed their native language with vigour if not exactly with grace.

17th Century Preachers.—When we think of Gallican theology during the 17th century, it is always with the famous pulpit orators of the period that thought is most busied. Nor is this unjust, for though the most prominent of them all, Jacques Bénigne Bossuet (1627-1704) was remarkable as a writer of matter intended to be read, not merely as a speaker of matter intended to be heard, this double character is not possessed by most of the orthodox theologians of the time; and even Bossuet, great as is his genius, is more of a rhetorician than of a philosopher or a theologian. No country has ever been able to show a more magnificent concourse of orators, sacred or profane, than that formed by Bossuet, Fénelon (1651-1715), Esprit Fléchier (1632-1710), Jules Mascarón (1634-1703), Louis Bourdaloue (1632-1704), and Jean Baptiste Massillon (1663-1742), to whom may be justly

added the Protestant divines, Jean Claude (1619-87) and Jacques Saurin (1677-1730). The characteristics of all these were different. Bossuet, the earliest and certainly the greatest, was also the most universal. He was not merely a preacher; he was, as we have said, a controversialist, indeed somewhat too much of a controversialist, as his battle with Fénelon proved. He was a philosophical or at least a theological historian, and his *Discours sur l'histoire universelle* is equally remarkable from the point of view of theology, philosophy, history and literature. Turning to theological politics, he wrote his *Politique tirée de l'écriture sainte*, to theology proper his *Méditations sur les évangiles* and his *Elévations sur les mystères*. But his principal work, after all, is his *Oraisons funèbres*.

While Bossuet made himself chiefly remarkable in his sermons and in his writings by an almost Hebraic grandeur and rudeness, the more special characteristics of Christianity, largely alloyed with a Greek and Platonic spirit, displayed themselves in Fénelon. In pure literature he is not less remarkable than in theology, politics and morals. His practice in matters of style was admirable, as the universally known *Télémaque* sufficiently shows to those who know nothing else of his writing. But his taste, both in its correctness and its audacity, is perhaps more admirable still. Despite Malherbe, Balzac, Boileau and the traditions of nearly a century, he dared to speak favourably of Ronsard, and plainly expressed his opinion that the practice of his own contemporaries and predecessors had cramped and impoverished the French language quite as much as they had polished or purified it.

The two Protestant ministers whom we have mentioned, though inferior to their rivals, yet deserve honourable mention among the ecclesiastical writers of the period. Claude engaged in a controversy with Bossuet, in which victory is claimed for the invincible eagle of Meaux. Saurin, by far the greater preacher of the two, long continued to occupy, and indeed still occupies, in the libraries of French Protestants, the position given to Bossuet and Massillon on the other side.

17th Century Moralists.—The interests of many different classes of persons were concentrated upon moralizings, which took indeed very different forms in the hands of Pascal and other grave and serious thinkers of the Jansenist complexion in theology, and in those of literary courtiers as, for example, Saint-Evremond and La Rochefoucauld, whose chief object was to depict the motives and characters prominent in the brilliant and not altogether frivolous society in which they moved. Both classes, however, were more or less tempted by the cast of their thoughts and the genius of the language to adopt the tersest and most epigrammatic form of expression possible, and thus to originate the "*pensée*" in which, as its greatest later writer, Joubert, has said, "the ambition of the author is to put a book into a page, a page into a phrase, and a phrase into a word." The great genius and admirable style of Pascal are certainly better shown in his *Pensées* than in his *Lettres Provinciales*, which, though admirable, if not unequalled, in their particular genre, do not evoke the same depth of thought and power of expression.

There arose only a little later a very different group of moralists, whose writings have been as widely read, and who have had as great a practical and literary influence as perhaps any other class of authors. The earliest to be born and the last to die of these was Charles de Saint-Denis, seigneur de Saint-Evremond (1613-1703). Saint-Evremond was long known rather as a conversational wit, some of whose good things were handed about in manuscript, or surreptitiously printed in foreign lands, than as a writer, and this is still to a certain extent his reputation. He was at least as cynical as his still better known contemporary La Rochefoucauld, if not more so, and he had less intellectual force and less nobility of character. But his wit was very great, and he set the example of the brilliant societies of the next century.

In direct literary value, however, no comparison can be made between Saint-Evremond and the author of the *Sentences et maximes morales*. François, duc de La Rochefoucauld (1613-80), has other literary claims besides those of this famous book. His *Mémoires* were very favourably judged by his contemporaries, and they are still held to deserve no little praise even among the numerous and excellent works of the kind which that age of memoir-

writers produced. But while the *Mémoires* thus invite comparison, the *Maximes et sentences* stand alone. Even allowing that the mere publication of detached reflections in terse language was not absolutely new, it had never been carried, perhaps has never since been carried, to such a perfection. Beside La Rochefoucauld all other writers are diffuse, vacillating, unfinished, rough. Not only is there in him never a word too much, but there is never a word too little. The thought is always fully expressed, not compressed. Frequently as the metaphor of minting or stamping coin has been applied to the art of managing words, it has never been applied so appropriately as to the maxims of La Rochefoucauld. The form of them is almost beyond praise, and its excellencies, combined with their immense and enduring popularity, have had a very considerable share in influencing the character of subsequent French literature. Of hardly less importance in this respect, though of considerably less intellectual and literary individuality, was the translator of Theophrastus and the author of the *Caractères*, Jean de la Bruyère (1645-96), but though frequently epigrammatic, he did not aim at the same incredible terseness as the author of the *Maximes*.

17th Century Scholars.—The institution of the Academy led to various linguistic works. One of the earliest of these was the *Remarques* of the Savoyard Claude Favre de Vaugelas (1595-1650), afterwards re-edited by Thomas Corneille. Pellisson wrote a history of the Academy itself when it had as yet but a brief one. The famous *Examen du Cid* was an instance of the literary criticism of the time which was afterwards represented by René Rapin (1621-87), Dominique Bouhours (1628-1702) and René de Bossu (1631-80), while Adrien Baillet (1649-1706) has collected the largest thesaurus of the subject in his *Jugemens des savants*. Boileau set the example of treating such subjects in verse, and in the latter part of the century *Reflexions*, *Discours*, *Observations*, and the like, on particular styles, literary forms and authors, became exceedingly numerous. In earlier years France possessed a numerous band of classical scholars of the first rank, such as Scaliger and Casaubon, who did not lack followers.

The famous quarrel between the Ancients and the Moderns, of Italian origin, was mainly started in France by Charles Perrault (1628-1703), who thereby rendered much less service to literature than by his charming fairy tales. The opposite side was taken by Boileau, and the fight was afterwards revived by Antoine Houdar[d, t] de la Motte (1672-1731), a writer of little learning but much talent in various ways, and by the celebrated Madame Dacier, Anne Lefèvre (1654-1720). The discussion was conducted, as is well known, without very much knowledge or judgment among the disputants on the one side or on the other. But at this very time there were in France students and scholars of the most profound erudition. Fleury is only the last and the most popular of a race of omnivorous and untiring scholars, whose labours have ever since, until the modern fashion of first-hand investigations came in, furnished the bulk of historical and scholarly references and quotations. To this century belong le Nain de Tillemont (1637-98), whose enormous *Histoire des empereurs* and *Mémoires pour servir à l'histoire ecclésiastique* served Gibbon and a hundred others as quarry; Charles Dufresne, seigneur de Ducange (1614-88), whose well-known glossary was only one of numerous productions; Jean Mabillon (1632-1707), one of the most voluminous of the voluminous Benedictines; and Bernard de Montfaucon (1655-1741).

THE 18TH CENTURY

The beginning of the 18th century is among the dead seasons of French literature. Fénelon and Malebranche still survived, but they were emphatically men of the last age, as was Massillon, though he lived till nearly the middle of the century. The characteristic literary figures of the opening years of the period are d'Aguesseau, Fontenelle, Saint-Simon, personages in many ways interesting and remarkable, but purely transitional in their characteristics. Bernard le Bovier de Fontenelle (1657-1757) is, indeed, perhaps the most typical figure of the time. He was a dramatist, a moralist, a philosopher, physical and metaphysical, a critic, an historian, a poet and a satirist. The manner of his

works is always easy and graceful, and their matter rarely contemptible.

18th Century Poetry.—The dispiriting signs shown during the 17th century by French poetry proper received entire fulfilment in the following age. The two poets who were most prominent at the opening of the period were the abbé de Chaulieu (1639–1720) and the marquis de la Fare (1644–1712), poetical or rather versifying twins who are always quoted together. They were followed, however, by the one poet who succeeded in producing something resembling poetry in this artificial style, J. B. Rousseau (1671–1741). Rousseau, who in some respects was nothing so little as a religious poet, was nevertheless strongly influenced, as Marot had been, by the Psalms of David. His *Odes* and his *Cantates* are perhaps less destitute of that spirit than the work of any other poet of the century excepting André Chénier. Rousseau was also an extremely successful epigrammatist, having in this respect, too, resemblances to Marot.

The universal genius of Voltaire (1694–1778) showed itself in his poetical productions no less than in his other works, and it is perhaps not least remarkable in verse. It is impossible nowadays to regard the *Henriade* as anything but a highly successful prize poem, but the burlesque epic of *La Pucelle*, discreditable as it may be from the moral point of view, is remarkable enough as literature. The epistles and satires are among the best of their kind, the verse tales are in the same way admirable, and the epigrams, impromptus, and short miscellaneous poems generally are the *ne plus ultra* of verse which is not poetry. The Anglomania of the century extended into poetry, and the *Seasons* of Thomson set the example of a whole library of tedious descriptive verse, which in its turn revenged France upon England by producing or helping to produce English poems of the Darwin school.

André Chénier (1762–94) stands far apart from the art of his century, though the strong chain of custom, and his early death by the guillotine, prevented him from breaking finally through the restraints of its language and its versification. Chénier, half a Greek by blood, was wholly one in spirit and sentiment. The manner of his verses, the very air which surrounds them and which they diffuse, are different from those of the 18th century; and his poetry is probably the utmost that its language and versification could produce. To do more, the revolution which followed a generation after his death was required.

18th Century Drama.—The results of the cultivation of dramatic poetry at this time were even less individually remarkable than those of the attention paid to poetry proper. Here again the astonishing power and literary aptitude of Voltaire gave value to his attempts. There is no doubt that no work of Voltaire's comes up to *Polyeucte* and *Rodogune*, as certainly no single passage in any of his plays can approach the best passages of *Cinna* and *Les Horaces*. But the remaining tragic writers of the century, with the single exception of Crébillon *père*, are scarcely third-rate. C. Jolyot de Crébillon (1674–1762) himself had genius, and there are to be found in his work evidences of a spirit which had seemed to die away with *Saint-Genest*, and was hardly to revive until *Hernani*.

Very early in the century Alain René le Sage (1668–1747), in the admirable comedy of *Turcaret*, produced a work not unworthy to stand by the side of all but his master's best. Philippe Desfontaines (1680–1754) was also a fertile comedy writer in the early years of the century, and in *Le Glorieux* and *Le Philosophe marié* achieved considerable success. As the age went on, comedy, always apt to lay hold of passing events, devoted itself to the great struggle between the Philosophes and their opponents. Curiously enough, the party which engrossed almost all the wit of France had the worst of it in this dramatic portion of the contest, if in no other. The *Méchant* of Gresset and the *Métromanie* of Alexis Piron (1689–1773) were far superior to anything produced on the other side, and the *Philosophes* of Charles Palissot de Montenoy (1730–1814), though scurrilous and broadly farcical, had a great success. On the other hand, it was to a Philosophe that the invention of a new dramatic style was due, and still more the promulgation of certain ideas on dramatic criticism and construction, which, after being filtered through the German mind, were

to return to France and to exercise the most powerful influence on its dramatic productions. This was Denis Diderot (1713–84), the most fertile genius of the century, but also the least productive in finished and perfect work. His chief dramas, the *Fils naturel* and the *Père de famille*, are certainly not great successes; the shorter plays, *Est-il bon? est-il méchant?* and *La Pièce et le prologue*, are better. But it was his follower Michel Jean Sedaine (1719–97) who, in *Le Philosophe sans le savoir* and other pieces, produced the best examples of the bourgeois as opposed to the heroic drama. Diderot is sometimes credited or discredited with the invention of the *Comédie Larmoyante*, a title which indeed his own plays do not altogether refuse, but this special variety seems to be, in its invention, rather the property of Pierre Claude Nivelle de la Chaussée (1692–1754). The most original dramatist of the century is perhaps Pierre de Marivaux (1688–1763) whose *Jeu de l'Amour et du Hasard*, for delicacy of style and feeling, is one of the permanent masterpieces of the comic stage. He reaches at times to an astonishing modernity of tone and sensibility.

At the extreme limit of our present period there appears the remarkable figure of Pierre Caron de Beaumarchais (1732–99). The *Mariage de Figaro* and the *Barbier de Séville* are well known as having had attributed to them no mean place among the literary causes and forerunners of the Revolution. Their dramatic and literary value would itself have sufficed to obtain attention for them at any time, though there can be no doubt that their popularity was mainly due to their political appositeness. The most remarkable point about them, as about the school of comedy of which Congreve was the chief master in England at the beginning of the century, was the abuse and superfluity of wit in the dialogue, indiscriminately allotted to all characters alike.

18th Century Fiction.—Le Sage in his *Diable boiteux* and *Gil Blas* went to Spain not merely for his subject but also for his inspiration and manner, following the lead of the picaresque romance of Rojas and Scarron. Like Fielding, however, whom he much resembles, Le Sage mingled with the romance of incident the most careful attention to character and the most lively portrayal of it, while his style and language are such as to make his work one of the classics of French literature. The novel of character was really founded in France by the abbé Prévost d'Exilles (1697–1763), the author of *Cleveland* and of the incomparable *Manon Lescaut*. The popularity of this style was much helped by the immense vogue in France of the works of Richardson. Side by side with it, however, and for a time enjoying still greater popularity, there flourished a very different school of fiction, of which Voltaire, whose name occupies the first or all but the first place in every branch of literature of his time, was the most brilliant cultivator. This was a direct development of the earlier *conte*, and consisted usually of the treatment, in a humorous, satirical, and not always over-decent fashion, of contemporary foibles, beliefs, philosophies and occupations. These tales are of every rank of excellence and merit both literary and moral, and range from the astonishing wit, grace and humour of *Candide* and *Zadig* to the book which is Diderot's one hardly pardonable sin, and the similar but more lively efforts of Crébillon *fils* (1707–77).

A third class of 18th-century fiction consists of attempts to return to the humorous *fatrasie* of the 16th century, attempts which were as much influenced by Sterne as the sentimental novel was by Richardson. The *Homme aux quarante écus* of Voltaire has something of this character, but the most characteristic work of the style is the *Jacques le fataliste* of Diderot, which shows it nearly at its best.

The great vogue and success of *Télémaque* produced a certain number of didactic works, in which moral or historical information was sought to be conveyed under a more or less thin guise of fiction. Such was the *Voyage du jeune Anacharsis* of Jean Jacques Barthélemy (1716–95); such the *Numa Pompilius* and *Gonzalve de Cordoue* of Florian (1755–94), who also deserves notice as a writer of pastorals, fables and short prose tales; such the *Bélisaire* and *Les Incas* of Jean François Marmontel (1723–99). Between this class and that of the novel of sentiment may perhaps be placed *Paul et Virginie* and *La Chaumière indienne*; though Bernardin de Saint-Pierre (1737–1814) should more prop-

erly be noticed after Rousseau and as a moralist. Diderot's fiction-writing has already been referred to, but his *Religieuse* deserves citation here as a powerful specimen of the novel both of analysis and polemic; while his undoubted masterpiece, the *Neveu de Rameau*, though very difficult to class, comes under this head as well as under any other. There are, however, two of the novelists of this age, and of the most remarkable, who have yet to be noticed, and these are the author of *Marianne* and the author of *Julie*. We do not mention Pierre de Marivaux (1688-1763) in this connection as the equal of Jean Jacques Rousseau (1712-1778), but merely as being in his way almost equally original and equally remote from any suspicion of school influence. Gray's definition of happiness, "to lie on a sofa and read endless novels by Marivaux," is well known, and the production of mere pastime by means more or less harmless has since become so well-recognized a function of the novelist that Marivaux, as one of the earliest to discharge it, deserves notice. The name, however, of Jean Jacques Rousseau is of far different importance. His two great works, the *Nouvelle Héloïse* and *Émile*, are as far as possible from being perfect as novels. But no novels in the world have ever had such influence as these. To a great extent this influence was due mainly to their attractions as novels, imperfect though they may be in this character, but it was beyond dispute also owing to the doctrines which they contained, and which were exhibited in novel form. In the other works of Rousseau, especially in the *Confessions*, there is not merely shown passion as fervid though perhaps less unaffected than that of Mademoiselle de Lespinasse—there appear in them two literary characteristics which, if not entirely novel, were for the first time brought out deliberately by powers of the first order, being for the first time made the mainspring of literary interest, and thereby set an example which for more than a century has been persistently followed, and which has produced some of the finest results of modern literature. The first of these was the elaborate and unsparing analysis and display of the motives, the weaknesses and the failings of individual character. This process, which Rousseau unflinchingly performed on himself, has been followed usually in respect to fictitious characters by his successors. The other novelty was the feeling for natural beauty and the elaborate description of it, the credit of which latter must, it has been agreed by all impartial critics, be assigned rather to Rousseau than to any other writer. His influence in this direction was, however, soon taken up and continued by Bernardin de Saint-Pierre, the connecting link between Rousseau and Chateaubriand, some of whose works have been already alluded to. In particular the author of *Paul et Virginie* set himself to develop the example of description which Rousseau had set, and his word-paintings, though less powerful than those of his model, are more abundant, more elaborate, and animated by a more amiable spirit.

18th Century History, Memoirs and Letters.—The historical studies and results of 18th-century speculation in France are of especial and peculiar importance. There is no doubt that what is called the science of history dates from this time, and though the beginning of it is usually assigned to the Italian Vico, its complete indication may perhaps with equal or greater justice be claimed by the Frenchman Turgot. Before Turgot, however, there were great names in French historical writing, and perhaps the greatest of all is that of Charles Secondat de Montesquieu (1689-1755). The three principal works of this great writer are all historical and at the same time political in character. In the *Lettres persanes* he handled, with wit inferior to the wit of no other writer even in that witty age, the corruptions and dangers of contemporary morals and politics. The literary charm of this book is very great, and its plan was so popular as to lead to a thousand imitations, of which all, except those of Voltaire and Goldsmith, only bring out the immense superiority of the original. Few things could be more different from this lively and popular book than Montesquieu's next work, the *Grandeur et décadence des Romains*, in which the same acuteness and knowledge of human nature are united with considerable erudition, and with a weighty though perhaps somewhat grandiloquent and rhetorical style. His third and greatest work, the *Esprit des lois*, is again different both in

style and character, and such defects as it has are as nothing when compared with the merits of its fertility in ideas, its splendid breadth of view, and the felicity with which the author, in a manner unknown before, recognizes the laws underlying complicated assemblages of fact. The style of this great work is equal to its substance; less light than that of the *Lettres*, less rhetorical than that of the *Grandeur des Romains*, it is still a marvellous union of dignity and wit. Around Montesquieu, partly before and partly after him, is a group of philosophical or at least systematic historians, of whom the chief are Jean Baptiste Dubos (1670-1742), and G. Bonnot de Mably (1709-85).

Montesquieu was, as we have said, followed by Anne Robert Jacques Turgot (1727-81), whose writings are few in number, and not remarkable for style, but full of original thought. Turgot in his turn was followed by Condorcet (1743-94), whose tendency is somewhat more sociological than directly historical. Towards the end of the period, too, a considerable number of philosophical histories were written, the usual object of which was, under cover of a kind of allegory, to satirize and attack the existing institutions and government of France. The most famous of these was the *Histoire des Indes*, nominally written by the Abbé Guillaume Thomas François Raynal (1713-96), but really the joint work of many members of the Philosophe party, especially Diderot. Side by side with this really or nominally philosophical school of history there existed another and less ambitious school, which contented itself with the older and simpler view of the science. The Abbé René de Vertot (1655-1735) belongs almost as much to the 17th as to the 18th century. In the same class, too, far superior as is his literary power, must be ranked the historical works of Voltaire, *Charles XII.*, *Pierre le Grand*, *Histoire du Siècle de Louis XIV.*

The century opened with the memoirs of the duc de Saint-Simon (1675-1755), an extraordinary series of pictures of the court of Louis XIV. and the Regency, written in a powerful style, with something of the irregular excellence of the great 16th-century writers, and most striking in the sombre bitterness of its tone. The subsequent and less remarkable memoirs of the century are so numerous that it is almost impossible to select a few for reference, and altogether impossible to mention all. Of those bearing on public history the memoirs of Madame de Staël (Mlle. Delaunay) (1684-1750), of Pierre Louis de Voyer, marquis d'Argenson (1694-1757), of Charles Pinot Duclos (1704-72), of Stephanie Félicité de Saint-Aubin, Madame de Genlis (1746-1830), of Pierre Victor de Bénéval (1722-91), of Madame Campan (1752-1822) and of the cardinal de Bernis (1715-94), may perhaps be selected for mention; of those bearing on literary and private history, the memoirs of Madame d'Épinay (1726-83), those of Mathieu Marais (1664-1737), the so-called *Mémoires secrets* of Louis Petit de Bachaumont (1690-1770), and the innumerable writings having reference to Voltaire and to the Philosophe party generally. Here, too, may be mentioned a remarkable class of literature, consisting of purely private and almost confidential letters, which were written at this time with very remarkable literary excellence. As specimens may be selected those of Mademoiselle Aissé (1694-1757), which are models of easy and unaffected tenderness, and those of Mademoiselle de Lespinasse (1732-76) the companion of Madame du Deffand and afterwards of d'Alembert. These latter, in their extraordinary fervour and passion, not merely contrast strongly with the generally languid and frivolous gallantry of the age, but also constitute one of its most remarkable literary monuments. It has been said of them that they "burn the paper," and the expression is not exaggerated. Madame du Deffand's (1697-1780) own letters, many of which were written to Horace Walpole, are noteworthy in a very different way. Of lighter letters the charming correspondence of Diderot with Mademoiselle Voland deserves special mention.

18th Century Philosophy.—The Philosophes, as a general rule, have but little claim to their title. There were some who manifested, however, an aptitude for purely philosophical argument, and one who confined himself strictly thereto. Among these the most remarkable are Julien Offroy de la Mettrie (1709-51)

and Denis Diderot. La Mettrie in his works *L'Homme machine*, *L'Homme plante*, etc., applied a lively and vigorous imagination, a considerable familiarity with physics and medicine, and a brilliant but unequal style, to the task of advocating materialistic ideas on the constitution of man. Diderot, in a series of early works, *Lettre sur les aveugles*, *Promenade d'un sceptique*, *Pensées philosophiques*, etc., exhibited a good acquaintance with philosophical history and opinion, and gave sign in this direction, as in so many others, of a far-reaching intellect. But the French metaphysician of the century is undoubtedly Étienne Bonnot, abbé de Condillac (1714-80), almost the only writer of the time in France who succeeded in keeping strictly to philosophy without attempting to pursue his system to its results in ethics, politics and theology. In the *Traité des sensations*, the *Essai sur l'origine des connaissances humaines* and other works Condillac elaborated and continued the imperfect sensationalism of Locke.

It has never been at all accurately decided how far what may be called the scoffing school of Voltaire represents a direct revolt against Christianity, and how far it was merely a kind of guerilla warfare against the clergy. It is positively certain that Voltaire was not an atheist, and that he did not approve of atheism. But his *Dictionnaire philosophique*, which is typical of a vast amount of contemporary and subsequent literature, consists of a heterogeneous assemblage of articles directed against various points of dogma and ritual and various characteristics of the sacred records. From the literary point of view, it is one of the most characteristic of all Voltaire's works, though it is perhaps not entirely his. The desultory arrangement, the light and lively style, the extensive but not always too accurate erudition, and the somewhat captious and quibbling objections, are intensely Voltairian. But there is little seriousness about it, and certainly no kind of rancorous or deep-seated hostility. With many, however, of Voltaire's pupils and younger contemporaries, the case was altered. They were distinctively atheists and anti-super-naturalists. The atheism of Diderot, unquestionably the greatest of them all, has been keenly debated; but in the case of Étienne Damilaville (1723-68), Jacques André Naigeon (1738-1810), Paul Henri Dietrich, baron d'Holbach, and others there is no room for doubt. By these persons a great mass of atheistic and anti-Christian literature was composed and set afloat. The characteristic work of this school, its last word indeed, is the famous *Système de la nature*, attributed to Holbach (1723-89), but known to be, in part at least, the work of Diderot. In this remarkable work, which caps the climax of the metaphysical materialism or rather nihilism of the century, the atheistic position is clearly stated.

As the Revolution approached, and the victory of the Philosophie party was declared, there appeared for a brief space a group of cynical and accomplished phrase-makers presenting some similarity to that of which, 100 years before, Saint-Evremond was the most prominent figure. The chief of this group were Nicolas Chamfort (1747-94) on the republican side, and Antoine Rivarol (1753-1801) on that of the royalists. Like the older writer to whom we have compared them, neither can be said to have produced any one work of eminence, and in this they stand distinguished from moralists like La Rochefoucauld. The floating sayings, however, which are attributed to them, or which occur here and there in their miscellaneous work, yield in no respect to those of the most famous of their predecessors in wit and a certain kind of wisdom, though they are frequently more personal than aphoristic.

18th Century Moralists and Politicians.—Not the least part, however, of the energy of the period in thought and writing was devoted to questions of a directly moral and political kind. With regard to morality proper the favourite doctrine of the century was what is commonly called the selfish theory, the only one indeed which was suitable to the sensationalism of Condillac and the materialism of Holbach. The pattern book of this doctrine was the *De l'Esprit* of Claude Adrien Helvétius (1715-71), the most amusing book perhaps which ever pretended to the title of a solemn philosophical treatise. There is some analogy between the principles of this work and those of the *Système de la nature*.

Luc de Clapiers, marquis de Vauvenargues (1715-47) has produced maxims and reflections of considerable mental force and literary finish. From Voltaire downwards it has been usual to compare him with Pascal, from whom he is chiefly distinguished by a striking but somewhat empty stoicism. Between the moralists and the politicians may be placed Rousseau, who in his novels and miscellaneous works is of the first class, in his famous *Contrat social* of the second. All his theories, whatever their originality and whatever their value, were made novel and influential by the force of their statement and the literary beauties of their form.

Political economy and administrative theories received much attention. The earliest writer of eminence on these subjects was the great engineer Sébastien le Prestre, marquis de Vauban (1633-1707), whose *Oisivetés* and *Dime royale* exhibit both great ability and extensive observation. A more utopian economist of the same time was Charles Irénée Castel, abbé de Saint-Pierre (1658-1743), not to be confounded with the author of *Paul et Virginie*. Soon political economy in the hands of François Quesnay (1694-1774) took a regular form, and towards the middle of the century a great number of works on questions connected with it, especially that of free trade in corn, on which Ferdinand Galiani (1728-87), André Morellet (1727-1819), both abbés, and above all Turgot, distinguished themselves.

18th Century Criticism and Periodical Literature.—Literary criticism assumes in this century a sufficient importance to be treated under a separate heading. Contributions were made to it of many different kinds and from many different points of view. Periodical literature, the chief stimulus to its production, began more and more to come into favour. Even in the 17th century the *Journal des savants*, the Jesuit *Journal de Trévoux*, and other publications had set the example of different kinds of it. Just before the Revolution the *Gazette de France* was in the hands of J. B. A. Suard (1734-1817), a man who was nothing if not a literary critic. Perhaps, however, the most remarkable contribution of the century to criticism of the periodical kind was the *Feuilles de Grimm*, a circular sent for many years to the German courts by Frédéric Melchior Grimm (1723-1807), the comrade of Diderot and Rousseau, and containing a *compte rendu* of the ways and works of Paris, literary and artistic as well as social.

The most characteristic critic of the mid-century was the abbé Charles Batteux (1713-80) who illustrated a tendency of the time by beginning with a treatise on *Les Beaux Arts réduits à un même principe* (1746); reduced it and others into *Principes de la littérature* (1764), and added in 1771 *Les Quatres Poétiques* (Aristotle, Horace, Vida and Boileau). Batteux is a very ingenious critic and his attempt to conciliate "taste" and "the rules," though inadequate, is interesting. Works on the arts in general or on special divisions of them were not wanting, as, for instance, that of Dubos, the *Essai sur la peinture* of Diderot and others. Critically annotated editions of the great French writers also came into fashion. Of these Voltaire's edition of Corneille was the most remarkable, and his annotations, united separately under the title of *Commentaire sur Corneille*, form not the least important portion of his works. The method of much of the literary criticism of the close of this period was indeed deplorable enough. Jean François de la Harpe (1739-1803), who though a little later in time as to most of his critical productions is perhaps the most representative figure, shows criticism in one of its worst forms. La Harpe lays it down distinctly that a beauty, however beautiful, produced in spite of rules is a "monstrous beauty" and cannot be allowed.

18th Century Savants.—In science and general erudition the 18th century in France was at first much occupied with the mathematical studies for which the French genius is so peculiarly adapted, which the great discoveries of Descartes had made possible and popular, and which those of his supplanter Newton only made more popular still. Voltaire took to himself the credit, which he fairly deserves, of first introducing the Newtonian system into France, and it was soon widely popular—even ladies devoting themselves to the exposition of mathematical subjects, as in the case of Gabrielle de Breteuil, marquise du Châtelet (1706-49) Voltaire's "divine Emilie." Indeed ladies played a great part in

the literary and scientific activity of the century, by actual contribution sometimes, but still more by continuing and extending the tradition of "salons." The duchesse du Maine, Mesdames de Lambert, de Tencin, Geoffrin, du Deffand, Necker, and above all, the baronne d'Holbach (whose husband, however, was here the principal personage) presided over coteries which became more and more "philosophical." Many of the greatest mathematicians of the age, such as de Moivre and Laplace, were French by birth, while others like Euler belonged to French-speaking races, and wrote in French. The physical sciences were also ardently cultivated, the impulse to them being given partly by the generally materialistic tendency of the age, partly by the Newtonian system, and partly also by the extended knowledge of the world provided by the circumnavigatory voyage of Louis Antoine de Bougainville (1729-1811), and other travels. P. L. de Moreau Maupertuis (1698-1759) and C. M. de la Condamine (1701-74) made long journeys for scientific purposes and duly recorded their experiences. Jean le Rond, called d'Alembert (1717-83), a great mathematician and a writer of considerable though rather academic excellence, is principally known from his connection with and introduction to the *Encyclopédie*, of which more presently. Chemistry was also assiduously cultivated, the baron d'Holbach, among others, being a devotee thereof, and helping to advance the science to the point where, at the conclusion of the century, it was illustrated by Berthollet and Lavoisier. During all this devotion to science in its modern acceptation, the older and more literary forms of erudition were not neglected, especially by the illustrious Benedictines of the abbey of St. Maur. Dom Augustin Calmet (1672-1757) the author of the well-known *Dictionary of the Bible*, belonged to this order, and to them also (in particular to Dom Rivet) was due the beginning of the immense *Histoire littéraire de la France*, a work interrupted by the Revolution and long suspended, but diligently continued since the middle of the 19th century. The immense *Natural History* of Georges Louis Leclerc, comte de Buffon (1717-88), though not entirely his own, is a remarkable monument of the union of scientific tastes with literary ability. As has happened in many similar instances, there is in parts more literature than science to be found in it, yet many fruitful scientific ideas and theories are here propounded for the first time.

The *Encyclopédie*, unquestionably on the whole the most important French literary production of the century, if we except the works of Rousseau and Voltaire, was conducted for a time by Diderot and d'Alembert, afterwards by Diderot alone. It numbered among its contributors almost every Frenchman of eminence in letters. It had, besides a considerable theological and political influence, an immense share in diffusing and gratifying the taste for general information.

1789-1830—General Sketch.—The period which elapsed between the outbreak of the Revolution and the accession of Charles X. has often been considered a sterile one in point of literature. Casimir Delavigne (1793-1843), the author of *Les Messénienes*, is a writer of very great talent, and, according to the measure of J. B. Rousseau and Lebrun, no mean poet. It is usual to reckon Delavigne as transitional between the classical and romantic schools, but in strictness he must be counted with the classicists. Dramatic poetry exhibited somewhat similar characteristics. Jean François Ducis (1733-1816), who passes with Englishmen as a feeble reducer of Shakespeare to classical rules, passed with his contemporaries as an introducer into French poetry of strange and revolutionary novelties. Comedy, on the other hand, fared better, as indeed it had always fared. Fabre d'Eglantine (1755-94) the companion in death of Danton, Collin d'Harleville (1755-1806), François G. J. S. Andrieux (1759-1833), Picard, Alexandre Duval, and Népomucène Lemercier (1771-1840) (the most vigorous of all as a poet and a critic of mark) were the comic authors of the period. Perhaps the most remarkable work in point of originality of the time was Xavier de Maistre's (1763-1852) *Voyage autour de ma chambre*, an attempt in quite a new style, which has been happily followed up by other writers.

The chief philosophical writers were Pierre Paul Royer Collard (1763-1845), F. P. G. Maine de Biran (1776-1824), and Théodore

Simon Jouffroy (1796-1842). Their influence on literature, however, was altogether inferior to that of the reactionist school, of whom Louis Gabriel, vicomte de Bonald (1754-1840), and Joseph de Maistre (1753-1821) were the great leaders. As Bonald is royalist and aristocratic, so Maistre is the advocate of a theocracy pure and simple, with the pope for its earthly head, and a vigorous despotism for its system of government. Joseph Joubert (1754-1824) is the most illustrious successor of Pascal and Vauvenargues, and to be ranked perhaps above both in the literary finish of his maxims, and certainly above Vauvenargues in the breadth and depth of thought which they exhibit. In pure literary criticism more particularly, Joubert, though exhibiting some inconsistencies due to his time, is astonishingly penetrating and suggestive. Etienne Pivert de Sénancourt (1770-1846), with *Obermann* (1804), had an extraordinary influence on his own and the next generation in the direction of melancholy moralizing.

We have already alluded to some of the beginnings of periodical and journalistic letters in France. For some time, in the hands of Bayle, Basnage, Des Maizeaux, Jurieu, Leclerc, periodical literature consisted mainly of a series, more or less disconnected, of pamphlets, with occasional extracts from forthcoming works, critical *adversaria* and the like. Of a more regular kind were the often-mentioned *Journal de Trévoux* and *Mercur de France*, and later the *Année littéraire* of Fréron and the like. The *Correspondance* of Grimm also, as we have pointed out, bore considerable resemblance to a modern monthly review, though it was addressed to a very few persons. Of political news there was, under a despotism, naturally very little. 1789, however, saw a vast change in this respect. An enormous efflorescence of periodical literature at once took place, and a few of the numerous journals founded in that year or soon afterwards survived for a considerable time. A whole class of authors arose who pretended to be nothing more than journalists, while many writers distinguished for more solid contributions to literature took part in the movement, and not a few active politicians contributed. Thus to the original staff of the *Moniteur*, or, as it was at first called, *La Gazette Nationale*, La Harpe, Lacretelle, Andrieux, Dominique Joseph Garat (1749-1833) and Pierre Ginguéné (1748-1826) were attached. Among the writers of the *Journal de Paris* André Chénier had been ranked. Fontanes contributed to many royalist and moderate journals. Guizot and Morellet, representatives respectively of the 19th and the 18th century, shared in the *Nouvelles Politiques*, while Bertin, Fievée and J. L. Geoffroy (1743-1814), a critic of peculiar acerbity, contributed to the *Journal de l'empire*, afterwards turned into the still existing *Journal des débats*. With Geoffroy, François Benoît Hoffman (1760-1828), Jean F. J. Dussault (1769-1824) and Charles F. Dorimond, abbé de Féletz (1765-1850), constituted a quartet of critics sometimes spoken of as "the *Débats* four," though they were by no means all friends. Of active politicians Marat (*L'Ami du peuple*), Mirabeau (*Courrier de Provence*), Barère (*Journal des débats et des décrets*), Brissot (*Patriote français*), Hébert (*Père Duchesne*), Robespierre (*Défenseur de la constitution*), and Tallien (*La Sentinelle*) were the most remarkable who had an intimate connection with journalism. On the other hand, the type of the journalist pure and simple is Camille Desmoulins (1759-94), one of the most brilliant, from a literary point of view, of the short-lived celebrities of the time. Of the same class were Pelletier, Durozoir, Loustalot, Royou. As the immediate daily interest in politics drooped, there were formed periodicals of a partly political and partly literary character. Such had been the *décade philosophique*, which counted Cabanis Chénier, and De Tracy among its contributors, and this was followed by the *Revue française* at a later period, which was in its turn succeeded by the *Revue des deux mondes*. On the other hand, parliamentary eloquence was even more important than journalism during the early period of the Revolution. Mirabeau naturally stands at the head of orators of this class, and next to him may be ranked the well-known names of Malouet and Meunier among constitutionalists; of Robespierre, Marat and Danton, the triumvirs of the Mountain; of Maury, Cazalès and the vicomte de Mirabeau, among the royalists; and above all of the Girondist speakers Barnave, Vergniaud and Lan-

juinai. The last named survived to take part in the revival of parliamentary discussion after the Restoration. But the permanent contributions to French literature of this period of voluminous eloquence are, as frequently happens in such cases, by no means large. The union of the journalist and the parliamentary spirit produced, however, in Paul Louis Courier a master of style. Courier spent the greater part of his life, tragically cut short, in translating the classics and studying the older writers of France, in which study he learnt thoroughly to despise the pseudo-classicism of the 18th century. It was not till he was past 40 that he took to political writing, and the style of his pamphlets, and their wonderful irony and vigour, at once placed them on the level of the very best things of the kind. Along with Courier should be mentioned Benjamin Constant (1767-1830), who, though partly a romance writer and partly a philosophical author, was mainly a politician and an orator, besides being fertile in articles and pamphlets.

Madame de Staël (1766-1817) on the other hand, as became a daughter of Necker, retained a great deal of the Philosophe character and the traditions of the 18th century, especially its liberalism, its *sensibilité*, and its thirst for general information; to which, however, she added a cosmopolitan spirit, and a readiness to introduce into France the literary and social, as well as the political and philosophical, peculiarities of other countries. Her early writings were of the critical kind, half aesthetic, half ethical, of which the 18th century had been fond, and which their titles, *Lettres sur J. J. Rousseau, De l'influence des passions, De la littérature considérée dans ses rapports avec les institutions sociales*, sufficiently show. Her romances, *Delphine* and *Corinne*, had immense literary influence at the time. Still more was this the case with *De l'Allemagne*, which practically opened up to the rising generation in France the till then unknown treasures of literature and philosophy, which during the most glorious half century of her literary history Germany had, sometimes on hints taken from France herself, been accumulating. The literary importance of Chateaubriand (1768-1848) is far greater, while his literary influence can hardly be exaggerated. Chateaubriand's literary father was Rousseau, and his voyage to America helped to develop the seeds which Rousseau had sown. In *René* and other works of the same kind, the naturalism of Rousseau received a still further development. But it was not in mere naturalism that Chateaubriand was to find his most fertile and most successful theme. It was, on the contrary, in the rehabilitation of Christianity as an inspiring force in literature. This theme he develops with the most splendid language, and with every conceivable advantage of style, in the *Génie du Christianisme* and the *Martyrs*. The splendour of imagination, the summonings of history and literature to supply effective and touching illustrations, analogies and incidents, the rich colouring so different from the peculiarly monotonous and grey tones of the masters of the 18th century, and the fervid admiration for nature which were Chateaubriand's main attractions and characteristics, could not fail to have an enormous literary influence.

THE 19TH CENTURY

The literary work of the 19th century and of the great Romantic movement which began in its second quarter was to repeat on a far larger scale the work of the 16th, to break up and discard such literary forms as had become useless or hopelessly stiff, to give strength, suppleness and variety to such as were retained, to invent new ones where necessary, to enrich the language by importations, inventions and revivals, and, above all, to bring into prominence the principle of individualism. Authors and even books, rather than groups and kinds, demand principal attention.

The result of this revolution is naturally most remarkable in the *belles-lettres* and the kindred department of history. Poetry, not dramatic, was revived; prose romance and literary criticism were brought to a perfection previously unknown; and history produced works more various and more remarkable than at any previous stage of the language.

At the accession of Charles X. France possessed three writers,

and perhaps only three, of already remarkable eminence, if we except Chateaubriand, who was already of a past generation. These three were Pierre Jean de Béranger (1780-1857), Alphonse de Lamartine (1790-1869), and Hugues Félicité Robert Lamennais (1782-1854). The first belongs definitely in manner, despite his striking originality of *nuance*, to the past. He has remnants of the old periphrases, the cumbrous mythological allusions, the poetical "properties" of French verse. His astonishing popularity makes it necessary to mention him, but very little of value remains of his work. Béranger's talent was still too much a matter of individual genius to have great literary influence, and he formed no school. It was different with Lamartine, who was, nevertheless like Béranger, a typical Frenchman. The *Méditations* and the *Harmonies* exhibit a remarkable transition between the old school and the new. In going direct to nature, in borrowing from her striking outlines, vivid and contrasted tints, harmony and variety of sound, the new poet showed himself an innovator of the first class. In using romantic and religious associations, and expressing them in affecting language, he was the Chateaubriand of verse. But with all this he retained some of the vices of the classical school. His versification, harmonious as it is, is monotonous, and he does not venture into the bold lyrical forms which true poets love. He has still the horror of the *mot propre*; he is always spiritualizing and idealizing, and his style and thought have a double portion of the feminine and almost flaccid softness which had come to pass for grace in French. The last of the three, Lamennais, represents an altogether bolder and rougher genius. Strongly influenced by the Catholic reaction, Lamennais shows the strongest possible influence of the revolutionary spirit. His earliest work, the *Essai sur l'indifférence en matière de religion* (1817 and 1818) was a defence of the church on curious uneclesiastical lines. It was written in an ardent style, full of illustrations, and extremely ambitious in character.

In Lamennais's prose, especially as afterwards developed in the apocalyptic *Paroles d'un croyant* (1839), are to be discerned many of the tendencies of the Romantic school, particularly the hardy and picturesque choice of language, and the disdain of established and accepted methods which it professed. The signs of the revolution itself were, as was natural, first given in periodical literature. The feudalist affectations of Chateaubriand and the legitimists excited a sort of aesthetic affection for Gothic and Walter Scott became one of the favourite authors in France. Soon was started the periodical *La Muse française*, in which the names of Hugo, Vigny, Deschamps and Madame de Girardin appear. Almost all the writers in this periodical were eager royalists, and for some time the battle was still fought on political grounds. There could, however, be no special connection between classical drama and liberalism; and the liberal journal, the *Globe*, with no less a person than Sainte-Beuve among its contributors, declared definite war against classicism in the drama. The chief "classical" organs were the *Constitutionnel*, the *Journal des débats*, and after a time and not exclusively, the *Revue des deux mondes*. Soon the question became purely literary, and the Romantic school proper was born in the famous *cénacle* or clique in which Hugo was chief poet, Sainte-Beuve chief critic, and Gautier, Charles de Nerval, the brothers Émile (1791-1871) and Alfred (1800-69) Deschamps, Petrus Borel (1809-59) and others were officers. Alfred de Vigny and Alfred de Musset stand somewhat apart, and so does Charles Nodier (1780-1844), a versatile voluminous writer, the very variety and number of whose works have somewhat prevented the individual excellence of any of them from having justice done to it. The objects of the school were, briefly stated, the burning of everything which had been adored, and the adoring of everything which had been but despised. They would have no unities, no arbitrary selection of subjects, no restraints on variety of versification, no academically limited vocabulary, no considerations of artificial beauty, and, above all, no periphrastic expression. The *mot propre*, the calling of a spade a spade, was the great commandment of Romanticism; but it must be allowed that what was taken away in periphrase was made up in adjectives. The representation of *Hernani* in 1830 was the culmination of the struggle, and during a great part of the reign

Louis Philippe almost all the younger men of letters in France were Romantics. The representation of the *Lucrece* of François Ponsard (1814-67) in 1843 is often quoted as the herald or sign of a classical reaction.

Romantic Drama and Poetry.—Although the immediate subject on which the battles of Classics and Romantics arose was dramatic poetry, the dramatic results of the movement have not been those of greatest value or most permanent character. The principal effect in the long run has been the introduction of a species of play called *drame*, as opposed to regular comedy and tragedy, admitting of much freer treatment than either of these two as previously understood in French, and lending itself in some measure to the lengthy and disjointed action, the multiplicity of personages, and the absence of stock characters which characterized the English stage in its palmy days. All Victor Hugo's dramatic works are of this class, and each, as it was produced or published (*Cromwell*, *Hernani*, *Marion de l'Orme*, *Le Roi s'amuse*, *Lucrece Borgia*, *Marie Tudor*, *Ruy Blas* and *Les Burgraves*), was a literary event, and excited the most violent discussion—the author's usual plan being to prefix a prose preface of a very militant character to his work. A still more melodramatic variety of *drame* was that chiefly represented by Alexandre Dumas (1802-70), whose *Henri III.* and *Antony*, to which may be added later *La Tour de Nesle* and *Mademoiselle de Belle-Isle*, were almost as much rallying points for the early Romantics as the dramas of Hugo, despite their inferior literary value. Alfred de Vigny's *Chatterton* is perhaps the best single drama produced by the Romantic movement. A special variety of drama of the first literary importance was also cultivated under the title of *scènes* or *proverbes*, slight dramatic sketches in which the dialogue and style are of even more importance than the action. The best of all of these are those of Alfred de Musset (1810-57), whose *Il faut qu'une porte soit ouverte ou fermée*, *On ne badine pas avec l'amour*, etc., are models of grace and wit.

In poetry proper, as in drama, Victor Hugo showed the way. In him all the Romantic characteristics were expressed and embodied—disregard of arbitrary critical rules, free choice of subject, variety and vigour of metre, splendour and sonorosity of diction, abundant "local colour," and that irrepressible individualism which is one of the chief, though not perhaps the chief, of the symptoms. A deficient sense of the ludicrous which characterized many of the Romantics was strongly apparent in their leader, as was also an equally representative grandiosity, and a fondness for the introduction of foreign and unfamiliar words, especially proper names, which occasionally produces an effect of burlesque. Victor Hugo's earliest poetical works, his chiefly royalist and political *Odes*, were cast in the older and accepted forms, but already displayed astonishing poetical qualities. But it was in the *Balades* (e.g., the splendid *Pas d'armes du roi Jean*, written in verses of three syllables) and the *Orientales* (of which may be taken for a sample the sixth section of *Navarin*, a perfect torrent of outlandish terms poured forth in the most admirable verse, or *Les Djinns*, where some of the stanzas have lines of two syllables each) that the grand provocation was thrown to the believers in alexandrines, careful caesuras and strictly separated couplets. *Les Feuilles d'automne*, *Les Chants du crépuscule*, *Les Voix intérieures*, *Les Rayons et les ombres*, the productions of the next 20 years, were quieter in style and tone, but no less full of poetical spirit. The Revolution of 1848, the establishment of the empire and the poet's exile brought about a fresh concentration of his genius on lyrical subjects. *Les Châtiments* and *La Légende des siècles*, the one political, the other historical, reach perhaps the high-water mark of French verse; and they were accompanied by the philosophical poems *Dieu*, *La Fin de Satan*, and by *Les Contemplations*, and followed by the lighter *Chansons des rues et des bois*, the *Année terrible*, the second *Légende des siècles*, etc. The literary productiveness of Victor Hugo himself has been the measure and sample of the whole literary productiveness of France on the poetical side. At 25 he was acknowledged as a master, at 75 he was a master still. He is the one single universal literary genius whom France can recognize as her representative, and to be set in world literature on the level of Dante, Cervantes, Shakespeare

and Goethe. In the later part of his work, in such poems as *Dieu* and *La Fin de Satan* he takes his place among the religious prophets of mankind.

Hugo's poetical influence has been represented in different schools, from which very few of the poetical writers of the century can be excluded. Alfred de Musset, a writer of great talent, felt part of the Romantic inspiration very strongly, but was on the whole unfortunately influenced by Byron, and partly out of wilfulness, partly from a natural want of persevering industry and vigour, allowed himself to be careless and even slovenly in composition. Notwithstanding this, some of his lyrics are among the finest poems in the language, and his verse, careless as it is, has extraordinary natural grace. Auguste Barbier (1805-82) whose *Iambes* shows an extraordinary command of nervous and masculine versification, also comes in here. Alfred de Vigny (1799-1865) is a great poet of little bulk and somewhat overfastidious, but possessing one of the strongest styles to be found in French with a curious restrained passion and a complicated originality, rising to the greater heights of philosophical poetry. Madame Ackermann (1813-90) is the philosophical poetess of the Romantic period; but for actual poetical powers, Marceline Desbordes-Valmore (1786-1859) perhaps excelled her, though in a looser and more sentimental fashion. Théophile Gautier (1811-72) is one of the best poets in point of form that France has produced. The *Comédie de la mort*, the *Poésies diverses*, and still more the *Emaux et camées*, display a distinctly classical tendency—classical, that is to say, not in the party and perverted sense, but in its true acceptance. The tendency to the fantastic and horrible may be taken as best shown by Petrus Borel (1809-59), a writer of singular power almost entirely wasted. Gerard Labrunie or de Nerval (1808-55) adopted a manner also fantastic but more idealistic than Borel's, and distinguished himself by his oriental travels and studies, and by his attention to popular ballads and traditions, while his style has an exquisite but unaffected strangeness hardly inferior to Gautier's. Théodore de Banville (1823-91), adopting the principles of Gautier, and combining with them a considerable satiric faculty, composed a large amount of verse, faultless in form, delicate and exquisite in shades and colours, but so entirely neutral in moral and political tone that it has found fewer admirers than it deserved. Charles Marie René Leconte de Lisle (1818-94) (*Poèmes Antiques*, *Poèmes Barbares*, *Poèmes Tragiques*), carrying out the principle of ransacking foreign literature for subjects, went to Celtic, classical or even oriental sources for his inspiration, and despite a science in verse not much inferior to Banville's, and a far wider range and choice of subject, diffused an air of erudition, not to say pedantry, over his work which disgusted some readers, and a pessimism which displeased others, but has left poetry only inferior to that of the greatest of his countrymen. Charles Baudelaire (1821-67) in *Les Fleurs du Mal*, by his choice of unpopular subjects and the terrible truth of his analysis, revolted not a few of those who, in the words of an English critic, cannot take pleasure in the representation if they do not take pleasure in the thing represented, and who thus miss his extraordinary command of the poetical appeal in sound, in imagery and in suggestion generally. He is, as Hugo said, the inventor of a *frisson nouveau*, and his influence on French poetry is growing greater and greater.

Post-romantic Poetry.—In 1866 a collection of poems, entitled after an old French fashion *Le Parnasse contemporain*, appeared. It included contributions by some of the poets just mentioned, but the mass of the contributors were hitherto unknown to fame. A similar collection appeared in 1869, and was interrupted by the German war, but continued after it, and a third in 1876.

The first *Parnasse* had been projected by MM. Xavier de Ricard (b. 1843) and Catulle Mendès (1841-1909) as a sort of manifesto of a school of young poets: but its contents were largely coloured by the inclusion among them of work by representatives of older generations—Gautier, Laprade, Leconte de Lisle, Banville, Baudelaire and others. The continuation, however, of the title in the later issues, rather than anything else, led to the formation and promulgation of the idea of a "Par-

nassien" or an "Impassible" school which was supposed to adopt as its watchword the motto of "Art for Art's sake," to pay especial attention to form, and also to aim at a certain objectivity. As a matter of fact the greater poets and the greater poems of the *Parnasse* admit of no such restrictive labelling, which can only be regarded as mischievous, though (or very mainly because) it has been continued. Another school, arising mainly in the later '80s and calling itself that of "Symbolism," has been supposed to indicate a reaction against Parnassianism and even against the main Romantic tradition generally, with a throwing back to Lamartine and perhaps Chénier. This idea of successive schools ("Decadents," "Naturists," etc.) has even been reduced to such an *absurdum* as the statement that "France sees a new school of poetry every 15 years." Those who have studied literature sufficiently widely, and from a sufficient elevation, know that these systematizings are always more or less delusive. Parnassianism, symbolism and the other things are merely phases of the Romantic movement itself—as may be proved to demonstration by the simple process of taking, say, Hugo and Verlaine on the one hand, Delille or Escouchard Lebrun on the other, and comparing the two first mentioned with each other and with the older poet. The differences in the first case will be found to be differences at most of individuality: in the other of kind. We shall not, therefore, further refer to these dubious classifications, but specify briefly the most remarkable poets whom they concern, and all the older of whom, it may be observed, were represented in the *Parnasse* itself. Of these the most remarkable were Sully Prudhomme (1839-1907), François Coppée (1842-1908) and Paul Verlaine (1844-96). The first (*Stances et poèmes*, 1865, *Vaines Tendresses*, 1875, *Bonheur*, 1888, etc.) is a philosophical and rather pessimistic poet. The second (*La Grève des forgerons*, 1869, *Les Humbles*, 1872, *Contes et vers*, 1881-87, etc.) a dealer with more generally popular subjects in a more sentimental manner; and the third (*Sagesse*, 1881, *Parallèlement*, 1889, *Poèmes saturniens*, including early work, 1867-90), by far the most original and remarkable poet of the three, starting with Baudelaire and pushing farther the fancy for forbidden subjects, but treating both these and others with wonderful command of sound and image-suggestion. Verlaine in fact (he was actually well acquainted with English) endeavoured, and to a small extent succeeded in the endeavour to communicate to French the vague suggestion of visual and audible appeal which has characterized English poetry from Blake and Coleridge onwards. Rimbaud (1854-91), an extraordinary personality who gave up writing before he was 20, must be mentioned for his influence, which ranks with that of Baudelaire and Verlaine. His *Le Bateau ivre* is a short masterpiece. Stéphane Mallarmé (1842-98), afterwards chief of the Symbolists, was also a true poet in his way, but somewhat barren, and the victim of pose and trick; José Maria de Heredia (1842-1905), was a very exquisite practitioner of the sonnet but with perhaps more art than matter in him. A. Villiers de l'Isle-Adam was another eccentric with but a spark of genius; Léon Dierx, after producing even less than Mallarmé, succeeded him as Symbolist chief.

Yet another flight of poets may be grouped as those specially representing the last quarter of the century and (whether Parnassian, Symbolist or what not) the latest development of French poetry. Verlaine and Mallarmé already mentioned were in a manner the leaders of these. The whole tendency of the period has been to relax the stringency of French prosody. Albert Samain (1859-1900), a musical versifier, Jean Moréas (1856-1910), who began with a volume called *Les Syrtes* in 1884; Laurent Tailhade (1854-1919) and others are more or less Symbolist, and contributed to the Symbolist periodical (one of many such since the beginning of the Romantic movement which would almost require an article to themselves), the *Mercure de France*. Jean Richepin (1849-1926) made for a time considerable noise with poetical work of a colour older even than his age, and harked back somewhat to the type of early Romanticism—*La Chanson des gueux*, *Les Blasphèmes*, etc. Edmond Rostand brilliantly revived the romantic drama in verse in *Cyrano de Bergerac* (1897) and other plays. Henri de Regnier, born in 1864, has received very high praise for work in *Lendemain* (1886) and other

volumes like *Les Jeux rustiques et divins* (1897) and *Les Médailles d'argile* (1900). His later writings cover a larger field.

Prose Fiction Since 1830.—The romance-writing of France during the period has taken two different directions—the first that of the novel of incident, the second that of analysis and character. The first was that which, as was natural when Scott was the model, was formerly most trodden; the second required the genius of George Sand, of Balzac and of Beyle to attract students to it. The novels of Victor Hugo are novels of incident, with a strong infusion of purpose, and considerable but rather ideal character drawing. They are in fact lengthy prose *dramas* rather than romances proper, and they have found no imitators. They display, however, the powers of the master at their fullest. On the other hand, Alexandre Dumas originally composed his novels in close imitation of Scott, and they are much less dramatic than narrative in character. The best of them, such as *Les Trois Mousquetaires*, *Vingt ans après*, *La Reine Margot*, are probably the best specimens extant of their time. Of something the same kind, but of a far lower stamp, are the novels of Eugène Sue (1804-57). Dumas and Sue were accompanied and followed by a vast crowd of companions, independent or imitative. Alfred de Vigny had already attempted the historical novel in *Cinq-Mars*. By degrees, however, the taste for the novel of incident, at least of an historical kind, died out till it was revived in another form, and with an admixture of domestic interest, by Erckmann-Chatrian. The last and one of the most splendid instances of the old style was *Le Capitaine Fracasse*, which Théophile Gautier began early and finished late as a kind of *tour de force*. The last-named writer in his earlier days had modified the incident novel in many short tales, a kind of writing for which French has always been famous, and in which Gautier's sketches are masterpieces. His only other long novel, *Mademoiselle de Maupin*, belongs rather to the class of analysis. With Gautier, as a writer whose literary characteristics even excel his purely tale-telling powers, may be classed Prosper Mérimée (1803-70), one of the most exquisite 19th-century masters of the language. Already, however, in 1830 the tide was setting strongly in favour of novels of contemporary life and manners.

The great master of the novel of character and manners as opposed to that of history and incident is Honoré de Balzac (1799-1850). With him George Sand and Stendhal must be studied. Henri Beyle (1798-1865), who wrote under the *nom de plume* of Stendhal, stands by himself. His chief books in the line of fiction are *La Chartreuse de Parme* and *Le Rouge et le Noir*, exceedingly powerful novels of the analytical kind, and he also composed a considerable number of critical and miscellaneous works. Of little influence at first (though he had great power over Mérimée) being somewhat in front of his time, he has exercised ever increasing authority as a master of pessimist analysis. Indeed much of his work was never published till towards the close of the century. George Sand (1804-76) began with books strongly tinged with the spirit of revolt against moral and social arrangements, and she sometimes diverged into very curious paths of pseudo-philosophy, such as was popular in the second quarter of the century. At times, too, as in *Lucrezia Floriani* and some other works, she did not hesitate to draw largely on her own personal adventures and experiences. But later on she devoted herself rather to sketches of country life and manners, and to novels involving bold if not very careful sketches of character and more or less dramatic situations. She was one of the most fertile of novelists, continuing to the end of her long life to pour forth fiction at the rate of many volumes a year. Of her different styles may be mentioned as fairly characteristic, *Lélia*, *Lucrezia Floriani*, *Consuelo*, *La Mare au diable*, *La Petite Fadette*, *François le champi*, *Mademoiselle de la Quintinie*. Considering the shorter length of his life the productiveness of Balzac was almost more astonishing, especially if we consider that some of his early work was never reprinted, and that he left great stores of fragments and unfinished sketches. He is, moreover, the most remarkable example in literature of untiring work and determination to achieve success despite the greatest discouragements. His early work was worse than unsuccessful, it was positively bad.

After more than a score of unsuccessful attempts, *Les Chouans* at last made its mark, and for 20 years from that time the astonishing productions composing the so-called *Comédie humaine* were poured forth successively. The sub-titles which Balzac imposed upon the different batches, *Scènes de la vie parisienne, de la vie de province, de la vie intime*, etc., show, like the general title, a deliberate intention on the author's part to cover the whole ground of human, at least of French life. Such an attempt could not succeed wholly; yet the amount of success attained is astonishing. Balzac has, however, with some justice been accused of creating the world which he described, and his personages, wonderful as is the accuracy and force with which many of the characteristics of humanity are exemplified in them, are sometimes not altogether human. Balzac stands as the foremost novelist of France, and in the opinion of many as the greatest of all novelists.

The so-called realist side of Balzac was developed (but, as he himself acknowledged, with a double dose of intermixed if somewhat transformed Romanticism) by Gustave Flaubert (1821-80), who showed culture, scholarship and a literary power over the language inferior to that of no writer of the century. No novelist of his generation has attained a higher literary rank than Flaubert. *Madame Bovary* and *L'Education sentimentale* are studies of contemporary life; in *Salammô* and *La Tentation de Saint Antoine* erudition and antiquarian knowledge furnish the subjects for the display of the highest literary skill. Eugène Fromentin (1820-76), best known as a painter, wrote a novel, *Dominique*, which is highly appreciated by good judges.

The Naturalists proper chiefly developed or seemed to develop one side of Balzac, but almost entirely abandoned his Romantic element. They aimed first at exact and almost photographic delineation of the incidents of modern life, and secondly at still more uncompromising non-suppression of the essential features and functions of that life which are usually suppressed. This school may be represented in chief by four novelists (really three, as two of them were brothers who wrote together till the rather early death of one of them), Émile Zola (1840-1903), Alphonse Daudet (1840-97), and Edmond (1822-97) and Jules (1830-70) de Goncourt. The first, of Italian extraction and Marseillais birth, began by work of undecided kinds and was always a critic as well as a novelist. Of this first stage *Contes à Ninon* (1864) and *Thérèse Raquin* (1867) deserve to be specified. But after 1870 Zola entered upon a huge scheme (suggested no doubt by the *Comédie humaine*) of tracing the fortunes in every branch, legitimate and illegitimate, and in every rank of society of a family, *Les Rougon-Macquart*, and carried it out in a full score of novels during more than as many years. He followed this with a shorter series on places, *Paris, Rome, Lourdes*, and lastly by another of strangely apocalyptic tone, *Fécondité, Travail, Vérité*, the last a story of the Dreyfus case, retrospective and, as it proved, prophetic. The repulsiveness of much of his work, and the overdone detail of almost the whole of it, caused great prejudice against him, and will probably always prevent his being ranked among the greatest novelists; but his power is indubitable, and in passages, if not in whole books, does itself justice.

The Goncourts, besides their work in Naturalist (they would have preferred to call it "Impressionist") fiction, devoted themselves especially to study and collection in the fine arts, and produced many volumes on the historical side of these, volumes distinguished by accurate and careful research. This quality they carried, and the elder of them after his brother's death continued to carry, into novel-writing (*Renée Mauperin, Germinie Lacerteux, Chérie*, etc.) with the addition of an extraordinary care for peculiar and, as they called it, "personal" diction. On the other hand, Alphonse Daudet (who with the other three, Flaubert to some extent, and the Russian novelist Turgeniev, formed a sort of *cénacle* or literary club) mixed with some Naturalism a far greater amount of fancy and wit than his companions allowed themselves or could perhaps attain; and in the *Tartarin series* (dealing with the extravagances of his fellow-Provençaux) added not a little to the gaiety of Europe. His other novels (*Fromont jeune et Risler aîné, Jack, Le Nabab*, etc.), also very popular, have been variously judged, there being something strangely like plagiarism in some

of them, and in others, in fact in most, an excessive use of that privilege of the novelist which consists in introducing real persons under more or less disguise. It should be observed in speaking of this group that the Goncourts, or rather the survivor of them, left an elaborate *Journal* of much importance for the appreciation of the personal side of French literature during the last half of the century.

Barbey d'Aureville (1808-1889) with *l'Ensorcelée* and *Le Chevalier Destouches* has a place of his own and many passionate admirers. He is in his own way a master of fiction and a master of prose. The tales of Villiers de l'Isle-Adam (1840-89) also deserve to be at least mentioned.

In 1880 Zola, who had by this time formed a regular school of disciples, issued with certain of them a collection of short stories, *Les Soirées de Médan*, which contains one of his own best things, *L'Attaque du moulin*, and also the capital story, *Boule de suif*, by Guy de Maupassant (1850-93), who in the same year published poems, *Des vers*, of very remarkable if not strictly poetical quality. Maupassant developed during his short literary career perhaps the greatest powers shown by any French novelist since Flaubert (his sponsor in both senses) in a series of longer novels (*Une Vie, Bel Ami, Pierre et Jean, Fort comme la mort*) and shorter stories (*Monsieur Parent, Les Soeurs Rondoh, Le Horla*), but they were distorted by the Naturalist pessimism and grime, and perhaps also by the brain-disease of which their author died. J. K. Huysmans (b. 1848), also a contributor to *Les Soirées de Médan*, who had begun a little earlier with *Marthe* (1876) and other books, gave his most characteristic work in 1884 with *Au rebours* and in 1891 with *Là-bas*, stories of exaggerated and "satanic" pose, decorated with perhaps the extremest achievements of the school in mere ugliness and nastiness. Afterwards, by an obvious reaction, he returned to Catholicism. Of about the same date as these two are two other novelists of note, Julien Viaud ("Pierre Loti," b. 1850), a naval officer who embodied his experiences of foreign service with a faint dose of story and character interest, and a far larger one of elaborate description, in a series of books (*Aziyadé, Le Mariage de Loti, Madame Chrysanthème*, etc.), and Paul Bourget (b. 1852), an important critic as well as novelist who deflected the Naturalist current into a "psychological" channel, connecting itself higher with Stendhal, and composed in it books very popular in their way—*Cruelle Enigme* (1885), *Le Disciple, Terre promise, Cosmopolis*. As a contrast or complement to Bourget's "psychological" novel may be taken the "ethical" novel of Edouard Rod (1857-1909)—*La Vie privée de Michel Tessier* (1893), *Le Sens de la vie, Les Trois Coeurs*. Contemporary with these as a novelist though a much older man; and occupied at different times of his life with verse and with criticism, came Anatole France (1844-1924), who in *Le Crime de Silvestre Bonnard, La Rôtisserie de la reine Pédauque, Le Lys rouge*, and others, made a kind of novel as different from the ordinary styles as Pierre Loti's, and of the highest appeal in its wit, its subtle fancy and its perfect French.

Periodical Literature Since 1830. Criticism.—One of the causes which led to this extensive composition of novels was the great spread of periodical literature in France, and the custom of including in almost all periodicals, daily, weekly or monthly, a *feuilleton* or instalment of fiction. Of the contributors of these periodicals who were strictly journalists and almost political journalists only, the most remarkable after Carrel were his opponent in the fatal duel, Émile de Girardin, Lucien A. Prévost-Paradol (1829-70), Jean Hippolyte Cartier, called de Villemessant (1812-79), and, above all, Louis Veuillot (1815-83), the most violent and unscrupulous but by no means the least gifted of his class. The same spread of periodical literature, together with the increasing interest in the literature of the past, led also to a very great development of criticism, and the most remarkable of the critics was Charles Augustin Sainte-Beuve (1804-69). Sainte-Beuve's first remarkable work (his poems and novels we may leave out of consideration) was the sketch of 16th-century literature which he contributed to the *Globe*. But it was not till later that his style of criticism became fully developed and accentuated. During the first decade of Louis Philippe's reign his critical papers,

united under the title of *Critiques et portraits littéraires*, show a gradual advance. During the next ten years he was mainly occupied with his studies of the writers of the Port Royal school. But it was during the last 20 years of his life, when the famous *Causeries du lundi* appeared weekly in the columns of the *Constitutionnel* and the *Moniteur*, that his most remarkable productions came out. Sainte-Beuve's style of criticism (which is the key to so much of French literature of the last half-century that it is necessary to dwell on it at some length), excellent and valuable as it is, lent itself to two corruptions. There is, in the first place, in making the careful investigations into the character and circumstances of each writer which it demands, a danger of paying too much attention to the man and too little to his work, and of substituting for a critical study a mere collection of personal anecdotes and traits, especially if the author dealt with belongs to a foreign country or a past age. The other danger is that of connecting the genius and character of particular authors too much with their conditions and circumstances, so as to regard them as merely so many products of the age. These faults, and especially the latter, have been very noticeable in many of Sainte-Beuve's successors, particularly perhaps in Hippolyte Taine (1828-93), who, however, besides his work on English literature, did much of importance on French, and has been regarded as the first critic who did thorough honour to Balzac in his own country. Beginning with philosophical studies, and always maintaining a strong tincture of philosophical determinism, he applied himself later, first to literary history and criticism in his famous *Histoire de la littérature anglaise* (1864), and then to history proper in his still more famous *Origines de la France contemporaine* (1876).

Edmond Scherer (1815-89) and Paul de Saint-Victor (1827-1881) represent different sides of Sainte-Beuve's style in literary criticism, Scherer combining with it a martinet and somewhat prudish precision, while Saint-Victor, with great powers of appreciation, is the most flowery and "prose-poetical" of French critics. In theatrical criticism Francisque Sarcey (1827-99), an acute but somewhat severe and limited judge, succeeded to the good-natured sovereignty of Janin. The criticism of the *Revue des deux mondes* has played a sufficiently important part in French literature to deserve separate notice in passing. Founded in 1829, the *Revue*, after some vicissitudes, soon attained, under the direction of the Swiss Buloz, the character of being one of the first of European critical periodicals. Its style of criticism has, on the whole, inclined rather to the classical side—i.e., to classicism as modified by, and possibly after, the Romantic movement. Besides some of the authors already named, its principal critical contributors were Gustave Planche (1808-57), an acute but somewhat truculent critic, Saint-René Taillandier (1817-79), and Émile Montégut (1825-95).

A remarkable writer whose talent, approaching genius, was spoilt by eccentricity and pose, and who belonged to a more modern generation, Jules Barbey d'Aureville (1808-89), poet, novelist and critic, produced much of his critical work, and corrected more, in his later days. Not only did the critical work in various ways of Renan, Taine, Sarcey and others continue during the latter part of the century, but a new generation, hardly in this case inferior to the old, appeared. The chiefs of this were Anatole France, Émile Faguet (1847-1916), Ferdinand Brunetière (1849-1906) and Jules Lemaitre (1853-1914). The last, however, though a brilliant writer, was but an "interim" critic, beginning with poetry and other matters, and after a time turning to yet others, while, brilliant as he was, his criticism was often ill-formed. So too Anatole France, after compiling four volumes of *La Vie littéraire* in his own inimitable style and with singular felicity of appreciation, also turned away. But the body of recent critical literature in France is perhaps larger in actual proportion and of greater value when considered in relation to other kinds of literature than has been the case at any previous period.

Philosophy and History: 1830-1890.—In philosophy proper France has been more remarkable for attention to the historical side of the matter than for the production of new systems; and the principal exception among her philosophical writers, Auguste Comte (1793-1857), besides inclining, as far as his matter went,

to the political and scientific rather than to the purely philosophical side (which indeed he regarded as antiquated), was not very remarkable merely as a man of letters. Victor Cousin (1792-1867), on the other hand, almost a brilliant man of letters and for a time regarded as something of a philosophical apostle preaching "eclecticism," betook himself latterly to biographical and other miscellaneous writings. Similar phenomena, not so much of inconstancy to philosophy as of a tendency towards the applied rather than the pure branches of the subject, are noticeable in Edgar Quinet (1803-75), in Charles de Rémusat (1797-1875), and in Ernest Renan (1823-92), the first of whom began by translating Herder while the second and third devoted themselves early to scholastic philosophy, de Rémusat dealing with Abélard (1845) and Anselm (1856), Renan with Averroes (1852). Renan is one of the greatest of prose writers of all time, for purity, elegance and fluidity. Outside his historical work, his *Souvenirs* and his *Drames* and *Dialogues philosophiques* are imperishable masterpieces. His original ideas are best expressed in *L'Avenir de la Science*. More single-minded devotion to at least the historical side was shown by Jean Philibert Damiron (1794-1862), who published in 1842 a *Cours de philosophie* and many minor works at different times; but the inconstancy recurs in Jules Simon (1814-96), who, in the earlier part of his life a professor of philosophy and a writer of authority on the Greek philosophers (especially in *Histoire de l'école d'Alexandrie*, 1844-45), began before long to take an active and, towards the close of his life-work, all but a foremost part in politics.

Political philosophy and its kindred sciences have naturally received a large share of attention. Towards the middle of the century there was a great development of socialist and fanciful theorizing on politics, with which the names of Claude Henri, comte de Saint-Simon (1760-1825), Charles Fourier (1772-1837), Étienne Cabet (1788-1856), and others are connected. As political economists Frédéric Bastiat (1801-50), L. G. L. Guilhaud de Lavergne (1809-80), Louis Auguste Blanqui (1805-81), and Michel Chevalier (1806-79) may be noticed. In Alexis de Tocqueville (1805-59) France produced a political observer of a remarkably acute, moderate and reflective character.

The brothers Thierry devoted themselves to early French history Amédée Thierry (1797-1873) producing a *Histoire des Gaulois* and other works concerning the Roman period, and Augustin Thierry (1795-1856) the well-known history of the Norman Conquest, the equally attractive *Récits des temps Mérovingiens* and other excellent works. Philippe de Ségur (1780-1873) wrote a history of the Russian campaign of Napoleon, and some other works chiefly dealing with Russian history. The voluminous *Histoire de France* of Henri Martin (1810-83) is an impartial work dealing in detail with the whole subject. A. G. P. Bruguère, baron de Barante (1782-1866), after beginning with literary criticism, turned to history, and in his *Histoire des ducs de Bourgogne* produced a work of capital importance. As was to be expected, many of the most brilliant results of this devotion to historical subjects consisted of works dealing with the French Revolution. No series of historical events has ever perhaps received treatment at the same time from so many different points of view, and by writers of such varied literary excellence, among whom it must, however, be said that the purely royalist side is hardly at all represented. One of the earliest of these histories is that of François Mignet (1796-1884), a sober and judicious historian of the older school, also well known for his *Histoire de Marie Stuart*. About the same time was begun the brilliant if not extremely trustworthy work of Adolphe Thiers (1797-1877) on the Revolution, which established the literary reputation of the future president of the French republic, and was at a later period completed by the *Histoire du consulat et de l'empire*. The downfall of the July monarchy and the early years of the empire witnessed the publication of several works of the first importance on this subject. Barante contributed histories of the Convention and the Directory, but the three books of greatest note were those of Lamartine, Jules Michelet (1798-1874), and Louis Blanc (1811-82). Lamartine's *Histoire des Girondins* is written from the constitutional-republican point of view, and is sometimes con-

sidered to have had much influence in producing the events of 1848. It is, perhaps, rather the work of an orator and poet than of an historian. The work of Michelet is of a more original character. Besides his history of the Revolution, Michelet wrote an extended history of France, and a very large number of smaller works on historical, political and social subjects. His imaginative powers are of the highest order, and his style stands alone in French for its strangely broken and picturesque character, its turbid abundance of striking images, and its somewhat sombre magnificence, qualities which, as may easily be supposed, found full occupation in a history of the Revolution. Edgar Quinet (1803-75), like Louis Blanc a devotee of the republic and an exile for its sake, brought to this subject a mind and pen long trained to literary and historical studies; but *La Révolution* is not considered his best work. And Taine, after distinguishing himself, as we have mentioned, in literary criticism, and attaining less success in philosophy (*De l'intelligence*), turned in *Les Origines de la France moderne* to an elaborate discussion of the Revolution, its causes, character and consequences. François Pierre Guillaume Guizot (1787-1874), like his rival Thiers, devoted himself much to historical study. His earliest works were literary and linguistic, but he soon turned to political history, and for the last half-century of his long life his contributions to historical literature were almost incessant and of the most various character. The most important are the histories *Des Origines du gouvernement représentatif*, *De la révolution d'Angleterre*, *De la civilisation en France*, and a *Histoire de France*, which he was writing at the time of his death.

In the last quarter of the century, under the department of history, the most remarkable names were still those of Taine and Renan. Indeed it may be here proper to remark that Renan, in the kind of elaborated semi-poetic style which has most characterized the prose of the 19th century in all countries of Europe, takes pre-eminence among French writers even in the estimation of critics who are not enamoured of his substance and tone. The chief work of his life is the *Histoire des origines du Christianisme*, which includes the celebrated *Vie de Jésus*. But, under the influence of Taine to some extent and of a general European tendency still more, France during this period attained or recovered a considerable place for what is called "scientific" history—the history which while, in some cases, though not in all, not neglecting the development of style attaches itself particularly to "the document," on the one hand, and to philosophical arrangement on the other. The chief representatives of the school were probably Albert Sorel (1842-1906) and Fustel de Coulanges (1830-89) (*La Cité Antique*, *Histoire des Institutions de l'ancienne France*).

CONTEMPORARY LITERATURE

The Pre-War Generation.—It was about the year 1890 that new tendencies were manifested simultaneously in poetry, in philosophy, in criticism and in the novel. While keeping as a fundamental principle the recognition of the fact, that is to say the method of observation, the newcomers insisted upon their observation being complete, upon its taking into account the whole of reality, not merely facts, but also all the stuff of feeling, the impulses of the soul, and spiritual energy. As a result of all this, thought became re-invigorated, took a new lease of life. Such was the accomplishment of men very different in their inspiration and their convictions. Paul Bourget and Barrès among the novelists, Henri de Régnier among the poets, Rémy de Gourmont, Charles Maurras and André Gide among the critics, played a great part in this change. Groups like those of the *Mercure de France*, the *Nouvelle Revue Française*, the *Cahiers de la Quinzaine*, under the leadership of Charles Péguy, did their capable share.

It may be said that the distinction had been clearly made between science, which establishes laws and fundamental causes and sets them forth in abstract terms, and art, which manifests these causes sympathetically by appealing at one and the same time to the reason, the heart and the senses. The works of a mathematician of genius, Jules Henri Poincaré, had made for the development of a more exact conception of science and the scientific

method. The books of Henri Bergson, especially the one which appeared in 1907 (*L'évolution créatrice*), had created a new spiritual awakening. The teaching of Hamelin (*Essai*, 1907) established a new deism based on the most technical disquisitions of intellectualistic philosophy. Everything thus contributed towards liberating the spirit from the narrow boundaries of naturalism. A literary outburst was the result, the main characteristic of which is that each work reflects the temperament and the tastes of the author, without dependence on any school. Certain writers remain faithful to their conception of the novel (Gustave Geffroy, *Cécile Pommier*, 1922), and the Académie Goncourt continue the tradition of objectivity and naturalism. But the brilliant group of psychological writers that followed Paul Bourget and Maurice Barrès goes back to Benjamin Constant and Stendhal, indeed even invokes Balzac, and attempts to make of the novel a complete representation of life, of the spiritual life as well as the social and material.

Paul Bourget (b. 1852) produced *Le Démon de Midi* (1914), *Némésis* (1918). Maurice Barrès (1862-1923) wrote *Greco*, ou *Le secret de Tolède* (1912), *La colline inspirée* (1913), and just before his death published that *Enquête aux pays du Levant* (1923), which unites in itself all his peculiar qualities of thought and expression and remains one of his finest books. René Bazin (*Les nouveaux Oberlé*, 1919); Henri Bordeaux (*La maison*, 1913, and *La résurrection de la chair*, 1920); René Boylesve (*Tu n'es plus rien*, 1914, *Elise*, 1921); Louis Bertrand (*Jean Serbal*, 1924); Edouard Estaunié (*Les choses voient*, 1913, *L'ascension de M. Baslèvre*, 1920), attest the vitality of a genre which was tried with success also by Emile Clermont (1878-1915), author of *Laure* (1913); Louis Codet (1877-1918), author of *La petite Chiquette* (1911), *César Capéran* (1918), *La fortune de Bécot* (1919); and Roger Martin du Gard, of a more philosophical turn (*Jean Barois*, 1914, and *Les Thibault*, 1922-1928).

The analytic and descriptive novel of manners continued with Henri Lavedan (*Irène Olette*, *Le chemin du salut*, 1920-23); Abel Hermant (*Les Renards*, 1912, *L'aube ardente*, 1919, *La journée brève*, 1920); Gaston Chérau (*La prison de verre*, 1912, *Le monstre*, 1913); Jérôme and Jean Tharaud (*L'ombre de la croix*, 1917, and *Un royaume de Dieu*, 1920); Gilbert de Voisins (*L'enfant qui prit peur*, 1912); the tales of Henri Duvernois (*Le veau gras*, 1912, *Edgar*, 1912); André Gide (*L'immoraliste*, *La porte étroite*, *Les faux monnayeurs*, 1926); Edmond Jaloux, Marcel Boulenger, Eugène Montfort (*César Casteldor*, 1927), Claude Anet, Charles Géniaux. An offshoot of the symbolist movement, the poetic novel of fantasy has its most illustrious exponents in the poet Henri de Régnier (*La pêcheuse*, 1920, *Le divertissement provincial*, 1923); in the poet Francis Jammes (*M. le Curé d'Ozeron*, 1918, *Le poète rustique*, 1920); and in the young Alain Fournier (1886-1914), snatched away too soon from letters by the War, whose book *Le grand Meaulnes* (1914) remains a charming and impressive work. Finally, exotic literature, dominated by the great name of Pierre Loti, finds brilliant expression in Claude Farrère (*La Bataille*, 1911, *Dix-sept histoires de Marins*, 1914); Jérôme and Jean Tharaud (*La fête Arabe*, 1912); Pierre Mille, Marius-Ary Leblond, and in the posthumous book of Louis Hémon on Canada, *Maria Chapdelaine* (1916), which had a prodigious success. Romain Rolland produced in *Jean Christophe* (10 vols., 1904-12) an epic of French life inspired by ardent enthusiasm for spiritual values, and yet full of the sharpest criticism of the epoch.

Women have always excelled in the literature of imagination. Three writers occupy the first rank in this respect—Colette, whose works include *La vagabonde* (1910), *L'entrave* (1914), *Chéri* (1920), *La maison de Claudine* (1922) and *La fin de Chéri* (1926); Gérard d'Houville, daughter of the great poet J. M. de Heredia, wife of Henri de Régnier, who has a rare poetic gift and who tells in the most fluid style prose stories of charming and often profound imagination (*Le séducteur*, 1914, *Jeune fille*, 1916, *Tant pis pour toi*, 1920), and who has written in *L'enfant* (1926) a little masterpiece; and Comtesse de Noailles, a poet of passionate and inspired quality as well, who in 1923 under the title of *Les innocentes* published a series of novelettes and meditations in

which lyricism is made the vehicle of a daring frankness. Mme. Marcelle Tinayre published in 1920 *Perséphone* and in 1922 *Priscille Séverac*. Mme. Lucie Delarue-Mardrus, a very gifted storyteller, observant and poetic, wrote *L'âme aux trois visages* in 1919 and *Graine au vent* in 1925.

Edmond Rostand became a popular celebrity of the stage at the beginning of the century. *Cyrano de Bergerac* (1897), *l'Aiglon* (1900), *Chanticleer* (1910) are romantic dramas of poor quality as dramas, but which may yet survive because of some passages that rise into really great rhetoric. François de Curel, produced *Terre inhumaine* (1923), *La viveuse* and *Le moribond* (1925). G. de Porto-Riche has made vigorous studies of passion in *Le vieil homme* (1911) and *Le marchand d'estampes* (1918). Maurice Donnay, so charming, and, at the same time, so melancholy and whimsical, has written social studies in *Les éclaircissements* (1913) and *La chasse à l'homme* (1920). Alfred Capus, a lucid realist, ironical and with a gift for natural dialogue, produced *Hélène Ardouin* in 1913 and *L'institut de beauté* in 1914. Henri Bataille (1872-1922), hypersensitive, slightly involved and exotic, brought out *Le Phalène* in 1914 and *L'homme à la rose* in 1922. Henry Bernstein, after a series of dramatic and violent plays, brought out *Le secret* (1917), in which his effects are drawn from psychology and character. Comedy has owed its greatest successes to Robert de Flers (*L'habit vert*, 1913, *M. Brotanneau*, 1914, *Les nouveaux messieurs*, 1925); to Tristan Bernard (*Les petites curieuses*, 1920); to Francis de Croisset (*Le cœur dispose*, 1912); and to Sacha Guitry, whose vivacity and wit find triumphant expression in *Le veilleur de nuit* (1911), *L'illusionniste* (1921) and *L'amour masqué* (1924). The most interesting attempts in the way of original work have been made by François Porché, who in *Les butors et la Finette* (1918) and *Le Chevalier de Colomb* (1922) combines in a curious way the relics of ancient traditions with an entirely modern feeling for symbolism; and by P. Claudel, author of *L'otage* (1911), *L'annonce faite à Marie* (1912), *Le père humilié* (1920) and *Le pain dur* (1918), works sometimes obscure, but freighted with purpose of an incontestable quality, and with austere emotion.

In the domain of poetry all the squabbles of the schools had already been silenced by 1910. Symbolism had done its work. Its most illustrious representative, Henri de Régnier, had returned to traditional forms. Master of rhythm and of rhyme, connoisseur of language, sumptuous and self-contained, he has amplitude and richness. The outcome of this is magnificent and lordly poetry (*Poésies*, 1907, *Vestigia Flammae*, 1921). Much nearer symbolism, Francis Vielé-Griffin has studied the ancient myths and has attempted to interpret their eternal significance (*Voix d'Ionie*, 1914). Francis Jammes is the poet of nature and divinity. He knows the country well, and he speaks of it with a charming simplicity and freshness (*Les Géorgiques chrétiennes*, 1911-12). He shows the same ingenuousness, the same healthy realism, the same humility in his poetry of religious inspirations; he has in him something at once bucolic and Christian (*La Vierge et les sonnets*, 1919). Comtesse de Noailles is on the contrary pantheistic and pagan. Impetuous and consciously unrestrained, heavy with doom like a priestess of old time, she has sung in eloquent and remarkably rhythmical verse of youth, love, the beauty of the universe, and also of human unhappiness, implacable destiny and death (*Les vivants et les morts*, 1913, *Les forces éternelles*, 1920). In her later verses (*Poème de l'amour*, 1924) she has adopted a deliberately simple and bare style, in which is traceable a growing melancholy, a strange lassitude in her ardent work, and, by way of substitute for resignation, a courage full of serenity. Paul Claudel, a vigorous personality, penetrated by a faith which, unlike the tenderness of Francis Jammes, is austere and sometimes sombre, has written poems (*La cantate à trois voix*, 1914, *Trois poèmes de guerre*, 1915, *La messe là-bas*, 1919) which present a mixture of rather obscure metaphysics, rather self-conscious simplicity, and vivid and powerful imagery.

Charles Péguy, Socialist and patriot, has shown in his poems *Le mystère de la Charité de Jeanne d'Arc* (1910), *Le mystère des Saints Innocents* (1912), *Eve* (1914) a fluency which is slightly wearing because of his repetition of the same themes, but

at the same time a real power due to sincerity, tenderness and the human need for faith and piety. Finally, Paul Valéry, who had made his appearance between 1889 and 1898 in reviews of poetry and letters, *La Conque* and *Le Centaure*, published in 1917 *Le jeune Parque*, and in 1922 *Charmes*. These two extremely slender collections contained much substance under an unpretentious form, and established his reputation. Mathematician and philosopher, a subtle and experienced artist, a disciple of Mallarmé, to whom he owes much, he gives expression to an abstract and intellectual life which though slightly arid is still passionate, and his work has a deep full note. He has taken his place with *Monsieur Teste* (1896-1927) and *Euphémios* (1923) among the great writers of prose and the great moralists of the best French tradition. The tendency to return to simple, pure and classical sources is found also with Paul Fort, whose *Ballades françaises* are full of colour and imagination; with J. P. Toulet, Fernand Gregh, Abel Bonnard, Fanc-Nohain, whose *Fables* (1921) are delightfully humorous; with Alfred Droin and Pierre Camo; while symbolistic description is the more natural vehicle for Jean Royère.

If one were obliged, in spite of this diversity of temperaments, to characterize the period between 1911 and 1914, one might make two observations. One is that in matters of form pre-War writers went back almost without exception to classical traditions, to proportion, simplicity, clearness. The other is, that as far as guiding principles went they were for the most part occupied with furnishing a moral discipline to their contemporaries, and that in the wake of dilettantism and naturalistic pessimism they laboured to restore notions of order, of decorum, of hierarchy, which to them seemed useful to the national life. Whatever may have been the glory of Anatole France, it was not he who was then a leader, and who exercised an influence over men's souls; it was Paul Bourget and Maurice Barrès. There appeared at the approach of that danger constituted by the War a phenomenon worthy of remark by historians of the future. The grandson of Renan, Ernest Psichari, wrote in 1913 *L'appel des armes*, and shortly afterwards *Le voyage du centurion* (1916). Political crises and intellectual visionings had brought about a state of uncertainty that might prove a cause of weakness. Under the pressure of national exigencies that were apparent to all thoughtful minds, French literature in 1911 was mainly inspired by the attempt, which has been justified by the facts, to assure the future of the threatened country, to make readers acquainted with the strenuous life and the fundamental principles of the social and moral worlds.

The Post-War Generation.—The War abruptly ended the literary careers of many young men, who were killed on the field of battle, men who in all branches of literary activity gave high promise—novelists like Alain Fournier and Emile Clermont, poets like Paul Drouot and J. M. Bernard, essayists like Dufresnoy and Pierre Gilbert. But with those who survived it and had passed through its fires it only stimulated the desire for expression. During the course of the War there appeared a series of brilliant books of diverse character, but sincere and passionate, retracing the heroic years. It is impossible to mention all, but we must at least set down here *Le songe* (1922), by Henry de Montherlant; *Les croix de bois* (1919), by Roland Dorgelès; *Le feu* (1916), by Henri Barbusse; *La flamme au poing* (1917), by H. Malherbe; *Gaspard* (1916), by René Benjamin; *Civilisation* (1918) and *La vie des martyrs* (1917), by Georges Duhamel; *Sous Verdun* (1916), by Maurice Genevoix; *La guerre à vingt ans* (1924), by Philippe Barrès; *Fond de Cantine* (1920), by Pierre Drieu la Rochelle, and *Les récits de guerre dits à une femme*, by Camille Mayran. All these works powerfully represent direct impressions and strong emotions; they have a meaning, and our grandchildren will find in them one day a sincerely moving record of a period that was shaken by a terrible storm.

This interesting and noble outburst necessarily faded as the events moved further away. More or less indifferent to the heritage of their elders, the young writers appeared to be under the impression of existing in a new world where they had to recreate everything. But nevertheless they remained under the influence

of the past, sometimes without suspecting it themselves. They discovered, by the very fact that they lived in a predetermined epoch, the result of the labours of their elders. Tendencies, varieties of talent and aspirations are very diverse. There is little unity in the literature of the younger generation. Everyone follows the inclinations of his own temperament.

The dominating form in modern literature is still the novel, and it will serve as a type. It is not distinctively, in spite of the definition, a narrative representing life, but often consists of recollections like a book of memoirs or of reflections like a book of essays. The strongest influence to appear has been that of Marcel Proust (1871-1922). According to the date of his birth he belongs to the pre-War generation; his work has appeared almost entirely during or since the War. Only the first volume of his great novel *A la recherche du temps perdu*, namely *Du côté de chez Swann*, had appeared by the end of the year 1913. All the others appeared in sequence down to 1925. Marcel Proust is remarkable for the depth and daring of his analysis. Gifted with an acute, morbid sensitivity, he probed deeply into the motives of the heart and soul. With an extraordinary delicacy and detail, he succeeded in expressing new and original nuances of thought in sinuous and often interminable sentences. The bold analysis of the emotions in French literature was begun some years before Marcel Proust; by Anatole France, but with discretion, and later with more freedom by the female writers; but Marcel Proust has gone much further. He has carried the taste and feeling for introspection to the extreme limits. By this one can say he has enlarged the scope of the novel, and that is the reason for his great prestige and influence among post-War writers.

This preoccupation with analysis is found in a series of works the most characteristic of which are: Jacques Rivière's *Aimée* (1921), Jacques de Lacretelle's *Silbermann* (1922) and *La Bonifas* (1925). In reality a gift as personal and exceptional as that of Marcel Proust encourages tendencies more than it provokes imitation. Psychological introspection is part of our period. It appeared in the course of the War more acutely and frequently than ever. Carried to the extreme, it has resulted in an attempt at the formation of a super-realist (*sur-réaliste*) school.

The writers who have been most successful in these last years escape any attempt at classification. Each follows his own temperament and inclination. Recourse to the past is necessary to distinguish influences, forerunners, schools. In contemporary literature the only thing that can be distinguished is the individual. The choir of young poets protest their personal freedom (Tristan Derème, Charles Derennes, Géraudy, Roger Allard, Chabaneix). The novelists do the same; M. Pierre Benoît is a master of the novel of adventure; he knows how to construct; he knows how to tell a story; and addressing himself to a public which, as after every period of upheaval, is in need of distraction, he has been able to captivate the attention, in a series of well-made novels (*Koenigsmark*, 1918; *L'Atlantide*, 1919; *Mlle. de la Ferté*, 1923; *Le puits de Jacob*, 1924), in which he shows a remarkable facility in employing imaginary or historical events and in keeping the reader breathless with suspense over the turns of his stories.

It is only necessary to recall *Le kilomètre 83*, by Henry Daguerrhes (1913), to show that since before the War the taste for the novel of adventure had been revived. The influence of Anglo-Saxon literature, and particularly that of Kipling, had been a powerful stimulant in this development. The War naturally only accentuated this tendency. A proof of this is found in the books of Pierre MacOrlan (*La cavalière Elsa*, 1921), of Louis Chaudourne (*Terre de Chanaan*, 1921) of Jean d'Esme (*Les Barbères*, 1925), of Roland Dorgelès (*Le reveil des morts*, 1923), of René Bizet (*La sirène hurle*, 1921) and of J. Kessel (*La Steppe rouge*, 1922, *L'Équipage*, 1924). All of these appeared between 1918 and 1925. Actually, however, it does not seem that this form of literature is capable of much further development, except in the case of the exotic, historical or colonial novel. French literature is traditionally psychological. It is characteristic that the best book of Pierre Benoît, the most popular writer of novels of adventure, is a novel of manners, *Mlle. de la Ferté* (1923).

Francis Carco is a painter of the lower depths of society, of

the world of the apaches and of the outer boulevards. He deals, as did Villon in his day, with the world of thieves. He has handled this difficult subject with a great deal of tact (*Les innocents*, 1916, *L'homme traqué*, 1922, *Perversités*). Jean Giraudoux is also a subtle analyst. He has a capricious imagination and a very individual, if somewhat complicated, poetic manner, which makes him difficult reading; but he is provocative. There is in him much humour, often of an unexpected kind, difficult to understand. The world of images has no secrets from him. Unusual comparisons and strange associations of ideas abound in his books. The most successful of these are *Suzanne et le Pacifique* (1921), the story of a shipwrecked young girl who lives alone on a desert island, and *Bella* (1926), a story of contemporary French political life.

Henry de Montherlant is one of the most gifted among the young writers. He has a sense of style, and is capable of vigorous mental activity. After *Le Songe* (1922) he wrote *Les onze devant la porte dorée* (1924) and *Les Bestiaires* (1926)—books which disclose his national and moral preoccupations. He is interested in the disciplines which make a human being master of himself, permit him to live under the best conditions, and give the greatest possible value to his acts. He is very modern, and at the same time deeply attached to tradition; his works are filled with youthful ardour, strength of will, and an impetuosity which express themselves in vivid and poetic language.

François Mauriac is a harsh and powerful novelist. His books (*Le baiser au lépreux*, 1922, *Genitrix*, 1923, *Le désert de l'amour*, 1925, *Thérèse Desqueyroux*, 1927) have placed him among the most notable writers of his generation. Brought up in the Catholic tradition and attached to his faith, François Mauriac is aware both of the demands imposed by a Christian life and of the weaknesses of most human beings. All his work, which incidentally is open-minded, seems dominated by the idea of sin, by the necessary artifices in which egotism and passion entangle human beings, by the nothingness of their desires and the need for discipline.

André Maurois, who during the War was interpreter with the British army, made his début with an impressionistic book, entitled *Les silences du Colonel Bramble* (1918), which had a great success. This was followed by *Ariel, ou la vie de Shelley* (1923), which had great charm, *Des dialogues sur le Commandement* (1924) and *Disraëli* (1927). He is less a novelist than an essayist. He has a penetrating, highly cultivated mind and loves the play of ideas; he excels in delicate analyses, in the nuances of the emotions and in psychological insight.

Valéry Larbaud is interested in the manifestations of the international mind, and has written fascinating novels. *Firmina Marquez* is an original study of the life of young people in South American schools. *Le journal d' A. O. Barnabooth*, which followed, is a novel in which satire is mingled with poetic fancy.

Paul Morand represents the impressionist school at its acme of success. His short stories *Ouvert la nuit* (1922), and his novel *Lewis et Irène* (1924) are certainly among the most entertaining studies of the present time. Paul Morand has a keen feeling for the feverishness and instability of contemporary life. He is also keenly aware of the international aspect of post-War cities.

Pierre Hamp (*Le Lin*, 1924) has elaborated a new kind of novel with no hero and no tale. He aims at giving a picture of human effort in all its aspects and uses his personal experience and technical knowledge to make up a most vivid presentation chiefly of the life of the working classes.

Jean Richard Bloch (*Et Compagnie*, 1925) has written perhaps the most successful Balzacian novel of his generation. He has since attempted the novel of adventure on the poetical plane in *La Nuit Kurde* (1925), and produced in *Le Dernier Empereur* (1926) a much more vigorous type of play than the French stage has seen for many years.

Jules Romains, known before the War as the founder of the poetical school *l'Unanimité*, has achieved success in the novel with *Lucienne* (1922) and on the stage with *Dr. Knocke* (1924) and *le Dictateur* (1926). André Chamson is one of the most promising of the newest writers; his vigorous essay *L'Homme contre l'Histoire* (1926) attracted considerable attention after *Roux le Bandit* (1924); and *Les Hommes de la Route* (1927) is the most

the committee of public instruction, Charles Gilbert Romme (1750-95), who was aided in the work by the mathematicians Gaspard Monge and Joseph Louis Lagrange, the poet Fabre d'Églantine and others. The result of their labours was submitted to the convention in September; it was accepted, and the new calendar became law on Oct. 5, 1793. The new arrangement was regarded as beginning on Sept. 22, 1792, because it was the day of the proclamation of the republic, and, in this year, the day of the autumnal equinox.

By the new calendar the year of 365 days was divided into 12 months of 30 days each, every month being divided into three periods of ten days, each of which were called *décades*, and the tenth, or last, day of each decade being a day of rest. It was also proposed to divide the day on the decimal system, but this arrangement was found to be highly inconvenient and it was never put into practice. Five days of the 365 still remained to be dealt with, and these were set aside for national festivals and holidays and were called *Sans-culottides*. They were to fall at the end of the year, *i.e.*, on the five days between Sept. 17 and 21 inclusive, and were called the festivals of virtue, of genius, of labour, of opinion and of rewards. A similar course was adopted with regard to the extra day which occurred once in every four years, but the first of these was to fall in the year III., *i.e.*, in 1795, and not in 1796, the leap year in the Gregorian calendar. This day was set apart for the festival of the Revolution and was to be the last of the *Sans-culottides*. Each period of four years was to be called a *Franciade*.

Some discussion took place about the nomenclature of the new divisions of time. Eventually this work was entrusted to Fabre d'Églantine. Beginning with the new year on Sept. 22, the autumn months were *Vendémiaire*, the month of vintage, *Brumaire*, the month of fog, and *Frimaire*, the month of frost. The winter months were *Nivôse*, the snowy, *Pluviôse*, the rainy, and *Ventôse*, the windy month; the spring months, *Germinal*, the month of buds, *Floréal*, the month of flowers, and *Prairial*, the month of meadows; the summer months, *Messidor*, the month of reaping, *Thermidor*, the month of heat, and *Fructidor*, the month of fruit. To the days Fabre d'Églantine gave names which retained the idea of their numerical order, calling them Primedi, Duodi, etc., the last day of the ten, the day of rest, being named Décadi. The new order was soon in force in France and the new method was employed in all public documents, but it did not last many years. In Sept. 1805 it was decided to restore the Gregorian calendar, and the republican one was officially discontinued on Jan. 1, 1806.

The connecting link between the old and the new calendars is slight and the expression of a date in one calendar in terms of the other is a matter of some difficulty. A simple method of doing this, however, is afforded by the table on the preceding page, which is taken from the article by J. Dubourdieu in *La Grande Encyclopédie*.

Thus Robespierre was executed on 10 Thermidor An II., *i.e.*, July 28, 1794. The insurrection of 12 Germinal An III. took place on April 1, 1795. The famous 18 Brumaire An VIII. fell on Nov. 9, 1799, and the *coup d'état* of 18 Fructidor An V. on Sept. 4, 1797.

For a complete concordance of the Gregorian and the republican calendars see Stokvis, *Manuel d'histoire*, vol. iii. (Leyden, 1889); also G. Villain, "Le Calendrier républicain," in *La Révolution Française* for 1884-85.

FRENCH REVOLUTION, THE. There have been several revolutions in France, but when the French Revolution is spoken of without qualification it means the great revolution, by which, towards the close of the 18th century, the old order in France was overthrown. Though the Revolution passed through many phases and its beginnings must be set far back in the history of France, one event was from the first held to mark its decisive moment. When, on the afternoon of July 14, 1789, the Duc de La Rochefoucauld-Liancourt brought to King Louis XVI. at Versailles the news of the capture of the Bastille, the king exclaimed: "Why, this is a revolt!" "No, Sire," replied the duke, "It is a revolution." Three days later the tidings reached Arthur Young at Nancy; he noted in his journal that he had just received the news

of the "complete overthrow of the old order." To this day the anniversary of the fall of the Bastille, July 14, is celebrated by the French as the birthday of their national liberties.

It is not proposed here to explain why the capture by the populace of an old castle-prison, garrisoned by a handful of pensioners, was at once taken as marking the downfall of the old autocratic *régime* in France; an account of the Revolution which this heralded, of its antecedent causes, and of its later developments will be found in the article FRANCE: *History*. But the great Revolution was of epoch-making importance, not for France only, but for the whole world; for it set in motion those revolutionary forces—democracy, nationalism, socialism—which have changed the face of Europe and of the world, and are not yet spent. To say this, is not to belittle the importance of the American Revolution, which preceded the French Revolution and to a great extent inspired it. July 4, 1776, was certainly also an epoch-making date. The American Declaration of Independence first laid down the principle that governments derive their just powers from the consent of the governed, and so for the first time authoritatively proclaimed democracy as the only legitimate foundation of civil society. But the American Revolution was not so revolutionary as at first it seemed. Though a breach was made with England, no breach was made with English traditions of government and law. Of those who signed the Declaration of Independence but very few were democrats at heart. They subscribed to the revolutionary principles embodied by Jefferson in the preamble, but they had no idea of giving them a logical and universal application. That was reserved for the French. The Americans first established modern democracy. The French made it a militant creed.

There had been revolutions in Europe before 1789; but these revolutions had been strictly limited in their aims, and there had been no idea of setting up one form of constitution as absolutely superior to all others. Before 1789 the words "republic" and "democracy" conveyed no suggestion of revolutionary peril. Though Rousseau declared the ultimate sovereignty of the people to be inalienable, and all governments not established on this basis usurpations, he agreed with Montesquieu that republicanism and democracy were suitable only to small States, and were therefore peaceful in their tendencies. Even when a great new Republic was founded beyond the Atlantic, the monarchs watched its rise without misgiving, and even assisted in its foundation. "Time is necessary for the creation of a conquering people," said a contemporary diplomatic report, "It is more difficult to produce the spirit of conquest in a republic than in the head of a government which is entrusted to a single person."

This was an illusion which the history of the French Revolution should have dispelled, though it still persists. It serves partly to explain the apathy displayed at the outset by the Continental monarchs towards the troubles of their brother of France, which they even regarded as providential, since they prevented him from interfering with their plans for the final partition of Poland. It was only gradually that they awoke to the fact that the triumph of the Revolution in Paris had introduced a wholly new factor into international politics, and one very perilous to themselves. For the principles of the Revolution had an application far beyond the borders of France, since the doctrine of the sovereignty of the people as the only legitimate foundation of government challenged the right to exist of every State in Europe. This was the new thing which the crusading spirit of the Revolution revealed to the world: political idealism in arms, war waged, not in the name of the State for purposes of conquest, but in the name of humanity to set up everywhere on the ruins of the old order the theoretically perfect State. There were those, even at the time, who could read the meaning of the portent. Goethe was present when, at Valmy on Sept. 20, 1792, the ragged levies of the nascent French Republic withstood the attack of Brunswick's Prussian veterans. "From this place and this day," he noted in his diary, "dates a new epoch in the history of the world, and you will be able to say: I was there."

Characteristics of the Revolution.—The French Revolution, by the challenge thrown down to all the old world, had revealed itself as different to any revolution that had hitherto been

| 1. Maximilien François Isidore de Robespierre (1758–94) | 11. Emmanuel Joseph Sieyès (Abbé) (1748–1836) |
| 2. Georges Jacques Danton (1759–94) | 12. Lazare Hippolyte Carnot (1753–1823) |
| 3. Louis XVI., king of France (1754–93) | 13. Général Louis Lazare Hoche (1768–97) |
| 4. Marie Antoinette, queen of France (1755–93) | 14. Charles Maurice de Talleyrand-Périgord, prince de Bénévent (1754–1838) |
| 5. Jacques Necker (1732–1804) | 15. André Masséna, duc de Rivoli, prince d'Essling (1756–1817) |
| 6. Jeanne Manon Philpon, Madame Roland (1754–93) | 16. Paul François Jean Nicolas, vicomte de Barras (1755–1829) |
| 7. Jean Paul Marat (1743–93) | 17. Marie Joseph Motier, marquis de La Fayette (1757–1834) |
| 8. Honoré Gabriel Victor Riqueti, comte de Mirabeau (1749–1791) | 18. François Christophe Kellermann, duc de Valmy (1735–1820) |
| 9. Jacques Pierre Brissot (1754–93) | 19. Général Charles François Dumouriez (1739–1823) |
| 10. Pierre Victurnien Vergniaud (1753–93) | 20. Général Jean Victor Marie Moreau (1763–1813) |

In what did this difference consist? and what were its causes? The essential difference was that the French Revolution, increasingly as overturn succeeded overturn, represented not so much an effort to remedy admitted evils in the body politic, as an effort to recreate it on an ideal basis. "What does this mysterious science of government and legislation amount to?" said Robespierre, "To putting into the laws the moral truths culled from the works of the philosophers."

In holding this view Robespierre was not singular, though he was the most rigid in upholding it. Of the 1,200 deputies who met in the States-General at Versailles, in May 1789, but few had any experience of the practical problems of government, or had learned politics in any other school than the conversations of the *salons* and the writings of the philosophers. So far as they were not merely conservative, the champions of outworn prerogatives and privilege, they were for the most part—as Talleyrand was to put it—"builders of theories for an imaginary world." The voices of those who, like Mirabeau, realized the force of tradition in human affairs, and tried to hold fast what was good and useful in the old order, were soon silenced by the eloquence of the ideologues and—the roar of the Paris mob. And so, beginning with the "orgy" of Aug. 4, 1789, the old order was swept away before a new order was ready to take its place. The internal history of France during the Revolution is mainly that of successive attempts to build up an ideal order on the ruins.

Divergent Tendencies.—The process, of course, was not simple. The Revolutionists might agree on the principles embodied in the Declaration of the Rights of Man, but they differed about their application. The Constitution of 1791 was ostensibly an effort to apply them logically; but its framers tempered their logic with a *bourgeois* caution; for them "equality" meant at most equality before the law, not equality of opportunity, and they limited the franchise in the interests of the possessing classes. The Constitution was overthrown, with the monarchy, on Aug. 10, 1792; but the rift it had created in the revolutionary ranks continued, and widened, in the National Convention.

The struggle between the Girondins (*see* GIRONDISTS) and the Mountain (*q.v.*), as M. Albert Mathiez has now shown, was no mere struggle of rival groups for power, nor was it primarily a revolt of the provinces against the predominance of Paris and the Paris mob. Though the border-line between the factions was never very clearly marked, the essential difference between them was that the Girondins, though republicans and idealists, were champions of the rights of property, while the Mountain, which depended for its power on the organized mob of Paris, tended more and more in the direction of what is now called Socialism. It is a question how far this tendency was deliberate, or how far the socialistic laws (Law of the Maximum, etc.) put in force under the Terror were merely "war measures." But, at least in the case of Robespierre and his party, it now seems clear that they represented a conscious attempt to realize the ideal of the Socialist Republic. Socialists, from Buonarrotti onwards, have claimed him, not without reason, as the apostle and protomartyr of their economic creed.

The Revolution and Nationalism.—If modern democracy, in its various developments, received its first great impulse from the Revolution, this is also true of nationalism, which during the 19th century was to prove the most powerful solvent of the established order. The principle of nationality was not, indeed, originally part of the revolutionary gospel, which was beautifully cosmopolitan. The orators of the Constituent Assembly held up the ideal of universal peace, and asserted with confidence that regenerated France would never again wage wars of conquest; and those who later, in the Legislative Assembly, clamoured for war spoke of carrying "liberty" to oppressed peoples. But already the mood was changing. The threat of foreign invasion had aroused in the French themselves an intense national consciousness, and Danton was not alone in urging that the great object of the war should be to gain for France the frontiers "fixed by nature"—the Rhine, the Alps and the Pyrenees. And so, almost insensibly, the war of defence and revolutionary propaganda developed into a war of conquest, till in the end the rights of man were forgotten, blotted

out by the splendour of the man, Napoleon, who had become the incarnation of a Revolution now identified with all the glories of France.

The sparks from the conflagration in Paris had meanwhile been carried far and wide, and had started fires even in places unexpected and remote, where they glowed under the surface, to burst into flame later. But though the agitations, which were in the end to lead to the rise of a whole series of new nations in eastern Europe, were sometimes inspired at the outset by French revolutionary doctrines, it was not so much these doctrines which gave its mighty impulse to the new spirit of nationality in Europe at large as the example of French nationalism, and the reaction against it when it became a conquering force. In Italy Napoleon, for his own purposes, deliberately awakened a national consciousness which had slumbered for a thousand years. In Germany, which like Italy had become little more than "a geographical expression," the humiliations he inflicted stirred up memories of ancient greatness and a new passion for national unity. When Spain set the example of national resistance, and with success, all Europe recognized that a new force had come into the world; that war was no longer a mere ordeal by battle, to be fought out according to fixed rules by professional armies, but a trial of strength between nations in arms. And so it was that, in their final struggle against the revolutionary doctrine of conquest, as embodied in Napoleon, the monarchs themselves appealed to the new-born national sentiment of the peoples, and not in vain. The battle of Leipzig, which practically sealed Napoleon's doom, is rightly known as "the Battle of the Nations."

The processes of national segregation and national expansion, then, which during the century that followed changed the face of Europe, received their first great impulse from the French Revolution. The result has been a complete change in the substance of the old order, even where the outward semblance has remained unaltered. Everywhere before the World War, except in the Austrian and Ottoman empires, sovereignty had ceased to be territorial and become national; even in Germany, where territorial sovereignties continued to exist, these were overshadowed by the power and prestige of the German emperor, whose title implied not a territorial but a national authority. The World War, a world-wide battle of the nations, completed the process, so far as the principle of national sovereignty is concerned; for Luxembourg, Liechtenstein and Monaco are insignificant exceptions which serve to emphasize the rule. Above all, the disappearance of the Habsburg monarchy, the last great purely territorial dominion, proclaimed the World War as the most stupendous phase of the Revolution which started with the capture of the Bastille. That it was the last phase cannot be said. In their internal affairs the nations are still experimenting in the application of the democratic principles proclaimed by the Revolution, except where—as in most Latin countries—the experiment has conspicuously broken down. As for the social revolution, dreamed of by Robespierre, this has to a large extent been realized even in countries reputed conservative—in universal free education, the duty of the State to provide work or the maintenance of those out of work, and so on. In the matter of international relations, too, some return has been made to the revolutionary ideal of the brotherhood of man; and the League of Nations represents an attempt to put into the laws the moral truths culled from the works of the philosophers. But the jealous and mutually exclusive sentiment of nationality remains the most fateful legacy of the Revolution, the forces of which for good or evil are not yet spent.

BIBLIOGRAPHY.—Albert Sorel, *L'Europe et la Révolution française* (1903-05), though characterized by French bias, remains the most authoritative work of the reaction of the Revolution on contemporary Europe and vice versa. For the significance of the Revolution for France itself *see* Godfrey Elton, *The Revolutionary Idea in France* (1923). (W. A. P.)

FRENCH REVOLUTIONARY WARS (1792-1800), the general name for the first part of the series of French wars which went on continuously, except for some local and temporary cessations of hostilities, from the declaration of war against Britain in 1792 to the final overthrow of Bonaparte in 1815. The most important of these cessations—viz., the peace of 1801-03—

closes the "Revolutionary" and opens the "Napoleonic" era of land warfare, for which see NAPOLEONIC CAMPAIGNS, PENINSULAR WAR and WATERLOO CAMPAIGN. The naval history of the period is dated somewhat differently; the first period, treated below, is 1792-99; for the second, 1799-1815, see NAPOLEONIC CAMPAIGNS.

MILITARY OPERATIONS

France declared war on Austria on April 20, 1792. But Prussia and other powers had allied themselves with Austria in view of war, and it was against a coalition and not a single power that France found herself pitted, at the moment when the "émigration," the ferment of the Revolution, and want of material and of funds had thoroughly disorganized her army. The first engagements were singularly disgraceful. Near Lille the French soldiers fled at sight of the Austrian outposts, crying "*Nous sommes trahis*," and murdered their general (April 29). The commanders-in-chief of the armies that were formed became one after another "suspects"; and before a serious action had been fought, the three armies of Rochambeau, Lafayette and Lückner had resolved themselves into two commanded by Dumouriez and Kellermann. Thus the disciplined soldiers of the Allies had apparently good reason to consider the campaign before them a military promenade. On the Rhine, a combined army of Prussians, Austrians, Hessians and *émigrés* under the duke of Brunswick was formed for the invasion of France, flanked by two smaller armies on its right and left, all three being under the supreme command of the king of Prussia. In the Netherlands the Austrians were to besiege Lille, and in the south the Piedmontese also took the field. The first step, taken against Brunswick's advice, was the issue (July 25) of a proclamation which, couched in terms in the last degree offensive to the French nation, generated the spirit that was afterwards to find expression in the "armed nation" of 1793-94, and sealed the fate of Louis XVI. The duke, who was a model sovereign in his own principality, sympathized with the constitutional side of the Revolution, while as a soldier he had no confidence in the success of the enterprise. After completing its preparations in the leisurely manner of the previous generation, his army crossed the French frontier on Aug. 19. Longwy was easily captured; and the Allies slowly marched on to Verdun, which was more indefensible even than Longwy. The commandant, Col. Beaurepaire, shot himself in despair, and the place surrendered on Sept. 3. Brunswick now began his march on Paris and approached the defiles of the Argonne. But Dumouriez, who had been training his raw troops at Valenciennes in constant small engagements, with the purpose of invading Belgium, now threw himself into the Argonne by a rapid and daring flank march, almost under the eyes of the Prussian advanced guard, and barred the Paris road, summoning Kellermann to his assistance from Metz. The latter moved but slowly, and before he arrived the northern part of the line of defence had been forced. Dumouriez, undaunted, changed front so as to face north, with his right wing on the Argonne and his left stretching towards Châlons, and in this position Kellermann joined him at St. Meneshould on Sept. 19.

Valmy.—Brunswick meanwhile had passed the northern defiles and had then swung round to cut off Dumouriez from Châlons. At the moment when the Prussian manoeuvre was nearly completed, Kellermann, commanding in Dumouriez's momentary absence, advanced his left wing and took up a position between St. Meneshould and Valmy. The result was the world-renowned cannonade of Valmy (Sept. 20, 1792). Kellermann's infantry, nearly all regulars, stood steady. The French artillery justified its reputation as the best in Europe, and eventually, with no more than a half-hearted infantry attack, the duke broke off the action and retired. This trivial engagement was the turning-point of the campaign and a landmark in the world's history. Ten days later, without firing another shot, the invading army began its retreat. Dumouriez's pursuit was not seriously pressed; he occupied himself chiefly with a series of subtle and curious negotiations which, with the general advance of the French troops, brought about the complete withdrawal of the enemy from the soil of France.

Meanwhile, the French forces in the south had driven back the Piedmontese and had conquered Savoy and Nice. Another French success was the daring expedition into Germany made by Custine from Alsace. Custine captured Mainz itself on Oct. 21 and penetrated as far as Frankfurt. In the north the Austrian siege of Lille had completely failed, and Dumouriez now resumed his interrupted scheme for the invasion of the Netherlands. His forward movement, made as it was late in the season, surprised the Austrians, and he disposed of enormously superior forces. On Nov. 6 he won the first great victory of the war at Jemappes, near Mons, and, this time advancing boldly, he overran the whole country from Namur to Antwerp within a month.

Such was the prelude of what was called the "Great War" in England and the "*Épopée*" in France. Before going farther it is necessary to summarize the special features of the French army—in leadership, discipline, tactics, organization and movement—which made these campaigns the archetype of modern warfare.

The French Army 1792-1796.—At the outbreak of the Revolution, the French army, like other armies in Europe, was a "voluntary" long-service army, augmented to some extent in war by drafts of militia. One of the first problems that the Constituent Assembly took upon itself to solve was the nationalization of this strictly royal and professional force, and as early as October 1789, the word "conscription" was heard in its debates. But it was decreed, nevertheless, that free enlistment alone befitted a free people, and the regular army was left unaltered in form. However, a national guard came into existence side by side with it, and the history of French army organization in the next few years is the history of the fusion of these two elements. The first step, as regards the regular army, was the abolition of proprietary rights, the serial numbering of regiments throughout the army, and the disbandment of the *Maison du roi*. The next was the promotion of deserving soldiers to fill the numerous vacancies caused by the emigration. Along with these, however, there came to the surface many incompetent leaders, favourites in the political clubs of Paris, etc., and the old strict discipline became impossible owing to the frequent intervention of the civil authorities in matters affecting it, the denunciation of generals, and especially the wild words and wild behaviour of "Volunteer" (embodied national guard) battalions.

When war came, it was soon found that the regulars had fallen too low in numbers and that the national guard demanded too high pay, to admit of developing the expected field strength. Arms, discipline, training alike were wanting to the new levies, and the repulse of Brunswick was effected by manoeuvring and fighting on the old lines and chiefly with the old army. The cry of "*La patrie en danger*," after giving, at the crisis, the highest moral support to the troops in the front, dwindled away after victory, and the French Government contented itself with the half-measures that had, apparently, sufficed to avert the peril. More, when the armies went into winter quarters, the volunteers claimed leave of absence and went home. But in the spring of 1793, confronted by a far more serious peril, the Government took strong measures. Universal liability was asserted, and passed into law. Yet even now whole classes obtained exemption and the right of substitution as usual forced the burden of service on the poorer classes, so that of the 100,000 men called on for the regular army and 200,000 for the volunteers, only 180,000 men were actually raised. Desertion, quite usually regarded as the curse of professional armies, became a conspicuous vice of the defenders of the Republic, except at moments when a supreme crisis called forth supreme devotion.

Amalgamation and Universal Service.—While this unsatisfactory general levy was being made, defeats, defections and invasion in earnest came in rapid succession, and to deal with the almost desperate emergency, the ruthless Committee of Public Safety sprang into existence. "The levy is to be universal. Unmarried citizens and widowers without children of ages from 18 to 25 are to be called up first," and 450,000 recruits were immediately obtained by this single act. The complete amalgamation of the regular and volunteer units was decided upon. The white uniforms of the line gave place to the blue of the national guard

in all arms and services. The titles of officers were changed, and in fact every relic of the old régime, save the inherited solidity of the old regular battalions, was swept away. This rough combination of line and volunteers, therefore—for the "Amalgam" was not officially begun until 1794—must be understood when we refer to the French army of Hondschoote or of Wattignies. It contained, by reason of its universality and also because men were better off in the army than out of it—if they stayed at home they went in daily fear of denunciation and the guillotine—the best elements of the French nation. To some extent the political *arrivistes* had been weeded out, and though the informer, here as elsewhere, struck unseen blows, the mass of the army gradually evolved its true leaders and obeyed them. It was, therefore, an army of individual citizen-soldiers of the best type, welded by the enemy's fire, and conscious of its own solidarity in the midst of the revolutionary chaos. After 1794 the system underwent but little radical change until the end of the Revolutionary period. Its regiments grew in military value month by month and attained their highest level in the great campaign of 1796. In 1795 the French forces (now all styled national guard) consisted of 531,000 men, of whom 323,000 were infantry (100 3-battalion demi-brigades), 97,000 light infantry (30 demi-brigades), 29,000 artillery, 20,000 engineers and 59,000 cavalry. This novel army developed novel fighting methods, above all in the infantry. This arm had just received a new drill-book, as the result of a long controversy (*see* INFANTRY) between the advocates of "lines" and "columns," and this drill-book, while retaining the principle of the line, set controversy at rest by admitting battalion columns of attack, and movements at the "quick" (100–120 paces to the minute) instead of at the "slow" march (76). On these two prescriptions, ignoring the rest, the practical troop leaders built up the new tactics little by little, and almost unconsciously.

Tactics.—The earlier battles were fought more or less according to the drill-book, partly in line for fire action, partly in column for the bayonet attack. But line movements required the most accurate drill, and what was attainable after years of practice with regulars moving at the slow march was wholly impossible for new levies moving at 120 paces to the minute. When, therefore, the line marched off, it broke up into a shapeless swarm of individual firers. This was the form, if form it can be called, of the tactics of 1793—"horde-tactics" as they have quite justly been called—and a few such experiences as that of Hondschoote sufficed to suggest the need of a remedy. This was found in keeping as many troops as possible out of the firing line. In other words, the bravest and coolest marksmen were let loose to do what damage they could, and the rest, massed in close order, were kept under the control of their officers and only exposed to the dissolving influence of the fight when the moment arrived to deliver, whether by fire or by shock, the decisive blow.

The cavalry underwent little change in its organization and tactics, which remained as in the drill-books founded on Frederick's practice. But except in the case of the hussars, who were chiefly Alsations, it was thoroughly disorganized by the emigration or execution of the nobles who had officered it, and for long it was incapable of facing the hostile squadrons in the open.

In artillery matters, this period, 1792–96, marks an important progress, due above all to Gribeauval (*q.v.*) and the two du Teils, Jean Pierre (1722–94) and Jean (1733–1820), who were Bonaparte's instructors. The change was chiefly in organization and equipment—the great tactical development of the arm was not to come until the time of the Grande Armée—and may be summarized as the transition from battalion guns and reserve artillery to batteries of "horse and field."

The engineers, like the artillery, were a technical and non-noble corps. They escaped, therefore, most of the troubles of the Revolution—indeed, the artillery and engineer officers, Bonaparte and Carnot amongst them, were conspicuous in the political regeneration of France—and the engineers carried on with little change the traditions of Vauban and Cormontaigne (*see* FORTIFICATION AND SIEGECRAFT). Both these corps were, after the Revolution as before it, the best in Europe, other armies admitting

their superiority and following their precepts.

In all this the army naturally outgrew its old "linear" organization. Temporary divisions, called for by momentary necessities, placed under selected generals and released from the detailed supervision of the commander-in-chief, soon became, though in an irregular and haphazard fashion, permanent organisms, and by 1796 the divisional system had become practically universal. The next step, as the armies became fewer and larger, was the temporary grouping of divisions; this, too, in turn became permanent as the army corps.

New System of War.—This subdivision of forces was intimately connected with the general method of making war adopted by the "New French," as their enemies called them. What astonished the Allies most of all was the number and the velocity of the Republicans. These improvised armies had, in fact, nothing to delay them. Tents were unprocurable for want of money, untransportable for want of the enormous number of wagons that would have been required, and also unnecessary, for the discomfort that would have caused wholesale desertion in professional armies was cheerfully borne by the men of 1793–94. Supplies for armies of then unheard-of size could not be carried in convoys, and the French soon became familiar with "living on the country." Thus 1793 saw the birth of a new system of war—rapidity of movement, full development of national strength, bivouacs and requisitions, and force, as against cautious manoeuvring, small professional armies, tents and full rations, and chicanery. The first represented the decision-compelling spirit, the second the spirit of risking a little to gain a little. Above all the decision-compelling spirit was reinforced by the presence of the emissaries of the Committee of Public Safety, the "representatives on mission" who practically controlled the guillotine. There were civil officials with the armies of the Allies too, but their chief function was not to infuse desperate energy into the military operations, but to see that the troops did not maltreat civilians. Such were the fundamental principles of the "New French" method of warfare, but it only reached maturity after a painful period of trial and error.

CAMPAIGNS IN THE NETHERLANDS

The year 1793 opened disastrously for the Republic. As a consequence of Jemappes and Valmy, France had taken the offensive both in Belgium, which had been overrun by Dumouriez's army, and in the Rhine countries. But the execution of Louis XVI. raised up a host of new and determined enemies. England, Holland, Austria, Prussia, Spain and Sardinia promptly formed the First Coalition. England poured out money in profusion to pay and equip her Allies' land armies, and herself began the great struggle for the command of the sea (*see Naval Operations*, below).

Neerwinden.—In the Low Countries, while Dumouriez was beginning his proposed invasion of Holland, Prince Josias of Saxe-Coburg, the new Austrian commander on the Lower Rhine, advanced from the region of Cologne and drove in the various detachments that Dumouriez had posted to cover his right. The French general thereupon abandoned his advance into Holland, and, with what forces he could gather, turned towards the Meuse. The two armies met at Neerwinden (*q.v.*) on March 18, 1793. Dumouriez had only a few thousand men more than his opponent, instead of the enormous superiority he had had at Jemappes. Thus the enveloping attack could not be repeated, and in a battle on equal fronts the old generalship and the old armies had the advantage. Dumouriez was thoroughly defeated, the house of cards collapsed, and the whole of the French forces retreated in confusion to the strong line of border fortresses, created by Louis XIV. and Vauban.¹ Dumouriez, witnessing the failure of his political schemes, declared against the Republic and, after a vain attempt to induce his own army to follow his example, fled (April 5) into the Austrian lines. The leaderless Republicans streamed back to Valenciennes. There, however, they found a general. Picot (comte de) Dampierre was a regimental officer of the old army, who, in spite of his vanity and extravagance, pos-

¹For the following operations see map in SPANISH SUCCESSION WAR.

essed real loyalty to the new order of things, and brilliant personal courage. At the darkest hour he seized the reins without orders and without reference to seniority, and began to reconstruct the force and the spirit of the shattered army by wise administration and dithyrambic proclamations.

France was, however, for a time defenceless, and the opportunity existed for the military promenade to Paris that the allied statesmen had imagined in 1792. But Coburg now ceased to be a purely Austrian commander, for one by one allied contingents, with instructions that varied with the political aims of the various governments, began to arrive. Soon the idea of restoring order in France became little more than a pretext for a general intrigue amongst the confederate powers, each seeking to aggrandize itself at France's expense. Coburg's plan of campaign was limited to the objects acceptable to all the Allies alike. He aimed at the conquest of a first-class fortress—Lille or Valenciennes—his reason being largely that he might gain a depot as near as possible to the front to save the customarily exorbitant hire of transport for supplies. As for the other governments which Coburg served as best he could, the object of the war was material concessions, and it would be easy to negotiate for the cession of Dunkirk and Valenciennes when the British and Austrian colours already waved there. The Allies, therefore, instead of following up their advantage over the French field army and driving forward on the open Paris road, set their faces westward, intending to capture Valenciennes, Le Quesnoy, Dunkirk and Lille one after the other.

Dampierre meanwhile grew less confident as responsibility settled upon his shoulders. Quite unable to believe that Coburg would bury himself in a maze of rivers and fortresses when he could scatter the French army to the winds by a direct advance, he was disquieted and puzzled by the Austrian investment of Condé. And the result of skirmishes around Valenciennes gave him little confidence in the troops. But the representatives on mission bade him relieve Condé at all costs. On May 1, Coburg's positions west of Quiévrain were attacked. The French won some local successes by force of numbers and surprise, but the Allies recovered themselves, and drove the Republicans in disorder to their entrenchments. Dampierre's discouragement now became desperation, and, urged on by the representatives (who, be it said, had exposed their own lives freely enough in the action), he attacked Clerfayt, who was covering the siege of Condé, on the 8th at Raismes. The troops fought far better in the woods and hamlets west of the Scheldt than they had done in the plains to the east. But in the heat of the action Dampierre risked and lost his life in leading a storming party, and his men retired sullenly, though this time in good order, to Valenciennes. Another pause followed, Coburg awaiting the British contingent under the duke of York, and the Republicans endeavouring to assimilate the reinforcements of conscripts, who now arrived. Mutiny and denunciations augmented the confusion in the French camp. Plan of campaign there was none, save a resolution to stay at Valenciennes in the hope of finding an opportunity of relieving Condé and to create diversions elsewhere. These came to nothing, and before they had even started, Coburg, resuming the offensive, had stormed the lines of Famars (May 24), whereupon the French army retired to Bouchain, leaving not only Condé, but also Valenciennes to resist as best they could. Here, surrounded by streams and marshes, the French generals thought that their troops were secure from the rush of the dreaded Austrian cavalry. Coburg refrained from a regular siege of Condé. He wished to gain possession of the fortress in a defensible state, intending to use it as his own depot later in the year. He therefore reduced it by famine. During the siege of Valenciennes the Allies appear to have been supplied from Mons.

Many Commanders.—Custine next took charge of the dispirited army, the fourth commander in two months. His first task was to institute a severe discipline, and his prestige was so great that his mere threat of death sentences for offenders produced the desired effect. As to operations, he wished for a concentration of all possible forces from other parts of the frontier towards Valenciennes, even if necessary at the cost of sacrificing his own con-

quest of Mainz. But the generals of the numerous other armies refused to give up their troops, and on June 17 the idea was abandoned in view of the growing seriousness of the Vendéan insurrection (*see* VENDÉE). Custine, therefore, could do no more than continue the work of reorganization. Coburg, who had all this time succeeded in remaining concentrated, now found himself compelled to extend leftwards towards Flanders, for Custine had infused some energy into the scattered groups of the Republicans in the region of Douai, Lille and Dunkirk—and during this respite the Paris Jacobins sent to the guillotine both Custine and his successor La Marlière before July was ended. Both were "ci-devant" nobles and, so far as is ascertainable, neither was guilty of anything worse than attempts to make his orders respected by his soldiers. By this time, owing to the innumerable denunciations and arrests, the confusion in the Army of the North was at its height, and no further efforts were made for the relief of Valenciennes and Condé. Condé, starved out as Coburg desired, capitulated on June 10, and Valenciennes, which held out bravely until the civil population began to plot treachery, on July 28. Shortly after this the wreck of the field army retired on Arras. By this they gave up the direct defence of the Paris road, but placed themselves in a "flank position" relatively to it. Thus ended the second episode of the campaign of 1793. Military operations were few and spasmodic, on the one side because the Allied statesmen were less concerned with the nebulous common object of restoring order in France than with their several schemes of aggrandizement, on the other owing to the almost incredible confusion of France under the *régime* of Danton and Marat. The third episode shows little or no change in the force and direction of the allied efforts, but a very great change in France. Thoroughly roused by disaster and now dominated by the furious and bloodthirsty energy of the Terrorists, the French people and armies at last set before themselves clear and definite objects to be pursued at all costs.

Jean Nicolas Houchard, the next officer appointed to command, had been a heavy cavalry trooper in the Seven Years' War. His bravery, his stature, his bold and fierce manner, his want of education, seemed all to betoken the ideal *sans-culotte* general. But he was incapable of leading an army, and knowing this, carefully conformed to the advice of his staff-officers, Berthelmy and Gay-Vernon, the latter of whom, an exceptionally capable officer, had been Custine's chief of staff and was consequently under suspicion. At one moment, indeed, operations had to be suspended altogether because his papers were seized by the civil authorities, and amongst them were all the confidential memoranda and maps required for the business of headquarters. It was the darkest hour. The Vendéans, the people of Lyons, Marseille and Toulon, were in open and hitherto successful revolt. Valenciennes had fallen and Coburg's hussar parties pressed forward into the Somme valley. Again the Allies had the decision of the war in their own hands. Coburg, indeed, thought an advance on Paris hazardous. But, hazardous or not, it would have been attempted but for the English. The duke of York had definite orders from his government to capture Dunkirk—at present a nest of corsairs which interfered with the Channel trade, and in the future, it was hoped, a second Gibraltar—and the English and Hanoverians marched away to besiege the coast fortress. Thereupon the king of Prussia in turn called off his contingent for operations on the middle Rhine. Coburg, therefore, was brought to a complete standstill, and the scene of the decision was shifted to the district between Lille and the coast.

Thither came Carnot, the engineer officer who was in charge of military affairs in the Committee of Public Safety and who is known to history as the "Organizer of Victory." He went no further than to recommend an inroad into Flanders on the ground that no enemy would be encountered there. This, however, in the event developed into an operation of almost decisive importance, for at the moment of its inception the duke of York was already on the march. Fighting *en route* a severe but successful action at Lincelles, to extricate the Dutch, the Anglo-Hanoverians entered the district—densely intersected with canals and morasses—around Dunkirk and Bergues on August 21 and 22.

On the right, by way of Furnes, the British moved towards Dunkirk and invested the east front of the weak fortress, while on the left the Hanoverian field-marshal von Freytag moved via Poperinghe on Bergues. The French detachments were easily dispersed. Houchard was in despair at the bad conduct of his troops. But one young general, Jourdan, anticipating Houchard's orders, had already brought a strong force from Lille to Cassel, whence he incessantly harried Freytag's posts. Carnot encouraged the garrisons of Dunkirk and Bergues, and caused the sluices to be opened. The *morale* of the defenders rose rapidly. Houchard prepared to bring up every available man of the Army of the North, and only waited to make up his mind as to the direction in which his attack should be made. The Allies themselves recognized the extreme danger of their position. It was cut in half by the Great Morass, stretches of which extended even to Furnes. Neither Dunkirk nor Bergues could be completely invested owing to the inundations, and Freytag sent a message to King George III. to the effect that if Dunkirk did not surrender in a few days the expedition would be a complete failure.

As for the French, they could hardly believe their good fortune. Generals, staff officers and representatives on mission alike were eager for a swift and crushing offensive. "Attack" and "attack in mass" became the shibboleth and the catch-phrase of the camps (Chuquet), and fortresses and armies on other parts of the frontier were imperiously called upon to supply large drafts for the Army of the North. Gay-Vernon's strategical instinct found expression in a wide-ranging movement designed to secure the annihilation of the duke of York's forces. Beginning with an attack on the Dutch posts north and east of Lille, the army was then to press forward towards Furnes, the left wing holding Freytag's left wing in check, and the right swinging inwards and across the line of retreat of both allied corps. On Aug. 28, consequently, the Dutch posts were attacked and driven away by the mobile forces at Lille, aided by parts of the main army from Arras. But even before they had fired their last shot the Republicans dispersed to plunder and compromised their success. Houchard and Gay-Vernon began to fear that their army would not emerge successfully from the supreme test they were about to impose on it, and from this moment the scheme of destroying the English began to give way to the simpler and safer idea of relieving Dunkirk. The place was so ill-equipped that after a few days' siege it was *in extremis*, and the political importance of its preservation led not merely the civilian representatives, but even Carnot, to implore Houchard to end the crisis at once. An army of 37,000 men was left to watch Coburg and to secure Arras and Douai, and the rest, 50,000 strong, assembled at Cassel. Everything was in Houchard's favour could he but overcome the indiscipline of his own army. The duke of York was more dangerous in appearance than in reality and Freytag's covering army extended in a line of disconnected posts from Bergues to Ypres.

Hondschoote.—Against the left and centre of this feeble cordon 40,000 men advanced in many columns on Sept. 6. A confused outpost fight, in which the various assailing columns dissolved into excited swarms, ended, long after nightfall, in the orderly withdrawal of the various allied posts to Hondschoote. The French generals were occupied the whole of next day in sorting out their troops, who had not only completely wasted their strength against mere outposts, but had actually consumed their rations and used up their ammunition. On the 8th, the assailants, having more or less recovered themselves, advanced again. They found the enemy entrenched on either side of the village of Hondschoote, the right resting on the great morass and the left on the village of Leysele. Houchard, now concerned more with the relief of Dunkirk than with the defeat of the enemy, had sent away one division to Dunkirk, another to Bergues, and a third towards Ypres, and left himself only some 20,000 men for the battle. The enemy, however, had only 13,000. Houchard despatched a column, guided by his staff officer Berthelmy, to turn the Hanoverians' left, but this column lost its way in the dense country about Loo. The centre waited motionless under the fire of the allied guns near Hondschoote. In vain the representative Delbrel implored the general to order the advance. Houchard

was obstinate, and ere long the natural result followed. Though Delbrel posted himself in front of the line, conspicuous by his white horse and tricoloured sash and plume, to steady the men, the bravest left the ranks and skirmished forward from bush to bush, and the rest sought cover. Then the allied commander ordered forward one regiment of Hessians, and these, advancing at a ceremonial slow march, and firing steady rolling volleys, scattered the Republicans before them. At this crisis Houchard uttered the fatal word "retreat," but Delbrel overwhelmed him with reproaches and stung him into renewed activity. He hurried away to urge forward the right wing while Jourdan rallied the centre and led it into the fight again. Once more Jourdan awaited in vain the order to advance, and once more the troops broke. But at last the exasperated Delbrel rose to the occasion. "You fear the responsibility," he cried to Jourdan; "well, I assume it. My authority overrides the general's and I give you the formal order to attack at once!" Then, gently, as if to soften a rebuke, he continued, "You have forced me to speak as a superior; now I will be your aide-de-camp," and at once hurried off to bring up the reserves and to despatch cavalry to collect the fugitives. This incident, amongst many, serves to show that the representatives on mission were no mere savage marplots, as is too generally assumed. They were often wise and able men, brave and fearless of responsibility in camp and in action. Jourdan fell wounded, but Delbrel headed a wild irregular bayonet charge which checked the Hanoverians, and Houchard himself, in his true place as a cavalry leader, came up with 500 fresh sabres and flung himself on the Allies. The disciplined Hanoverians soon re-formed after the shock, but by this time the fugitives collected by Delbrel's troopers, reanimated by new hopes of victory, were returning to the front in hundreds, and a last assault on Hondschoote met with complete success.

Hondschoote was a psychological victory. Materially, it was no more than the crushing of an obstinate rearguard at enormous expense to the assailants, for the duke of York was able to withdraw while there was still time. But it established the fact that the "New French" were determined to win, at any cost and by sheer weight and energy. It was long before they were able to meet equal numbers with confidence, and still longer before they could freely oppose a small corps to a larger one. But the nightmare of defeats and surrenders was dispelled. Having missed the opportunity of crushing the English, Houchard turned his attention to the Dutch posts about Menin, which he overwhelmed (Sept. 12-13). After this engagement, won by immensely superior forces, Houchard pushed still further inland, but missed his target—the Austrian general, Beaulieu—while his own detachments suffered a series of pin-prick defeats. Houchard's offensive died away completely, and he halted at Gaverelle, half-way between Douai and Arras, a prey to conflicting rumours from which emerged the conclusion that Coburg was about to join the duke of York in a second siege of Dunkirk. In consequence he began to close on his left. But his conclusion was entirely wrong. The Allies were closing on *their* left inland to attack Maubeuge.

Houchard was now denounced and brought captive to Paris. Placed upon his trial, he offered a calm and reasoned defence of his conduct, but when the intolerable word "coward" was hurled at him by one of his judges he wept with rage, pointing to the scars of his many wounds, and then, his spirit broken, sank into a lethargic indifference, in which he remained to the end. He was guillotined on Nov. 16, 1793. After Houchard's arrest Jourdan accepted the command, though with many misgivings. The new levies, instead of filling up the depleted ranks of the line, were assembled in indisciplined and half-armed hordes at various frontier camps, under elected officers who had for the most part never undergone the least training. But an enthusiasm equal to that of Hondschoote, and similarly demanding a plain, urgent and recognizable objective, animated it, and although Jourdan and Carnot (who was with him) began to study the general strategic situation, the Committee brought them back to realities by ordering them to relieve Maubeuge at all costs.

Wattignies.—The Allies disposed in all of 66,000 men around the threatened fortress, but 26,000 of these were actually em-

Clerfayt, the garrison of Lille and a few outlying corps to occupy the archduke and Kinsky, and in the centre, Moreau and Bonnaud, with 40,000 effectives, were to attack the Tourcoing-Mouvieux position in front and flank at dawn with all possible energy.

Battle of Tourcoing.—The first shots were fired on the Lys, where Clerfayt's infantry had effected its crossing in the night. Vandamme's troops were, by the chance of a fatigue-enforced halt near Menin, massed on the flank of Clerfayt's subsequent line of advance. Vandamme used his advantage well. He attacked Clerfayt's columns as they moved on Lincelles with perhaps 12,000 men against 21,000. Clerfayt stopped at once, turned upon him and drove him towards Roncq and Menin. Still, fighting, rallying and fighting again, Vandamme's regiments managed to spin out time and to commit Clerfayt deeper and deeper to a false direction till it was too late in the day to influence the battle elsewhere. Von dem Bussche's column at Dottignies, still shaken from the day before, did nothing, and actually retreated to the Scheldt. On the other flank, Kinsky and the archduke Charles practically remained inactive. There remained the two centre columns, Otto's and the duke of York's. The orders of the emperor to the duke were that he should advance to establish communication with Clerfayt at Lincelles as a preliminary to a general advance to crush the French Courtrai group, thereby isolated. These airy schemes were destroyed at dawn on the 18th. One of Moreau's brigades carried Tourcoing at the first rush, another brigade swarmed round the duke of York's entrenchments at Mouvieux, while Bonnaud's mass from the side of Lille lapped round the flanks of the British posts at Roubaix and Lannoy. The duke had used up his reserves in assisting Otto, and by 8 A.M. the positions of Roubaix, Lannoy and Mouvieux were isolated from each other. But the Allies fought magnificently, and by now the Republicans were in confusion, excited to the highest pitch and therefore extremely sensitive to waves of enthusiasm or panic. Otto was able to retire gradually, though with heavy losses, to Leer, before he could be cut off, and thither the English fell back, not without confusion, to join him.

With the retreat of the two sorely tried columns and the suspension of Clerfayt's attack, the battle of Tourcoing ended. It was a victory of which the young French generals had reason to be proud. The main attack was vigorously conducted, and the two-to-one numerical superiority which the French possessed at the decisive point is the best testimony at once to Souham's generalship and to Vandamme's bravery. As for the Allies, those of them who took part in the battle at all, covered themselves with glory, but the inaction of two-thirds of Coburg's army was the bankruptcy declaration of the old strategical system. But Souham's victory, owing to his geographical position, had merely given him air. The Allies, except for the loss of some 5,500 men, were in no way worse off. The plan had failed, but the army as a whole had not been defeated, while the troops of the duke of York and Otto were far too well disciplined not to take their defeat as "all in the day's work." Souham was still on the Lys and midway between the two allied masses, able to strike each in turn or liable to be crushed between them in proportion as the opposing generals calculated time, space and endurance accurately. Souham, therefore, as early as the 19th, had left Bonnaud to hold the main body of the Allies on the side of Tournai, while he concentrated most of his forces towards Courtrai. This move had the desired effect, for Clerfayt retired without a contest, and on May 21 Souham issued his orders for an advance on Coburg's army, which, as he knew, had meantime been reinforced. Vandamme alone was left to face Clerfayt, and this time with outposts far out so as to ensure his chief, not a few hours', but two or three days', freedom from interference.

Pichegru now returned and took up the supreme command, Souham remaining in charge of his own and Moreau's divisions. On the extreme right, from Pont-à-Tressin, only demonstrations were to be made; the centre, between Baisieux and Estaimbourg, was to be the scene of the holding attack of Bonnaud's command, while Souham, in greater strength, delivered the decisive attack on the allied right by St. Leger and Warcoing. The battle opened

in the early morning of the 22nd and was long and desperately contested. The demonstration on the French extreme right was soon recognized by the defenders to be negligible, and the allied left wing thereupon closed on the centre. There Bonnaud attacked with vigour, dislodging the Allies from Nechin. The defenders of Templeuve then fell back, and the attacking swarms—a dissolved line of battle—fringed the brook beyond Templeuve, on the other side of which was the Allies' main position, and even for a moment seized Blandain. Meanwhile the French at Nechin pressed on towards Ramegnies in concert with the main attack. Macdonald's and other brigades had forced the Espierre rivulet and driven von dem Bussche partly over the Scheldt, partly southward. The main front of the Allies was defined by the brook that flows between Templeuve and Blandain and empties into the Scheldt near Pont-à-Chin. Here, till close on nightfall, a fierce battle raged. Pichegru's main attack was still by his left, and Pont-à-Chin was taken and retaken by French, Austrians, British and Hanoverians in turn. Between Blandain and Pont-à-Chin Bonnaud's troops more than once entered the line of defence. But the attack was definitively broken off at nightfall and the Republicans withdrew slowly towards Lannoy and Leers. They had for the first time in a fiercely contested "soldier's battle" measured their strength, regiment for regiment, against the Allies, and failed, but by so narrow a margin that henceforward the Army of the North realized its own strength and solidity.

The Moselle Army.—But the actual strategic decision was destined by a process of evolution to be given by Jourdan's Army of the Moselle, to which we turn. The Army of the Moselle had been ordered to assemble a striking force on its left wing, while maintaining its cordon in Lorraine, and with this striking force to operate towards Liège and Namur. Its first movement on Arlon, in April, was repulsed, but early in May the advance was resumed though the troops were ill-equipped and ill-fed, and requisitions had reduced the civil population to semi-starvation and sullen hostility. At this moment the general situation east of the Scheldt was as follows: The Allies' centre under Coburg had captured Landrecies and now (May 4) lay around that place, about 65,000 strong, while the left under Kaunitz (27,000) was somewhat north of Maubeuge. Beyond these again were the detachment of Beaulieu (8,000) near Arlon, and another, 9,000 strong, around Trier. On the side of the French, the Army of the Moselle (41,000 effectives) was in cordon between Saargemünd and Longwy; the Army of the Ardennes (22,000) between Beaumont and Givet; of the Army of the North, the right wing (38,000) in the area Beaumont-Maubeuge and the centre (24,000) about Guise. In the aggregate the Allied field armies numbered 139,000 men, those of the French 203,000. Tactically the disproportion was sufficient to give the latter the victory, if, strategically, it could be made effective at a given time and place. But the French missed their opportunity, as Coburg had missed his in 1793. Pichegru's right was ordered to march on Mons, and his left to master the navigation of the Scheldt so as to reduce the Allies to wagon-drawn supplies, while Jourdan's task was to conquer the Liège or Namur country without unduly stripping the cordon on the Saar and the Moselle. Jourdan's orders and original purpose were to march through the Ardennes as rapidly as possible, living on what supplies he could pick up from the enemy or the inhabitants.

The movement began on May 21 from Longwy through Arlon towards Neufchâteau. Irregular fighting, sometimes with the Austrians, sometimes with the bitterly hostile inhabitants, marked its progress. On the 28th the French, after a vain détour made in the hope of forcing Beaulieu to fight, reached Ciney, and there heard that the enemy had fallen back to a strongly entrenched position on the east bank of the Meuse near Namur. Jourdan was preparing to attack them there, when considerations of quite another kind intervened to change his direction, and thereby to produce the drama of Charleroi and Fleurus—which military historians have asserted to be the foreseen result of the initial plan. At the same moment (29th) Jourdan received new orders from Paris—(a) to take Dinant and Charleroi and to clear the country between the Meuse and the Sambre, and (b) to attack Namur

either by assault or by regular siege. From these orders and from the action of the enemy the campaign at last took a definite shape.

Charleroi.—When the Army of the Moselle passed over to the left bank of the Meuse, it was greeted by the distant roar of guns towards Charleroi and by news that the Army of the Ardennes, which had already twice been defeated by Kaunitz, was for the third time deeply and unsuccessfully engaged beyond the Sambre. The resumption of the march again complicated the supply question—for the system of “living on the country” had broken down in the Ardennes, and Jourdan had been dependent on intermittent convoys—and it was only slowly that the army advanced towards Charleroi. But at last, on June 3, the concentration of parts of three armies on the Sambre was effected. Jourdan took command of the united force (Army of the Sambre and Meuse) with a strong hand, the 40,000 newcomers inspired fresh courage in the beaten Ardennes troops, and in the sudden dominating enthusiasm of the moment pillaging and straggling almost ceased. Troops that had secured bread shared it with less fortunate comrades, and even the Liégeois peasantry made free gifts of supplies. Meanwhile, Tourcoing and Tournai had at last convinced Coburg that Pichegru was his most threatening opponent, and he had therefore, though with many misgivings, decided to move towards his right, leaving the prince of Orange with not more than 45,000 men on the side of Maubeuge-Charleroi-Namur. Jourdan crossed the Sambre on June 12, practically unopposed. Charleroi was rapidly invested and the covering army extended in a semicircular position. Although forced to recross the Sambre on June 16, it was back again two days later, and this time the prince of Orange gave up the effort to interfere with his irrepressible antagonists.

Charleroi, garrisoned by less than 3,000 men, was intimidated into surrender (25th); thus the object of the first operations was achieved. As to the next, neither Jourdan nor the representatives seem to have had anything further in view than the capture of more fortresses. But within 24 hours events had decided for them. Coburg had quickly abandoned his intention of closing on his right wing, and (after the usual difficulties with his Allies on that side) had withdrawn 12,000 Austrians from the centre of his cordon opposite Pichegru, and made forced marches to join the prince of Orange. On June 24 he had collected 52,000 men at various points round Charleroi, and on the 25th he set out to relieve the fortress, of whose surrender he did not know until in the midst of the battle next day.

Fleurus.—On the 26th Jourdan's army (now some 73,000 strong) was still posted in a semicircle of entrenched posts, 20m. in extent, round the captured town, but Coburg was still more widely extended. Inferior in numbers as he was, he proposed to attack on an equal front, and thus gave himself, for the attack of an entrenched position, an order of battle of three men to every two yards of front, all reserves included. The Allies were to attack in five columns, the prince of Orange from the west and north-west towards Trazeignes and Monceau wood, Quasdanovich from the north on Gosselies, Kaunitz from the north-east, the archduke Charles from the east through Fleurus, and finally Beaulieu towards Lambusart. The scheme was worked out in such minute detail and with so entire a disregard of the chance of unforeseen incidents, that once he had given the executive command to move, the Austrian general could do no more. If every detail worked out as planned, victory would be his; if accidents happened, he could do nothing to redress them, and unless these righted themselves (which was improbable in the case of the stiffly organized old armies) he could only send round the order to break off the action and retreat. In these circumstances the battle of Fleurus is the sum rather than the product of the various fights that took place between each allied column and the French division that it met. The prince of Orange attacked at earliest dawn and gradually drove in the French left wing to Courcelles, Roux and Marchiennes, but somewhat after noon, the French, under the direction for the most part of Kléber, began a series of counterstrokes which recovered the lost ground, and about five, without waiting for Coburg's instructions, the prince retired north-westward off the battlefield. The Quasdanovich column

and part of Kaunitz's force pressed the French centre division back on Gosselies, but the brook west of Mellet was a serious obstacle to the rigid order of the Allies and had to be bridged before their guns could be got over. Kaunitz's column and Championnet's division met on the battlefield of 1690. The French were gradually driven in from the outlying villages to their main position between Heppignies and Wangenies. Here they were so hard pressed as to need the intervention of Jourdan's slender reserves, and the attackers only gave way to this counterstroke at the moment they received Coburg's orders for a general retreat.

On the allied left wing the fighting was closer and more severe than at any point. Beaulieu on the extreme left advanced upon Velaine and the woods to the south in several small groups of all arms. Here were the divisions of the Army of the Ardennes, markedly inferior in discipline and endurance to the rest, and only too mindful of their four previous reverses. For six hours, more or less, they resisted the oncoming Allies, but then, in spite of the example and the despairing appeals of their young general Marceau, they broke and fled, leaving Beaulieu free to combine with the archduke Charles, who carried Fleurus after obstinate fighting, and then pressed on towards Campinaire. Beaulieu took command of all the allied forces on this side about noon, and from then to 5 P.M. launched a series of terrible attacks on the French about Campinaire and Lambusart. The Austrians came on time after time over ground that was practically destitute of cover. Villages, farms and fields of corn caught fire. The French grew more and more excited—“No retreat to-day!” they called out to their leaders, and finally, clamouring to be led against the enemy, they had their wish. Lefebvre seized the psychological moment when the fourth attack of the Allies had failed, and (though he did not know it) the order to retreat had come from Coburg. The losses of the unit that delivered it were small, for the charge exactly responded to the moral conditions of the moment, but the proportion of killed to wounded (55 to 81) is good evidence of the intensity of the momentary conflict. So ended the battle. Coburg had by now learned definitely that Charleroi had surrendered, and while the issue of the battle was still doubtful—for though the prince of Orange was beaten, Beaulieu was in the full tide of success—he gave (towards 3 P.M.) the order for a general retreat. This was delivered to the various commanders between four and five, and these, having their men in hand even in the heat of the engagement, were able to break off the battle without undue confusion. The French were far too exhausted to pursue them (they had lost twice as many men as the Allies), and their leader had practically no formed body at hand to follow up the victory, thanks to the extraordinary dissemination of the army.

Tourcoing, Tournai and Fleurus represent the maximum result achievable under the earlier Revolutionary system of making war and show the men and their leaders at the highest point of combined steadiness and enthusiasm they ever reached—that is, as a “Sans-culotte” army. Fleurus was also the last great victory of the French, in point of time, prior to the advent of Bonaparte, and may therefore be considered as illustrating the general conditions of warfare at one of the most important points in its development. The sequel of these battles can be told in a few words. The Austrian government had, it is said, long ago decided to evacuate the Netherlands, and Coburg retired over the Meuse, practically unpursued, while the duke of York's forces fell back in good order, though pursued by Pichegru through Flanders. The English contingent embarked for home, the rest retired through Holland into Hanoverian territory, leaving the Dutch troops to surrender to the victors. The last phase of the pursuit reflected glory on Pichegru, for it was conducted in midwinter through a country bare of supplies and densely intersected with dykes and meres. The crowning incident was the dramatic capture of the Dutch fleet, frozen in at the Texel, by a handful of hussars who rode over the ice and browbeat the crews of the well-armed battleships into surrender. It was many years before a prince of Orange ruled again in the United provinces, while the Austrian whitecoats never again mounted guard in Brussels.

The Rhine campaign of 1794, waged chiefly by the Prussians, was not of great importance. Möllendorf won a victory at Kaiserslautern on May 23, but operations thereafter became spasmodic, and were soon complicated by Coburg's retreat over the Meuse. With this event the offensive of the Allies against the French Revolution came to an inglorious end. Poland now occupied the thoughts of European statesmen, and Austria began to draw her forces on to the east. England stopped the payment of subsidies and Prussia made the Peace of Basle on April 5, 1795. On the Spanish frontier the French were successful in almost every encounter, and Spain, too, made peace. Only the eternal enemies, France and Austria, were left face to face on the Rhine, and elsewhere of all the Allies, Sardinia alone (*see below under ITALIAN CAMPAIGNS*) continued the struggle in a half-hearted fashion. The operations of 1795 on the Rhine present no feature of the revolutionary wars that other and more interesting campaigns fail to show. Austria had two armies on foot under the general command of Clerfayt, one on the upper Rhine, the other south of the Main, while Mainz was held by an army of imperial contingents. The French, Jourdan on the lower, Pichegru on the upper, Rhine, had as usual superior numbers at their disposal. Jourdan combined a demonstrative frontal attack on Neuwied with an advance in force via Düsseldorf, reunited his wings beyond the river near Neuwied, and drove back the Austrians in a series of small engagements to the Main, while Pichegru passed at Mannheim and advanced towards the Neckar. But ere long both were beaten, Jourdan at Höchst and Pichegru at Mannheim, and the investment of Mainz had to be abandoned. This was followed by the invasion of the Palatinate by Clerfayt and the retreat of Jourdan to the Moselle. The position was further compromised by secret negotiations between Pichegru and the enemy for the restoration of the Bourbons. The meditated treason came to light early in the following year, and the guilty commander disappeared into the obscure ranks of the royalist secret agents till finally brought to justice in 1804.

THE CAMPAIGN OF 1796 IN GERMANY

The wonder of Europe now transferred itself from the drama of the French Revolution to the equally absorbing drama of a great war on the Rhine. France's policy was no longer defensive. She aimed at invading and "revolutionizing" the monarchies and principalities of old Europe, and to this end the campaign of 1796 was to be the great and conclusive effort. The "liberation of the oppressed" had its part in the decision, and the glory of freeing the serf easily merged itself in the glory of defeating the serf's masters. But a still more pressing motive for carrying the war into the enemy's country was the fact that France and the lands she had overrun could no longer subsist her armies. The Directory frankly told its generals, when they complained that their men were starving and ragged, that they would find plenty of subsistence beyond the Rhine. On her part, Austria, no longer fettered by allied contingents nor by the expenses of a far distant campaign, could put forth more strength than on former campaigns, and as war came nearer home and the citizen saw himself threatened by "revolutionizing" and devastating armies, he ceased to hamper or to swindle the troops. Thus the duel took place on the grandest scale then known in the history of European armies. Apart from the secondary theatre of Italy, the area embraced in the struggle was a vast triangle extending from Düsseldorf to Basle and thence to Ratisbon, and Carnot sketched the outlines in accordance with the scale of the picture. He imagined nothing less than the union of the armies of the Rhine and the Riviera before the walls of Vienna.

Jourdan and Moreau.—The scheme took shape only gradually. The first advance was made partly in search of food, partly to disengage the Palatinate, which Clerfayt had conquered in 1795. "If you have reason to believe that you would find some supplies on the Lahn, hasten thither with the greater part of your forces," wrote the Directory to Jourdan (Army of the Sambre-and-Meuse, 76,000) on March 29. He was to move at once, before the Austrians could concentrate, pass the Rhine at Düsseldorf and do his utmost to break them up completely. A

fortnight later Moreau (Army of the Rhine-and-Moselle, 78,000) was ordered to take advantage of Jourdan's move, which would draw off the Austrian forces, to enter the Breisgau and Suabia. "You will attack Austria at home, and capture her magazines. You will enter a new country, the resources of which, properly handled, should suffice for the needs of the Army of the Rhine-and-Moselle." Jourdan, therefore, was to take upon himself the destruction of the enemy, Moreau the invasion of south Germany. Jourdan crossed at Düsseldorf and reached the Lahn, but the Austrians, now commanded by the archduke Charles, concentrated against him very swiftly and he had to retire over the river. Still he enabled Moreau to cross at Strasbourg without much difficulty. On hearing of Moreau's progress, the archduke returned to the Neckar country with 20,000 men, leaving Wartensleben with 36,000 to observe Jourdan. In later years he admitted himself that his own force, weakened by the usual numerous detachments, was far too small to deal with Moreau, who, he probably thought, would retire after a few manoeuvres.

The Archduke's Plan.—But Carnot had indicated a decisive battle as the object. Jourdan was instructed, if the archduke turned on Moreau, to follow him up and bring him to action. Moreau, too, was not retreating but advancing. The two armies, Moreau's and the archduke's, met in a straggling and indecisive battle at Malsch on July 9, and soon afterwards Charles learned that Jourdan had recrossed the Rhine and was driving Wartensleben before him. He thereupon retired both armies from the Rhine valley into the interior, hoping that at least the French would detach large forces to besiege the river fortresses. Disappointed of this, he determined, in his own words: "to retire both armies step by step without committing himself to a battle, and to seize the first opportunity to unite them so as to throw himself with superior or at least equal strength on one of the two hostile enemies." This is the ever-recurring idea of "interior lines." It was not new, for C. Claudius Nero in the Metaurus campaign (207 B.C.) had given the earliest example, and Frederick the Great had used similar means in similar circumstances, as had Souham at Tourcoing and even Dampierre at Valenciennes. Nor was it differentiated, as were Bonaparte's operations in this same year, by the deliberate use of a small containing force at one point to obtain relative superiority at another. The point to be observed is not the expedient, which was dictated by the circumstances, but the courage of the young general, who, unlike Wartensleben and the rest of his generals, unlike, too, Moreau and Jourdan themselves, surmounted difficulties instead of lamenting them. On the other side, Carnot, of course, foresaw this possibility. He warned the generals not to allow the enemy to "use his forces sometimes against one, sometimes against the other, as he did in the last campaign," and ordered them to go forward respectively into Franconia and into the country of the upper Neckar, with a view to seeking out and defeating the enemy's army. But the plan of operations soon grew bolder. Jourdan was informed on July 21 that he was not to hesitate to advance to Ratisbon and even to Passau if the disorganization of the enemy admitted it, but in these contingencies he was to detach a force into Bohemia to levy contributions. "We presume that the enemy is too weak to offer a successful resistance and will have united his forces on the Danube; we hope that our two armies will act in unison to rout him completely. Each is, in any case, strong enough to attack by itself, and nothing is so pernicious as slowness in war." Evidently the fear that the two Austrian armies would unite against one of their assailants had now given place to something like disdain.

This was due in all probability to the rapidity with which Moreau was driving the archduke before him. Wartensleben was similarly falling back before Jourdan. Hitherto an independent leader, he resented the loss of his freedom of action, and beside lamentations opposed a dull passive resistance to all but the most formal orders of the prince. Many weeks passed before this was overcome sufficiently for his leader even to arrange for the contemplated combination, and in these weeks the archduke was being driven back day by day, and the German principalities were falling away one by one as the French advanced and preached the

revolutionary formula. But their operating armies had seriously diminished in numbers, Jourdan disposing of not more than 45,000 and Moreau of about 50,000. The archduke had now, owing to the arrival of a few detachments from the Black Forest and elsewhere, about 34,000 men, Wartensleben almost exactly the same, and the former suddenly turned and fought a long, severe and straggling battle above Neresheim (Aug. 11). This did not, however, give him much respite, and on the 12th he began to retire over the Danube. At this date Wartensleben was about Amberg, almost as far away from the other army as he had been on the Rhine, owing to the necessity of retreating round instead of through the neutral principality of Bayreuth (Prussian). Hitherto Charles had intended to unite his armies on the Danube against Moreau. His later choice of Jourdan's army as the objective of his combination grew out of circumstances and in particular out of the brilliant reconnaissance work of one of Wartensleben's cavalry brigadiers, Nauendorff. This general's reports induced the archduke, on the 12th, to begin a concentration of his own army towards Ingolstadt; the 13th showed that the main columns of the French were swinging away to the east against Wartensleben's front and inner flanks, and on the 14th he boldly suggested the idea that decided the campaign, "If your Royal Highness will or can advance 12,000 men against Jourdan's rear, he is lost." When this message arrived at headquarters the archduke had already issued orders to the same effect. Latour, with 30,000 men, was to keep Moreau occupied—another expedient of the moment, due to the very close pressure of Moreau's advance, and the failure of the attempt to put him out of action at Neresheim. The small remainder of the army, with a few detachments gathered *en route*, in all about 27,000 men, began to recross the Danube on the 14th, and slowly advanced north on a broad front, its leader being now sure that at some point on his line he would encounter the French, whether they were heading for Ratisbon or Amberg. Meanwhile, the Directory, still acting on the theory of the archduke's weakness, had ordered Moreau to combine the operations with those of Bonaparte in Italian Tirol, and Jourdan to turn both flanks of his immediate opponent, and thus to prevent his joining the archduke, as well as his retreat into Bohemia. And, curiously enough, it was this latter, and not Moreau's move, which suggested to the archduke that his chance had come. The chance was, in fact, one dear to the 18th century general, catching his opponent in the act of executing a manoeuvre.

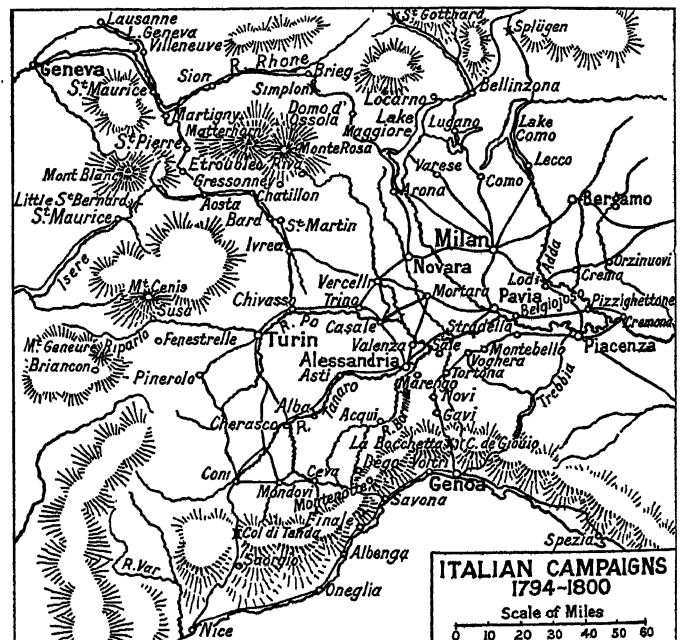

Amberg and Würzburg.—The decisive events of the campaign can be described very briefly, the ideas that directed them having been made clear. The long thin line of the archduke wrapped itself around Jourdan's right flank near Amberg, while Wartensleben fought him in front. The battle (Aug. 24) was a series of engagements between the various columns that met; it was a repetition in fact of Fleurus, without the intensity of fighting spirit that redeems that battle from dullness. Success followed, not upon bravery or even tactics, but upon the pre-existing strategical conditions. At the end of the day the French retired, and the next morning the archduke began another wide extension to his left, hoping to head them off. This consumed several days. In the course of it Jourdan attempted to take advantage of his opponent's dissemination to regain the direct road to Würzburg, but the attempt was defeated by an almost fortuitous combination of forces at the threatened point. More effective, indeed, than this indirect pursuit was the very active hostility of the peasantry, who had suffered in Jourdan's advance and retaliated so effectually during his retreat that the army became thoroughly demoralized, both by want of food and by the strain of incessant sniping. Defeated again at Würzburg (*q.v.*) on Sept. 3, Jourdan confined his retreat to the Lahn, and finally withdrew the shattered army over the Rhine. In the last engagement on the Lahn the young and brilliant Marceau was mortally wounded. Far away in Bavaria, Moreau had meantime been driving Latour from one line of resistance to another. On receiving the news of Jourdan's reverses, however, he made a rapid and successful retreat to Strasbourg, evading the prince's army, which had ascended the Rhine valley to head him off, in the nick

of time.

This celebrated campaign raised the reputation of the archduke Charles to the highest point, and deservedly, for he wrested victory from the most desperate circumstances by the skilful and resolute employment of his one advantage. But this was only possible because Moreau and Jourdan were content to accept strategical failure without seeking to redress the balance by hard fighting. The great question of this campaign is, why did Moreau and Jourdan fail against inferior numbers, when in Italy Bonaparte with a similar army against a similar opponent won victory after victory against equal and superior forces? So far as it is possible to summarize the answer in one phrase, it lies in the fact that though the Directory meant this campaign to be the final word in the Revolutionary War, for the nation at large this final word had been said at Fleurus. In default of a cause, however, soldiers will fight for a man, and this brings us by a natural sequence of ideas to the war in Italy.

THE WAR IN ITALY 1793-97

Hitherto we have ignored the operations on the Italian frontier, partly because they were of minor importance and partly because the conditions out of which Bonaparte's first campaign arose can be best considered in connection with that campaign itself. It has been mentioned that in 1792 the French overran Savoy and Nice. In 1793 the Sardinian army and a small auxiliary corps of Austrians waged a desultory mountain warfare against the Army of the Alps about Briançon and the Army of Italy on the Var. That furious offensive on the part of the French, which signalized the year 1793 elsewhere, was made impossible here by the counter-revolution in the cities of the Midi. In 1794, when this had been crushed, the intention of the French government was to take the offensive against the Austro-Sardinians. The first operation was to be the capture of Oneglia. The concentration of large forces in the lower Rhone valley had naturally infringed upon the areas told off for the provisioning of the Armies of the Alps (Kellermann) and of Italy (Dumerbion); indeed, the sullen population could hardly be induced to feed the

troops suppressing the revolt, still less the distant frontier armies. Thus the only source of supply was the Riviera of Genoa: "Our connections with this district are imperilled by the corsairs of Oneglia (a Sardinian town) owing to the cessation of our operations afloat. The army is living from hand to mouth," wrote the younger Robespierre in Sept. 1793. Vessels bearing supplies from Genoa could not avoid the corsairs by taking the open sea, for there the British fleet was supreme. The Army of Italy began operations in April, and not only was Oneglia captured, but also the Col di Tenda. Napoleon Bonaparte served in these affairs

on the headquarters staff. Meantime the Army of the Alps had possessed itself of the Little St. Bernard and Mont Cenis, and the Republicans were now (May) masters of several routes into Piedmont. But the Alpine roads merely led to fortresses, and both Carnot and Bonaparte—who had by now captivated the younger Robespierre and become the leading spirit in Dumerbion's army—considered that the Army of the Alps should be weakened to the profit of the Army of Italy, and that the time had come to disregard the feeble neutrality of Genoa, and to advance over the Col di Tenda.

Bonaparte in 1794.—Bonaparte's first suggestion for a rapid condensation of the French cordon, and an irresistible blow on the centre of the Allies by Tenda-Coni, came to nothing owing to the waste of time in negotiations between the generals and the distant Committee, and meanwhile new factors came into play. The capture of the pass of Argentera by the right wing of the Army of the Alps suggested that the main effort should be made against the barrier fortress of Demonte, but here again Bonaparte proposed a concentration of effort on the primary and economy of force in the secondary objective. About the same time, in a memoir on the war in general, he laid down his most celebrated maxim: "The principles of war are the same as those of a siege. Fire must be concentrated on one point, and as soon as the breach is made, the equilibrium is broken and the rest is nothing." These tactical ideas of concentration and breaking the equilibrium he had already carried into the sphere of policy and strategy on the same lines. "Austria is the great enemy; Austria crushed, Germany, Spain, Italy fall of themselves. We must not disperse, but concentrate our attack." Bonaparte argued that Austria could be effectively wounded by an offensive against Piedmont, and even more effectively by an ulterior advance from Italian soil into Germany. But the younger Robespierre perished with his brother in the *coup d'état* of 9th Thermidor, the advance was suspended, and Bonaparte, amongst other leading spirits of the Army of Italy, was arrested and imprisoned. Profiting by this moment, Austria increased her auxiliary corps, and the allied forces moved (in September) towards the Riviera. This threat to the French supplies was averted by the expedition of Dego, planned chiefly by Bonaparte, who had been released from prison and was at headquarters, though unemployed.

Schérer and Kellermann.—In November 1794, Dumerbion was replaced by Schérer, who was soon transferred to the Spanish frontier, while the plan he left, as limited in scope as in force, was never put into execution, for spring had scarcely arrived when the prospect of renewed revolts in the south of France practically paralysed the army. This encouraged the enemy to deliver the blow that had so long been feared. Their combined forces, the Sardinians, the Austrian auxiliary corps and the newly arrived Austrian main army, advanced together and forced the French right wing to evacuate Vado and the Genoese littoral. But at this juncture the conclusion of peace with Spain released the Pyrenees armies, and Schérer returned to the Army of Italy at the head of reinforcements. He was faced with a difficult situation, but he had the means wherewith to meet it, as Bonaparte promptly pointed out. Up to this time, Bonaparte said, the French commanded the mountain crest, and therefore covered Savoy and Nice, and also Oneglia, Loano and Vado, the ports of the Riviera. But now that Vado was lost the breach was made. Genoa was cut off, and the south of France was the only remaining resource for the army commissariat. Vado must therefore be retaken and the line reopened to Genoa. But Bonaparte's mind ranged beyond the immediate future. He calculated that if the French advanced into the interior by the road Savona-Ceva, the Austrians would seek to cover Lombardy, the Piedmontese Turin, and this separation, already morally accomplished, it was to be the French general's task to accentuate in fact. Next, Sardinia having been coerced into peace, the Army of Italy would expel the Austrians from Lombardy and connect its operations with those of the French in South Germany by way of Tirol. The supply question, once the soldiers had gained the rich valley of the Po, would solve itself.

Loano.—This was the essence of the first of four memoranda on this subject prepared by Bonaparte in his Paris office. The second

indicated the means of coercing Sardinia—first the Austrians were to be driven or scared away towards Alessandria, then the French army would turn sharp to the left, driving the Sardinians eastward and north-eastward through Ceva, and this was to be the signal for the general invasion of Piedmont from all sides. In the third paper he framed an elaborate plan for the retaking of Vado, and in the fourth he summarized the contents of the other three. Having thus cleared his own mind as to the conditions and the solution of the problem, he did his best to secure the command for himself. The measures recommended by Bonaparte were translated into a formal and detailed order to recapture Vado. To Bonaparte the miserable condition of the Army of Italy was the most urgent incentive to prompt action. In Schérer's judgment, however, the army was unfit to take the field, and therefore *ex hypothesi* to attack Vado, without thorough reorganization, and it was only in November that the advance was finally made. It culminated, thanks once more to the resolute Masséna, in the victory of Loano (Nov. 23–24). But Schérer thought more of the destitution of his own army than of the fruits of success, and contented himself with resuming possession of the Riviera. Meanwhile the mentor, whose suggestions and personality were equally repugnant to Schérer, had undergone strange vicissitudes of fortune—dismissal from the headquarters staff, expulsion from the list of general officers, and then the "whiff of grapeshot" of 13th Vendémiaire, followed shortly by his marriage with Josephine, and his nomination to command the Army of Italy. These events had neither shaken his cold resolution nor disturbed his balance.

Napoleon in Command.—The Army of Italy spent the winter of 1795–96 as before in the narrow Riviera, while on the one side, just over the mountains, lay the Austro-Sardinians, and on the other, out of range of the coast batteries but ready to pounce on the supply ships, were the British frigates. On Bonaparte's left Kellermann, with no more than 18,000, maintained a string of posts between Lake Geneva and the Argentera as before. Of the Army of Italy 10,000 watched the Tenda road and 12,000 the coast line. There remained for active operations some 27,000 men, ragged, famished and suffering in every way in spite of their victory of Loano. The Sardinian and Austrian auxiliaries (Colli), 25,000 men, lay between Mondovi and Ceva; a force strung out in the Alpine valleys opposed Kellermann; and the main Austrian army (commanded by Beaulieu) in widely extended cantonments between Acqui and Milan, numbered 30,000 field troops. Thus the short-lived concentration of all the allied forces for the battle against Schérer had ended in a fresh separation. Austria was far more concerned with Poland than with the moribund French question, and committed as few of her troops as possible to this distant and secondary theatre of war. As for Piedmont, "peace" was almost the universal cry, even within the army. All this scarcely affected the regimental spirit and discipline of the Austrian squadrons and battalions, which had now recovered from the defeat of Loano. But they were important factors for the new general-in-chief on the Riviera, and formed the basis of his strategy.

Bonaparte's first task was to grasp the reins and to prepare his troops, morally and physically, for active work. It was not merely that a young general with many enemies, a political favourite of the moment, had been thrust upon the army. The army itself was in a pitiable condition. Whole companies with their officers went plundering in search of mere food, the horses had never received as much as half-rations for a year past, and even the generals were half-starved. Thousands of men were barefooted and hundreds were without arms. But in a few days he had secured an almost incredible ascendancy over the sullen, starved, half-clothed army.

"Soldiers," he told them, "you are famished and nearly naked. The government owes you much, but can do nothing for you. Your patience, your courage, do you honour, but give you no glory, no advantage. I will lead you into the most fertile plains of the world. There you will find great towns, rich provinces. There you will find honour, glory and riches. Soldiers of the Army of Italy, will you be wanting in courage?"

He augmented his army of operations to about 40,000, at the

expense of the coast divisions, and set on foot also two small cavalry divisions, mounted on the half-starved horses that had survived the winter. Then he announced that the army was ready and opened the campaign. If the present separation of the Allies continued, he proposed to overwhelm the Sardinians first, before the Austrians could assemble from winter quarters, and then to turn on Beaulieu. If, on the other hand, the Austrians, before he could strike his blow, united with Colli, he proposed to frighten them into separating again by moving on Acqui and Alessandria. Hence Carcare, where the road from Acqui joined the "cannon-road" over the Apennines to Ceva, was the first objective of his march, and from there he could manoeuvre and widen the breach between the allied armies. His scattered left wing would assist in the attack on the Sardinians as well as it could—for the immediate attack on the Austrians its co-operation would of course have been out of the question. In any case he grudged every week spent in administrative preparation. The delay due to this, as a matter of fact, allowed a new situation to develop. Beaulieu was himself the first to move, and he moved towards Genoa instead of towards his Allies. The gap between the two allied wings was thereby widened, but it was no longer possible for the French to use it, for their plan of destroying Colli *while Beaulieu was ineffective* had collapsed.

In connection with a plan for a Genoese loan, and to facilitate the movement of supply convoys, a small French force had been pushed forward to Voltri. Bonaparte ordered it back as soon as he arrived at the front, but the alarm was given. The Austrians broke up from winter quarters at once, and rather than lose the food supplies at Voltri, Bonaparte actually reinforced Masséna at that place, and gave him orders to hold on as long as possible, cautioning him only to watch his left rear (Montenotte). But he did not abandon his purpose. Starting from the new conditions, he devised other means, as we shall see, for reducing Beaulieu to ineffectiveness. The French advance to Voltri had not only spurred Beaulieu into activity, but convinced him that the bulk of the French army lay east of Savona. He therefore made Voltri the object of a converging attack, not with the intention of destroying the French army but with that of "cutting its communications with Genoa and expelling it from the only place in the Riviera where there were sufficient ovens to bake its bread." As the Sardinians and auxiliary Austrians were ordered to extend leftwards on Dego to close the gap that Beaulieu's advance on Genoa-Voltri opened up, and the furthest to the right of Beaulieu's own columns had orders to seize Monte Legino, the wings were therefore so far connected that Colli wrote to Beaulieu on this day "the enemy will never dare to place himself between our two armies." The event belied the prediction, and the proposed minor operation against granaries and bakeries became the first act of a decisive campaign.

On the night of April 9 the French were grouped as follows: brigades under Garnier and Macquard at the Finestre and Tenda passes, Sérurier's division and Rusca's brigade east of Gareggio; Augereau's division about Loano, Meynier's at Finale, Laharpe's at Savona with an outpost on the Monte Legino, and Cervoni's brigade at Voltri. Masséna was in general charge of the last-named units. The cavalry was far in rear beyond Loano. Colli's main force was around Coni and Mondovi-Ceva, the latter group connecting with Beaulieu by a detachment under Provera between Millesimo and Carcare. Of Beaulieu's army, Argenteau's division, still concentrating to the front in many small bodies, extended over the area Acqui-Dego-Sassello. Vukassovich's brigade was equally extended between Ovada and the mountain-crests above Voltri, and Pittoni's division was grouped around Gavi and the Bocchetta, the two last units being destined for the attack on Voltri. Farther to the rear was Sebottendorf's division around Alessandria-Tortona. On the afternoon of the 10th Beaulieu delivered his blow at Voltri, not, as he anticipated, against three-quarters of the French army, but against Cervoni's detachment. This, after a long irregular fight, slipped away in the night to Savona. Discovering his mistake next morning, Beaulieu sent back some of his battalions to join Argenteau. But there was no road by which they could do so save the détour through Acqui

and Dego, and long before they arrived Argenteau's advance on Monte Legino had forced on the crisis. On the 11th (a day behind time), this general drove in the French outposts, but he soon came on three battalions under Col. Rampon, who threw himself into some old earthworks that lay near, and said to his men, "We must win or die here, my friends." His redoubt and his men stood the trial well, and when day broke on the 12th Bonaparte was ready to deliver his first "Napoleon-stroke."

Montenotte.—The principle that guided him in the subsequent operations may be called that of "concentrating a temporary superiority of force at the point of balance." Touch had been gained with the enemy all along the long line between the Tenda and Voltri, and he decided to concentrate swiftly upon the nearest enemy—Argenteau. Augereau's division, or such part of it as could march at once, was ordered to Mallare. Masséna, with 9,000 men, was to send two brigades in the direction of Carcare and Altare, and with the third to swing round Argenteau's right and to head for Montenotte village in his rear. Laharpe with 7,000 (it had become clear that the enemy at Voltri would not pursue their advantage) was to join Rampon, leaving only Cervoni and two battalions in Savona. Sérurier and Rusca were to keep the Sardinians in front of them occupied. The far-distant brigades of Garnier and Macquard stood fast, but the cavalry drew eastward as quickly as its condition permitted. In rain and mist on the early morning of the 12th the French marched up from all quarters, while Argenteau's men waited in their cold bivouacs for light enough to resume their attack on Monte Legino. About nine the mists cleared, and heavy fighting began, but Laharpe held the mountain, and Masséna with his nearest brigade stormed forward against Argenteau's right. A few hours later, seeing Augereau's columns heading for their line of retreat, the Austrians retired, sharply pressed, on Dego. The threatened intervention of Provera was checked by Augereau's presence at Carcare.

Montenotte was a brilliant little victory, and one can imagine its effects on the but lately despondent soldiers of the Army of Italy, but only two-thirds of Argenteau's force, and none of the other divisions, had been beaten, and the heaviest fighting was to come. Bonaparte, eager to begin at once the subjugation of the Piedmontese (for which purpose he wanted to bring Sérurier and Rusca into play) sent only Laharpe's division and a few details of Masséna's, under the latter, towards Dego. These were to protect the main attack from interference by the forces that had been engaged at Montenotte (imagined to be Beaulieu's main body), the said main attack being delivered by Augereau's division, reinforced by most of Masséna's, on the positions held by Provera. The latter, only 1,000 strong to Augereau's 9,000, shut himself in the castle of Cossaria, which, imitating Rampon, he defended against a series of furious assaults. Not until the morning of the 14th was his surrender secured, after his ammunition and food had been exhausted.

Argenteau also won a day's respite on the 13th, for Laharpe did not join Masséna till late, and nothing took place opposite Dego but a little skirmishing. During the day Bonaparte saw for himself that he had overrated the effects of Montenotte. Beaulieu, on the other hand, underrated them, treating it as a mishap that was more than counterbalanced by his own success in "cutting off the French from Genoa." He began to reconstruct his line on the front Dego-Sassello, trusting to Colli to harry the French until the Voltri troops had finished their détour through Acqui and rejoined Argenteau. This, of course, presumed that Argenteau's troops were intact and Colli's able to move, which was not the case with either. Not until the afternoon of the 14th did Beaulieu place a few extra battalions at Argenteau's disposal "to be used only in case of extreme necessity," and order Vukassovich from the region of Sassello to "make a diversion" against the French right with *two* battalions.

Dego.—Thus Argenteau, already shaken, was exposed to destruction. On the 14th, after Provera's surrender, Masséna and Laharpe, reinforced until they had nearly a two-to-one superiority, stormed Dego and killed or captured 3,000 of Argenteau's 5,500 men, the remnant retreating in disorder to Acqui. But nothing was done towards the accomplishment of the purpose of

destroying Colli on that day, save that Sérurier and Rusca began to close in to meet the main body between Ceva and Millesimo. Moreover, the victory at Dego had produced its usual results on the wild fighting swarms of the Republicans, who threw themselves like hungry wolves on the little town, without pursuing the beaten enemy or even placing a single outpost on the Acqui road. In this state, during the early hours of the 15th, Vukassovich's

brigade,¹ marching up from Sassello, surprised them, and they broke and fled in an instant. The whole morning had to be spent in rallying them at Cairo, and Bonaparte had for the second time to postpone his union with Sérurier and Rusca, who meanwhile, isolated from one another and from the main army, were groping forward in the mountains. A fresh assault on Dego was ordered, and after very severe fighting, Masséna and Laharpe succeeded late in the evening in retaking it. Vukassovich lost heavily, but retired steadily and in order on Spigno. The killed and wounded numbered probably about 1,000 French and 1,500 Austrians, out of considerably less than 10,000 engaged on each side—a loss which contrasted very forcibly with those suffered in other battles of the Revolutionary Wars, and by teaching the Army of Italy to bear punishment, imbued it with self-confidence. But again success bred disorder, and there was a second orgy in the houses and streets of Dego which went on till late in the morning and paralysed the whole army.

This was perhaps the crisis of the campaign. Even now it was not certain that the Austrians had been definitively pushed aside, while it was quite clear that Beaulieu's main body was intact and Colli was still more an unknown quantity. But Bonaparte's intention remained the same, to attack the Piedmontese as quickly and as heavily as possible, Beaulieu being held in check by a containing force under Masséna and Laharpe. The remainder of the army, counting in now Rusca and Sérurier, was to move westward towards Ceva. This disposition, while it illustrates the Napoleonic principle of delivering a heavy blow on the selected target and warding off interference at other points, shows also the difficulty of rightly apportioning the available means between the offensive mass and the defensive system, for, as it turned out, Beaulieu was already sufficiently scared, and thought of nothing but self-defence on the line Acqui-Ovada-Bocchetta, while the French offensive mass was very weak compared with Colli's unbeaten and now fairly concentrated army about Ceva.

On the afternoon of the 16th the real avalanche was begun by Augereau's division, reinforced by other troops. Rusca joined

Augereau towards evening, and Sérurier approached Ceva from the south. Colli's object was now to spin out time, and having repulsed a weak attack by Augereau, and feeling able to repeat these tactics on each successive spur of the Apennines, he retired in the night to a new position behind the Cursaglia. On the 17th, reassured by the absence of fighting on the Dego side, and by the news that no enemy remained at Sassello, Bonaparte released Masséna from Dego, leaving only Laharpe there, and brought him over towards the right of the main body, which thus on the evening of the 17th formed a long straggling line on both sides of Ceva, Sérurier on the left, écheloned forward, Augereau, Joubert and Rusca in the centre, and Masséna, partly as support, partly as flank guard, on Augereau's right rear. Sérurier had been bidden to extend well out and to strive to get contact with Masséna, *i.e.*, to encircle the enemy. The line of supply, as an extra guarantee against interference, was changed from that of Savona-Carcare to that of Loano-Bardinetto. When this was accomplished, four clear days could be reckoned with certainty in which to deal with Colli.

The latter, still expecting the Austrians to advance to his assistance, had established his corps (not more than 12,000 muskets in all) in the immensely strong positions of the Cursaglia. Opposite this position the French arrived, after many delays due to the weariness of the troops, on the 19th. A day of irregular fighting followed, everywhere to the advantage of the defenders. Bonaparte, fighting against time, ordered a fresh attack on the 20th, and only desisted when it became evident that the army was exhausted, and, in particular, when Sérurier reported frankly that without bread the soldiers would not march. The delay thus imposed, however, enabled him to clear the "cannon-road" of all vehicles, and to bring up the Dego detachment to replace Masséna in the valley of the western Bormida, the latter coming in to the main army. Twenty-four thousand men, for the first time with a due proportion of cavalry and artillery, were now disposed along Colli's front and beyond his right flank. Colli, outnumbered by two to one, and threatened with envelopment, decided once more to retreat, and the Republicans occupied the Cursaglia lines on the morning of the 21st without firing a shot. But Colli halted again at Vico, half-way to Mondovì, and while he was in this unfavourable situation the pursuers came on with true Republican swiftness, lapped round his flanks and crushed him. A few days later (April 27), the armistice of Cherasco put an end to the campaign before the Austrians moved a single battalion to his assistance.

The Napoleon Touch.—The interest of the campaign lies in the "Napoleon touch" that differentiated it from other Revolutionary campaigns. Revolutionary energy was common to the Army of Italy and to the Army of the North. Why, therefore, when the war dragged on from one campaign to another in the great plains of the Meuse and Rhine countries, did Bonaparte bring about so swift a decision in these cramped valleys? The answer is to be found partly in the exigencies of the supply service, but still more in Bonaparte's own personality and the strategy born of it. Action of some sort was the plain alternative to starvation. He would have no quarter-rations on the Riviera, but plenty and to spare beyond the mountains. Strategical conditions and "new French" methods of war did not save Bonaparte in the two crises—the Dego rout and the sullen halt of the army at San Michele—but the personality which made the soldiers, on the way to Montenotte, march barefoot past a wagon-load of new boots. Later critics evolved from his success the theory of "interior lines," but actually the method was in many respects old. What, therefore, in the theory or its application was the product of Bonaparte's own genius and will? A comparison with Souham's campaign of Tourcoing will enable us to answer this question. To begin with, Souham found himself midway between Coburg and Clerfayt almost by accident, and his utilization of the advantages of his position was an expedient for the given case. Bonaparte, however, placed himself *deliberately* in an analogous situation at Carcare and Cairo. Then he swift "concentrated fire, made the breach, and broke the equilibrium" at the spot where the interests and forces of the two allies converged and diverged.

¹Vukassovich had received Beaulieu's order to demonstrate with two battalions, and also appeals for help from Argenteau. He therefore brought most of his troops with him.

Relative Superiority.—Another guiding idea was that of "relative superiority." Whereas Souham had been in superior force (90,000 against 70,000), Bonaparte (40,000 against 50,000) was not, and yet the Army of Italy was always placed in a position of relative superiority (at first about 3 to 2 and ultimately 2 to 1) to the immediate antagonist. "The essence of strategy," said Bonaparte in 1797, "is, with a weaker army, always to have more force at the crucial point than the enemy. But this art is taught neither by books nor by practice; it is a matter of tact." In this he expressed the result of his victories on his own mind rather than a preconceived formula which produced those victories. But the idea, though undefined, and the method of practice, though imperfectly worked out, were in his mind from the first. As soon as he had made the breach, though preparing to throw all available forces against Colli, he posted Masséna and Laharpe at Dego to guard, not like Vandamme on the Lys against a real and pressing enemy, but against a *possibility*, and he only diminished the strength and altered the position of this protective detachment in proportion as the Austrian danger dwindled. Later in his career he defined this system as "having all possible strength at the decisive point," and "being nowhere vulnerable," and the art of reconciling these two requirements, in each case as it arose, was always the principal secret of his generalship. At first his precautions (judged by events and not by the probabilities of the moment) were excessive, and the offensive mass small. But the point is that such a system, however rough its first model, had been imagined and put into practice.

The first phase of the campaign satisfactorily settled, Bonaparte was free to turn his attention to the "arch-enemy" to whom he was now considerably superior in numbers (35,000 to 25,000). The day after the signature of the armistice of Cherasco he began preparing for a new advance and also for the rôle of arbiter of the destinies of Italy. Beaulieu had fallen back into Lombardy, and now bordered the Po right and left of Valenza. To achieve further progress, Bonaparte had first to cross that river, and the point and method of crossing was the immediate problem, a problem the more difficult as he had no bridge train and could only make use of such existing bridges as he could seize intact. If he crossed above Valenza he would be confronted by one river-line after another. Milan was his objective, and Tortona-Piacenza his indirect route thither. To give himself every chance he had stipulated with the Piedmontese authorities for the right of passing at Valenza, and he had the satisfaction of seeing Beaulieu fall into the trap and concentrate opposite that part of the river. The French meantime had moved to the region Alessandria-Tortona. Thence on May 6 Bonaparte set out for a forced march on Piacenza, and that night the advanced guard was 30m. on the way, at Castel San Giovanni, and Laharpe's and the cavalry divisions at Stradella, 10m. behind them. Augereau was at Broni, Masséna at Salò and Sérurier near Valenza, the whole forming a rapidly extending fan, 50m. from point to point. If the Piacenza detachment succeeded in crossing, the army was to follow rapidly in its track. If, on the other hand, Beaulieu fell back to oppose the advanced guard, the Valenza divisions would take advantage of his absence to cross there. In either case, be it observed, the Austrians were to be *evaded*, not brought to action. On the 7th, the advanced guard under Dallemagne crossed at Piacenza,¹ and, hearing of this, Bonaparte ordered every division except Sérurier's thither with all possible speed. In the exultation of the moment he mocked at Beaulieu's incapacity, but the old Austrian was already on the alert. This game of manoeuvres he understood; already one of his divisions had arrived in close proximity to Dallemagne and the others were marching eastward by all available roads. But the mobility of the French enabled them to pass the river before the Austrians (who had actually started a day in advance of them) put in an appearance, and afterwards to be in superior numbers at each point of contact. The culmination Bonaparte himself indicated as the turning-point of his life.

¹On entering the territory of the duke of Parma, Bonaparte imposed, besides other contributions, the surrender of 20 famous pictures, and thus began a practice which for many years enriched the Louvre and only ceased with the capture of Paris in 1814.

"Vendémiaire and even Montenotte did not make me think myself a superior being. It was after Lodi that the idea came to me . . . that first kindled the spark of boundless ambition."

Lodi.—Abandoning his original idea of giving battle, Beaulieu retired to the Adda, and most of his troops were safely beyond it before the French arrived near Lodi, but he felt it necessary to leave a strong rearguard on the river opposite that place to cover the reassembly of his columns after their scattered march. On the afternoon of May 10, Bonaparte, with Dallemagne, Masséna and Augereau, came up and seized the town. But 200yds. of open ground had to be passed from the town gate to the bridge, and the bridge itself was another 250yds. in length. A few hundred yards beyond it stood the Austrians, 9,000 strong with 14 guns. Bonaparte brought up all his guns to prevent the enemy from destroying the bridge. Then sending all his cavalry to turn the enemy's right by a ford above the town, he waited two hours, employing the time in cannonading the Austrian lines, resting his advanced infantry and closing up Masséna's and Augereau's divisions. Finally he gave the order to Dallemagne's 4,000 grenadiers, who were drawn up under cover of the town wall, to rush the bridge. As the column, not more than 30 men broad, made its appearance, it was met by the concentrated fire of the Austrian guns, and half way across the bridge it checked, but Bonaparte himself and Masséna rushed forward, the courage of the soldiers revived, and, while some jumped off the bridge and scrambled forward in the shallow water, the remainder stormed on, passed through the guns and drove back the infantry. This was, in bare outline, the astounding passage of the bridge of Lodi. It was not till after the battle that Bonaparte realized that only a rearguard was in front of him. When he launched his 4,000 grenadiers he thought that on the other side there were four or five times that number of the enemy. No wonder, then, that after the event he recognized in himself the flash of genius, the courage to risk everything, and the "tact" which, independent of and indeed contrary to all reasoned calculations, told him that the moment had come for "breaking the equilibrium." Lodi was a tactical success in the highest sense, in that the principles of his tactics rested on psychology—on the "sublime" part of the art of war as Saxe had called it long ago. The spirit produced the form, and Lodi was the prototype of the Napoleonic battle—contact, manoeuvre, preparation and finally the well-timed, massed and unhesitating assault. The failure to reap the strategical fruits mattered little. Many months elapsed before this bold assertion of superiority ceased to decide the battles of France and Austria.

Milan.—Next day he set off in pursuit of Beaulieu, postponing his occupation of the Milanese, but the Austrians were now out of reach, and during the next few days the French divisions were installed at various points in the area Pavia-Milan-Pizzighetone, facing outwards in all dangerous directions, with a central reserve at Milan. Thus secured, Bonaparte turned his attention to political and military administration. This took the form of exacting from the neighbouring princes money, supplies and objects of art, and the once famished Army of Italy revelled in its opportunity. Now, however, the Directory, suspicious of the too successful and too sanguine young general, ordered him to turn over the command in Upper Italy to Kellermann, and to take an expeditionary corps himself into the heart of the peninsula, there to preach the Republic and the overthrow of princes. Bonaparte absolutely refused, and offered his resignation. In the end (partly by bribery) he prevailed, but the incident reawakened his desire to close with Beaulieu. This indeed he could now do with a free hand, since not only had the Milanese been effectively occupied, but also the treaty with Sardinia had been ratified. But no sooner had he resumed the advance than it was interrupted by a rising of the peasantry in his rear. The exactions of the French had in a few days generated sparks of discontent which it was easy for the priests and the nobles to fan into open flames. Milan and Pavia as well as the countryside broke into insurrection, and at the latter place the mob forced the French commandant to surrender. Bonaparte acted swiftly and ruthlessly. Bringing back a small portion of the army with him, he

punished Milan on the 25th, sacked and burned Binasco on the 26th, and on the evening of the latter day, while his cavalry swept the open country, he broke his way into Pavia with 1,500 men and beat down all resistance. Then he advanced to the banks of the Mincio, where the remainder of the Italian campaign was fought out, both sides contemptuously disregarding Venetian neutrality. It centred on the fortress of Mantua, which Beaulieu, too weak to keep the field, and dislodged from the Mincio in the action of Borghetto (May 30), strongly garrisoned before retiring into Tirol. Beaulieu was soon afterwards replaced by Wurmser who brought reinforcements from Germany.

At this point, mindful of the narrow escape he had had of losing his command, Bonaparte thought it well to begin the resettlement of Italy. The scheme for co-operating with Moreau on the Danube was indefinitely postponed, and the Army of Italy (now reinforced from the Army of the Alps) was again disposed in a protective "zone of manoeuvre," with a strong central reserve. Against Mantua no siege artillery was available till the Austrians in the citadel of Milan capitulated, and thus not till July 18 was the first parallel begun. Almost at the same moment Wurmser began his advance from Trent with 55,000 men to relieve Mantua.

Siege of Mantua.—The protective system on which his attack would fall in the first instance was now as follows: Augereau (6,000) about Legnago, Despinoy (8,000) south-east of Verona, Masséna (13,000) at Verona and Peschiera, Sauret (4,500) at Salò and Gavardo. Sérurier (12,000) was besieging Mantua, and the only central reserve was the cavalry (2,000) under Kilmaine. The main road to Milan passed by Brescia. Sauret's brigade, therefore, was practically a detached post on the line of communication, and on the main defensive front less than 30,000 men were disposed at various points between La Corona and Legnago (30m. apart), and at a distance of 15 to 20m. from Mantua. The strength of such a disposition depended on the fighting power and handiness of the troops, who in each case would be called upon to act as a rearguard to gain time. The lie of the country scarcely permitted a closer grouping, unless Bonaparte fell back on the old-time device of a "circumvallation," and shut himself up in a ring of earthworks round Mantua—and this was impossible for want of supplies.

As Wurmser's attack procedure has received almost universal condemnation, in justice it may be pointed out that the object of the expedition was not to win a battle by falling on the disunited French with a well-concentrated army, but to overpower

29th Quasdanovich attacked Sauret at Salò, drove him towards Desenzano, and pushed on to Gavardo and thence into Brescia. Wurmser expelled Masséna's advanced guard from La Corona, and captured in succession the Monte Baldo and Rivoli posts. The Brenta column approached Verona with little or no fighting. News of this column led Bonaparte early in the day to close up Despinoy, Masséna and Kilmaine at Castelnovo, and to order Augereau from Legnago to advance on Montebello (19m. east of Verona) against Davidovich's left rear. But after these orders had been despatched came the news of Sauret's defeat, and this moment was one of the most anxious in Bonaparte's career. He could not make up his mind to give up the siege of Mantua, but he hurried Augereau back to the Mincio, and sent order after order to the officers on the lines of communication to send all convoys by the Cremona instead of by the Brescia road. More, he wrote to Sérurier a despatch which included the words "perhaps we shall recover ourselves . . . but I must take serious measures for a retreat." On the 30th he wrote: "The enemy have broken through our line in three places . . . and . . . captured Brescia. You see that our communications with Milan and Verona are cut." Early reports that day enabled him to "place" the main body of the enemy opposite Masséna, and this at least helped to make his course less doubtful. Augereau was ordered to hold the line of the Molinella, in case Davidovich's attack, the least-known factor, should after all prove to be serious; Masséna to hold Wurmser at Castelnovo as long as he could. Sauret and Despinoy were concentrated at Desenzano with orders on the 31st to clear the main line of retreat and to recapture Brescia. On the Austrian side Quasdanovich wheeled inwards, his right finally resting on Montechiaro and his left on Salò, and Wurmser drove back Masséna to the west side of the Mincio. Davidovich made a slight advance.

In the late evening Bonaparte held a council of war at Roverbella. The proceedings of this council are unknown, but it at any rate enabled Bonaparte to see clearly and to act. Hitherto he had been covering the siege of Mantua with various detachments, the defeat of any one of which might be fatal to the enterprise. Thus, when he had lost his main line of retreat, he could assemble no more than 8,000 men at Desenzano to win it back. Now, however, he made up his mind that the siege could not be continued, and bitter as was the decision, it gave him freedom. At this moment of crisis the instincts of the great captain came into play, and showed the way to a victory that would more than counterbalance the now inevitable failure. Sérurier was ordered to spike the 140 siege guns which had been so welcome a few days before, and, after sending part of his force to Augereau, to establish himself with the rest at Marcaria on the Cremona road. The field forces were to be used on interior lines. On the 31st Sauret, Despinoy, Augereau and Kilmaine advanced westward against Quasdanovich. The first two found the Austrians at Salò and Lonato and drove them back, while with Augereau and the cavalry Bonaparte himself made a forced march on Brescia, never halting night or day till he reached the town and recovered his depots. Meantime Masséna had gradually drawn in towards Lonato, Sérurier had retired (night of July 31) from before Mantua, and Wurmser's advanced guard triumphantly entered the fortress (Aug. 1).

Lonato and Castiglione.—The Austrian general now formed the plan of crushing Bonaparte between Quasdanovich and his own main body. But meantime Quasdanovich had evacuated Brescia under the threat of Bonaparte's advance and was now fighting a long irregular action with Despinoy and Sauret about Gavardo and Salò, and Bonaparte, having missed his expected target, had brought Augereau by another severe march back to Montechiaro. Masséna was now assembled between Lonato and Ponte San Marco. Wurmser's main body, weakened by the detachment sent to Mantua, crossed the Mincio about Valeggio and Goito on the 2nd, and penetrated as far as Castiglione, whence Masséna's rearguard was expelled. But a renewed advance of Quasdanovich, ordered by Wurmser, which drove Sauret and Despinoy back on Brescia and Lonato, in the end only placed a strong detachment of the Austrians within striking distance of

one, any one, of the corps covering the siege, and to press straight forward to the relief of Mantua. New ideas and new forces, undiscernible to a man of 72 years of age, obliterated his achievement by surpassing it; but such as it was—a limited use of force for a limited object—the venture undeniably succeeded.

The Austrians formed three corps, one (Quasdanovich, 18,000 men) marching round the west side of the lake of Garda, the second (under Wurmser, about 30,000) moving directly down the Adige, and the third (Davidovich, 6,000) making a détour by the Brenta valley and heading for Verona by Vicenza. On the

Masséna, who on the 3rd attacked and destroyed it, while at the same time Augereau recaptured Castiglione from Wurmser. On the 4th Sauret and Despinoy pressed back Quasdanovich beyond Salo and Gavardo, and Masséna annihilated an isolated column which tried to break its way through to Wurmser. Wurmser, thinking rightly or wrongly that he could not now retire to the Mincio without a battle, drew up his whole force, close on 30,000 men, in the plain between Solferino and Medole. The finale may be described in very few words. Bonaparte, convinced that no more was to be feared from Quasdanovich, called in Despinoy's division to the main body and sent orders to Sérurier, then far distant on the Cremona road, to march against the left flank of the Austrians. On the 5th the battle of Castiglione (*q.v.*) was fought. Closely contested in the first hours of the frontal attack till Sérurier's arrival decided the day, it ended in the retreat of the Austrians over the Mincio and into Tirol, whence they had come.

Thus the new way had failed to keep back Wurmser, and the old had failed to crush Bonaparte. In former wars a commander threatened as Bonaparte was would have fallen back at once to the Adda, abandoning the siege in such good time that he would have been able to bring off his siege artillery. Instead of this Bonaparte hesitated long enough to lose it, which, according to accepted canons, was a waste, and held his ground, which was, by the same rules, sheer madness. But revolutionary discipline was not firm enough to stand a retreat. Once it turned back, the army would have streamed away to Milan and perhaps to the Alps (*cf.* 1799). As to the manner of this fighting, even the principle of "relative superiority" failed him so long as he was endeavouring to cover the siege and again when his chief care was to protect his new line of retreat and to clear his old. In this period, viz., up to his return from Brescia on Aug. 2, the only "mass" he collected delivered a blow in the air, while the covering detachments had to fight hard for bare existence. Once released from its trammels, the Napoleonic principle had fair play. He stood between Wurmser and Quasdanovich, ready to fight either or both. The latter was crushed, thanks to local superiority and the resolute leading of Masséna, but at Castiglione Wurmser actually outnumbered his opponent till the last of Bonaparte's precautionary dispositions had been given up, and Sérurier brought back from the "alternative line of retreat" to the battlefield. The moral is, again, that it was not the mere fact of being on interior lines that gave Bonaparte the victory, but his "tact," his fine appreciation of the chances in his favour, measured in terms of time, space, attacking force and containing power. All these factors were greatly influenced by the ground, which favoured the swarms and columns of the French and deprived the brilliant Austrian cavalry of its power to act. But of far greater importance was the mobility that Bonaparte's personal force imparted to the French. Bonaparte himself rode five horses to death in three days, and Augereau's division marched from Roverbella to Brescia and back to Montechiaro, a total distance of nearly 50m., in about 36 hours. This indeed was the foundation of his "relative superiority," for every hour saved in the time of marching meant more freedom to destroy one corps before the rest could overwhelm the covering detachments and come to its assistance.

By the end of the second week in August the blockade of Mantua had been resumed, without siege guns. But still under the impression of a great victory gained, Bonaparte was planning a long forward stride. He thought that by advancing past Mantua directly on Trieste and thence onwards to the Semmering he could impose a peace on the emperor. The Directory, however, which had by now focussed its attention on the German campaign, ordered him to pass through Tirol and to co-operate with Moreau, and this plan, Bonaparte, though protesting against an Alpine venture being made so late in the year, prepared to execute. Wurmser was thought to have posted his main body near Trent, and to have detached one division to Bassano "to cover Trieste." The French advanced northward on the 2nd, in three disconnected columns which successfully combined and drove the enemy before them to Trent. There, however, they missed their target. Wurmser had already drawn over the bulk of his army (22,000) into

the Val Sugana, whence with the Bassano division as his advanced guard, he intended once more to relieve Mantua, while Davidovich with 13,000 (excluding detachments) was to hold Tirol against any attempt of Bonaparte to join forces with Moreau.

Thus Austria was preparing to hazard a second (as in the event she hazarded a third and a fourth) highly trained and expensive professional army in the struggle for the preservation of a fortress, and we must conclude that there were weighty reasons which actuated so notoriously cautious a body as the Council of War in making this unconditional venture. While Mantua stood, Bonaparte, for all his energy and sanguineness, could not press forward into Friuli and Carniola, and immunity from a Republican visitation was above all else important for the Vienna statesmen, governing as they did more or less discontented and heterogeneous populations that had not felt the pressure of war for a century and more. If we neglect pure theory, and regard strategy as the handmaiden of statesmanship—which fundamentally it is—we cannot condemn the Vienna authorities unless it be first proved that they grossly exaggerated the possible results of Bonaparte's threatened irruption.

Bassano.—When Masséna entered Trent on the morning of Sept. 5, Bonaparte became aware that the force in his front was a mere detachment, and news soon came in that Wurmser was in the Val Sugana about Primolano and at Bassano. This move he supposed to be intended to cover Trieste. He therefore informed the Directory that he could not proceed with the Tirol scheme, and spent one more day in driving Davidovich well away from Trent. Then leaving Vaubois to watch him, Bonaparte marched Augereau and Masséna, with a rapidity he scarcely ever surpassed, into the Val Sugana. Wurmser's rearguard was attacked and defeated again and again, and Wurmser himself felt compelled to stand and fight, in the hope of checking the pursuit before reaching the plains. Half his army had already reached Montebello on the Verona road, and with the rear half he posted himself at Bassano, where on the 8th he was defeated with heavy losses. Then began a strategic pursuit or general chase, and in this Bonaparte at first directed the pursuers so as to cut off Wurmser from Trieste, not from Mantua. Late on the 9th, Bonaparte realized that his opponent was heading for Mantua via Legnago and despite the fresh cast his net closed so rapidly that Wurmser barely succeeded in reaching Mantua on the 12th, with all the columns of the French, weary as most of them were, converging in hot pursuit. After an attempt to keep the open field, defeated in a general action on the 15th, the relieving force was merged in the garrison, now some 28,000 in all. So ended the episode of Bassano, the most brilliant feature of which was the marching power of the French infantry. Between the 5th and the 11th, besides fighting three actions, Masséna had marched 114m. and Augereau 114.

Alvintzi was now appointed to command a new army of relief. Practically the whole of the fresh forces available were in Carniola, the military frontier, etc., while Davidovich was still in Tirol. Alvintzi's intention was to assemble his new army (29,000) in Friuli, and to move on Bassano. Meantime, Davidovich (18,000) was to capture Trent, and the two columns were to connect by the Val Sugana. All being well, Alvintzi and Davidovich, still separate, were then to converge on the Adige between Verona and Legnago. Wurmser was to co-operate by vigorous sorties. At this time Bonaparte's protective system was as follows: Kilmaine (9,000) investing Mantua, Vaubois (10,000) at Trent, and Masséna (9,000) at Bassano and Treviso, Augereau (9,000) and Macquard (3,000) at Verona and Villafranca constituting, for the first time in these operations, important mobile reserves. Hearing of Alvintzi's approach in good time, he meant first to drive back Davidovich, then with Augereau, Masséna, Macquard and 3,000 of Vaubois's force to fall upon Alvintzi who, he calculated, would at this stage have reached Bassano, and finally to send back a large force through the Val Sugana to attack Davidovich. This plan miscarried.

By Nov. 7 Davidovich had forced Vaubois back to Rivoli, and Alvintzi pressed forward within 5m. of Vicenza. Bonaparte watched carefully for an opportunity to strike out, and on the 8th

massed his troops closely around the central part of Verona. On the 9th, to give himself air, he ordered Masséna to join Vaubois, and to drive back Davidovich at all costs. But before this order was executed, reports came in that Davidovich had suspended his advance. The 10th and 11th were spent by both sides in relative inaction, the French waiting on events and opportunities, the Austrians resting after their prolonged exertions. Then on the afternoon of the 11th, being informed that Alvinczi was approaching, Bonaparte decided to attack him. On the 12th Alvinczi's advanced guard was assailed at Caldiero. But the troops in rear came up rapidly, and by 4 P.M. the French were defeated all along the line and in retreat on Verona. Bonaparte's situation was now indeed precarious. He was on "interior lines" it is true, but he had neither the force nor the space necessary for the delivery of rapid radial blows. Alvinczi was in superior numbers, as Caldiero had proved, and at any moment Davidovich, who had twice Vaubois' force, might advance to the attack of Rivoli. The reserves had proved insufficient, and Kilmaine had to be called up from Mantua, which was thus for the third time freed from the blockaders. Bonaparte chose a daring move on the enemy's rear in preference to the hazards of a retreat, though it was not until the evening of the 14th that he actually issued the fateful order.

The Austrians, too, had selected the 15th as the date of their final advance on Verona, Davidovich from the north, Alvinczi via Zevio from the south. But Bonaparte was no longer there; leaving Vaubois to hold Davidovich as best he might, he had collected the rest of his small army between Albaro and Ronco. His plan seems to have been to cross the Adige well in rear of the Austrians, to march north and establish himself on the Verona-Vicenza highway, where he could supply himself from their convoys. The troops passed the Adige in three columns near Ronco and Albaredo, and marched forward along the dikes, with deep marshes and pools on either hand. If Bonaparte's intention was to reach the dry open ground of San Bonifacio in rear of the Austrians, it was not realized, for the Austrian army, instead of being at the gates of Verona, was still between Caldiero and San Bonifacio, heading, as we know, for Zevio. Thus Alvinczi was able, easily and swiftly, to wheel to the south.

Arcola.—The battle of Arcola almost defies description. The first day passed in a series of resultless encounters between the heads of the columns as they met on the dikes. In the evening Bonaparte withdrew over the Adige, expecting every moment to be summoned to Vaubois' aid. But Davidovich remained inactive, and on the 16th the French again crossed the river. Masséna from Ronco advanced on Porcile, driving the Austrians along the causeway thither, but on the side of Arcola, Alvinczi had deployed a considerable part of his forces on the edge of the marshes, within musket shot of the causeway by which Bonaparte and Augereau had to pass, along the Austrian front, to reach the bridge of Arcola. In these circumstances the second day's battle was more murderous and no more decisive than the first, and again the French retreated to Ronco. But Davidovich again stood still, and with extraordinary resolution, Bonaparte ordered a third assault for the 17th, trying a fresh tactical move. Masséna again advanced on Porcile, Robert's brigade on Arcola, but the rest, under Augereau, were to pass the Alpone near its confluence with the Adige, and joining various small bodies which passed the main stream lower down, to storm forward on dry ground to Arcola. The Austrians, however, themselves advanced from Arcola, overwhelmed Robert's brigade on the causeway and almost reached Ronco. This was perhaps the crisis of the battle, for Augereau's force was now on the other side of the stream, and Masséna, with his back to the new danger, was approaching Porcile. But the fire of a deployed regiment stopped the head of the Austrian column; Masséna, turning about, cut into its flank on the dike; and Augereau, gathering force, was approaching Arcola from the south. The bridge and the village were evacuated soon afterwards, and Masséna and Augereau began to extend in the plain beyond. But the Austrians still sullenly resisted. It was at this moment that Bonaparte secured victory by a mere ruse, but a ruse which would have been unprofitable and ridiculous had it not been based on his fine sense of the moral conditions. Both sides were nearly fought out, and

he sent a few trumpeters to the rear of the Austrian army to sound the charge. They did so, and in a few minutes the Austrians were streaming back to San Bonifacio. This ended the drama of Arcola, which more than any other episode of these wars, perhaps of any wars in modern history, centres on the personality of the hero. It is said that the French fought without spirit on the first day, and yet on the second and third Bonaparte had so thoroughly imbued them with his own will to conquer that in the end they prevailed over an enemy nearly twice their own strength.

The climax was reached just in time, for on the 17th Vaubois was completely defeated at Rivoli and withdrew to Peschiera, leaving the Verona and Mantua roads completely open to Davidovich. But on the 19th Bonaparte turned upon him, and combining the forces of Vaubois, Masséna and Augereau against him, drove him back to Trent. Meantime Alvinczi returned from Vicenza to San Bonifacio and Caldiero (Nov. 21), and Bonaparte at once stopped the pursuit of Davidovich. On the return of the French main body to Verona, Alvinczi finally withdrew, Wurmser, who had emerged from Mantua on the 23rd, was driven in again, and this epilogue of the great struggle came to a feeble end because neither side was now capable of prolonging the crisis. In Jan. 1797 Alvinczi renewed his advance with all the forces that could be assembled for a last attempt to save Mantua. At this time 8,000 men under Sérurier blockaded Mantua. Masséna (9,000) was at Verona, Joubert (Vaubois' successor) at Rivoli with 10,000, Augereau at Legnago with 9,000. In reserve were Rey's division (4,000) between Brescia and Montechiaro, and Victor's brigade at Goito and Castelnovo. On the other side Alvinczi's location was the reverse of that in the previous campaign, for while he had 9,000 men under Provera at Padua, 6,000 under Bayalich at Bassano, he himself with 28,000 men stood in the Tirol about Trent. This time he intended to make his principal effort on the Rivoli side. Provera was to capture Legnago on Jan. 9, and Bayalich Verona on the 12th, while the main army was to deliver its blow against the Rivoli position on the 13th.

Rivoli.—The first marches of this scheme were duly carried out, and several days elapsed before Bonaparte was able to discern the direction of the real attack. Augereau fell back, skirmishing a little, as Provera's and Bayalich's advance developed. On the 11th, when the latter was nearing Verona, Alvinczi's leading troops appeared in front of the Rivoli position. On the 12th Bayalich, weakened by sending reinforcements to Alvinczi, made an unsuccessful attack on Verona, Provera, farther south, remaining inactive. On the 13th, Bonaparte, still in doubt, launched Masséna's division against Bayalich, who was driven back to San Bonifacio; but at the same time definite news came from Joubert that Alvinczi's main army was in front of La Corona. From this point begins the decisive, though by no means the most intense or dramatic, struggle of the campaign. Once he felt sure of the situation Bonaparte acted promptly. Joubert was ordered to hold on to Rivoli at all costs. Rey was brought up by a forced march to Castelnovo, where Victor joined him, and ahead of them both Masséna was hurried on to Rivoli. Bonaparte himself joined Joubert on the night of the 13th. There he saw the watch-fires of the enemy in a semicircle around him, for Alvinczi, thinking that he had only to deal with one division, had begun a widespread enveloping attack. The horns of this attack were as yet so far distant that Bonaparte, instead of extending on an equal front, only spread out a few regiments to gain an hour or two and to keep the ground for Masséna and Rey, and on the morning of Jan. 14, with 10,000 men in hand against 26,000, he fell upon the central columns of the enemy as they advanced up the steep broken slopes of the foreground. The fighting was severe, but Bonaparte had the advantage. Masséna arrived at 9 A.M., and a little later the column of Quasdanovich, which had moved along the Adige and was now attempting to gain a foothold on the plateau in rear of Joubert, was crushed by the converging fire of Joubert's right brigade and by Masséna's guns, their rout being completed by the charge of a handful of cavalry under Lasalle. The right horn of Alvinczi's attack, when at last it swung in upon Bonaparte's rear, was caught between Masséna and the advancing troops of Rey and annihilated, and even before this the dispirited Austrians were in

full retreat. A last alarm, caused by the appearance of a French infantry regiment in their rear (this had crossed the lake in boats from Salò), completed their demoralization, and though less than 2,000 had been killed and wounded, some 12,000 Austrian prisoners were left in the hands of the victors. Rivoli was indeed a moral triumph. After the ordeal of Arcola, the victory of the French was a foregone conclusion at each point of contact. Bonaparte refrained from striking so long as his information was incomplete, but he knew now from experience that his covering detachment, if well led, could not only hold its own without assistance until it had gained the necessary information, but could still give the rest of the army time to act upon it. Then, when the centre of gravity had been ascertained, the French divisions hurried thither, caught the enemy in the act of manoeuvring and broke them up. And if that confidence in success which made all this possible needs a special illustration, it may be found in Bonaparte sending Murat's regiment over the lake to place a mere 2,000 bayonets across the line of retreat of a whole army. Alvinzi's manoeuvre was faulty neither strategically in the first instance, nor tactically as regards the project of enveloping Joubert on the 14th. It failed because, apart from Bonaparte's genius, Joubert and his men were better soldiers than their Austrian opponents, and because a French division could move twice as fast as an Austrian division, and from these two factors a new form of war was evolved, the essence of which was that, for a given time and in a given area, a small force of the French should engage and hold a much larger force of the enemy.

The remaining operations can be very briefly summarized. Provera, still advancing on Mantua, joined hands there with Wurmser, and for a time held Sérurier at a disadvantage. But hearing of this, Bonaparte sent back Masséna from the field of Rivoli, and that general, with Augereau and Sérurier, not only forced Wurmser to retire again into the fortress, but compelled Provera to lay down his arms. And on Feb. 2, 1797, Mantua, and with it what was left of Wurmser's army, surrendered. The campaign of 1797, which ended the war of the First Coalition, was the brilliant sequel of these hard-won victories. Austria had decided to save Mantua at all costs, and had lost her armies in the attempt, a loss which was not compensated by the "strategic" victories of the archduke. Thus the Republican "visitation" of Carinthia and Carniola was one swift march—politically glorious, if dangerous from a purely military standpoint—of Bonaparte's army to the Semmering. The archduke, who was called thither from Germany, could do no more than fight a few rearguard actions and make threats against Bonaparte's rear, which the latter, with his usual "tact," ignored.

On the Rhine, as in 1795 and 1796, the armies of the Sambre-and-Meuse (Hoche) and the Rhine-and-Moselle (Moreau) were opposed by the armies of the Lower Rhine (Werneck) and of the Upper Rhine (Latour). Moreau crossed the river near Strasbourg and fought a series of minor actions. Hoche, like his predecessors, crossed at Düsseldorf and Neuwied and fought his way to the Lahn, where for the last time in the history of these wars, there was an irregular widespread battle. But Hoche, in this his last campaign, displayed the brilliant energy of his first, and delivered the "series of incessant blows" that Carnot had urged upon Jourdan the year before. Werneck was driven with ever-increasing losses from the lower Lahn to Wetzlar and Giessen. Thence, pressed hard by the French left wing under Championnet, he retired on the Nidda, only to find that Hoche's right had swung completely round him. Nothing but the news of the armistice of Leoben saved him from envelopment and surrender. This general armistice was signed by Bonaparte, on his own authority and to the intense chagrin of the Directory and of Hoche, on April 18, and was the basis of the peace of Campo Formio.

BONAPARTE IN EGYPT

Within the scope of this article, yet far more important from its political and personal than from its general military interest, comes the expedition of Bonaparte to Egypt and its sequel. (See also *EGYPT: History*; *NAPOLEON*, etc.) Bonaparte left Toulon on May 19, 1798, at the same time as his army (40,000 strong in 400 transports) embarked secretly at various ports. Nelson's fleet

was evaded, and, capturing Malta *en route*, the armada reached the coast of Egypt on July 1. The Republicans stormed Alexandria on the 2nd. Between Embabeh and Gizeh, on the left bank of the Nile, 60,000 Mamelukes were easily dispersed on the 21st (battle of the Pyramids), the French for the most part marching and fighting in the chequer of infantry squares that afterwards became the classical formation for desert warfare. While his lieutenants pursued the more important groups of the enemy, Bonaparte entered Cairo in triumph, and proceeded to organize Egypt as a French protectorate. Meantime Nelson, though too late to head off the expedition, had annihilated the squadron of Admiral Brueys. This blow severed the army from the home country, and destroyed all hope of reinforcements. But to eject the French already in Egypt, military invasion of that country was necessary. The first attempts at this were made in September by the Turks as overlords of Egypt. Bonaparte—after suppressing a revolt in Cairo—marched into Syria to meet them, and captured El Arish and Jaffa; at the latter place the prisoners, whom he could afford neither to feed, to release, nor to guard, were shot by his order. But he was brought to a standstill (March 17–May 20) before the half-defensible fortifications of Acre, held by a Turkish garrison and animated by the leadership of Sir Sidney Smith (*q.v.*). In May, though meantime a Turkish relieving army had been severely beaten in the battle of Mount Tabor (April 16, 1799), Bonaparte gave up his enterprise and returned to Egypt, where he won a last victory in annihilating at Aboukir, with 6,000 of his own men, a Turkish army 18,000 strong that had landed there (July 25, 1799). With this tactical success to set against the Syrian reverses, he handed over the command to Kléber and returned to France (Aug. 22) to ride the storm in a new *coup d'état*, the "18th Brumaire." Kléber, attacked by the English and Turks, concluded the convention of El Arish (Jan. 27, 1800), whereby he secured free transport for the army back to France. But this convention was disavowed by the British Government, and Kléber prepared to hold his ground. On March 20, 1800, he thoroughly defeated the Turkish army at Heliopolis and recovered Cairo, and French influence was once more in the ascendant in Egypt, when its director was murdered by a fanatic on June 14, the day of Marengo. Kléber's successor, the incompetent Menou, fell an easy victim to the British expeditionary force under Sir Ralph Abercromby in 1801. The British forced their way ashore at Aboukir on March 8. On the 21st Abercromby won a decisive battle, and himself fell in the hour of victory. (See *ALEXANDRIA: Battle of 1801*.) His successor, Gen. Hely Hutchinson, slowly followed up this advantage, and received the surrender of Cairo in July and of Alexandria in August, the debris of the French army being given free passage back to France. Meantime a mixed force of British and native troops from India, under Sir David Baird, had landed at Kosseir and marched across the desert to Cairo.

THE WAR OF THE SECOND COALITION

In the autumn of 1798, while Bonaparte's Egyptian expedition was in progress, and the Directory was endeavouring at home to reduce the importance and the predominance of the army and its leaders, the Powers of Europe once more allied themselves, not now against the principles of the Republic, but against the Treaty of Campo Formio. Russia, Austria, England, Turkey, Portugal, Naples and the pope formed the Second Coalition. The war began with an advance into the Roman States by a worthless and ill-behaved Neapolitan army (commanded, much against his will, by Mack), which the French troops under Championnet destroyed with ease. Championnet then revolutionized Naples. After this unimportant prelude the curtain rose on a general European war. The Directory, which now had at its command neither numbers nor enthusiasm, prepared as best it could to meet the storm. Four armies, numbering only 160,000, were set on foot, in Holland (Brune, 24,000); on the Upper Rhine (Jourdan, 46,000); in Switzerland, which had been occupied in 1798 (Masséna, 30,000); and in Upper Italy (Schérer, 60,000). In addition there was Championnet's army, now commanded by Macdonald, in southern Italy. All these forces the Directory ordered, in Jan. and Feb. 1799, to assume the offensive.

Stokach.—Jourdan, in the Constance and Schaffhausen region, had only 40,000 men against the Archduke Charles's 80,000, and was soon brought to a standstill and driven back on Stokach. The archduke had won these preliminary successes with seven-eighths of his army acting as one concentrated mass. But as he had only encountered a portion of Jourdan's army, he became uneasy as to his flanks, checked his bold advance, and ordered a reconnaissance in force. This practically extended his army while Jourdan was closing his, and thus the French began the battle of Stokach (March 25) in superior numbers, and it was not until late in the day that the archduke brought up sufficient strength (60,000) to win a victory. This was a battle of the "strategic" type, a widespread straggling combat in which each side took 15 hours to inflict a loss of 12% on the other, and which ended in Jourdan accepting defeat and drawing off, unpursued by the magnificent Austrian cavalry, though they counted five times as many sabres as the French.

The French secondary army in Switzerland was in the hands of the bold and active Masséna. The forces of both sides in the Alpine region were, from a military point of view, mere flank guards to the main armies on the Rhine and the Adige. But unrest, amounting to civil war, among the Swiss and Grison peoples tempted both Governments to give these flank guards considerable strength.

Masséna in Switzerland.—The Austrians in the Vorarlberg and Grisons were under Hotze, who had 13,000 men at Bregenz, and 7,000 commanded by Auffenberg around Chur, with, between them, 5,000 men at Feldkirch and a post of 1,000 in the strong position of the Luziensteig near Mayenfeld. Masséna's available force was about 20,000, and he used almost the whole of it against Auffenberg. The Rhine was crossed by his principal column near Mayenfeld, and the Luziensteig stormed (March 6), while a second column from the Zürich side descended upon Disentis and captured its defenders. In three days Auffenberg's division was broken up, Oudinot meanwhile holding off Hotze by a hard-fought combat at Feldkirch (March 7). But a second attack on Feldkirch made on the 23rd by Masséna was repulsed and the advance of his left wing came to a standstill. Behind Auffenberg and Hotze was Bellegarde in Tirol with some 47,000 men. Most of these were stationed north of Innsbrück and Landeck, probably as a sort of strategic reserve to the archduke. The rest, with the assistance of the Tirolese themselves, were to ward off irruptions from Italy. Here the French offensive was entrusted to two columns, one from Masséna's command under Lecourbe, the other from the Army of Italy under Dessolle. Simultaneously with Masséna, Lecourbe marched from Bellinzona with 10,000 men, by the San Bernardino pass into the Splügen valley, and thence over the Julier pass into the upper Engadine. A small Austrian force under Loudon attacked him near Zernetz, but was after three days of rapid manoeuvres and bold tactics driven back to Martinsbrück, with considerable losses. But ere long the country people flew to arms, and Lecourbe found himself between two fires, the levies occupying Zernetz and Loudon's regulars Martinsbrück. But though he had only some 5,000 of his original force left, he was not disconcerted, and by driving back the levies into the high valleys whence they had come, and constantly threatening Loudon, he was able to maintain himself and to wait for Dessolles. The latter, moving up the Valtelline, fought his way to the Stelvio pass, but beyond it the defile of Tauffers (south-west of Glurns), was entrenched by Loudon, who thus occupied a position midway between the two French columns, while his irregulars beset all the passes and ways giving access to the Vintschgau and the lower Engadine. In this situation the French should have been destroyed in detail. But as usual their speed and dash gave them the advantage in every manoeuvre and at every point of contact.

Operations in Tirol.—On the 25th Lecourbe and Dessolles attacked Loudon at Nauders in the Engadine and Tauffers in the Vintschgau respectively. At Nauders the French passed round the flanks of the defence by scrambling along the high mountain crests adjacent, while at Tauffers, the assailants, only 4,500 strong, descended into a deep ravine, debouched unnoticed in the Austrians' rear, and captured 6,000 men and 16 guns. The Austrian

leader with a couple of companies made his way through Glurns to Nauders, and there, finding himself headed off by Lecourbe, he took to the mountains. His corps, like Auffenberg's, was annihilated. This ended the French general offensive. Jourdan had been defeated by the archduke and forced or induced to retire over the Rhine. Masséna was at a standstill before the strong position of Feldkirch, and the Austrians of Hotze were still massed at Bregenz, but the Grisons were revolutionized, two strong bodies of Austrians numbering in all about 20,000 men had been destroyed, and Lecourbe and Dessolles had advanced far into Tirol. A pause followed. The Austrians in the mountains needed time to concentrate and to recover from their astonishment. The archduke fell ill, and the Vienna war council forbade his army to advance lest Tirol should be "uncovered," though Bellegarde and Hotze still disposed of numbers equal to those of Masséna and Lecourbe. Masséna succeeded Jourdan in general command on the French side and promptly collected all available forces of both armies in the hilly non-Alpine country between Basle, Zürich and Schaffhausen, thereby directly barring the roads into France (Berne-Neuchâtel-Pontarlier and Basle-Besançon) which the Austrians appeared to desire to conquer. The protection of Alsace and the Vosges was left to the fortresses. There was no suggestion, it would appear, that the Rhine between Basle and Schaffhausen was a flank position sufficient of itself to bar Alsace to the enemy.

It is now time to turn to events in Italy, where the Coalition intended its principal effort. At the beginning of March the French had 80,000 men in Upper Italy and some 35,000 in the heart of the Peninsula, the latter engaged chiefly in supporting newly-founded republics. Of the former, 53,000 formed the field army on the Mincio under Schérer. The Austrians, commanded by Kray, numbered in all 84,000, but detachments reduced this figure to 67,000, of whom, moreover, 15,000 had not yet arrived when operations began. They were to be joined by a Russian contingent under the celebrated Suvórov, who was to command the whole on arrival, and whose extraordinary personality gives the campaign its special interest. Kray himself was a resolute soldier, and when the French, obeying the general order to advance, crossed the Adige, he defeated them in a severely fought battle at Magnano near Verona (March 5). The war, however, was undertaken not to annihilate, but to evict the French, and, probably under orders from Vienna, Kray allowed the beaten enemy to depart.

Suvórov.—Suvórov appeared with 17,000 Russians on April 4. His first step was to set Russian officers to teach the Austrian troops—whose feelings can be imagined—how to attack with the bayonet, his next to order the whole army forward. The Allies broke camp on April 17, 18 and 19, and on the 20th, after a forced march of close on 30m., they passed the Chiese. Brescia had a French garrison, but Suvórov soon cowed it into surrender by threats of a massacre, which no one doubted that he would carry into execution. At the same time, dissatisfied with the marching of the Austrian infantry, he sent the following characteristic reproof to their commander: "The march was in the service of the Kaiser. Fair weather is for my lady's chamber, for dandies, for sluggards. He who dares to cavil against his high duty is, as an egoist, instantly to vacate his command. Whoever is in bad health can stay behind. The so-called reasoners do no army any good. . . ." One day later, under this unrelenting pressure, the advanced posts of the Allies reached Cremona and the main body the Oglio. The pace became slower in the following days, as many bridges had to be made, and meanwhile Moreau, Schérer's successor, prepared with a mere 20,000 men to defend the Adda. On the 26th he was attacked all along the line. The moral supremacy had passed over to the Allies. Melas, under Suvórov's stern orders, flung his battalions, regardless of losses, against the strong position of Cassano. The story of 1796 repeated itself with the rôles reversed. The passage was carried, and the French rearguard under Sérurier was surrounded and captured by an inferior corps of Austrians. The Austrians (the Russians at Lecco were hardly engaged) lost 6,000 men, but they took 7,000 prisoners, and in all Moreau's little army lost half its numbers and retreated in many disconnected bodies to the Ticino, and thence to Alessandria.

Everywhere the Italians turned against the French, mindful of the exactions of their commissaries. The strange Cossack cavalry that western Europe had never yet seen entered Milan on April 29, 11 days after passing the Mincio, and next day the city received with enthusiasm the old field-marshal, whose exploits against the Turks had long invested him with a halo of romance and legend. Here, for the moment, Suvórov's offensive culminated. He desired to pass into Switzerland and to unite his own, the archduke's, Hotze's and Bellegarde's armies in one powerful mass. But the emperor would not permit the execution of this scheme until all the fortresses held by the enemy in Upper Italy should have been captured. In any case, Macdonald's army in southern Italy, cut off from France by the rapidity of Suvórov's onslaught, and now returning with all speed to join Moreau by force or evasion, had still to be dealt with.

Suvórov's mobile army, originally 90,000 strong, had now dwindled, by reason of losses and detachments to sieges, to half that number, and serious differences arose between the Vienna Government and himself. If he offended the pride of the Austrian army, he was at least respected as a leader who gave it victories; but in Vienna he was regarded as a madman who had to be kept within bounds. But at last, when he was becoming thoroughly exasperated by this treatment, Macdonald came within striking distance and the active campaign recommenced. In the second week of June, Moreau, who had retired into the Apennines about Gavi, advanced with the intention of drawing upon himself troops that would otherwise have been employed against Macdonald. He succeeded, for Suvórov with his usual rapidity collected 40,000 men at Alessandria, only to learn that Macdonald with 35,000 men was coming up on the Parma road. When this news arrived, Macdonald had already engaged an Austrian detachment at Modena and driven it back, and Suvórov found himself between Moreau and Macdonald with barely enough men under his hand to enable him to play the game of "interior lines." But at the crisis the rough energetic warrior who despised "raisonneurs," displayed generalship of the first order, and taking in hand all his scattered detachments, he manoeuvred them in the Napoleonic fashion.

The Trebbia.—On the 14th Macdonald was calculated to be between Modena, Reggio and Carpi, but his destination was uncertain. Would he continue to hug the Apennines to join Moreau, or would he strike out northwards against Kray, who with 20,000 men was besieging Mantua? From Alessandria it is four marches to Piacenza and nine to Mantua, while from Reggio these places are four and two marches respectively. Piacenza, therefore, was the crucial point if Macdonald continued westward, while in the other case nothing could save Kray but the energetic conduct of Hohenzollern's detachment, which was posted near Reggio. This, however, was soon forced over the Po, and Ott, advancing from Cremona to join it, found himself sharply pressed in turn. The field-marshal had hoped that Ott and Hohenzollern together would be able to win him time to assemble at Parma, where he could bring on a battle whichever way the French took. But on receipt of Ott's report he was convinced that Macdonald had chosen the western route and ordering Ott to delay the French as long as possible by stubborn rearguard actions and to put a garrison into Piacenza under a general who was to hold out "on peril of his life and honour," he collected what forces were ready to move and hurried towards Piacenza, the rest being left to watch Moreau. He arrived just in time. When after three forced marches the main body (only 26,000 strong) reached Castel San Giovanni, Ott had been driven out of Piacenza, but the two joined forces safely. Both Suvórov and Macdonald spent the 17th in closing up and deploying for battle. The respective forces were Allies, barely 25,000, French, 35,000. Suvórov believed the enemy to be only 26,000 strong, and chiefly raw Italian regiments, but his temperament would not have allowed him to stand still even had he known his inferiority. He had already issued one of his peculiar battle-orders, which began with the words: "The hostile army will be taken prisoners" and continued with directions to the Cossacks to spare the surrendered enemy. But Macdonald was too full of energy, and believed still that he could annihilate Ott before Suvórov's arrival. Thus the battle of the Trebbia (June 17-19)

was fought by both sides in the spirit of the offensive. It was one of the most severe struggles in the Republican wars, and it ended in Macdonald's retreat with a loss of 15,000 men—probably 6,000 in the battle and 9,000 killed and prisoners when and after the equilibrium was broken—for Suvórov, unlike other generals, had the necessary surplus of energy, after all the demands made upon him by a great battle, to order and to direct an effective pursuit. The Allies lost about 6,000. Macdonald retreated to Modena, harassed by the peasantry, and finally recrossed the Apennines and made his way to Genoa. The battle of the Trebbia is one of the most clearly defined examples in military history of the result of moral force—it was a matter not merely of energetic leading on the battlefield, but far more of educating the troops beforehand to meet the strain, of ingraining in the soldier the determination to win at all costs.

To return now to the Alpine region, where the French offensive had culminated at the end of March. Their defeated left was behind the Rhine in the northern part of Switzerland, the half-victorious centre athwart the Rhine between Mayenfeld and Chur, and their wholly victorious right far within Tirol between Glurns, Nauders and Landeck. But neither the centre nor the right could maintain itself. The forward impulse given by Suvórov spread along the whole Austrian front from left to right. Dessolles' column (now under Loison) was forced back to Chiavenna. Bellegarde drove Lecourbe from position to position towards the Rhine during April. There Lecourbe added to the remnant of his expeditionary column the outlying bodies of Masséna's right wing, but even so he had only 8,000 men against Bellegarde's 17,000, and he was now exposed to the attack of Hotze's 25,000 as well. The Luziensteig fell to Hotze and Chur to Bellegarde, but the defenders managed to escape from the converging Austrian columns into the valley of the Reuss. Having thus reconquered all the lost ground and forced the French into the interior of Switzerland, Bellegarde and Hotze parted company, the former marching with the greater part of his forces to join Suvórov, the latter moving to his right to reinforce the archduke. Only a chain of posts was left in the Rhine valley between Disentis and Feldkirch. The archduke's operations now recommenced.

Charles and Hotze stood, about May 15, at opposite ends of the lake of Constance. The two together numbered about 88,000 men, but both had sent away numerous detachments to the flanks, and the main bodies dwindled to 35,000 for the archduke, and 20,000 for Hotze. Masséna, with 45,000 men in all, retired slowly from the Rhine to the Thur. Pressed by the combined forces he continued to yield ground until at last he halted in the position he had prepared for defence at Zürich. He had only 25,000 men in hand, owing to detachments, to cover his right and his left. These 25,000 occupied an entrenched position 5m. in length, against which the Austrians, detaching as usual many posts to protect their flanks and rear, deployed only 42,000 men, of whom 8,000 were sent on a wide turning movement and 8,000 held in reserve 4m. in rear of the battlefield. Thus the frontal attack was made with forces not much greater than those of the defence and it failed accordingly (June 4). But Masséna, fearing perhaps to strain the loyalty of the Swiss to their French-made constitution by exposing their town to assault and sack, retired on the 5th to the valley of the Aar between Baden and Lucerne. The archduke did not seek to press Masséna, and for two months operations were at a standstill.

Döttingen.—Ere mid-August, Lecourbe, who formed a loose right wing of the French army in the Reuss valley, was reinforced to a strength of 25,000 men, and pounced upon the extended left wing of the enemy, which had stretched itself, to keep pace with Suvórov, as far westward as the St. Gothard. The movement began on the 14th, and in two days the Austrians were driven back from the St. Gothard and the Furka to the line of the Linth, with the loss of 8,000 men and many guns. At the same time an attempt to take advantage of Masséna's momentary weakness by forcing the Aar at Döttingen near its mouth failed completely (Aug. 16-17). This was the end of the archduke's campaign in Switzerland. Though he would have preferred to continue it, the Vienna Government desired him to return to Germany. An Anglo-Russian

expedition was about to land in Holland,¹ and the French were assembling fresh forces on the Rhine, and, with the double object of preventing an invasion of South Germany and of inducing the French to augment their forces in Alsace at the expense of those in Holland, the archduke left affairs in Switzerland to Hotze and a fresh Russian force under Korsákov, and marched away to the Black Forest. His new campaign never rose above the level of a war of posts and manoeuvres about Mannheim and Philippsburg.

Suvórov's last exploit in Italy coincided in time, but in no other respect, with the skirmish at Döttingen. Returning swiftly from the battlefield of the Trebbia, he began to drive back Moreau to the Riviera. At this point Joubert succeeded to the command on the French side, and against the advice of his generals, gave battle. Equally against the advice of his own subordinates, Suvórov accepted it, and won his last great victory at Novi on Aug. 13, Joubert being killed, and only a third of his army making good its retreat. This was followed by another rapid march against a new French "Army of the Alps" which had entered Italy by way of the Mt. Cenis. But immediately after this he left all further operations in Italy to Melas, and himself, with the Russians and an Austrian corps, marched away for the St. Gothard to combine operations against Masséna with Hotze and Korsákov. It was with a heavy heart that he left the scene of his battles, in which the force of his personality had carried the old-fashioned "linear" armies for the last time to complete victory. He had himself urged an advance into France, but the Vienna Government had been unwilling, for their interest was concentrated on Italy. The Tsar Paul I., annoyed with the Austrians, ordered Suvórov to bring back the Russian army, through Switzerland and thence to South Germany. The archduke had already left Switzerland, and was committed to a resultless warfare in the high mountains, with an army which was a mere detachment and in the hope of co-operating with two other detachments far away on the other side of Switzerland.

In loyalty to the formal order of his sovereign Suvórov prepared to carry out his instructions. Masséna's command (77,000 men) was distributed, at the beginning of September, along an enormous S, from the Simplon through the St. Gothard and Glarus, and along the Linth, the Züricher See and the Limmat to Basle. Opposite the lower point of this S, Suvórov (28,000 men) was about to advance. Hotze's corps (25,000 Austrians), extending from Utznach by Chur to Disentis, formed a thin line roughly parallel to the lower curve of the S, Korsákov's Russians (30,000) were opposite the centre at Zürich, while Nauendorff with a small Austrian corps at Waldshut faced the extreme upper point. Thus the only completely safe way in which Suvórov could reach the Zürich region was by skirting the lower curve of the S, under protection of Hotze. But this *détour* would be long and painful, and the ardent old man preferred to cross the mountains once for all at the St. Gothard, and to follow the valley of the Reuss to Altdorf and Schwyz—*i.e.*, to strike vertically upward to the centre of the S—and to force his way through the French cordon to Zürich; and if events, so far as concerned his own corps, belied his optimism, they at any rate justified his choice of the shortest route. For, aware of the danger gathering in his rear, Masséna gathered up all his forces within reach towards his centre, leaving Lecourbe to defend the St. Gothard and the Reuss valley and Soult on the Linth. On Sept. 24 he forced the passage of the Limmat at Dietikon. On the 25th, in the second battle of Zürich, he completely routed Korsákov, who lost 8,000 killed and wounded, large numbers of prisoners and 100 guns. All along the line the Allies fell back, one corps after another, at the moment when Suvórov was approaching the foot of the St. Gothard.

Suvórov in the Alps.—On the 21st his headquarters were at Bellinzona, where he made the final preparations. Expecting to be four days *en route* before he could reach the nearest friendly magazine, he took his supply trains with him, which inevitably augmented the difficulties of the expedition. On the 24th Airolo

was taken, but when the far greater task of storming the pass presented itself before them, even the stolid Russians were terrified, and only the passionate protests of the old man, who reproached his "children" with deserting their father in his extremity, induced them to face the danger. At last after 12 hours' fighting the summit was reached. The same evening Suvórov pushed on to Hospenthal, while a flanking column from Disentis made its way towards Amsteg over the Crispalt. Lecourbe was threatened in rear and pressed in front, and his engineers, to hold off the Disentis column, had broken the Devil's bridge. Discovering this, he left the road, threw his guns into the river and made his way by fords and water-meadows to Göschenen, where by a furious attack he cleared the Disentis troops off his line of retreat. His rearguard meantime held the ruined Devil's bridge. This point and the tunnel leading to it, called the Urner Loch, the Russians attempted to force, with the most terrible losses, battalion after battalion crowding into the tunnel and pushing the foremost ranks into the chasm left by the broken bridge. But at last a ford was discovered and the bridge, cleared by a turning movement, was repaired. More broken bridges lay beyond, but at last Suvórov joined the Disentis column near Göschenen. When Altdorf was reached, however, Suvórov found not only Lecourbe in a threatening position, but an entire absence of boats on the Lake of the Four Cantons. It was impossible (in those days the Axenstrasse did not exist) to take an army along the precipitous eastern shore; and thus, passing through one trial after another, each more severe than the last, the Russians, men and horses and pack animals in an interminable single file, ventured on the path leading over the Kinzig pass into the Muotta Thal. The passage lasted three days, the leading troops losing men and horses over the precipices, the rearguard from the fire of the enemy, now in pursuit. And at last, on arrival in the Muotta Thal, Suvórov received definite information that Korsákov's army was no longer in existence. Yet even so it was long before he could make up his mind to retreat, and the pursuers gathered on all sides. Fighting, sometimes severe, and never altogether ceasing, went on day after day as the Allied column, now reduced to 15,000 men, struggled on over one pass after another, but at last it reached Ilanz on the Vorder Rhine (Oct. 8). The Archduke Charles meanwhile had, on hearing of the disaster of Zürich, brought over a corps from the Neckar, and for some time negotiations were made for a fresh combined operation against Masséna. But these came to nothing, for the archduke and Suvórov could not agree, either as to their own relations or as to the plan to be pursued. Practically, Suvórov's retreat from Altdorf to Ilanz closed the campaign. It was his last active service, and formed a gloomy but grand climax to the career of the greatest soldier who ever wore the Russian uniform.

MARENGO AND HOHENLINDEN

The disasters of 1799 sealed the fate of the Directory, and placed Bonaparte, who returned from Egypt with the prestige of a recent victory, in his natural place as civil and military head of France. In the course of the campaign the field strength of the French had been gradually augmented, and in spite of losses now numbered 227,000 at the front. These were divided into the army of Batavia, Brune (25,000), the army of the Rhine, Moreau (146,000), the army of Italy, Masséna (56,000), and, in addition, there were some 100,000 in garrisons and depots in France. Most of these field armies were in a miserable condition owing to the losses and fatigues of the last campaign. The treasury was empty and credit exhausted, and worse still—for spirit and enthusiasm, as in 1794, would have remedied material deficiencies—the conscripts obtained under Jourdan's law of 1798 came to their regiments most unwillingly. Most of them, indeed, deserted on their way to join the colours. A large draft sent to the Army of Italy arrived with 310 men instead of 10,250, and after a few such experiences, the First Consul decided that the untrained men were to be assembled in the fortresses of the interior and afterwards sent to the active battalions in numerous small drafts, which they could more easily assimilate. Besides accomplishing the immense task of reorganizing existing forces, he created new

¹For this expedition, which was repulsed by Brune in the battle of Castricum, see Fortescue's *History of the British Army*, vol. iv., and Sachot's *Brune en Hollande*.

ones, including the Consular Guard, and carried out at this moment of crisis two such far-reaching reforms as the replacement of the civilian drivers of the artillery by soldiers, and of the hired teams by horses belonging to the State, and the permanent grouping of divisions in army corps.

The Army of Reserve.—As early as Jan. 25, 1800, the First Consul provided for the assembly of all available forces in the interior in an "Army of Reserve." He reserved to himself the command of this army,¹ which gradually came into being as the pacification of Vendée and the return of some of Brune's troops from Holland set free the necessary nucleus troops. The conscription law was stringently reinforced, and impassioned calls were made for volunteers (the latter, be it said, did not produce 500 useful men). The district of Dijon, partly as being central with respect to the Rhine and Italian armies, partly as being convenient for supply purposes, was selected as the zone of assembly. As for the process of assembling it, we can scarcely imagine one which required more accurate and detailed staff work—correspondence with the district commanders, with the adjutant-generals of the various armies, and orders to the civil authorities on the lines of march, to the troops themselves and to the arsenals and magazines. No one but Bonaparte, even aided by a Berthier, could have achieved so great a task in six weeks, and the great captain, himself doing the work that nowadays is apportioned amongst a crowd of administrative staff officers, still found time to administer France's affairs at home and abroad, and to think out a general plan of campaign that embraced Moreau's, Masséna's and his own armies.

The Army of the Rhine, by far the strongest and best equipped, lay on the upper Rhine. The small and worn-out Army of Italy was watching the Alps and the Apennines from Mt. Blanc to Genoa. Between them Switzerland, secured by the victory of Zürich, offered a starting-point for a turning movement on either side—this year the advantage of the flank position was recognized and acted upon. The Army of Reserve was assembling around Dijon, within 200 m. of either theatre of war. The general plan was that the Army of Reserve should march through Switzerland to close on the right wing of the Army of the Rhine. Thus supported to whatever degree might prove to be necessary, Moreau was to force the passage of the Rhine about Schaffhausen, to push back the Austrians rapidly beyond the Lech, and then, if they took the offensive in turn, to hold them in check for 10 or 12 days. During this period of guaranteed freedom the decisive movement was to be made—a swoop along an immense arc on to the rear of the Austrians who had penned Masséna into the north-west corner of Italy. The Army of Reserve, augmented by one large corps of the Army of the Rhine, was to descend by the Splügen (alternatively by the St. Gothard and even by Tirol) into the plains of Lombardy. Magazines were to be established at Zürich and Lucerne (not at Chur, lest the plan should become obvious from the beginning), and all likely routes reconnoitred in advance. The Army of Italy was at first to maintain a strict defensive, and then to fix the Austrians until the entry of the reserve army into Italy was assured.

But Moreau was tardy in moving, and at the beginning of April the enemy took the offensive against Masséna. On the 8th Melas's right wing dislodged the French from the Mt. Cenis, and most of the troops that had then reached Dijon were shifted southward to be ready for emergencies. By the 25th Berthier reported that Masséna was seriously attacked and that he might have to be supported by the shortest route, *i.e.*, the more westerly passes. Bonaparte's resolution was already taken. He waited no longer for Moreau (who, indeed, so far from volunteering assistance, actually demanded it for himself). Convinced from the paucity of news that Masséna's army was closely pressed and probably severed from France, and feeling also that the Austrians were deeply committed to their struggle with the Army of Italy, he told Berthier to march with 40,000 men at once by way of the St. Bernard unless otherwise advised. Berthier protested that he

¹He afterwards appointed Berthier to command the Army of Reserve, but himself accompanied it and directed it, using Berthier as chief of staff.

had only 25,000 effectives, and the equipment and armament were still far from complete—as indeed they remained to the end—but the troops marched, though their very means of existence were precarious from the time of leaving Geneva to the time of reaching Milan, for nothing could extort supplies and money from the sullen Swiss.

Bonaparte's Plan of Campaign.—At the beginning of May the First Consul learned of the serious plight of the Army of Italy. Masséna with his right wing was shut up in Genoa, Suchet with the left wing driven back to the Var. Meanwhile Moreau had won a preliminary victory at Stokach, and the Army of Reserve had begun its movement to Geneva. With these data the plan of campaign took a clear shape at last—Masséna to resist as long as possible; Suchet to resume the offensive, if he could do so, towards Turin; the Army of Reserve to pass the Alps and to debouch into Piedmont by Aosta and Ivrea; the Army of the Rhine to send a strong force into Italy by the St. Gothard. Bonaparte left Paris on May 6. Gradually, and with immense efforts, Berthier's leading troops were passed over the snow-clad St. Bernard, drawing their artillery on sledges, on the 15th and succeeding days. Driving away small posts of the Austrian army, the advance guard entered Aosta on the 16th—and the alarm was given. Melas, committed as he was to his Riviera campaign, began to look to his right rear, but he was far from suspecting the seriousness of his opponent's purpose. Infinitely more dangerous for the French than the small detachment that Melas opposed to them, or even the actual crossing of the pass, was the unexpected stopping power of the little fort of Bard. The advanced guard of the French appeared before it on the 19th, and after three wasted days the infantry managed to find a difficult mountain by-way and to pass round the obstacle. Ivrea was occupied on the 23rd, and Bonaparte hoped to assemble the whole army there by the 27th. But except for a few guns that with infinite precautions were smuggled one by one through the streets of Bard, the whole of the artillery, as well as a detachment to besiege the fort, had to be left behind. Bard surrendered on June 2, having delayed the infantry of the French army for four days and the artillery for a fortnight.

The military situation in the last week of May, as it presented itself to Bonaparte, at Ivrea, was this. The Army of Italy under Masséna was closely besieged in Genoa, where provisions were running short and the population hostile. But Masséna was no ordinary general, and Bonaparte knew that while Masséna lived the garrison would resist to the last extremity. Suchet was defending Nice and the Var by vigorous minor operations. The Army of Reserve, the centre of which had reached at Ivrea the edge of the Italian plains, consisted of four weak army corps under Victor, Duhesme, Lannes and Murat. There were still to be added to this small army of 34,000 effectives, Turreau's division, which had passed over the Mt. Cenis and was approaching Turin, Moncey's corps of the Army of the Rhine, which had at last been extorted from Moreau and was due to pass the St. Gothard before the end of May, Chabran's division left to besiege Bard, and a small force under Béchencourt, which was to cross the Simplon and to descend by Arona (this place proved in the event a second Bard and immobilized Béchencourt until after the decisive battle). Thus it was only the simplest part of Bonaparte's task to concentrate half his army at Ivrea, and he had yet to bring in the rest. The problem was to reconcile the necessity for time which he wanted to ensure the maximum force being brought over the Alps, with the necessity for haste, in view of the impending fall of Genoa. As early as May 14 he had informed Moncey that from Ivrea the Army of Reserve would move on Milan. On May 25 he ordered Lannes (advanced guard) to push out on the Turin road, "in order to deceive the enemy and to obtain news of Turreau," and Duhesme's and Murat's corps to proceed along the Milan road.

The March to Milan.—Very few of Bonaparte's acts of generalship have been more criticized than this resolution to march on Milan, which abandoned Genoa to its fate and gave Melas a week's leisure to assemble his scattered forces. But to hasten to Genoa would, in Bonaparte's eyes, have been playing the enemy's

game, for they would have concentrated at Alessandria, facing west "in their natural position." The course which he took gave his army the enemy's depôts at Milan, of which it unquestionably stood in sore need, and the reinforcement of Moncey's 15,000 men from the Rhine, while at the same time Moncey's route offered an "assured line of retreat" by the Simplon and the St. Gothard. Above all, it provided him with a "natural position" across Melas's rear—that strategic barrage which seems to have been the initial objective of most of his manoeuvres against the enemy's rear. For such a position, offering natural obstacles, afforded him a secure pivot from which to prepare a warm embrace for the enemy, whose natural tendency, when cut off from their line of retreat and supply, was to turn and flow back, often in dribblets, towards him. Once possessed of Milan, Bonaparte says, he could have engaged Melas with a light heart and with confidence in the greatest possible results of a victory, whether the Austrians sought to force their way back to the east by the right or the left bank of the Po. Thus, we are justified in assuming that his object was not the relief of Genoa, but the most thorough defeat of Melas's field army, to which end, putting all sentiment aside, he treated the hard-pressed Masséna as a "containing force" to keep Melas occupied during the strategical deployment of the Army of Reserve. In the beginning he had told Masséna that he would "disengage" him, even if he had to go as far east as Trent to find a way into Italy. From the first, then, no direct relief was intended, and when, on hearing bad news from the Riviera, he altered his route to the more westerly passes, it was because he felt that Masséna's containing power was almost exhausted, and that the passage and reassembly of the reserve army must be brought about in the minimum time and by the shortest way. It was a *pis aller* forced upon him by Moreau's delay and Masséna's extremity, and from the moment at which he arrived at Milan he did, as a fact, abandon it altogether in favour of the St. Gothard.

Bonaparte's immediate purpose, then, was to reassemble the Army of Reserve in a secure zone of manoeuvre about Milan. This was carried out in the first days of June. Lannes at Chivasso stood ready to ward off a flank attack until the main army had filed past on the Vercelli road, then leaving a small force to combine with Turreau (whose column had not been able to advance into the plain) in demonstrations towards Turin, he moved off, still acting as right flank guard to the army, in the direction of Pavia. On the morning of June 2 Murat occupied Milan, and in the evening the headquarters entered the great city, the Austrian detachment under Vukassovich (the flying right wing of Melas's general cordon system in Piedmont) retiring to the Adda. Duhesme's corps forced that river at Lodi, and pressed on with orders to organize Crema and if possible Orzinovi as temporary fortresses. Lannes reached Pavia, where, as at Milan, immense stores of food, equipment and warlike stores were seized. Bonaparte was now safe in his "natural" position and barred one of the two main lines of retreat open to the Austrians. But his ambitions went farther, and he intended to cross the Po and to establish himself on the other likewise, thus establishing across the plain a complete barrage between Melas and Mantua. Here his end outranged his means, as we shall see. But he gave himself every chance that rapidity could afford him, and the moment that a "zone of manoeuvre" had been secured between the Ticino and the Oglio, he pushed on his main body—or rather what was left after the protective system had been provided for—to the Po.

The Movements of Melas.—At this point the action of the enemy began to make itself felt. Melas had not gained the successes that he had expected in Piedmont and on the Riviera, thanks to Masséna's obstinacy and to Suchet's brilliant defence of the Var. These operations had led him very far afield, and the protection of his over-long line of communications had caused him to weaken his large army by throwing off many detachments to watch the Alpine valleys on his right rear. He was further handicapped by the necessity of supporting Ott before Genoa and Elsnitz on the Var, and hearing of Lannes' bold advance on Chivasso and of the presence of a French column with artillery (Turreau) west of Turin, he assumed that the latter represented the main

body of the Army of Reserve—in so far indeed as he believed in the existence of that army at all. Next, when Lannes moved away towards Pavia, Melas thought for a moment that fate had delivered his enemy into his hands, and began to collect such troops as were at hand at Turin with a view to cutting off the retreat of the French on Ivrea while Vukassovich held them in front. It was only when news came of Moncey's arrival in Italy and of Vukassovich's fighting retreat on Brescia that the magnitude and purpose of the French column that had penetrated by Ivrea became evident. Melas promptly decided to give up his western enterprises, and to concentrate at Alessandria, preparatory to breaking his way through the network of small columns—as the disseminated Army of Reserve still appeared to be—which threatened to bar his retreat. But orders circulated so slowly that he had to wait in Turin till June 8 for Elsnitz, whose retreat was, moreover, sharply followed up and made exceedingly costly by the enterprising Suchet. Ott, too, in spite of orders to give up the siege of Genoa at once and to march with all speed to hold the Alessandria-Piacenza road, waited two days to secure the prize, and agreed (June 4) to allow Masséna's army to go free and to join Suchet. And lastly, the cavalry of O'Reilly, sent on ahead from Alessandria to the Stradella defile, reached that point only to encounter the French. The barrage was complete, and it remained for Melas to break it with the mass that he was assembling, with all these misfortunes and delays, about Alessandria. His chances of doing so were anything but desperate.

On June 5 Murat had moved on Piacenza, and stormed the bridge-head there. Duhesme pushed out on Crema and Orzinovi and also towards Pizzighetone. Moncey's leading regiments approached Milan, and Berthier thereupon sent on Victor's corps to support Murat and Lannes. Meantime the half-abandoned line of operations, Ivrea-Vercelli, was briskly attacked by the Austrians, who had still detachments on the side of Turin. On the 6th Lannes from Pavia, crossing the Po, encountered and defeated O'Reilly, and barred the Alessandria-Parma main road. Opposite Piacenza, Murat had to spend the day in gathering material for his passage, as the pontoon bridge had been cut by the retreating garrison of the bridge-head. Meantime the last divisions of the Army of Reserve (two of Moncey's excepted) were hurried towards Lannes' point of passage, as Murat had not yet secured Piacenza. On the 7th, while Duhesme continued to push back Vukassovich and seized Cremona, Murat at last captured Piacenza, finding there immense magazines. Meantime the army, division by division, passed over slowly, owing to a sudden flood, near Belgiojoso, and Lannes' advanced guard was ordered to open communication with Murat, along the main road Stradella-Piacenza. "Moments are precious," said the First Consul. He was aware that Elsnitz was retreating before Suchet, that Melas had left Turin for Alessandria, and that heavy forces of the enemy were at or east of Tortona. He knew, too, that Murat had been engaged with certain regiments recently before Genoa and (wrongly) assumed O'Reilly's column to have come from the same quarter. Whether this meant the deliverance or the surrender of Genoa he did not yet know, but it was certain that Masséna's pinning action was over, and that Melas was gathering up his forces to recover his communications. Hence Bonaparte's great object was concentration. "Twenty thousand men at Stradella," in his own words, was the goal of his efforts, and with the accomplishment of this purpose the campaign enters on a new phase.

Bonaparte's Dispositions.—The army now being disseminated between the Alps, the Apennines, the Ticino and the Chiese, it was of vital importance to connect up the various parts into a well-balanced system. Duhesme was still absent at Cremona. Lechi was far away in the Brescia country, Bèthencourt detained at Arona. Moncey with about 15,000 men had to cover an area of 40m. square around Milan, which constituted the original zone of manoeuvre, and if Melas chose to break through the flimsy cordon of outposts on this side (the risk of which was the motive for detaching Moncey at all) instead of at the Stradella, it would take Moncey two days to concentrate his force on any battlefield within the area named, and even then he would be outnumbered

by two to one. As for the main body at the Stradella, its position was wisely chosen, for the ground was too cramped for the deployment of the superior force that Melas might bring up, but the strategy that set before itself as an object 20,000 men at the decisive point out of 50,000 available was, to say the least, hazardous. In truth, here, in contrast to his later campaigns, he had not the material to cement his strategic barrage. It is, however, clear from a letter to Carnot that Bonaparte counted greatly upon the union of Masséna and Suchet, with 18,000 men, to press Melas against the Army of Reserve. Another questionable feature was the order to Lannes to send forward his advanced guard, and to attack whatever enemy he met with on the road to Voghera. Bonaparte, in fact, calculated that Melas could not assemble 20,000 men at Alessandria before June 12. Acting on this order Lannes fought the battle of Montebello on the 9th. This was a very severe running fight, in which the French drove the Austrians from several successive positions, and it culminated in a savage fight at close quarters about Montebello itself. The singular feature of the battle is the disproportion between the losses on either side—French, 500 out of 12,000 engaged; Austrians, 2,100 killed and wounded and 2,100 prisoners out of 14,000. These figures are most conclusive evidence of the intensity of the French military spirit in those days, and also give a likely explanation of Bonaparte's apparent rashness in pushing Lannes forward. If, without endangering the bait, he could draw Melas towards the Stradella, he could thereby curtail the undue extent of his strategic barrage.

Meanwhile, Bonaparte had issued orders for the main body to stand fast, and for the detachments to take up their definitive covering positions. Duhesme's corps was directed, from its eastern foray, to Piacenza, to join the main body. Moncey was to provide for the defence of the Ticino line, Lechi to form a "flying camp" in the region of Orzinovi-Brescia and Cremona, and another mixed brigade was to control the Austrians in Pizzighetone and in the citadel of Piacenza. On the other side of the Po, between Piacenza and Montebello, was the main body (Lannes, Murat and part of Victor's and Duhesme's corps), and a flank guard was stationed near Pavia, with orders to keep on the right of the army as it advanced (this is the first hint of an intention to go westward) and to fall back fighting should Melas come on by the left bank.

For a new idea, and doubt, had begun to form in his mind. Still believing that Melas would attack him on the Stradella side, and hastening his preparations to meet this, he began to allow for the contingency of Melas giving up his attempt to re-establish his normal line of communication, and retiring instead on Genoa, which was now in his hands and could be provisioned and reinforced by sea. On the 10th Bonaparte ordered reserve ammunition to be sent from Pavia, giving Serravalle, which is south of Novi, as its probable destination. Such reports as were available indicated no important movements whatever which happened to be true, but could hardly appear so to the French headquarters. On the 11th, though he thereby forfeited the reinforcements coming up from Duhesme's corps at Cremona, Bonaparte ordered the main body to advance to the Scrivia. Lapoype's division (the right flank guard) was called to the south bank of the Po, and the zone around Milan was stripped so bare of troops that there was no escort for the prisoners taken at Montebello. The crisis was at hand, and influenced by the reports collected by Lapoype as to the quietude of the Austrians towards Valenza and Casale, Bonaparte and Berthier strained every nerve to bring up more men to the Voghera side in the hope of preventing the prey from slipping away to Genoa.

But Moncey, Duhesme, Lechi and Chabran were at a distance—and these represented almost exactly half of Berthier's command (30,000 out of 58,000), and even the concentration of 28,000 men on the Scrivia had only been obtained by practically giving up the "barrage" on the left bank of the Po. Even now (the 12th) the enemy showed nothing but a rearguard, and the old questions reappeared in a new and acute form. Was Melas still in Alessandria? Was he marching on Valenza and Casale to cross the Po, or to Acqui against Suchet, or to Genoa to base him-

self on the British fleet? As to the first, why had he given up his chances of fighting on one of the few cavalry battlegrounds in north Italy—the plain of Marengo—as he could not stay in Alessandria for any definite time? The second question had been answered in the negative by Lapoype, but his latest information was 36 hours old. As for the other questions, no answer whatever was forthcoming, and the only course open was to postpone decisive measures and to send forward the cavalry, supported by infantry, to gain information.

MAP SHOWING THE AREA ASSOCIATED WITH NAPOLEON'S ADVANCE AGAINST MELAS, JUNE 12-13, 1800

poned decisive measures and to send forward the cavalry, supported by infantry, to gain information.

Marengo.—On the 13th, therefore, Murat, Lannes and Victor advanced into the plain of Marengo, traversed it without difficulty and carrying the villages held by the Austrian rearguard, established themselves for the night within a mile of the fortress. But meanwhile Bonaparte had taken a step that was fraught with the gravest consequences. He had, as we know, no intention of forcing on a decision until his reconnaissance produced the information on which to base it, and he had therefore kept back three divisions under Desaix at Pontecurone. But as the day wore on without incident, he began to fear that the reconnaissance would be profitless, and unwilling to give Melas any further start, he sent out these divisions right and left to find and to hold the enemy, whichever way the latter had gone. At noon Desaix with one division was despatched southward to Rivalta to head off Melas from Genoa, and at 9 A.M. on the 14th, on the strength of a report, false as it turned out, that the Austrian rearguard had broken the bridges of the Bormida, Lapoype was sent back over the Po to hold the Austrians should they be advancing from Valenza towards the Ticino. Thus there remained in hand only 23,000 men when at last in the forenoon of the 14th the whole of Melas's army, 45,000 strong, moved out of Alessandria, not southward nor northward, but due west into the plain of Marengo (q.v.). The extraordinary battle that followed is described elsewhere. The outline of it is simple enough. The Austrians advanced slowly and in the face of the most resolute opposition, until their attack had gathered weight, and at last they were carrying all before them, when Desaix returned from beyond Rivalta and initiated a series of counterstrokes. These were brilliantly successful, and gave the French not only local victory but the supreme self-confidence that, coupled with their strategic position, enabled them to extort next day from Melas an agreement to evacuate all Lombardy as far as the Mincio. And though in this way the chief prize, Melas's army, escaped after all, Marengo was the birthday of the First Empire.

One more blow, however, was required before the Second Coalition collapsed, and it was delivered by Moreau. We have seen that he had crossed the upper Rhine and defeated Kray at Stokach. This was followed by other partial victories, and Kray then retired to Ulm, where he reassembled his forces, hitherto scattered in a long weak line from the Neckar to Schaffhausen. Moreau continued his advance, extending his forces up to and over the Danube below Ulm, and winning several combats of which the most important was that of Höchstädt, fought on the famous battlegrounds of 1703 and 1704, and memorable for the death of La Tour d'Auvergne, the "First Grenadier of France" (June 19). Finding himself in danger of envelopment, Kray now retired, swiftly and skilfully, across the front of the advancing French, and reached Ingolstadt in safety. Thence he retreated over the Inn, Moreau following him to the edge of that river, and an armistice put an end for the moment to further operations.

This not resulting in a treaty of peace, the war was resumed both in Italy and in Germany. The Army of Reserve and the Army of Italy, after being fused into one, under Masséna's command, were divided again into a fighting army under Brune, who opposed the Austrians (Bellegarde) on the Mincio, and a political army under Murat, which re-established French influence in the

peninsula. The former, extending on a wide front as usual, won a few strategical successes without tactical victory, the only incidents of which worth recording are the gallant fight of Dupont's division, which had become isolated during a manoeuvre, at Pozzolo on the Mincio (Dec. 25) and the descent of a corps under Macdonald from the Grisons by way of the Splügen, an achievement far surpassing Bonaparte's and even Suvórov's exploits, in that it was made after the winter snows had set in.

Hohenlinden.—In Germany the war for a moment reached the sublime. Kray had been displaced in command by the young archduke John, who ordered the denunciation of the armistice and a general advance. His plan, or that of his advisers, was to cross the lower Inn, out of reach of Moreau's principal mass, and then to swing round the French flank until a complete chain was drawn across their rear. But during the development of the manoeuvre, Moreau also moved, and by rapid marching made good the time he had lost in concentrating his over-dispersed forces. The weather was appalling, snow and rain succeeding one another until the roads were almost impassable. On Dec. 2 the Austrians were brought to a standstill, but the inherent mobility of the Revolutionary armies enabled them to surmount all difficulties, and thanks to the respite afforded him by the archduke's halt, Moreau was able to see clearly into the enemy's plans and dispositions. On Dec. 3, while the Austrians in many disconnected columns were struggling through the dark and muddy forest paths about Hohenlinden, Moreau struck the decisive blow. While Ney and Grouchy held fast the head of the Austrian main column at Hohenlinden, Richepanse's corps was directed on its left flank. In the forest Richepanse unexpectedly met a subsidiary Austrian column which actually cut his column in two. But profiting by the momentary confusion he drew off that part of his forces which had passed beyond the point of contact and continued his march, striking the flank of the archduke's main column, most of which had not succeeded in deploying opposite Ney, at the village of Mattempost. First the baggage train and then the artillery park fell into his hands, and lastly he reached the rear of the troops engaged opposite Hohenlinden, whereupon the Austrian main body practically dissolved. The rear of Richepanse's corps, after disengaging itself from the Austrian column it had met in the earlier part of the day, arrived at Mattempost in time to head off thousands of fugitives who had escaped from the carnage at Hohenlinden. The other columns of the unfortunate army were first checked and then driven back by the French divisions they met, which, moving more swiftly and fighting better in the broken ground and the woods, were able to combine two brigades against one wherever a fight developed. On this disastrous day the Austrians lost 20,000 men, 12,000 of them being prisoners, and 90 guns.

Marengo and Hohenlinden decided the war of the Second Coalition as Rivoli had decided that of the first, and the Revolutionary Wars came to an end with the armistice of Steyer (Dec. 25, 1800) and the treaty of Lunéville (Feb. 9, 1801). But only the first act of the great drama was accomplished. After a short respite Europe entered upon the Napoleonic Wars.

BIBLIOGRAPHY.—The most important modern works are A. Chuquet's *Guerres de la Révolution* (11 monographs forming together a complete history of the campaigns of 1792–93), and the publications of the French General Staff. Dupuis's *L'Armée du nord 1793*; Coutancé's *L'Armée du Nord 1794*; Colin's *Éducation militaire de Napoléon et Campagne de 1793 en Alsace*; and de Cugnac's *Campagne de l'Armée de réserve 1800* may be specially named. Among other works of importance the principal are C. von B(inder)-K(riegelstein), *Geist und Stoff im Kriege* (Vienna, 1896); E. Gachot's works on Masséna's career (containing invaluable evidence though written in a somewhat rhetorical style); Ritter von Angeli, *Erzherzog Karl* (Vienna, 1896); C. von Clausewitz, *Feldzug 1796 in Italien und Feldzug 1799* (French translations); H. Bonnal, *De Rosbach à Ulm*; Krebs and Moris, *Campagnes dans les Alpes* (Paris, 1891–95); Yorck von Wartenburg, *Napoleon als Feldherr* (English and French translations); F. Bouvier, *Bonaparte en Italie 1796*; Kuhl, *Bonaparte's erster Feldzug*; J. W. Fortescue, *Hist. of the British Army*, vol. iv.; E. D'Hauterive, *L'Armée sous la Révolution*; C. Rousset, *Les Volontaires*; Max Jähns, *Das französische Heer*; Shadwell, *Mountain Warfare*; works of Camon, (*Guerre Napoléonienne*, etc.); Austrian War Office, *Krieg gegen die franz. Revolution 1792–97* (Vienna, 1905); Archduke Charles, *Grundsätze der Strategie* (1796 campaign in Germany), and *Gesch. des*

Feldzuges 1799 in Deutschl. und der Schweiz; M. Hartmann, *Anteil der Russen am Feldzug 1799 in der Schweiz* (Zurich, 1892); Danélewski-Militutin, *Der Krieg Russlands gegen Frankreich unter Paul I.* (Munich, 1858); German General Staff, "Napoleons Feldzug 1796–97" (Suppl. *Mil. Wochenblatt*, 1889), and *Pirmasens und Kaiserslautern* ("Kriegsgesch. Einzelschriften," 1893). Spenser Wilkinson's *The Defence of Piedmont* (1927) sheds valuable light on the mid-18th century campaigns which foreshadowed the strategy of 1796.

(C. F. A.; X.)

NAVAL OPERATIONS

The sweeping aims of the French Revolutionary government, to obtain for France her so-called natural limits—the Rhine, the Alps, the Pyrenees, and the Ocean—quickly provoked a coalition of many European Powers pledged to resist it. Of these powers, England proved the most implacable; and it became the object of the Revolutionary, and still more of the Napoleonic, government to reduce her to submission. The intensity of the struggle produced a series of naval campaigns extending over most of the world. In the earlier years of the war France was hampered by the excessively democratic spirit which spread amongst her fleets. Her crews were often mutinous, and some of her most competent admirals were guillotined, their places being filled by men hastily promoted from very junior ranks—for example, Villaret-Joyeuse was promoted straight from lieutenant to admiral. Such drawbacks mattered less in 1792 when operations were confined to giving some assistance to troops operating against Austria in north Italy, and to reducing Naples; but when the First Coalition was completed by the entry of England in Feb., and Spain in March 1793, the naval weakness of the French became manifest. This was seen in the operations in the Channel, where they were unable to maintain an effective force for some time. It is true that Lord Howe, commanding the British Channel fleet, did not attempt to blockade Brest throughout 1793–94—in this connection, the many calls on the British navy for commerce and colonial protection over the whole world must be remembered—and that this freedom enabled Villaret to cover the safe arrival of a large convoy bringing corn from America in 1794. But he himself—more important than the convoy—was caught by Howe in the process, and severely defeated at the Battle of the Glorious 1st of June, losing seven ships. This defeat effectually completed the disorganization of the French, and their engagements in the Channel for the next two years, such as those with Cornwallis and Lord Bridport in 1795, only served to emphasize this ineffectiveness. None the less, French successes on land added to the already heavy British commitments at sea. Having overrun Holland in 1794, the French compelled her to go to war with England in Jan. 1795; and England was thereafter forced to maintain a separate North Sea fleet to guard against invasion from the Texel.

In the meantime operations had been proceeding in various colonial waters and in the Mediterranean. In the former the British had, as early as 1793, seized various French stations in the East Indies, including Pondicherry. In 1793–94 they also achieved some success in the West Indies, capturing Tobago, French San Domingo, Martinique and Guadeloupe, though the last-named was retaken by the Terrorist, Victor Hugues. Later in the war St. Lucia and other islands were also taken. In 1795, Admiral Elphinstone, afterwards Lord Keith, began operations against the colonial possessions of the unfortunate Dutch, and took from them the Cape of Good Hope and their station at Malacca. The importance of these operations lay not only in the captures made, but in the destruction of French sea-borne commerce that they involved.

Lord Hood was given the British command in the Mediterranean and, with 21 ships, directed his energies to the reduction of Toulon, in which he was joined by Spanish and Neapolitan squadrons. The extreme dissension between the Jacobins and Girondists helped him to secure the surrender of the city and its great arsenal; but after the Jacobin triumph, lack of troops forced him to relinquish his hold. Over 30 French ships, including 13 of the line, were destroyed before the withdrawal; but, owing to the lukewarm support of the Spanish, a sufficient number were left intact to form, later, the nucleus of a Mediterranean fleet. Sev-

eral thousands of the inhabitants were also taken off to escape the ferocious vengeance which was wreaked by the victorious Jacobins on their less fortunate countrymen left behind. From 1794-96 the British were mainly occupied in reducing Corsica and trying to help the Austrians in north Italy. Hood's successor, Hotham, failed to deal effectively with the Toulon squadron, though he was twice in action with it in 1795; on each occasion the French escaped serious damage, losing only three ships. Fortune, in the shape of the wind, assisted them; but Nelson held the opinion that Hotham's lack of energy did so too. Jervis, afterwards Lord St. Vincent, relieved Hotham at the end of 1795, and imparted a livelier spirit to the fleet; but in the following year Spain, who had made peace in 1795, re-entered the war on the French side. This gave England another long piece of coast-line to watch and forced her temporarily to withdraw from the Mediterranean.

From 1796 onwards French movements at sea became somewhat more purposeful; and in December they tried to strike at England by the time-honoured method of invading Ireland; but, though the expedition was allowed to sail from Brest, and some of the ships reached Bantry Bay, bad weather caused its failure, and the fleet returned in fragments to Brest. The year 1797 saw England standing alone against France and further embarrassed by the great naval mutinies at Spithead and the Nore, in which the sailors expressed their dissatisfaction with a state of affairs now admitted to have been disgraceful. None the less the gloom was relieved by the light of two great victories at sea, as a result of which Pitt was enabled to reopen negotiations for the formation of another coalition. In Feb. Jervis with 15 sail of the line encountered 27 Spaniards off Cape St. Vincent and, relying on Spanish inefficiency to counteract their advantage in numbers, attacked them and took four prizes. In Oct., Admiral Duncan in command of the North Sea fleet of 16 ships caught the Dutch at sea off Camperdown, also 16 strong. They tried to lure him on to the shoals, but he accepted the risk, chased them and piercing their line in two places took nine prizes.

In 1798, another, and slightly more successful, attempt was made to invade Ireland. General Humbert with 1,100 troops was actually landed; but, after some initial success, was compelled to surrender, while other forces were captured before they landed. But the most important movements were in the Mediterranean. Austria was willing to join a second coalition, but insisted on making the re-entry of the British into the Mediterranean a condition. Jervis, therefore, was ordered either to re-enter the Mediterranean himself, or, if he felt it necessary to continue the blockade of Cadiz, to detach a force thither. He replied that Nelson had already been detached to inquire into the nature of reported activities in Toulon, and he reinforced him with ten ships. The reported activities were the preparations for Napoleon's expedition to Egypt, the origin of which lay chiefly in his desire to keep himself in the public eye. The force succeeded in sailing from Toulon, covered by a fleet of 13 battleships commanded by Admiral Brueys, and in reaching Alexandria, where Napoleon was landed; but Nelson, discovering their whereabouts after a long search, came upon Brueys anchored in Aboukir Bay and destroyed his entire fleet with the exception of two battleships and two frigates, all of which were accounted for later. This placed Napoleon in a most awkward position. He advanced some distance, but was repulsed before Acre by Commodore Sir Sydney Smith, who had landed with Napoleon's own guns, taken at sea. The French tried to relieve his position, and Admiral Bruix succeeded in bringing the Brest fleet to the Mediterranean; but he did not venture far to the East and ultimately returned to Brest without having been brought to action. Napoleon came home as a fugitive, leaving his army to the mercy of the British, who followed up their victory at the Nile, and made further successes possible, by the capture of Minorca (1798) and Malta (1800). Some measure of success was also achieved in the autumn of 1799 by a combined Russian and British expedition, which proposed to attack the French army of occupation in Holland: Admiral Mitchell forced the entrance to the Texel and obtained the surrender of the Dutch fleet—the Dutch sailors showing little inclination to fight on behalf of their French conquerors. From the military standpoint,

however, the affair was not so successful.

By this time Napoleon had become First Consul, and was responsible for the formation of the Armed Neutrality of the Northern Powers which brought about the last great expedition of the war. The Scandinavian Powers, Russia and Prussia pledged themselves to resist the right of search of the British, who were dependent for the very existence of their fleet on supplies of timber and hemp from the Baltic. The Neutrality had to be broken, and in March 1801, a fleet of 18 ships under Sir Hyde Parker, with Nelson as second-in-command, sailed to the Baltic for the purpose. It was decided that an attempt should first be made to detach Denmark from her allies, peaceably or forcibly. Peaceable methods failing, it became necessary to attack the Danish fleet that was anchored along the sea-front of Copenhagen, protected by shoals. Parker thought approach to it impossible; but Nelson with 12 ships solved the problem, smashed the Danish fleet, and the Armed Neutrality with it. By this time peace was near. The English people were sick of the war, while Napoleon needed a truce for the consolidation of his position and the preparation of new schemes. Consequently the Peace of Amiens ended the Revolutionary War in 1802, a peace that was to be the truce Napoleon intended, rather than anything more lasting.

FRENCH WEST AFRICA. French West Africa comprises an area of about 4,665,000 sq.km., or eight times that of France, one-half that of Europe, and one-sixth of that of Africa. It extends from Senegal to the Gulf of Guinea, and from the Atlantic to Lake Chad. It is bounded on the north by Rio-de-Oro, by the territories of South Algeria and by Italian Libya, on the east by French equatorial Africa, on the south by Nigeria, and on the west by the Atlantic. There are certain foreign enclaves: Gambia, Portuguese Guinea, Sierra Leone, Liberia, the Gold Coast and Togoland (the latter is partly under French and partly under British mandate). In addition to the districts of the Sahara which form part of it, French West Africa comprises the districts through which the Niger flows in the great bend which it makes towards Timbuctoo, and the coast districts of Senegambia and Guinea, which include the four colonies of Senegal, French Guinea, the Ivory Coast and Dahomey.

Geology.—Geologically, French West Africa consists of gneisses and crystalline schists. There also occur at various points granites, old volcanic rocks, porphyries and diorites, old sedimentary deposits, schists and Silurian quartzites. Above these old folded formations are horizontal strata of non-fossiliferous sandstones which cover immense areas. Secondary and tertiary marine formations (Cretaceous and Eocene) are met with in Senegambia and extend as far as Lake Chad. The quaternary and recent deposits include alluvial deposits, dunes and laterites, and ferruginous red clays which are often found in strata of great thickness and are the result of the decomposition of rocks *in situ* under the influence of the intertropical climate.

The country is in the form of a plateau, broken up by two systems of fractures, one running south-west and north-east, and the other at right angles, north-west and south-east. The heights are domes of granite or diorite, which are remains of older chains of mountains now worn away, and the cliffs in which the plateau ends. The most mountainous regions are Futa Jallon (height 700-1,500 metres), which runs parallel to the coast for a distance of about 700 km., Mount Nimba (1,600 metres) on the frontier of Liberia and the Ivory Coast, and the Atacora chain (700-800 metres) in Dahomey. In the districts of the Sahara which are attached to French West Africa there are three principal mountain regions: the Adrar of Mauretania (500 metres), the Adrar of Ifoghas (1,000 metres) and the Aïr (1,700 metres).

The coast is straight and sandy from Cape Blanco to Cape Verde, which shelters the port of Dakar; after this it is cut up by estuaries, especially between Cape Verde and the island of Sherbro. After Cape Palmas the coast line runs from west to east and is bordered by an almost uninterrupted series of lagoons.

Rivers.—The Niger (*see* NIGER), the third longest river of Africa (4,200 km.) and the second in volume of water (minimum of 30,000 cu.m. at the mouth) is the main artery of French West Africa. It rises at an altitude of 860 metres, not far from the frontier of Sierra Leone, and at first flows from south-west to north-east, and then takes a great bend which brings it into the Sahara in the neighbourhood of Timbuctoo. After Burem it turns in a north-west to south-east direction, and finally runs into the Gulf of Guinea. In its upper reaches, from its source to Kulikoro, it receives tributaries from the right, particularly the Tan-kisso. In the middle reaches, from Kulikoro to Say, it receives its chief tributary, the Bagoe or Bani, and spreads out into a sort of wide inland delta, a great area subject to flooding, which in the rainy season is 140 kilometres wide at Mopti, and narrows in again after Tosaye and Burem. The lower part of the river, from Say to the sea, belongs to British Nigeria; it is separated from the middle reaches by the Bussa rapids. The upper course of the Niger is subject to summer floods between June and September; the floods arrive gradually and late in the Timbuctoo district, where the maximum is not reached until January. The middle reaches of the Niger are of great importance from the point of view of navigation, which is possible over a distance of 1,300 km., from Kulikoro to Ansongo, as well as for irrigation; the Niger has been called "the French Nile." The most important of the coast rivers is the Senegal (1,700 km.), formed by the junction of the Bakhoy, with its tributary the Baule, and the Bafing; it is navigable up to Kayes in the wet season (Aug. 15 to Oct. 1) and up to Podor in the dry season. The Casamance, the Cavally, the Sassandra, the Bandama, the Comoe, the Volta and the Ueme should also be mentioned.

Climate.—North of the eighth parallel of latitude the year is divided into two seasons, the rainy and the dry season; the latter is longer the nearer we approach the Sahara. On the banks of the Senegal the north-east trade wind blows for eight months, and the moist south-west wind only for four months; in French Guinea the contrary is the case. Saint-Louis has a rainfall of 423 mm. per annum, Dakar 514, Sedhiu 1,532, and Konakry 4,431. The highest temperatures occur at the end of the dry season, in April and May, and in northern Sudan, near the Sahara, whence blows the harmattan, a wind resembling the sirocco which raises a red dust. South of the eighth parallel there are two rainy seasons separated by a short dry season; in Dahomey the rains last from March to July and from September to December; Grand-Bassam has an annual rainfall of 1,077 mm., and Porto-Novo of 1,259. In the district enclosed by the bend of the Niger there is less rain than on the coast; the average is from 600 to 1,200 mm.; at Timbuctoo the tropical rains, which only last for three months (June to August) only give a rainfall of 229 mm.

From the point of view of vegetation, a distinction may be drawn between the Saharan zone (rainfall of less than 20 cm.), the Sahelian zone (rainfall of less than 60 cm.), which is a region of steppes in which grow dum palms and narrow-leaved acacias, the Sudanese zone (rainfall of 60 cm. to 1.50 metres), a country of savannas with forest belts, which is the principal agricultural region, and the Guinea zone (rainfall of over 1.50 metres) which is occupied by the great forest, attaining a width of 300 km. at Cape Palmas, and the characteristic feature of which is the oil palm (*Elaeis guineensis*). In this district there are no real mountains, and the various zones of vegetation shade gradually off into one another.

Population.—There is no racial unity among the populations of French West Africa; they differ in physique, physiognomy, manners and dialect, and they are of very mixed stock. They have spread mainly in two directions, towards the south and towards the west. Some of them are not connected with the negro races; these include the Saharans, Moors and Tuaregs, and the Fulbé or Peuhl, who, with their reddish-brown colouring and only slightly

woolly hair, appear to be of Ethiopian or Hamitic, or possibly of Semitic stock. Among the strictly negro populations, a distinction may be made between those of the region enclosed by the bend of the Niger and of Senegal on the one hand, and those of the Gulf of Guinea on the other. The former include the great group of the Mandé, which extends over the whole of the plateau within the bend of the Niger north of the great forest; it is subdivided into a number of tribes, including the Malinké or Mandingo, the Soninké, the Bambara and the Susu; then there are the Wolof of Senegal, the Tukulor of Segou, the Sonrhaï (Songhai) of the district of Gao, the Mossi of Haute Volta, and the Senufo of the upper Ivory Coast. The coast negroes are generally shorter than the Sudanese; their heads are not so long and their colour is lighter. Of this type are the Agni, the Dahomi, the Kru, etc. In the forest region there dwell small groups of inhabitants of an exceedingly primitive type; they appear to be related to the Pygmies or Négrillos.

The religion of the Sudanese tribes is animism, or belief in the omnipotence of spirits. About one-half of the population is Muslim, in name at any rate; for the negro manages to reconcile Islam with his ancient superstitions, and it is only the populations in the neighbourhood of the Sahara which have really been profoundly affected by Mohammedanism. The Guinea tribes, as well as the Mossi, have for the most part remained animists.

The population of French West Africa is estimated at 12 million; this represents a very low degree of density. The most thickly populated districts have 8–10 inhabitants per km., but the average is not more than 3–4, and in many places the density of population is as low as 1 per km. or less. The country has been depopulated by internecine warfare in the region enclosed by the bend of the Niger, and by the slave trade on the Guinea coast. The rate of increase is slow, mainly owing to the enormous infantile mortality, which reaches a figure of 45 per 100.

French West Africa, the capital of which is Dakar (34,000 inhabitants, including 3,000 Europeans), includes eight colonies administered by lieutenant-governors who are subordinate to the Governor-general. The colonies are Senegal, French Guinea, the Ivory Coast, Dahomey, the French Sudan, Haute-Volta, Mauretania and Niger. There are four coast colonies; Senegal, French Guinea, the Ivory Coast and Dahomey; two inland colonies occupying the region enclosed in the bend of the Niger; the French Sudan and Haute-Volta; and two Saharan districts, Mauretania and Niger. The number of inhabitants according to the census is 34,000 in the autonomous territory of Dakar, 1,318,000 in Senegal (chief town St. Louis, 18,000 inhabitants), 2,096,000 in French Guinea (chief town Konakry, 9,000 inhabitants), 1,725,000 in the Ivory Coast (chief town Bingerville, 1,000 inhabitants), 980,000 in Dahomey (chief town Porto-Novo, 22,000 inhabitants), 2,635,000 in the French Sudan (chief town Bamako, 16,000 inhabitants), 3,240,000 in Haute-Volta (chief town Wagadugu, 5,000 inhabitants), 289,000 in Mauretania (the lieutenant-governor resides in St. Louis) and 1,219,000 in the Niger colony (chief town Zinder, 6,000 inhabitants).

History.—The French have been established on the west coast of Africa since very early times, but if we except a few attempts at colonisation such as that of André Brue at the end of the seventeenth century their only object, until the middle of the nineteenth century, was to carry on the slave trade; in this respect their practice was similar to that of other European states. A new era was inaugurated by Faidherbe, who, in 1854, conceived the scheme of linking up the upper Senegal with the Upper Niger. From 1876 onwards the coast settlements were considerably extended into the hinterland by a series of campaigns and missions, and at the same time the possessions of other European Powers in the same region were reduced to the state of enclaves by a number of conventions. The most important events were the campaigns of the Upper Niger (1876–90), which resulted in the destruction of the old native kingdoms, the Binger mission to the Ivory Coast (1887–90), the campaigns of Dahomey (1889–94), the occupation of Timbuctoo (1894) and the Franco-British Conventions of 1890 and 1898. By about 1900 the period of expansion may be regarded as over, and the period of organization and development begun.

French West Africa was constituted in 1895 by the grouping of the various territories of which it is composed under one Governor-general. Endeavours have been made to encourage the development of the colonies which make up French West Africa as parts of a united whole, under a single government which looks after their common interests while leaving them a large measure of autonomy.

Production.—Until recent years, French West Africa chiefly produced jungle products, such as gum, rubber and ivory. Gum produced from the dried resin of various kinds of acacia, is the principal product of Mauretania. Rubber, which is obtained from trees and creepers, was for some years of considerable importance in French West Africa, which in 1910 produced 8,000 tons out of a total world production of 70,000 tons; but rubber collected from wild trees and vines can with difficulty compete with Asiatic cultivated rubber, and in 1925 the rubber production of French West Africa was only 2,000 tons out of a world total of 488,000 tons. On the other hand the exploitation of ordinary timber and precious woods has been considerably developed in the Ivory Coast, where there are 120,000 sq. km. of virgin forest. The production in 1905 was 13,000 cu. m., it is now 100,000 cu. m. and will no doubt soon reach 200,000 cu. m.

The colonies of French West Africa have now entered upon an agricultural era, and their development in recent years has been remarkable. The European inhabitants are few in number—about 12,000—and the progress of cultivation depends mainly on the natives, among whom agricultural work is as a rule held in high esteem. This applies both to the cultivation of food crops and of crops for export. The principal foodstuffs grown are millet, rice and maize. Cattle breeding is carried on to a considerable extent in the northern part of the country, in the relatively dry districts. There are 100,000 horses, 8 million head of cattle, and 5 million sheep. The Europeans are making efforts to improve the quality of the wool produced.

Vegetable oils are among the most important products of French West Africa. The ground nut is the principal source of the prosperity of Senegal, where it has been cultivated since about 1890; the production is 400,000 tons. The Ivory Coast and Dahomey produce principally palm oil and palm kernels; the production of the latter is 35,000 tons out of a world total of 100,000 tons, and of the latter 100,000 tons out of a world production of 300,000 tons.

The European inhabitants are specially anxious to develop the cultivation of cotton, both with and without irrigation. The whole of the Sudan appears to be suitable for this crop with the exception of the excessively dry districts near the Sahara and the excessively wet districts near the coast. The most suitable parts of the country seem to be the middle basin of the Niger for cultivation by means of irrigation, and Haute-Volta for cultivation without irrigation. For cotton cultivation there might be three zones: in the north, Egyptian cotton cultivated with irrigation; further south, American cotton cultivated without irrigation; further south again, improved native cotton cultivated without irrigation. It will however be necessary to find a solution for a number of problems connected with agricultural methods, labour and communications; and a considerable time must elapse before this work is completed. It will be necessary to establish ginning stations, to arrange for the transport of the cotton after ginning, to improve the native cotton, to introduce American cotton, and to provide a supply of water for irrigation purposes. Up to the present the amount of cotton exported has not exceeded 3,000 tons (15,000 bales).

In French Guinea there appears to be a great future for the export of fruit, including pineapples and above all bananas. There are cocoa and coffee plantations in the Ivory Coast as well as in Dahomey.

Gold is found in alluvial deposits in Senegal (the Bambuk and Brue deposits) and in veins in the Ivory Coast (Bule, Indenie), but its exploitation is not of great importance. The native industries, which produce leather and cotton goods, are interesting but of little economic importance; they are more highly developed among the Mandé of the interior than among the popu-

lations of the coast, because the latter for many years have been able to obtain the clothing and other objects which they require from the European trading stores. There is a great deal of internal trading and certain tribes are specially active in this respect. The principal objects of commerce are salt, kola nuts and European trade goods.

Transport.—The middle course of the Niger and the lower course of the Senegal constitute navigable waterways which, while not without importance, are not completely satisfactory; and the opening up of the African continent to civilization is only possible by means of railways. The four colonies of Senegal, French Guinea, the Ivory Coast and Dahomey are served by four railway lines, which it is proposed to link up later by a transversal line in the neighbourhood of Wagadugu or Bobo-Dioulasso. They represent, as it were, four artificial outlets for the Niger: (1) From the line Dakar-St. Louis, constructed in 1886, there branches the line Thiès-Kayes (667 km.), prolonged by the line Kayes-Kulikoro (550 km.), which brings the middle Niger within two days' reach of Dakar and a week of Bordeaux. (2) In French Guinea the line Konakry-Kankan (662 km.). (3) In the Ivory Coast the line Abidjan-Niangbo (453 km.), which is being extended to Wagadugu and Mossi. (4) In Dahomey, the lines Kotouou-Savé (261 km.) and Porto-Novo-Pobé (80 km.), which have a number of branch lines. French West Africa has in all over 3,000 km. of railways in operation, 10,000 km. of roads and tracks, and over 20,000 km. of telegraph lines. Dakar is the finest port on the west coast of Africa, and handled 900,000 tons of goods in 1928. The other ports are: in Mauretania, Port-Etienne; in Senegal, St. Louis, Rufisque and Kaolack; in French Guinea, Konakry; in the Ivory Coast there are wharfs at Grand-Bassam and Vridy; in Dahomey, a wharf at Kotonu.

French West Africa is served by a large number of French and foreign shipping lines (Chargeurs Réunis, Fraissinet, Cyprien Fabre, Maurel et Prom, Devès et Chaumet, Linea Italiana, Elder Dempster, Woermann, Compagnie belge du Congo, etc.). Its main shipping connections are with Bordeaux and Marseilles. Submarine cables run to St. Louis, Dakar, Konakry and Kotonu. There are 16 wireless stations, of which the most important are those of Dakar and Bamako.

Trade.—Trade has increased very rapidly, rising from 40 millions in 1890 to 156 in 1914, 227 in 1915, 1,242 in 1920 and 2,014 in 1925. Leaving north Africa out of account, French West Africa is at present the second French colony in commercial importance, coming immediately after Indo-China. One-half of its trade is with France, and the next countries are Great Britain, the United States and the Netherlands. The principal imports are unbleached, printed and dyed fabrics, rice, salt, sugar, metal goods, coal, cutlery, hardware and perfumery. Oil-bearing products, ground-nuts and palm, represent 87% of the exports. Timber, maize, rubber and cattle come next in importance. Cotton (6,000 tons) and cocoa (6,000 tons) are likely to be of great importance in the future, but do not as yet form a prominent feature of the trade statistics. French West Africa is a country of growing prosperity, and seems likely to develop into a second Brazil.

FRENEAU, PHILIP MORIN (1752–1832), American poet, patriot, editor and sea-captain, son of a New York wine merchant of French-Huguenot descent, was born on Jan. 2, 1752. Graduating in 1771 from Princeton, then a hotbed of "Whiggism," he won fame by 1775 as a satirist of the Tories. His admirable *Beauties of Santa Cruz*, *The Jamaica Funeral* and *The House of Night* (the first American romantic poem in the manner of Poe) were produced during his sojourn in Santa Cruz and the Bermudas from 1775 to 1778. He was captured by the British during the American Revolution and his experience (1780) in a prison ship called forth one of his most mordant satires. After some minor editorships and a few years in the Atlantic coast trade, Freneau became clerk of foreign languages for the secretary of State, Jefferson, and at the same time (1791–93) he exerted his greatest political influence as independent editor of *The National Gazette*. Opposed to Fenno's *Gazette of the United States*—the organ of Hamilton and the Federalists—Freneau as "the leading editor in America" attacked growing ceremonial, aristocratic, centralizing

tendencies and disseminated the doctrines of liberty, fraternity and equality upheld by Jefferson, Paine and Rousseau. As Jefferson said, Freneau's paper "saved our Constitution, which was fast galloping into monarchy." After more minor editorships and several years on the sea, Freneau retired in 1807 to his plantation-like estate, "Mount Pleasant," near Middletown Point, N.J., where he lived until his death on Dec. 18, 1832. Originally published in newspapers, his poems appeared in five editions during his lifetime—in 1786, 1788, 1795, 1809 and 1815.

Freneau is remembered as the greatest American poet before Bryant, by virtue of *The Wild Honeysuckle*; as the "poet of the revolution" who heartened the soldiers in the darkest days of the war; and as a powerful advocate, in a crucial period, of Jeffersonian democracy and French political philosophy.

Pattee, *Poems of Philip Freneau* (1902-07); V. H. Paltsits, *A Bibliography of the Works of Philip Freneau* (1903); H. H. Clark, *Poems of Freneau* (1928). (H. H. Cl.)

FRENSSEN, GUSTAV (1863–), German author, was born at Barlt on Oct. 19, 1863, and educated at the universities of Tübingen, Berlin and Kiel. He took orders, and from 1892 to 1902 was pastor at Hemme; but he had already for some years been known as a writer of novels, and in 1902, a year after his unexampled success with *Jörn Uhl* (1901), he gave up his pastorate and devoted all his time to literature. His work in fiction includes *Die Sandgräfin* (1896, 3rd ed., 1902); *Die drei Getreuen* (1898); *Hilligenlei* (1905); *Peter Moor's Fahrt nach Süd-West* (1906); *Klaus Hinrich Baas* (1909), and *Die Brüder* (1918). He also published sermons (*Dorfpredigten*, 1899-1902), and two plays, *Das Heimatsfest* (1903) and *Sönke Erichsen* (1912).

Frenssen gives a realistic and vivid description of the peasantry and the countryside in north Germany, and is perhaps the most powerful of the school of writers of the *Heimatkunst*, i.e., literature of special regions. *Jörn Uhl* showed an exact and detailed local knowledge, though the dialogue is more literary than pure realism demands. Its great popularity was due partly to this and to the power of the story, and partly to the many subsidiary and propagandist elements introduced into it.

See H. M. Elster, *Gustav Frenssen, sein Leben und sein Schaffen* (1912); also studies by E. Müsebeck (1908) and T. Rehtwisch (1902); and *Gustav Frenssen; Hilligenlei als Kunstwerk und als Tendenzschrift* (1906).

FRENTANI, one of the ancient Samnite tribes which formed an independent community on the east coast of Italy. They entered the Roman alliance after their capital, Frentum, was taken by the Romans in 305 or 304 B.C. (Livy ix. 16.45). This town either changed its name or perished some time after the middle of the 3rd century B.C., when it was issuing coins of its own with an Oscan legend. The town Larinum, which belonged to the same people (Pliny, *Nat. Hist.* iii. 103), became latinized before 200 B.C., as its coins of that epoch bear a legend—*LARINOR(VM)*—which cannot reasonably be treated as anything but Latin. Several Oscan inscriptions survive from the neighbourhood of Vasto (anc. *Histonium*), which was in the Frentane area.

On the forms of the name, and for further details see R. S. Conway, *Italic Dialects* (1897), p. 206 ff. and p. 212: for the coins, *id.* No. 195-196.

FREPPÉL, CHARLES ÉMILE (1827-1891), French bishop and politician, was born at Oberehnheim (Obernai), Alsace, on June 1, 1827. He was consecrated bishop of Angers in 1870. In 1880 he was elected deputy for Brest. Being the only priest in the Chamber of Deputies since the death of Dupanloup, he became the chief parliamentary champion of the Church. On all ecclesiastical affairs Freppél voted with the Royalist and Catholic party, yet on questions in which French colonial prestige was involved, such as the expedition to Tunis, Tong-King, Madagascar, he supported the government. He died at Angers on Dec. 12, 1891.

Freppél's chief works are: *Les Pères apostoliques et leur époque* (1859); *Les Apologistes chrétiens au II^e siècle* (2 vols., 1860); *Saint Irénée et l'éloquence chrétienne dans la Gaule aux deux premiers*

siècles (1861); *Tertullien* (2 vols., 1863); *Examen critique de la Vie de Jésus de M. Renan* (1863); *Saint Cyprien et l'Eglise d'Afrique* (1864); *Clément d'Alexandrie* (1865); *Origène* (2 vols., 1867).

See E. Cornut, *Mgr. Freppél* (1893) and A. Pavie, *Mgr. Freppél* (1906).

FREQUENCY is used in science generally to denote the number of variations which occur in unit time. In medicine (*q.v.*) the frequency of the pulse. In light (*q.v.*) it denotes the number of cycles executed by the electromagnetic vector per second. In sound (*q.v.*) the number of variations in pressure per second at a point as sound passes that point.

FREQUENCY CHANGER, a device which delivers alternating current into an output circuit of a radio receiving set at a frequency (*q.v.*), which differs from the frequency of the input or supply circuit.

FRERE, SIR HENRY BARTLE EDWARD, 1ST BART., cr. 1876 (1815-1884), British administrator, born at Clydach in Brecknockshire on March 29, 1815, was the son of Edward Frere, and a nephew of J. H. Frere, of *Anti-Jacobin* and *Aristophanes* fame. After leaving Haileybury, Bartle Frere was appointed a writer in the Bombay civil service in 1834, and in 1835 assistant collector at Poona. In 1842 he became private secretary to Sir George Arthur, governor of Bombay. In 1844 he became political resident at the court of the raja of Satara, administering the province, on the raja's death in 1848, even after its formal annexation in 1849. In 1850 he was appointed chief commissioner of Sind, where he established municipal buildings and made many other improvements.

On his return to India from leave in 1857 Frere learnt at Karachi of the mutiny. He sent his only European regiment to secure the strong fortress of Multan against the rebels, and sent further detachments to aid Sir John Lawrence in the Punjab. For his services he received the thanks of both houses of parliament and was made K.C.B. In 1862 he was appointed governor of Bombay, where he effected great improvements, including the inauguration of the university buildings. He established the Decan college at Poona, and a college for instructing natives in civil engineering. The prosperity, due to the American Civil War, which rendered these developments possible, resulted in a speculative mania, leading eventually to the disastrous failure of the Bombay bank, for which Frere incurred severe and not wholly undeserved censure. In 1867 he returned to England and was made a member of the Indian council. In 1872 he was sent by the foreign office to negotiate a treaty with the sultan, Seyyid Burghash, at Zanzibar, for the suppression of the slave traffic. In 1875 he accompanied the prince of Wales to Egypt and India.

But the greatest service that Frere undertook on behalf of his country was to be attempted not in Asia, but in Africa. He landed at Cape Town as high commissioner of South Africa on March 31, 1877. He had been chosen by Lord Carnarvon in the previous October as the statesman most capable of carrying his scheme of confederation into effect, and within two years it was hoped that he would be the first governor of the South African Dominion. He went out in harmony with the aims and enthusiasm of his chief, "hoping to crown by one great constructive effort the work of a bright and noble life." In this hope he was disappointed. The first year of his rule was marked by a Kaffir war on the one hand and by a rupture with the Cape (Molteno-Merriman) ministry on the other. The Transkei Kaffirs were subjugated early in 1878 by General Thesiger (the 2nd Lord Chelmsford) and a small force of regular and colonial troops. The constitutional difficulty was solved by Frere dismissing his obstructive cabinet and entrusting the formation of a ministry to Gordon Sprigg. Frere emerged successfully from a year of crisis, but the advantage was more than counterbalanced by the resignation of Carnarvon early in 1878, at a time when Frere required the steadiest and most unflinching support. He was convinced that there was a widespread insurgent spirit pervading the natives, which had its focus and strength in the celibate military organization of Cetywayo. Frere told the colonial office that this organization must be broken up, if necessary, by force. The colonial office appeared to agree, but when Frere sent, in Dec. 1878, an ultimatum to Cetywayo, the home Government abruptly discovered that a native war in South

Africa was inopportune and raised difficulties about reinforcements. Having entrusted to Lord Chelmsford the enforcement of the British demands, Frere's immediate responsibility ceased. On Jan. 11, 1879 the British troops crossed the Tugela, and 14 days later the disaster of Isandhlwana was reported; and Frere, attacked and censured in the House of Commons, was but feebly defended by the Government. Lord Beaconsfield, it appears, supported Frere; the majority of the cabinet were inclined to recall him. He was censured, but begged to stay on.

The Zulu trouble and the disaffection that was brewing in the Transvaal reacted upon each other in the most disastrous manner. Frere had had no part in the actual annexation of the Transvaal, which was announced by Sir Theophilus Shepstone a few days after the high commissioner's arrival at Cape Town. The delay in giving the country a constitution afforded a pretext for agitation to the malcontent Boers, a rapidly increasing minority, while the reverse at Isandhlwana had lowered British prestige. Owing to the Kaffir and Zulu wars Frere had hitherto been unable to give his undivided attention to the state of things in the Transvaal, which he visited in 1879. A large camp, numbering 4,000 disaffected Boers, had been formed near Pretoria, and they were terrorizing the country. Frere visited them unarmed and practically alone. On the condition that the Boers disperse, Frere undertook to present their complaints to the British Government, and to urge the fulfilment of the promises that had been made to them. They parted with mutual good feeling, and the Boers did eventually disperse—on the very day upon which Frere received the telegram announcing the Government's censure. But bad news met him on his return to Capetown—on June 1, 1879, the prince imperial had met his death in Zululand—and a few hours later Frere heard that the Government of the Transvaal and Natal, together with the high commissionership in the eastern part of South Africa, had been transferred from him to Sir Garnet Wolseley.

When Gladstone's ministry came into office in the spring of 1880, Lord Kimberley had no intention of recalling Frere. In June, however, a section of the Liberal party memorialized Gladstone to remove him, and the prime minister weakly complied (Aug. 1, 1880). Upon his return Frere replied to the charges relating to his conduct respecting Afghanistan as well as South Africa, previously preferred in Gladstone's Midlothian speeches, and was preparing a fuller vindication when he died at Wimbledon from the effects of a severe chill on May 29, 1884. He was buried in St. Paul's, and in 1888 a statue of Frere upon the Thames embankment was unveiled by the prince of Wales. Frere edited the works of his uncle, Hookham Frere, and the popular story-book, *Old Deccan Days*, written by his daughter, Mary Frere. He was three times president of the Royal Asiatic Society.

His *Life and Correspondence*, by John Martineau, was published in 1895. For the South African anti-confederation view, see P. A. Molteno's *Life and Times of Sir John Charles Molteno* (2 vols., 1900). See W. B. Worsfold, *Sir Bartle Frere* (1923). See also *Correspondence respecting the Affairs of South Africa*, H.M.S.O. (C. 2220, 1878), and *Further Correspondence* (C. 2222, 1879), in *Accounts and Papers* (11) vol. 52 (1878-79); also the article SOUTH AFRICA: *History*.

FRERE, JOHN HOOKHAM (1769-1846), English diplomat and author, was born in London. He was educated at Eton, where he met Canning, and at Caius college, Cambridge. He entered public service in the Foreign Office under Lord Grenville, and sat from 1796 to 1802 as M.P. for the close borough of West Looe in Cornwall. He and Canning were ardent supporters of Pitt, and contributors to the *Anti-Jacobin*. On Canning's removal to the Board of Trade in 1799 he succeeded him as under-secretary of State; in Oct. 1800 he was appointed envoy extraordinary and plenipotentiary to Lisbon; and in Sept. 1802 he was transferred to Madrid, where he remained for two years. He was made a member of the privy council in 1805; in 1807 he was appointed plenipotentiary at Berlin, but the mission was abandoned, and Frere was again sent to Spain in 1808 as plenipotentiary to the Central Junta. The condition of Spain rendered his position a very responsible and difficult one. When Napoleon began to advance on Madrid Frere wholeheartedly advised Sir John Moore not to retreat. After Corunna public opinion accused him of having endangered the army, and he was recalled.

Thus ended Frere's public life. In 1816 he married Elizabeth Jemima, dowager countess of Erroll, and in 1820, on account of her failing health, he went with her to the Mediterranean. There he finally settled in Malta, where he lived the rest of his life. He died at the Pietà Valetta on Jan. 7, 1846. Frere's literary reputation now rests entirely upon his spirited verse translations of Aristophanes, which remain in many ways unrivalled. The translations of *The Acharnians*, *The Knights*, *The Birds*, and *The Frogs* were privately printed, and were first brought into general notice by Sir G. Cornewall Lewis in the *Classical Museum* for 1847.

Frere's complete works were published in 1871, with a memoir by his nephews, W. E. and Sir Bartle Frere, and reached a second edition in 1874. See also Gabrielle Festing, *J. H. Frere and his Friends* (1899).

FRÈRE-ORBAN, HUBERT JOSEPH WALTHER (1812-1896), Belgian statesman, was born at Liège on April 24, 1812. After studying law in Paris, he practised as a barrister at Liège, took a prominent part in the Liberal movement, and in June 1847 was returned to the Chamber as member for Liège. He was minister of public works in the Rogier cabinet, and from 1848 to 1852 was minister of finance. He founded the Banque Nationale and the Caisse d'Épargne, abolished the newspaper tax, reduced the postage, and modified the customs duties as a preliminary to a decided free-trade policy. To facilitate the negotiations for a new commercial treaty, he conceded to France a law of copyright, which proved highly unpopular in Belgium, and he resigned office, soon followed by the rest of the cabinet. His work *La Maimorte et la charité* (1854-1857), published under the pseudonym of "Jean van Damme," helped his party back to power in 1857, when he again became minister of finance. He now embodied his free-trade principles in commercial treaties with England and France, and abolished the *octroi* duties and the tolls on the national roads. He resigned in 1861 on the gold question, but soon resumed office, and in 1868 succeeded Rogier as prime minister. In 1869 he defeated the attempt of France to gain control of the Luxemburg railways. Defeated in 1870, he returned to office in 1878 as president of the council and foreign minister. He provoked the bitter opposition of the Clerical party by his law of 1879 establishing secular primary education, and in 1880 broke off diplomatic relations with the Vatican. Frère-Orban, while rejecting the Radical proposal of universal suffrage, conceded an extension of the franchise (1883); but the hostility of the Radicals, and the discontent caused by a financial crisis, overthrew the government at the elections of 1884. Frère-Orban continued to lead the Liberal opposition till 1894, when he failed to secure re-election. He died at Brussels on Jan. 2, 1896.

See F. Hymans, *Frère-Orban* (2 vols. 1906-10).

FRÉRET, NICOLAS (1688-1749), French scholar, was born in Paris. His father was *procureur* to the parlement of Paris, and destined him to the profession of the law. His first tutors were the historian Charles Rollin and Father Desmolets (1677-1760). He was hardly 26 years of age when he was admitted as pupil to the Academy of Inscriptions. One of the first memoirs which he read was *Sur l'origine des Francs* (1714). He maintained that the Franks were a league of South German tribes and not, according to the legend then almost universally received, a nation of free men deriving from Greece or Troy, who had kept their civilization intact in the heart of a barbarous country. These sensible views excited great indignation in the Abbé Vertot, who denounced Fréret to the Government as a libeller of the monarchy. A *lettre de cachet* was issued, and Fréret was sent to the Bastille. From the time of his liberation in March 1715 his life was uneventful. In Jan. 1716 he was received associate of the Academy of Inscriptions, and in Dec. 1742 he was made perpetual secretary. The list of his memoirs, many of them posthumous, occupies four columns of the *Nouvelle Biographie générale*. They treat of history, chronology, geography, mythology and religion. He was one of the first scholars of Europe to undertake the study of the Chinese language; and in this he was engaged at the time of his committal to the Bastille. He died in Paris on March 8, 1749.

BY COURTESY OF (1, 2, 3, 5, 6, 7, 8) THE METROPOLITAN MUSEUM OF ART, NEW YORK, (4) SIR ARTHUR EVANS; PHOTOGRAPHS, (9) ALINARI, (10) ANDERSON, (11) EWING GALLOWAY, (12) BONNEY

FRESCO PAINTING OF VARIOUS PERIODS

1. Ancient Egyptian fresco of geese, from the tomb of Ra'hotep at Medum, 4th dynasty (2900–2750 B.C.). From a facsimile. 2. Fresco of partridges from the walls of the Caravanserai at Knossos, Crete (c. 1600 B.C.). From a water-colour copy. 3. Fragment from an Egyptian ceiling decoration painted on mud plaster, in the Palace of Amenhotep III. at Thebes, 18th dynasty (c. 1400 B.C.). 4. Saffron gatherer. Cretan fresco from the Palace of Minos at Knossos, middle Minoan, about 1800 B.C. 5. Woman carrying a casket. Cretan fresco of the late Minoan period (1350–1100 B.C.), found at Tiryns, Greece. 6. Roman fresco decoration, a candelabrum surmounted by panel with Egyptian scene. Found in a villa at Boscoreale, near Pompeii. Probably 1st century A.D. 7. Roman fresco from Boscoreale, near Pompeii, 1st century A.D. 8. St. Christopher, by Antonio

del Pollaiuolo (1429–98), Florentine School, Italian Renaissance. 9. Detail from the "Procession of the Magi" by Benozzo Gozzoli (1420–97), a fresco decoration, brilliant in colour and crowded with figures, which lines the walls of the Medici Chapel in the Riccardi Palace, Florence. 10. Detail from "The School of Athens" by Raphael (1483–1520), one of the frescoes in the "Stanze of Raphael" in the Vatican. The figures shown represent Plato and Aristotle. 11. Section of the ceiling of the Sistine Chapel in the Vatican, by Michelangelo (1475–1564). The ceiling frescoes are a series of Biblical scenes, which together form a symmetrical pattern. Figures of sibyls and prophets fill the spaces in the vaulting and between the central panels. 12. Ceiling decoration in fresco, by Paul Baudouin, contemporary French

The best account of his works is "Examen critique des ouvrages composés par Fréret" in C. A. Walckenaer's *Recueil des notices*, etc. (1841-50). See also Quérard, *France littéraire*.

FRERICHS, FRIEDRICH THEODOR (1819-1885), German pathologist, became professor of pathology at Göttingen (1848), at Kiel (1850), at Breslau (1852) and Berlin (1859). He developed scientific clinical teaching in Germany. He discovered leucin and tyrosin in the urine in cases of acute yellow atrophy of the liver (1855), made pathological studies of cirrhosis of the liver and of pernicious malarial fever, and published works on Bright's disease (1851) and diseases of the liver (1858).

FRÉRON, ÉLIE CATHERINE (1719-1776), French critic and controversialist, is now remembered solely for his attacks on Voltaire and the Encyclopaedists, and by the retaliation they provoked on the part of Voltaire, who, besides attacking him in epigrams, and even incidentally in some of his tragedies, directed against him a virulent satire, *Le Pauvre diable*, and made him the principal personage in a comedy *L'Ecossoise*, in which the journal of Fréron is designated *L'Ane littéraire*. A further attack on Fréron entitled *Anecdotes sur Fréron* . . . (1760), published anonymously, is generally attributed to Voltaire.

Fréron was the author of *Ode sur la bataille de Fontenoy* (1745); *Histoire de Marie Stuart* (1742, 2 vols.); and *Histoire de l'empire d'Allemagne* (1771, 8 vols.). See Ch. Nisard, *Les Ennemis de Voltaire* (1853); Ch. Monselet, *Fréron, ou l'illustre critique* (1864); *Fréron, sa vie, souvenirs*, etc. (1876); F. Cornois, *Élie Fréron* (1922).

FRÉRON, LOUIS MARIE STANISLAS (1765-1802), French revolutionist, son of the preceding, was born at Paris on Aug. 17, 1765. On the death of his father his name was attached to *L'Année littéraire*, which was continued till 1790 and edited successively by the abbés G. M. Royou and J. L. Geoffroy. On the outbreak of the revolution Fréron, who was a schoolfellow of Robespierre and Camille Desmoulins, established the violent journal *L'Orateur du peuple*. With Barras in 1793 he repressed the opposition to the Convention at Marseilles and Toulon, but both afterwards joined the Thermidoriens, and Fréron became the leader of the *jeunesse dorée* and of the Thermidorian reaction. He brought about the accusation of Fouquier-Tinville and of J. B. Carrier, the deportation of B. Barère and the arrest of the last *Montagnards*. His paper became the official journal of the reactionists. He went in 1799 as commissioner to Santo Domingo and died there in 1802. He wrote *Mémoire historique sur la révolution royale et sur les malheurs du midi* (1796).

FRESCO (Ital. for cool, "fresh"), a term introduced into English, both generally (as in such phrases as *al fresco*, "in the fresh air"), and more especially as a technical term for mural painting on plaster. In the latter sense the Italians distinguished painting *a secco* (when the plaster had been allowed to dry) from a *fresco* (when it was newly laid and still wet). The nature and history of fresco-painting is dealt with in the article PAINTING.

FRESCOBALDI, GIROLAMO (1583-1644), Italian organist and composer, was born in Ferrara. He studied under the cathedral organist Luzzasco Luzzaschi, and owed his first reputation to his beautiful voice. He was organist at St. Peter's in Rome from 1608 to 1628. According to Baini no fewer than 30,000 people flocked to St. Peter's on his first appearance there. In 1628 he went to live in Florence, becoming organist to Duke Ferdinand II. Political troubles drove him back to Rome in 1633, and he was again organist at St. Peter's until March 1643. He died on March 2, 1644, being buried at Rome in the Church of the Twelve Apostles. Frescobaldi was perhaps the greatest organist of the 17th century, and his method was handed down by his pupil Froberger. His compositions show the consummate art of the early Italian school, and his works for the organ more especially are full of the finest devices of fugal treatment. He also wrote numerous vocal compositions, such as canzone, motets, hymns, etc., a collection of madrigals for five voices (Antwerp, 1608) being among the earliest of his published works.

FRESCO PAINTING. Painting in fresco is here defined as painting on wet lime plaster with pigments mixed with water or water and lime. As the water evaporates, the setting of the lime binds the pigment to the plaster, and the subsequent con-

version of the lime into carbonate of lime by the action of the carbonic acid gas in the air completes the binding of the pigment. This method of painting is very old—the wall paintings in the palace of Knossos are examples of genuine fresco painting.

The Egyptians, Greeks and Romans were familiar with the use of egg, gum arabic, size and wax as media for painting, and there has been a big controversy as to how the Pompeian frescoes were painted. Vitruvius gives a detailed account of the preparation of the plaster—a method that was obtained by the Romans from Greek practice. The Roman plaster was several inches thick, and beginning with sand, lime and broken brick, the final coats were made of lime and marble dust—the lime having been prepared by prolonged treatment with water, pounding and mixing. The marble dust, lime mortar was beaten and trowelled until a highly polished surface was obtained. The evidence from Vitruvius' account is on the whole, in favour of the pigments mixed with water being laid on the wet plaster. It has, however, been pointed out by Prof. Berger that this description may apply only to the ground colouring and not to the final painting, which he believes was done with a wax emulsion. Walls were certainly treated with wax driven in by heat, in Roman times. Vitruvius describes the process, and there are other references in Pliny and elsewhere. The most recent conclusions are in favour of the process having been genuine fresco. The description of mediaeval fresco painting given by Theophilus and the Mount Athos manuscript are of a method of painting by wetting the already dry plaster and painting with pigments mixed with water and a little lime.

In the 15th century, Italian painters distinguished between *fresco secco*—the pigments being mixed with egg as a medium, and *buon fresco*—the pigments being mixed with water and laid on the fresh wet plaster. The complete design for the fresco was drawn or pounced from a cartoon on the dry plaster. Over this was laid each day a thin coat of wet plaster of sufficient area for one day's work, and the pigments ground in water laid on this wet surface. At the end of the day, the plaster not painted upon was cut away, and the joins of the plaster can be seen on the walls to-day.

The proportions of lime to sand should be according to Cennino Cennini (see trans. by C. J. Herringham, 1899), one of lime to two of sand. It is essential that the quick lime slaked to a lime putty should be given months or even years to mature. The pigments must be fast to lime and light. For white, either lime or Bianco Sangiovanini prepared by making slaked lime into little cakes and exposing them to the air for some months should be used. For the rest, the earth pigments—red and yellow ochres, terra verte, umber, raw and burnt sienna, black and the permanent greens and blues, such as oxide of chromium, viridian, cobalt green, cobalt blue and cerulean blue should be used.

Italians before the invention of smalt were confined to azurite which is turned green by lime in time and the precious real ultramarine. They probably, therefore, laid on the blues mixed with egg.

BIBLIOGRAPHY.—There is an extensive literature on the subject of wall painting; among the most important are: *The Book of the Art of Cennino Cennini* (trans. C. J. Herringham, 1899); *Vasari on Technique* (trans. L. S. Maclehoze, 1907); M. P. Merrifields, *The Art of Fresco Painting* (1846). For modern practice see J. Ward, *Fresco Painting* (1909); A. P. Laurie, *The Painter's Methods and Materials* (1926). (A. P. L.)

FRESENIUS, KARL REMIGIUS (1818-1897), German chemist, was born at Frankfort-on-Main on Dec. 28, 1818. He studied at Bonn and at Giessen, where he acted as assistant in Liebig's laboratory, and in 1843 became assistant professor. In 1845 he was appointed to the chair of chemistry, physics and technology at the Wiesbaden Agricultural Institution, and in 1848 he became the first director of the chemical laboratory which the Nassau government established there. Fresenius occupied himself almost exclusively with analytical chemistry, and the fullness and accuracy of his text-books on that subject (of which that on qualitative analysis first appeared in 1841 and that on quantitative in 1846) soon rendered them standard works. Many of his original papers were published in the *Zeitschrift für analytische*

Chemie, which he founded in 1862 and continued to edit till his death. He died suddenly at Wiesbaden on June 11, 1897.

FRESHWATER, a watering place in the Isle of Wight, England, 11½ m. W. by S. of Newport by rail. Pop. (1921) 3,439. It is a scattered township lying on the peninsula west of the river Yar at the western extremity of the island. Freshwater Bay is separated from Alum bay on the west by the promontory between, with the group of detached rocks jutting from the sea known as the Needles, which are marked by a lighthouse. The cliffs are magnificent, rising 400–500 feet. Farringford house in the parish was the home of Alfred, Lord Tennyson, who is commemorated by a tablet in All Saints' church and by a great cross on High Down overlooking Freshwater Bay. There are golf links on the downs.

FRESNEL, AUGUSTIN JEAN (1788–1827), French physicist, was born at Broglie, Normandy, on May 10, 1788. He was educated at the *École Centrale* in Caen, the *École Polytechnique*, and finally went to the *École des Ponts et Chaussées*. He served as an engineer in several departments, but lost his appointment in 1814 because he opposed Napoleon's return from Elba. On the second restoration he obtained a post as engineer in Paris. His researches in optics appear to have been begun about 1814, when he prepared a paper on the aberration of light (*q.v.*), which, however, was not published. Fresnel's work on interference did a great deal to establish the wave theory of light. (See *LIGHT: The Age of Fresnel*); and various devices for producing interference fringes bear his name. He applied mathematical analysis to his work and removed a number of objections to the wave theory. With D. F. J. Arago he studied the laws of the interference of polarized rays. Circularly polarized light he obtained by means of a rhomb of glass, known as "Fresnel's rhomb." He was a pioneer in the use of compound lenses instead of mirrors for lighthouses. He was a member of the Académie des Sciences, and a foreign member of the Royal Society. He died at Ville-d'Avray, near Paris, on July 14, 1827.

He was a member of the Académie des Sciences and the Royal Society, but his labours in the cause of optical science received during his lifetime only scant public recognition, and some of his papers were not printed by the Académie till many years after his decease. But, as he wrote to Thomas Young, the English scientist, in him "that sensibility, or that vanity, which people call love of glory" had been blasted. "All the compliments," he says, "that I have received from Arago, Laplace and Biot never gave me so much pleasure as the discovery of a theoretic truth, or the confirmation of a calculation by experiment."

See A. Duleau "Notice sur Fresnel" in *Revue Encyclopédique* (vol. xxxix., 1828); D. F. G. Arago, *Oeuvres complètes*, vol. 1. (17 vols., 1854–62); G. Peacock, *Miscellaneous works of Thomas Young*, vol. 1. (3 vols., 1855).

FRESNILLO, a town of the state of Zacatecas, Mexico, 37m. N.W. of the city of Zacatecas. Pop. (1921) 27,496. It stands on a fertile plain between the Santa Cruz and Zacatecas ranges, about 7,700ft. above sea-level, has a temperate climate, and is surrounded by an agricultural district producing Indian corn and wheat. It is a clean, well-built town, whose chief distinction is its school of mines founded in 1853. Fresnillo has large amalgam works for the reduction of silver ores. Its silver mines, situated in the neighbouring Proaño hill, were discovered in 1569, and were for a time among the most productive in Mexico. There is a station near on the Mexican Central railway.

FRESNO, a city of California, U.S.A., in the heart of the San Joaquin valley, at the geographical centre of the State; the county seat of Fresno county. It is on Federal highway 99; is served by the Santa Fe and the Southern Pacific railways; has a municipal airport of 296ac. and is on one of the main air-mail routes. The population was 12,470 in 1900; 45,086 in 1920; and in 1930 was 52,513 by the Federal census of that year. The population of the metropolitan area in 1930 was about 80,000. Fresno is surrounded by irrigated lands of great fertility, where grains, hay, alfalfa and fruits (especially raisin-grapes, figs, peaches and apricots) are grown in vast quantities. Summer temperatures are high, rising at times to 115°, but the humidity is low and the nights are cool;

the normal annual mean temperature is 63°. The dominant manufacturing industry is the drying and packing of fruits. The packing plant of the Sun-Maid Raisin Growers (a great co-operative association) is said to be the largest of its kind in the world. There are also large flour and lumber mills, machine shops and foundries, creameries, potteries, brickworks and soap factories. In 1927 the output of the manufacturing establishments in the city was valued at \$35,798,684. The oil wells of the county in 1925 produced 7,774,000 barrels. Fresno is the trading and shipping centre of a large area. Bank debts to individual accounts in 1926 amounted to \$484,921,000. The assessed valuation of property was \$46,914,099. The newspapers include three in Armenian and one in Japanese. At Kearney park is an experimental irrigated farm of the University of California. The Fresno State college (established 1911), together with the Junior college (1910) under its administration, has a registration of over 2,000. Its summer session is held at Huntington lake in the Sierra Nevada in the eastern part of the county, at an elevation of 7,000ft. Fresno was laid out and incorporated in 1872, when the railroad came through the county. It was chartered as a city in 1885. The irrigation project was started in 1872.

FRESNOY, CHARLES ALPHONSE DU (1611–1665), French painter and writer on art, was born in Paris. He learned the rudiments of design under Perrier and Vouet. At the age of 21 he went to Rome, and there studied Raphael and the antique. He went in 1633 to Venice, and in 1656 returned to France. He died at Villiers le Bel, near Paris. His Latin poem, *De arte graphica*, written during his Italian sojourn, was translated into several languages.

FRET, properly, to devour, hence to gnaw, used of the slow corroding action of chemicals, water, etc., and thus, figuratively, to chafe or irritate. Possibly connected with this word, in the sense of rubbing, is the use of "fret" for a bar on the fingerboard of a banjo, guitar or similar instruments to mark the fingering. In decorative art and architecture, the word means any one of several types of running or repeated ornament consisting of lengths of straight lines or narrow bands, usually connected and at right angles to each other in T, L or square-cornered G shapes, so arranged that the spaces between the lines or bands are approximately equal to the width of the bands. Occasionally the system is arranged so that the lines intersect or interlace, as in the common "swastika (*q.v.*) fret." As the fret is one of the simplest and most natural decorative forms that can be produced in textiles, it is one of the most widely spread and is found alike from early times in all the continents. Thus it is a favourite decoration for the ceilings of Egyptian tombs from the fourth dynasty on, in later examples combined with rosettes, scarabs and the lotus into patterns of great richness. In America, it is found in early Peruvian textiles, it is frequent in sculpture and architecture in the Maya and Aztec remains in Central America and Mexico, and it is one of the most universal of pottery decorations among the plains Indians. It was highly developed by both Chinese and Japanese for textiles as well as for architectural ornament; it occurs not only as a band but as a complicated all-over pattern, sometimes with acute and obtuse angles instead of the more usual right angles. But its most important development was that by the Greeks (hence the common name "Greek fret"), who used it not only for pottery, but painted on architectural members, such as the abaci of capitals, and later carved it. Like so many Greek motives it was widely used by the Romans particularly in Syria (*e.g.*, the *propylaea* at Damascus and the great temple at Baalbek) and occurs in Byzantine and Romanesque work.

"Fret-work" has a wider significance and is often used of any small scale repeated ornament in which geometrical forms occur especially if in low relief or pierced.

(T. F. H.)

FREUD, SIGMUND (1856–), founder of psychoanalysis, was born, of Jewish extraction, at Freiberg in Moravia on May 6, 1856. Since the age of four he has always lived in Vienna. He felt no inclination towards medical work, being more interested in purely scientific research. Influenced by Goethe's essay *Die Natur*, however, he embarked on a medical curriculum. In his preliminary studies he was chiefly interested in botany and

chemistry. He worked from 1876 to 1882 in the physiological laboratory under Brücke and later in the Institute for Cerebral Anatomy under Meynert. The concurrent medical studies progressed slowly and he qualified only in 1881. Financial considerations compelled him to renounce his research work and he decided to become a clinical neurologist. In 1884 a Viennese physician, Dr. Breuer, related to him an extraordinary experience in which symptoms of hysteria were cured by getting the patient to recollect in a state of hypnosis the circumstances of their origin and to express the emotions accompanying this. This "cathartic" method of treatment was the starting-point of what later became psycho-analysis. In 1885 Freud went to Paris to study for over a year under the great neurologist Charcot, whose moral support strengthened his determination in the then revolutionary step of investigating hysteria from a psychological point of view. Just before this he had been made a Docent in Neuropathology for his pathological and clinical investigations. His psychological studies, however, met with immediate disapproval on the part of his colleagues. In the next few years he published important works in neurology, particularly on aphasia and the cerebral paralyses of children.

His interest in clinical psychology continued during these years, and in 1893 he persuaded Breuer to publish his remarkable case and to collaborate with him in a book called *Studien über Hysterie* (1895). In 1894 the partnership dissolved and soon afterwards Freud took the decisive step of replacing hypnotism as a means of resuscitating buried memories by the method of "free association," which is the kernel of the psycho-analytic method. This led him to make important discoveries concerning the structure and nature of the various psychoneuroses and to extend these discoveries to the normal mind. The three most fundamental of these were (1) the existence of the unconscious and the dynamic influence of this on consciousness; (2) the fact that the splitting of the mind into layers is due to an intrapsychical conflict between various sets of forces, to one of which he gave the name of "repression"; and (3) the existence and importance of infantile sexuality. He came to see in the unconscious conflicts over the young child's sexual attitude toward its parents, which together with the accompanying jealousy and hostility he refers to as the "Oedipus conflict," not only the central factor in the neuroses, but a fundamental contribution to the formation of character in general. The particular mechanisms he had found in the neuroses he demonstrated in detail in many other spheres, such as wit, dreams, literary products, art, mythology and religion. (See PSYCHO-ANALYSIS.)

For ten years Freud worked alone at psycho-analysis. About 1906 he was joined by a number of colleagues, Adler, Brill, Ferenczi, Ernest Jones, Jung, Sadger, Stekel and others, who met in 1908 at the first International Congress of Psycho-Analysis, since then a biennial institution. A couple of years later an International Association was founded, which now has branches in most countries of the world (the British one dates from 1913) and which maintains three official organs devoted to the subject. The influence of Freud's work, however, has extended far beyond the special activities of the 200 specialists in the subject. It has met with keen opposition, which he ascribes to the powerful resistance always operating against the recognition of the unconscious mind. Nevertheless it is recognized that he has given a powerful impetus to psychology in general and that in time this will probably affect many other fields of mental activity. On his 70th birthday Freud was the recipient of congratulations from learned societies in various parts of the world and was accorded the freedom of the city of Vienna. (E. J.)

BIBLIOGRAPHY.—A complete edition of Freud's writings (including an autobiography) has been published by the Internationaler Psychoanalytischer Verlag under the title of *Gesammelte Schriften*. His writings have also been published in English, chiefly by the Institute of Psycho-Analysis, London; this also publishes the *International Journal of Psycho-Analysis*, in which full information of current work can be obtained.

FREUDENSTADT, a town of Germany, in the republic of Württemberg, on the right bank of the Murg, 40 m. S.W. from Stuttgart by rail. Pop. (1925) 9,785. It has some small manu-

factures of cloth, furniture, knives, nails and glass, and is a health resort. It was founded in 1599 by Protestant refugees from Salzburg.

FREUND, WILHELM (1806–1894), German philologist and lexicographer, was born at Kempen in the grand duchy of Posen on Jan. 27, 1806. From 1855–70 he was director of the Jewish school at Gleiwitz in Silesia, and he died at Breslau on June 4, 1894. Freund took an important part in the movement for the emancipation of his Prussian coreligionists, and the *Judengesetz* of 1847 was in great measure the result of his efforts. The work by which he is best known is his *Wörterbuch der lateinischen Sprache* (1834–45), practically the basis of all Latin-English dictionaries.

FREUNDLICH, EMMY (1878–), Austrian politician, was born at Aussig, Czechoslovakia in 1878. She married in 1889, and with her husband began to work among the textile workers of Moravia. There, from 1900–1911, she was the leader of the Socialist women's organization, and one of the managing board of the local co-operative society. In 1911 she went to Vienna, and from that date began her assiduous and regular work for co-operation; she insisted on the importance of the representation of women on every co-operative society's management. Frau Freundlich became a member of the central committee of the Austrian Co-operatives, a member of the board of the wholesale society, and of the central committee, and in 1927 of the Executive Committee of the International Co-operative Alliance. She entered the Austrian parliament in 1919, and was closely associated with Dr. Renner during his premiership. From 1919 onwards, she represented the consumers on the Austrian food ministry, and sat on the municipal council of Vienna, from 1919–1921.

In 1926 she was invited by the League of Nations to sit on the preparatory committee for the World Economic Conference; she was a member of that conference (1927), and of the enlarged Advisory Economic Committee appointed to promote the decisions of the conference.

FREWEN, ACCEPTED (1588–1664), archbishop of York, was born at Northiam, in Sussex, and educated at Magdalen College, Oxford. As chaplain to Sir John Digby, ambassador in Spain, he preached at Madrid a sermon which pleased Prince Charles, afterwards Charles I., who, on his accession, appointed Frewen one of his chaplains. In 1625 he became canon of Canterbury and vice-president of Magdalen College, and in the following year was elected president. He was vice-chancellor of the university in 1628 and 1629, and again in 1638 and 1639. It was mainly by his instrumentality that the university plate was sent to the king at York in 1642. Two years later he was consecrated bishop of Lichfield and Coventry, and resigned his presidentship. Parliament declared his estates forfeited for treason in 1652, and Cromwell afterwards set a price on his head. He escaped to France, and at the Restoration was consecrated archbishop of York. In 1661 he acted as chairman of the Savoy conference.

FREY, ADOLF (1855–1920), Swiss poet, literary historian and critic, son of Jacob Frey, was born at Aarau on Feb. 18, 1855, and died at Zürich on Feb. 12, 1920. He became professor of German literature, first at Aarau and then at Zürich. His chief claim to attention is his keen and profound interpretation of Swiss literature and art, as shown in his book on *Schweizer Dichter* (1919), and in his monographs on *Albert von Haller* (1879), *Gottfried Keller* (enlarged edition, 1893), *C. F. Meyer* (1900), *Böcklin* (1903), *Koller* (1906), *Wetti* (1908), *Hodler* (1922) and others. He wrote also two vigorous historical novels, *Die Jungfer von Wattenwil* (1912) and *Bernhard Hürzel* (1918). A final selection of his best *Poems* was issued in 1922. His lyrics are graceful, and his dialect poems were especially popular. His dramas (e.g., *Erni Winkelried*, 1893) are less important.

See C. F. Wiegand, *Das Adolf Frey Buch* (1920); L. Frey, *Adolf Frey: sein Leben und Schaffen* (1923).

FREY, son of Njord, one of the chief deities in the northern pantheon and the national god of the Swedes. He is the god of fruitfulness, the giver of sunshine and rain. His sister Freyia, the most prominent goddess in northern mythology, shares his characteristics. (See TEUTONIC PEOPLES, *ad fin.*)

FREYCINET, CHARLES LOUIS DE SAULCES DE (1828–1923), French statesman, was born at Foix on Nov. 14, 1828. He was educated at the École Polytechnique, and entered the government service as a mining engineer. In 1858 he was appointed traffic manager to the Compagnie de chemins de fer du Midi, and in 1862 returned to the engineering service (in which he attained in 1886 the rank of inspector-general). He was sent on a number of special missions, among which, one to England, on which he wrote a *Mémoire sur le travail des femmes et des enfants dans les manufactures de l'Angleterre* (1867). On the establishment of the Third Republic in Sept. 1870, he offered his services to Gambetta, was appointed prefect of the department of Tarn-et-Garonne, and in October became chief of the military cabinet. It was mainly his powers of organization that enabled Gambetta to raise army after army to oppose the invading Germans. In 1871 he published a defence of his administration under the title of *La Guerre en province pendant le siège de Paris*. He entered the Senate in 1876 as a follower of Gambetta, and in Dec. 1877 became minister of public works in the Dufaure cabinet. He carried a scheme for the gradual acquisition of the railways by the state and the construction of new lines at a cost of three milliards, and for the development of the canal system at a further cost of one milliard. He retained his post in the ministry of Waddington, whom he succeeded in Dec. 1879 as president of the council and minister for foreign affairs. He passed an amnesty for the Communards, but in attempting to steer a middle course on the question of the religious associations, lost the support of Gambetta, and resigned in Sept. 1880. In Jan. 1882 he again became president of the council and minister for foreign affairs. His ministry resigned on the rejection of his plan to occupy the Isthmus of Suez. He returned to office in April 1885 as foreign minister in the Brisson cabinet, and retained that post when, in Jan. 1886, he succeeded to the premiership. He came into power with an ambitious programme of internal reform; but except that he settled the question of the exiled pretenders, his successes were won chiefly in the sphere of colonial extension. His ministry fell on Dec. 3, 1886.

In April 1888 he became minister of war in the Floquet cabinet—the first civilian since 1848 to hold that office. His services to France in this capacity were the crowning achievement of his life. He held his office without a break for five years through as many successive administrations—those of Floquet and Tirard, his own fourth ministry (March 1890–Feb. 1892), and the Loubet and Ribot ministries. He introduced the three-years' service and established a general staff, a supreme council of war, and the army commands. He failed to clear himself entirely of complicity in the Panama scandals, and in Jan. 1893 resigned the ministry of war. In Nov. 1898 he once more became minister of war in the Dupuy cabinet, but resigned office May 6, 1899. He published, besides the works already mentioned, *Traité de mécanique rationnelle* (1858); *De l'analyse infinitésimale* (1860, revised ed., 1881); *Des pentes économiques en chemin de fer* (1861); *Emploi des eaux d'épaut en agriculture* (1869); *Principes de l'assainissement des villes* and *Traité d'assainissement industriel* (1870); *Essai sur la philosophie des sciences* (1896); *La Question d'Égypte* (1905); besides some remarkable "Pensées" contributed to the *Contemporain* under the pseudonym of "Alceste." In 1882 he was elected a member of the Academy of Sciences, and in 1890 to the French Academy in succession to Émile Augier. He died on May 14, 1923 in Paris.

FREYCINET, LOUIS CLAUDE DESAULSES DE (1779–1842), French navigator, was born at Montélimar, Drôme. In 1793 he entered the French navy. After taking part in several engagements against the British, he joined in 1800, along with his brother Louis Henri Freycinet (1777–1840), who afterwards rose to the rank of admiral, the expedition sent out under Capt. Baudin in the "Naturaliste" and "Géographe" to explore the south and south-west coasts of Australia. Much of the ground already gone over by Flinders was revisited, and new names imposed by this expedition. In 1805 he returned to Paris, and prepared the maps and plans of the expedition; he also completed the narrative entitled *Voyage de découverts aux terres*

australes (1807–16). In 1817 he commanded the "Uranie," in which Arago and others went to Rio de Janeiro, to take a series of scientific observations. For three years Freycinet cruised about, visiting Australia, the Marianne, Sandwich and other Pacific Islands, South America, and other places, and, notwithstanding the loss of the "Uranie" on the Falkland islands during the return voyage, returned to France with fine collections in all departments of natural history, and with voluminous notes and drawings. The results of this voyage were published under Freycinet's supervision as *Voyage autour du monde sur les corvettes "l'Uranie" et "la Physicienne"* (1824–44). Freycinet was one of the founders of the Paris Geographical Society. (See *La Géographie* 41 (1924), pp. 265–273.)

FREYIA, the sister of Frey (q.v.).

FREYLINGHAUSEN, JOHANN ANASTASIUS (1670–1739), German theologian and poet, was born on Dec. 2, 1670, at Gandersheim, and studied theology at Jena, Erfurt and Halle, where, in 1727, he succeeded A. H. Francke as superintendent of the Paedagogium and of the orphan asylum, and as head pastor of St. Ulrich's church. Freylinghausen was one of the most gifted of the poets of German Pietism, and has left important editions of hymnals, which were published in 1704 and in 1714. They were reprinted in W. Schirck's *Geistliche Sängers* (pt. 2, 1855), and some were translated by C. Winkworth, *Lyra Germanica* (1868).

See Herzog, *Realencyklopädie*.

FREYTAG, GEORG WILHELM (1788–1861), German philologist, was born at Lüneburg on Sept. 19, 1788. He studied Arabic, Persian and Turkish under De Sacy at Paris. In 1819 he became professor of oriental languages at Bonn. He died on Nov. 16, 1861. He edited two volumes of Arabic songs (*Hamasa carmina*, 1828–52) and three of Arabic proverbs (*Arabum proverbialia*, 1838–43); and prepared the *Lexicon Arabico-latium* (Halle, 1830–37, abridged ed., 1837).

FREYTAG, GUSTAV (1816–1895), German novelist, was born at Kreuzburg, in Silesia, on July 13, 1816. He studied philology at Breslau and Berlin, and in 1838 took the degree with a remarkable dissertation, *De initiis poëseos scenicae apud Germanos*. In 1839 he settled at Breslau, as *Privatdocent* in German language and literature. His comedy *Die Brautfahrt, oder Kunz von der Rosen* (1844), had some success, but he made his name by his comedy *Die Journalisten* (1853), one of the best German comedies of the 19th century, the subject of which was drawn from his own experience. In 1847 he edited, with Julian Schmidt, *Die Grenzboten*, a weekly journal which, founded in 1841, now became the leading organ of German and Austrian liberalism. Freytag helped to conduct it until 1861, and again from 1867 till 1870, when for a short time he edited a new periodical, *Im neuen Reich*. His fame became universal with the publication in 1855 of his novel of the counting house, *Soll und Haben*, which was translated into almost all the languages of Europe. It was certainly the best German novel of its day, impressive by its sturdy but unexaggerated realism. Its main purpose is the recommendation of the German middle class as the soundest element in the nation. His powerful advocacy of the hegemony of Prussia in his *Grenzboten* gained him the friendship of the duke of Saxe-Coburg-Gotha, whose neighbour he had become on acquiring the estate of Siebleden near Gotha. At the duke's request Freytag was attached to the staff of the crown prince of Prussia in the campaign of 1870, and was present at the battles of Wörth and Sedan. Before this he had published another novel, *Die verlorene Handschrift* (1864), a description of Leipzig society, in which he endeavoured to do for German university life what in *Soll und Haben* he had done for commercial life. His *Bilder aus der deutschen Vergangenheit*, a popular account of the history and manners of the Germans, has been compared to Green's *Short History of the English People*. In 1872 he began a work with a similar patriotic purpose, *Die Ahnen*, a series of historical romances in which he unfolds the history of a German family from the earliest times to the middle of the 19th century. His other works include an autobiography (*Erinnerungen aus meinem Leben*, 1887); *Gesammelte Aufsätze*, chiefly reprinted from the *Grenzboten*

(1888); *Der Kronprinz und die deutsche Kaiserkrone; Erinnerungsblätter* (1889). He died at Wiesbaden on April 30, 1895.

Freytag's *Gesammelte Werke* were published in 22 vols. at Leipzig (1886-89). His *Vermischte Aufsätze* have been edited by E. Elster (2 vols., Leipzig, 1901-03). On Freytag's life see, besides his autobiography mentioned above, the lives by C. Alberti (Leipzig, 1890) and F. Seiler (Leipzig, 1898). See also *Flugenschriften-sammlung G. Freytag* (1925), published by the city library of Frankfurt-on-Main; and A. Kohut, *Gustav Freytag als Patriot und Politiker* (1916).

FRIAR, the English generic name for members of the mendicant religious orders (from Lat. *frater* through Fr. *frère*). Formerly it was the title given to individual members of these orders, as Friar Laurence (in *Romeo and Juliet*), but this is not now common. In England the chief orders of friars were distinguished by the colour of their habit: thus the Franciscans or Minors were the Grey Friars; the Dominicans or Preachers were the Black Friars (from their black mantle over a white habit), and the Carmelites were the White Friars (from their white mantle over a brown habit): these, together with the Austin Friars or Hermits, formed the four great mendicant orders—Chaucer's "alle the ordres fourre." Detailed information on these orders and on their position in England is given in separate articles. The difference between friars and monks is explained in article MONASTICISM.

See Fr. Cuthbert, *The Friars and how they came to England*, pp. 11-32 (1903); also F. A. Gasquet, *English Monastic Life*, pp. 234-249 (1904), where special information on all the English friars is conveniently brought together.

FRIAR-BIRD, the name given to several Australian birds of the honey-eater family from their ruff of feathers on the head, and sober plumage. The best-known species is *Tropidorkhynchus corniculatus*, also known as Pimlico and Four o'Clock, imitations of its loud cry. Friar-birds are bold and noisy, haunting trees in small flocks. The forms inhabiting some of the Malay islands are mimicked by orioles (see Wallace, *Malay Archipelago*; also HONEY-EATER; ORIOLE; MIMICRY).

FRIARS' BALSAM. An ancient and valuable medicament of which the essential constituent is benzoic acid. It is used largely for inhalation in cases of septic as well as inflammatory conditions of the respiratory tract. See BENZOIC ACID.

FRIBOURG (Ger. *Freiburg*), one of the Swiss Cantons, in the western portion of the country, taking its name from the town around which the various districts that compose it gradually gathered. Its area is 644 sq.m., of which 568 sq.m. are classed as "productive." It is a hilly region, the highest summits (of which the Vanil Noir, 7,858 ft., is the loftiest) rising in the Gruyère district at its south-eastern extremity, the best known being probably the Moléson (6,582 ft.) and the Berra (5,653 ft.). But it is the heart of pastoral Switzerland and is famed for its cheese and cattle. It is watered by the Sarine or Saane river (with its tributaries the Singine or Sense and the Glâne) that flows through the canton from north to south, and traverses its capital town. The upper course of the Broye (like the Sarine, a tributary of the Aar) and that of the Veveyse (flowing to the Lake of Geneva) are in the southern portion of the canton. A small portion of lakes Neuchâtel and Morat belongs to the canton, wherein is the Lac Noir or Schwarzsee. There are sulphur springs near the lake, and at Montbarry and Bonn. The main line from Lausanne to Bern past Fribourg runs through the canton with important branch lines in all directions. Pop. (1920) 143,055; 1925 estimate, 147,000; most of whom are Roman Catholics. The canton is on the linguistic frontier in Switzerland, the line of division running nearly due north and south through it, and even through its capital. The German-speaking inhabitants are found chiefly in the north-western (Morat region) and north-eastern (Singine valley) portions, as well as in the upper valley of the Jogne or Jaun in the south-east. Besides the capital, Fribourg (*q.v.*) the only villages of importance are Bulle, Châtel St. Denis, Morat (*q.v.*) or Murten, Romont and Estavayer le Lac or Stäffis am See.

The canton is pre-eminently a pastoral and agricultural region, tobacco, cheese and timber being its chief products. Its industries include watch-making (Semsales), paper-making (Marly) and chocolate manufacturing. It forms part of the diocese of Lau-

sanne and Geneva, the bishop living since 1663 at Fribourg. It is a stronghold of Roman Catholicism with monasteries and nunneries, such as those of the Carthusian monks at Valsainte, and the Cistercian nuns at La Fille Dieu and at Maigrauge.

FRIBOURG [Ger. *Freiburg*], the capital of the Swiss canton of that name. It is built almost entirely on the left bank of the Sarine, the oldest bit (the Bourg) being just above the river bank, flanked by the Neuveville and Auge quarters, these with the Planche quarter on the right bank of the river forming the *Ville Basse*. On the steep ground to the west of the Bourg is the Quartier des Places, beyond which, to the west and south-west, is the still newer Pérolles quarter, with the railway station and university; all these (with the Bourg) constituting the *Ville Haute*. In 1921 the population of the town was 20,064, of whom 18,024 were Roman Catholics and 95 Jews, while 12,831 were French-speaking and 6,921 German-speaking, these last being mainly in the *Ville Basse*. Founded as a German town, French became the official language during the 14th and 15th centuries, but when it joined the Swiss Confederation in 1481 German influence came to the fore, and German was the official language from 1483 to 1798. From 1798 to 1814, and again from 1830 onwards, French prevailed, as at present. Fribourg is on the main line from Berne (20 m.) to Lausanne (41 m.).

The town was founded in 1157 by Berchthold IV., duke of Zähringen. The spot was chosen for purposes of military defence, and was situated in the *Uechtland* or waste land between Alamanian and Burgundian territory. The oldest existing charter of the town dates from 1249. In 1218, the lands passed to Anna, the sister of the last duke and wife of Count Ulrich of Kyburg. The line became extinct in 1264. Their heiress married Eberhard, count of Habsburg-Laufenburg, who sold Fribourg in 1277 to his cousin Rudolf, the head of the house of Habsburg. The town had to struggle for its existence against Berne and the count of Savoy, between 1448 and 1452. Abandoned by the Habsburgs, and desirous of escaping from the increasing power of Berne, Fribourg in 1452 finally submitted to the count of Savoy. In the 15th century Fribourg exported much leather and cloth to France, Italy and Venice. When Yolande, dowager duchess of Savoy, entered into an alliance with Charles the Bold, duke of Burgundy, Fribourg joined Berne, and helped to gain the victories of Grandson and of Morat (1476).

In 1477 the town was finally freed from the rule of Savoy, while in 1481 (with Soleure) it became a member of the Swiss Confederation. In 1475 the town had taken Illens and Arconciel from Savoy, and in 1536 won from Vaud much territory, including Romont, Rue, Châtel St. Denis, Estavayer, St. Aubin, as well as Vuissens and Surpierre, which still form outlying portions (physically within the canton of Vaud) of its territory, while in 1537 it took Bulle from the bishop of Lausanne. In 1502-04 the lordship of Bellegarde or Jaun was bought, while in 1555 it acquired (jointly with Berne) the lands of the last count of the Gruyère, and thus obtained the rich district of that name. From 1475 it ruled (with Berne) the bailiwicks of Morat, Grandson, Orbe and Echallens, just taken from Savoy, but in 1798 Morat was incorporated with (finally annexed in 1814) the canton of Fribourg, the other bailiwicks being then given to the canton of Léman (later of Vaud). From the 16th century the democratic government gave place to an oligarchy which continued till the French occupation of 1798.

From 1803 (Act of Mediation) to 1814, Fribourg was one of the 19 cantons of the Swiss Confederation. But, on the fall of the new régime, in 1814, the old patrician rule was partly restored. In 1831 the Radicals secured a more liberal constitution. In 1846 Fribourg joined the *Sonderbund* and, in 1847, had to surrender to the Federal troops. The Radicals came back to power. In 1857 the Conservatives secured the adoption of a new cantonal constitution, and have since maintained their power.

The principal building in the town is the collegiate church of St. Nicholas, of which the nave dates from the 13th-14th centuries, while the choir was rebuilt in the 17th century. It has a lofty bell-tower (15th century). The town hall dates from the 16th century. In the Lycée is the Cantonal museum of fine arts.

On the P  rolles plateau is the International Catholic university founded in 1889. A dam built to the north of the town forms a sheet of water known as the Lac de P  rolles. This is part of a hydro-electric scheme.

FRICK, HENRY CLAY (1849-1919), American manufacturer and philanthropist, was born at West Overton (Pa.), on June 17, 1849. He early became interested in the coke business. In 1871 he organized the firm of Frick and Co., which ultimately acquired large coal deposits and ran 12,000 coke ovens. He was chairman of the board of Carnegie Bros., from 1889 to 1892, and in 1892, during the Homestead strike, was shot and stabbed by Alexander Berkman, an anarchist. He was a director of the Pennsylvania, the Santa F   and other railways, and of the U.S. Steel Corporation. He died in New York, Dec. 2, 1919.

He left to the city of Pittsburgh land for a park, together with an endowment. His New York mansion, with its collection of paintings, bronzes and enamels, he bequeathed with an endowment to the city on the death of his wife. Among the various objects are the Fragonard panels, Bellini's "St. Francis in the Desert," Velasquez' "Philip IV.," Van Dyck's "Paola Adorno," Rembrandt's "Portrait of Himself," Gainsborough's "The Mall," and "The Hon. Anna Duncan." It includes also fine examples of Titian, Vermeer, Frans Hals, Ruysdael, Cuyp, Rubens, El Greco, Goya, Sir Thomas Lawrence, Millet, Raeburn, Reynolds, Romney and Turner. He divided his residuary estate, estimated at \$50,000,000, between various hospitals and educational and charitable institutions.

FRICTION is the resistance offered to the motion of one portion of matter upon another. It is due partly to the molecular attraction between the surfaces and partly to the nature and condition of those surfaces. It is in the nature of a force which acts between the surfaces in contact and resists their sliding or rolling upon each other. This force, termed the force of friction (F), is independent, in a solid body, of the area of the surfaces in contact and the speed of the motion (unless it be very small) of the two bodies. It is proportional, however, to the force with which the surfaces are pressed together, that is, it is that force times some factor which is always less than unity. This factor is called the coefficient of friction and is designated by μ or f . Thus if a 100 lb. iron block (pressing the surfaces together with a force P) slides along a horizontally placed iron plate when a force of 20 lb. (F) is exerted against it, the ratio between the weight of the block and the force required to move it is the *coefficient of friction* (μ)

$$\mu = \frac{F}{P} = \frac{20}{100} = 0.2.$$

If the block of iron is placed upon the iron plate, one end of which is raised until the weight of the block will just overcome its tendency to slide, then the angle of the plate to the horizontal is called the *angle of repose*, which is generally denoted by θ . In the case of the iron block on the iron plate (θ) will be between 14   and 8   depending upon the roughness of the surfaces. The force which is required to overcome the friction of starting a body so that it will slide along another surface is called the friction of rest or *static friction*. This always is greater than the force necessary to keep it sliding in uniform motion, which is called the friction of motion or *kinetic friction*.

All surfaces are more or less rough, even those which are well machined and polished show, under the microscope, small projections and depressions. When any surfaces have been at rest for some time static friction is always increased. This is because two dry surfaces left under pressure embed themselves, the one in the other, more and more thoroughly as time passes, until with the exclusion of air, in some instances adhesion occurs. With lubricated surfaces that have been at rest for some time, and when the lubricant has been pressed out, a somewhat similar action occurs. As a result the starting effort is always much greater than the running effort; starting effort may even approximate the values for *solid friction*, which is the term used to denote friction when there has been no lubrication. After the surfaces have been forced into motion, the lubricant is drawn

between them and the force necessary to drive the part rapidly decreases as the lubricant begins to produce a film. When a perfect film is maintained between the surfaces they are then held apart and are without contact. The condition then follows the laws of *fluid friction* covering the movement of particles of liquids in contact with each other or with other bodies. This can be likened to the effect of a boat going through the water, giving motion to various strata or films of water. (See VISCOSITY.) The film in contact with the boat travels at about the speed of the boat, but every succeeding film or layer has less motion, the outside layer being then in contact with still water. The frictional resistance between the films is very great as the speed of the boat increases.

The laws of *fluid friction* as given by Thurston are: Frictional resistance is, (1) independent of the pressure between the masses in contact; (2) directly proportional to the area of rubbing surface; (3) proportional to the square of the relative velocity at moderate and high speeds; and to the velocity, nearly, at low speeds; (4) independent of the nature of the surfaces of the solid against which the stream may flow, but dependent to an extent upon the degree of roughness; (5) proportional to the density of the fluid and related in some way to its viscosity.

The following table (Thomsen) of approximate values for the coefficient of friction shows coefficient of friction with various conditions:—

Condition of surfaces	Coefficient of friction	
	Range	Average value
Unlubricated or poorly lubricated surfaces	0.1 to 0.4	0.160
Semi-lubricated surfaces	0.01 to 0.10	0.030
Perfectly lubricated surfaces	0.002 to 0.01	0.006
Ball bearings, in rolling contact	0.001 to 0.003	0.002
Roller bearings, in rolling contact	0.002 to 0.007	0.005

In the latest studies of the behaviour of bearings and lubricants it has been pointed out by Bernard (*Industrial and Engineering Chemistry*, April 1924) that the main variables influencing the lubrication of a given bearing of normal design and construction are the ratio $z \frac{n}{p}$ where z is the viscosity of the lubricant, n is the speed of rotation of the journal, and p is the pressure on the bearing. When speeds are high and loads are light viscosity is the only property of the lubricant which influences friction. With low speeds and heavy loads friction is largely effected by the ability of the lubricant to adhere to the bearing surfaces and resist rupture. (See also BEARINGS; LUBRICATION AND LUBRICANTS.) (W. F. P.)

FRIDAY, the sixth day of the week, corresponding to the Roman *Dies Veneris*, the French *Vendredi*. The ill-luck associated with the day arose from its connection with the Crucifixion. By the Western and Eastern Churches Fridays, except when Christmas falls on that day, have ever been observed as days of fast. The day on which the Passion of Christ is commemorated is known as Good Friday (*q.v.*).

FRIDOLIN or **FRIDOLD, SAINT** (*f.* 6th century), Irish missionary, is first mentioned by the monk Balther, at the beginning of the 11th century, as belonging to a noble Irish family, and as having been the first missionary from Ireland to work among the Alamanni on the upper Rhine, where he founded many monasteries. Some historians regard Balther's account as pure invention.

FRIEDBERG, the name of two towns in Germany.

1. A small town in Upper Bavaria, with an old castle, known mainly as the scene of Moreau's victory over the Austrians in 1796. Pop. (1925) 4,190.

2. FRIEDBERG IN DER WETTERAU, in the republic of Hesse, on the Usa, 14 m. N. of Frankfort-on-Main by rail. Pop. (1925) 11,048. Friedberg is of Roman origin, but is first mentioned as a town in the 11th century. In 1211 it became a free imperial city, in 1349 was pledged to the counts of Schwarzburg, and subsequently often changed hands, eventually in 1802 passing to

Hesse-Darmstadt. It is still surrounded by old walls and towers, and contains many mediaeval buildings, of which the Gothic town church and the old castle are noteworthy. It has manufactures of sugar, leather and photographic paper.

FRIEDEL, CHARLES (1832–99), French chemist and mineralogist, was born at Strasbourg on March 12, 1832. In 1854 he entered C. A. Wurtz's laboratory, and in 1856 was appointed conservator of the mineralogical collections at the École des Mines. In 1871 he began to lecture at the École Normale, and in 1876 he became professor of mineralogy at the Sorbonne, but on the death of Wurtz in 1884 he exchanged that position for the chair of organic chemistry. He died at Montauban on April 20, 1899. Friedel worked both in mineralogy and organic chemistry: He collaborated from 1879 to 1887 with Émile Edmond Sarasin (1843–90), on the formation of minerals by artificial means. In 1893, as the result of an attempt to make diamond by the action of sulphur on highly carburetted cast iron at 450°–500° C he obtained a black powder too small in quantity to be analysed but hard enough to scratch corundum. He also devoted much attention to the pyroelectric phenomena of crystals, to the determination of crystallographic constants, and to the study of the ketones and aldehydes. In 1862 he prepared iso-propyl alcohol, and in 1863, with J. M. Crafts (1839–1917), he obtained various organic compounds of silicon. A few years later further work, with A. Ladenburg, on silicon yielded silicochloroform and led to a demonstration of the close analogy existing between silicon and carbon. In 1871, with R. D. da Silva he synthesized glycerin, starting from propylene. In 1877, with Crafts, he described the valuable method for synthesizing benzene homologues, generally known as the "Friedel and Crafts reaction"; it was based on an accidental observation of the action of metallic aluminium on amyl chloride. The method consists in bringing together a hydrocarbon and an organic chloride in presence of aluminium chloride, when the residues of the two compounds unite to form a more complex body. Friedel was associated with Wurtz in editing the latter's *Dictionnaire de chimie*, and undertook the supervision of the supplements issued after 1884. He was the chief founder of the *Revue générale de chimie* in 1899. His publications include a *Notice sur la vie et les travaux de Wurtz* (1885), *Cours de chimie organique* (1887) and *Cours de minéralogie* (1893).

See memorial lecture by J. M. Crafts, printed in the *Journal of the London Chemical Society* (1900).

FRIEDJUNG, HEINRICH (1851–1920), Austrian historian, was born at Roßtin, Moravia, of Jewish parents. Friedjung spent much of his career in political journalism; he was a pronounced German nationalist, and the chief author of the nationalist *Unser Programm* of 1885. At the same time he devoted himself to historical research, especially over the period 1848–66, which he covered brilliantly and exhaustively in the three works *Oesterreich von 1849–60* (1908–12); *Der Krimkrieg und die oesterreichische Politik* (1907); and *Der Kampf um die Vorherrschaft in Deutschland* (10th ed., 1917). His other chief works are the volume *Historische Aufsätze* (1919) and the monumental review of modern times *Das Zeitalter des Imperialismus* (1919–22), which was finished by Prof. A. F. Pribram after Friedjung's death.

Friedjung was a conscientious and an attractive historian, whose works cover all aspects of life during the period with which they deal. The point of view expressed in them is, however, pronouncedly liberal, patriotic and anti-Catholic, and shows little sympathy for the Slav and Magyar nationalist movements in the Dual Monarchy. His last excursion into politics was most unlucky, and undeservedly clouded his name; on March 24, 1909, when the conflict between Austria-Hungary and Serbia over the annexation of Bosnia-Herzegovina was at its height, he published an article in the *Neue Freie Presse*, accusing the Serbo-Croat politicians in the Monarchy of treasonable practices with the Government of Serbia, and violently attacking conditions in Serbia. Fifty-two deputies of the Croato-Serb coalition and their leader Supilo separately, sued Friedjung for libel. It was disclosed that Friedjung had received the documents on which his article was based from the Austro-Hungarian Foreign Office, that

he had accepted them in good faith but after most insufficient scrutiny and that some at least were blatant forgeries. The affair ended at last in a compromise, but not until it had assumed the proportions of a European *cause célèbre*. Friedjung died in Vienna July 14, 1920.

See Dr. R. W. Seton-Watson, *The Southern Slav Question and the Habsburg Monarchy* (1911).

FRIEDLAND (AUSTRIA): see FRYDLANT.

FRIEDLAND, the name of seven towns in Germany. The most important is that in the republic of Mecklenburg-Strelitz, on the Mühlenteich, 35 m. N.E. of Strelitz by rail. Pop. (1925) 7,550. It possesses a Gothic church and has manufactures of iron, machinery, starch and sugar. Friedland was founded in 1244 by the margraves John and Otto III. of Brandenburg.

FRIEDLAND, a town of Prussia, on the Alle, 27 m. S.E. of Königsberg, famous as the scene of the battle fought between the French under Napoleon and the Russians commanded by General Bennigsen, on June 14, 1807 (see NAPOLEONIC CAMPAIGNS). The Russians had on the 13th driven the French cavalry outposts from Friedland to the westward, and Bennigsen's main body began to occupy the town in the night. The army of Napoleon was set in motion for Friedland, but it was still dispersed on its various march routes, and the first stage of the engagement was thus, as usual, a pure "encounter-battle." The corps of Marshal Lannes as "general advanced guard" was first engaged, in the Sortlack Wood and in front of Posthenen (2.30–3 A.M. on the 14th). Both sides now used their cavalry freely to cover the formation of lines of battle, and a race between the rival squadrons for the possession of Heinrichsdorf resulted in favour of the French under Grouchy. Lannes in the meantime was fighting hard to hold Bennigsen, for Napoleon feared that the Russians meant to evade him again. Actually, by 6 A.M. Bennigsen had nearly 50,000 men across the river and forming up west of Friedland. His infantry, in two lines, with artillery, extended between the Heinrichsdorf-Friedland road and the upper bends of the river. Beyond the right of the infantry, cavalry and Cossacks extended the line to the wood northeast of Heinrichsdorf, and small bodies of Cossacks penetrated even to Schwonau. The left wing also had some cavalry and, beyond the Alle, batteries were brought into action to cover it. A heavy and indecisive fire-fight raged in the Sortlack Wood between the Russian skirmishers and some of Lannes's troops. The head of Mortier's (French and Polish) corps appeared at Heinrichsdorf and the Cossacks were driven out of Schwonau. Lannes held his own, and by noon, when Napoleon arrived, 40,000 French troops were on the scene of action. His orders were brief: Ney's corps was to take the line between Posthenen and the Sortlack Wood, Lannes closing on his left, to form the centre, Mortier at Heinrichsdorf the left wing. Victor and the Guard were placed in reserve behind Posthenen. Cavalry masses were collected at Heinrichsdorf. The main attack was to be delivered against the Russian left, which Napoleon saw at once to be cramped in the narrow tongue of land between the river and the Posthenen mill-stream. Three cavalry divisions were added to the general reserve. The course of the previous operations had been such that both armies had still large detachments out towards Königsberg. The afternoon was spent by the emperor in forming up the newly arrived masses, the deployment being covered by an artillery bombardment. At 5 o'clock all was ready, and Ney, preceded by a heavy artillery fire, rapidly carried the Sortlack Wood. The attack was pushed on toward the Alle. One of Ney's divisions (Marchand) drove part of the Russian left into the river at Sortlack. A furious charge of cavalry against Marchand's left was repulsed by the dragoon division of Latour-Maubourg. Soon the Russians were huddled together in the bends of the Alle, an easy target for the guns of Ney and of the reserve. Ney's attack indeed came eventually to a standstill; Bennigsen's reserve cavalry charged with great effect and drove him back in disorder. As at Eylau, the approach of night seemed to preclude a decisive success, but in June and on firm ground the old mobility of the French reasserted its value. The infantry division of Dupont advanced rapidly from Posthenen, the cavalry divisions drove back the Russian squadrons into the now congested masses

of foot on the river bank, and finally the artillery general Sénarmont advanced a mass of guns to case-shot range. It was the first example of the terrible artillery preparations of modern warfare, and the Russian defence collapsed in a few minutes. Ney's exhausted infantry were able to pursue the broken regiments of Bennigsen's left into the streets of Friedland. Lannes and Mortier had all this time held the Russian centre and right on its ground,

PLAN OF THE BATTLE OF FRIEDLAND, JUNE 14TH, 1807

and their artillery had inflicted severe losses. When Friedland itself was seen to be on fire, the two marshals launched their infantry attack. Fresh French troops approached the battlefield. Dupont distinguished himself for the second time by fording the mill-stream and assailing the left flank of the Russian centre. This offered a stubborn resistance, but the French steadily forced the line backwards, and the battle was soon over. The losses incurred by the Russians in retreating over the river at Friedland were very heavy, many soldiers being drowned. Farther north the still unbroken troops of the right wing drew off by the Allenburg road; the French cavalry of the left wing, though ordered to pursue, remaining, for some reason, inactive. The losses of the victors were reckoned at 12,100 out of 86,000, or 14%, those of the Russians at 10,000 out of 46,000, or 21% (Berndt, *Zahl im Kriege*).

FRIEDMANN, MEIR (1831-1908), Hungarian Jewish scholar, was born at Kraszna on July 10, 1831. His editions of the Midrash are the standard texts. His chief editions were the *Sifra* (1864), the *Mekhilta* (1870), *Pesiqla Rabbathi* (1880). At the time of his death he was editing the *Sifra*. Friedmann, while inspired with regard for tradition, dealt with the Rabbinic texts on modern scientific methods, and rendered conspicuous service to the critical investigation of the Midrash and to the history of early homilies.

FRIEDRICH, CASPAR DAVID (1774-1840), German landscape painter and engraver, born at Greifswald on Sept. 5, 1774. He studied under Dr. J. G. Quistorp, the university drawing master of his native town, and from 1794 to 1798 at the Academy of Copenhagen. He then settled at Dresden, where he was a member of an artistic and literary circle of friends, which included Runge, Tieck and Novalis. His drawings in sepia, executed in his neat early style, won Goethe's approval and a prize from a Weimar art society in 1805. His first important oil painting, dated 1807, was an altarpiece for the castle of Graf Thun in Teschen, representing a "Crucifix in Mountain Scenery." Other notable works were the "Graveyard in Snow" (1810), "Alpine Scenery" (1828), now in the National Gallery, Berlin; "Two Men Contemplating the Moon" (1819); in Dresden; and "Rest in a Hayfield" (1835). In 1824 he was made professor of the Dres-

den academy. He died on May 7, 1840, at Dresden. For a long time his work was neglected and forgotten; but recently his memory has been revived. His influence made itself felt in the work of his pupils and friends, K. G. Carus, G. Kersting, K. F. Lessing, F. Olivier, E. Ohme, the Norwegian J. C. Dahl and others.

FRIEDRICH KRUPP AKTIENGESSELLSCHAFT, an industrial company founded at Essen in 1811. Alfred Krupp (q.v.) (1812-1887) supplied his steel in the shape of rolls, coining dies, weldless tyres for railway vehicles, etc., etc. At an early date, iron and coal mines were acquired. The excellent quality of his steel brought him the highest award, the Council Medal, at the 'Great Exhibition of London (1851), where he exhibited a homogeneous solid cast steel ingot weighing over 2 tons. His son started the manufacture of armour plates and in this connection acquired the Gruson Works at Magdeburg in 1895 and the Germania Shipbuilding Yard at Kiel in 1902. In 1896 he began the erection of what was to become one of the largest blast furnace plants in Europe, situated at Rheinhausen near Duisburg. In 1903, the Krupp firm was converted into a Joint Stock Company, the shares of which are all owned by the Krupp family. The basic activities of the undertaking are the manufacture and working of high-grade and special steels. The company also owns coal and iron mines, blast furnaces, a shipbuilding yard, and engineering works where locomotives and waggons, motor vehicles and a great variety of other machinery are built.

A community of interests has been entered into with the Westphalian Wire Works at Hamm and the Coal Mining Company Ver. Constantin der Grosse at Bochum. The administration of numerous other interests held by the Krupp firm in various other concerns is vested in the A. G. für Unternehmungen der Eisen- und Stahlindustrie in Berlin. On the 1st of July 1928, the Company had in its employ a total of 71,500 officials and workmen.

See *Krupp 1812-1912* (Essen, 1912); W. Berdrow, *Friedrich Krupp, der Gründer der Gusstahlfabrik, in Briefen und Dokumenten* (Berlin, 1915); W. Berdrow, *Alfred Krupp* (Berlin, 1926). (A. Goë.)

FRIEDRICHRODA, a summer resort in the republic of Thuringia, Germany, at the north foot of the Thuringian Forest, 13 m. by rail S.W. from Gotha. Pop. (1925) 7,394. In the immediate neighbourhood are the ruins of the Benedictine monastery founded in 1085, and now incorporated in a hunting seat. The town manufactures a variety of electric lamps, furniture and machinery.

FRIEDRICHSDOF, a town of Germany, in the Prussian province of Hesse-Nassau, on the southern slope of the Taunus range, 3 m. N.E. from Homburg. Pop. (1925) 1,683. It manufactures hats, leather and biscuits. It was founded in 1687 by Huguenot refugees.

FRIEDRICHSHAFEN, a town of Germany, in the republic of Württemberg, on the east shore of Lake Constance, at the junction of railways to Bretten and Lindau. Pop. (1925) 11,289. It consists of the former imperial town of Buchhorn and the monastery and village of Hofen. Buchhorn is mentioned (as Buachhorn or Puchhorn) in documents of 837 and in the 12th century passed through the hands of the Welfs to the Hohenstaufen. In 1275 it was made a free imperial city by King Rudolph I. In 1802 it was assigned to Bavaria, and in 1810 to Württemberg. The monastery of Hofen was founded in 1050 as a convent of Benedictine nuns, but was changed in 1420 into a provostship of monks, was suppressed in 1802, and in 1805 came to Württemberg. King Frederick I., who caused the harbour to be made, amalgamated Buchhorn and Hofen under the new name of Friedrichshafen. The principal building is the palace, formerly the residence of the provosts of Hofen, and here are also the natural history and antiquarian collections of the Lake Constance Association. Zeppelins are built here and in 1924 the L.Z. 126 flew from here to America and back. Its other industries include motor cars and tanning.

FRIEDRICHSRUH, a village in the Prussian province of Schleswig-Holstein, 15 m. S.E. of Hamburg. It gives its name to the country seat of the Bismarck family, the park of which

forms a portion of the Sachsenwald. Close by stands the mausoleum of Prince Otto von Bismarck.

FRIENDLY SOCIETIES. A friendly society is a mutual association the chief purpose of which is to provide its members with money allowances during incapacity for work resulting from sickness or infirmity and to make a provision for the immediate necessities arising on the death of a member or his wife. This definition is not exhaustive since there exist a considerable number of societies (some of them very large) the objects of which are principally restricted to the insurance of small sums at death. These bodies customarily use the words "friendly society" in their title and are registered in Great Britain under the Friendly Societies Act. To that extent they come within the scope of the present article but the great majority of them are, in fact, engaged in the business of industrial assurance and are fully described under that heading. Their methods of operation and their subjection to the statute by which industrial assurance is regulated (Industrial Assurance Act, 1923) distinguish them from the ordinary friendly society, and no further reference will be made to them in dealing with this subject.

The functions of most of the British friendly societies have undergone some change since 1912 when they became associated with the administration of national health insurance. The present article deals wholly with the position and activities of the societies as instruments of voluntary insurance, but in order to appreciate the scope of the societies' work it should be understood that a friendly society may be an "approved society" under the National Health Insurance Act and at the same time may be a wholly voluntary institution conducting its operations in this aspect under the sanction of the Friendly Societies Act or (if it is unregistered) of common law, without oversight by the government departments to which it is responsible so far as concerns its functions in regard to health insurance. If a society is so constituted it has separate codes of rules for each side of its business; in the usual case a majority of the members will be insured in respect of both voluntary and statutory benefits, but some will be insured for the "State" benefits only, while others will be insured on the voluntary side alone, these latter consisting partly of tradesmen and others not employed within the meaning of the National Health Insurance Act and partly of members who come within the Act but have effected their insurances under it elsewhere.

The Friendly Societies Act, 1896, as amended by the Act of 1908, defines a friendly society as a society "for the purpose of providing by voluntary subscriptions of the members thereof, with or without the aid of donations, for

"(a) The relief or maintenance of the members, their husbands, wives, children, fathers, mothers, brothers or sisters, nephews or nieces, or wards being orphans, during sickness or other infirmity, whether bodily or mental, in old age (which shall mean any age after 50) or in widowhood, or for the relief or maintenance of the orphan children of members during minority; or

"(b) Insuring money to be paid on the birth of a member's child or on the death of a member, or for the funeral expenses of the husband, wife, or child of a member, or of the widow of a deceased member, or, as respects persons of the Jewish persuasion, for the payment of a sum of money during the period of confined mourning; or

"(c) The relief or maintenance of the members when on travel in search of employment, or when in distressed circumstances, or in case of shipwreck or loss or damage of or to boats or nets; or

"(d) The endowment of members or nominees of members at any age; or

"(e) The insurance against fire, to any amount not exceeding £15, of the tools or implements of the trade or calling of the members; or

"(f) Guaranteeing the performance of their duties by officers and servants of the society or any branch thereof."

The great majority of the societies limit their operations to the objects comprised in (a) and (b) although in conformity

with the ideals by which they are actuated many of them are empowered by their rules to relieve cases of distress. So far as benefits under (a) include annuities the act prohibits a total insurance of more than £52 a year. Similarly insurance on life, whether through one or more societies may not exceed £300, exclusive of bonus.

HISTORY AND DEVELOPMENT

It may be conjectured that the English friendly societies are tenuously linked with the mediaeval guilds, the numerous objects of which included most of the purposes which the modern friendly society serves. Very few societies have survived from an earlier period than the 18th century, but there is ample evidence that towards the end of that century the system was widely established. It was, for example, sufficiently important to receive a considerable amount of attention in Sir F. M. Eden's *The State of the Poor* published in 1797, while the same author issued in 1801 his *Observations on Friendly Societies for Maintenance of the Industrious Classes During Sickness, Infirmity, Old Age and other Exigencies* in which he referred to returns he had obtained in respect of some 5,117 societies enrolled under the Act of 1793 (the first statute relating to friendly societies) and came to the conclusion that the total number of societies in existence was about 7,200. It is also on record that between 1793 and 1828 some 20,000 rules of societies—many of which no doubt had but a brief existence—were enrolled among the records of the courts of quarter sessions under the Act just mentioned. The financial arrangements of these early societies were primitive, and failures were evidently sufficiently numerous to receive the attention of parliament. The appendix to the later editions of Dr. Price's *Observations on Reversionary Payments, etc.*, contains a complete set of rates of contribution "prepared at the request of a committee of the House of Commons," apparently before 1789, and "intended to form the foundation of a plan for enabling the labouring poor to provide support for themselves in sickness and old age." The author's conception of the nature of a sickness risk was sound but in the absence of data his assumptions were of necessity hypothetical. His scheme was, however, so complete as to include an elaborate table of sums payable on the removal of a contributor from one parish to another, in order to enable him to remain in insurance at his original rate of contribution. This latter feature is of special interest as ante-dating by over 120 years the supposedly novel provisions of the National Insurance Act of 1911 in regard to "transfer values" for insured persons who change their society.

It is an interesting fact that 54 societies established before 1800 were on the English register at the end of 1927 and that 22 such societies were on the Scottish register at the end of 1924. Three of the English societies, two of them of Huguenot origin, date respectively to 1703, 1708 and 1712, a society of still earlier formation (1687) having disappeared but a few years ago. The Scottish registrations include even older cases. The date of the earliest society—the Incorporation of Carters in Leith—is given as 1555, and two other societies are stated as founded respectively in 1634 and 1670.

While the purely local societies were multiplying in the early years of the 19th century two other movements were developing. One of these, that of the "county" type of friendly society, was promoted by the rural gentry and clergy, and was distinguished by the correctness of the financial principles adopted and by the completeness of the administrative machinery set up on a county basis with devolution of details to parish agencies. The whole cost of management was frequently met from funds contributed by the patrons, in whom control was vested, and insurance of a substantial character was thus brought within the means of the rural population in various parts of the country. A few societies of this class, e.g., the Hampshire Friendly Society, have achieved considerable success but the county societies never obtained a position commensurate with their merits as insurance institutions and their place in the friendly society world is now quite inconsiderable. The other movement, that of the "Orders," was destined to transform the character of the whole friendly society system. In

speaking of these bodies it will be useful to employ this (their own) designation of orders, rather than the cumbersome description of "societies having branches" by which they are identified in the Friendly Societies' Act. The first of the orders to take definite form was the "Independent Order of Oddfellows, Manchester Unity" which, established in Manchester in or about the year 1810, spread rapidly through the industrial districts of the North of England and eventually extended its "lodges" throughout the whole country. Modestly imitating the ritual and symbolism of Freemasonry, its professions of secrecy, with signs and passwords, no less than its charitable designs, made a strong appeal to the social instincts of the tradesman and the better-paid artisan. At the outset its financial arrangements were entirely devoid of any scientific basis, but this came later with the gradual realization by its leaders that insurance and not benevolence was the real foundation of its operations. In the course of time the tide of emigration carried the society to the United States, to Canada, to Australia, to New Zealand, to South Africa, and elsewhere overseas. The place which the society has achieved in the provident institutions of the British people is indicated by the fact that in 1926 its lodges in Great Britain numbered 4,000 with an adult membership of about 750,000 and funds (including centralized accounts) amounting to nearly £20,000,000.

The Ancient Order of Foresters was the next important organization to rise from local obscurity. Also basing themselves on a mixture of ritual and benevolence, its "courts" began to spread from Leeds in 1834. In this case, again, numerical progress was long conspicuous but was unaccompanied by perception of the need of a sound insurance basis and in recent years essential reforms have, in consequence, proved a heavy handicap to progress. Much, however, has been accomplished and the returns for 1926 showed an adult membership in Great Britain and Ireland of nearly 600,000 distributed over 3,438 branches (courts) with funds of £11,650,000.

Other societies of the order type sprang up in the 19th century, and have established themselves with varying degrees of success. The membership, in most cases, is small in relation to that of the two great societies named above, and distinctive features are only to be found in the "temperance" group in which an undertaking of total abstinence is required as a condition of membership. The larger societies of this group are the Independent Order of Rechabites with approximately 700,000 members (of whom, however, nearly one half are juveniles) distributed over about 3,000 branches, called "tents," and the order of the Sons of Temperance with nearly 1,200 "divisions" and about 250,000 members, of whom over 100,000 are juveniles.

Societies of two other types came into prominence somewhat later. The first is the centralised society, without a social side, relying for support on its stability as an insurance institution. The most prominent example of this group is the Hearts of Oak Benefit Society which, established in 1840 as an offshoot of a society of the same class still in existence, had attained at the end of 1926 a membership of 425,000 with funds of nearly £9,000,000. The other type is that of the deposit society, of which the most important representative is the National Deposit Friendly Society. Though established so recently as 1868, on a plan which presents a somewhat curious blend of insurance and private saving—both excellent, but certainly divergent modes of thrift—this society numbered over 760,000 members at the end of 1926 with funds of about £6,000,000. Of the total membership, 420,000 were males of ages over 16, this being, substantially, the comparable figure with those of the other societies to which reference has been made. The corresponding number of women was 202,000, a feature of much interest in the constitution of the deposit type of society in view of the failure of the societies of other classes to attract any large body of women in the 30 years or more during which their doors have been widely open to the sex.

Less important than these major developments but worthy, nevertheless, of mention are the "dividing" societies, many of them unregistered, which exist in great numbers in Britain, especially in the large towns. These societies provide small benefits, relatively to the contributions, but share out their funds at

intervals, generally yearly. If numbers command respect it must in some degree at least, be accorded to these "slate clubs," "sick and annual" societies, "tontines," etc., as they are variously styled in different parts of the country.

Constitution of the Orders.—The orders, which constitute so prominent an element in the friendly society movement, are organized, both financially and administratively, on somewhat elaborate lines. At the base of the system are the local branches which are distributed over the country in somewhat haphazard fashion; in the rural districts one branch of an order will serve several neighbouring villages, while commonly a large town will have a number of branches, some of them clustering round the centre, while others are scattered over the suburbs. These branches are grouped in districts on a geographical basis, there being about 260 such districts in the Manchester Unity of Oddfellows and about 200 in the Ancient Order of Foresters. Above the districts is the central authority of the society, the board of directors in the first of the two large societies and the executive council in the other. As regards legal status the society is entitled to registration under the Friendly Societies Act as a single organization, the primary units (lodges, courts, etc.) and the districts being similarly entitled to registration as branches. Under this form of constitution every branch is subject to the rules of the society and though it has its own rules these must comply with the rules of the superior body. All the branch rules are, therefore, to a large extent in common form—and this, no less than the free interchange of views on the best methods of effecting the common purpose, ensures a considerable degree of uniformity in administration throughout the whole organization. The domestic affairs of the primary unit are legally subject to its own committee of management, though in fact the members, in their fortnightly or monthly meetings, are enabled to exercise whatever share they are inclined to take in the general conduct of business. This unit elects its delegates to the district meeting held half-yearly or quarterly and the districts appoint their representatives to the annual meeting of the society, which in the case of the larger bodies is a somewhat imposing assemblage, the proceedings of which are largely devoted to the discussion of major questions of policy. The tripartite arrangement of lodge (or whatever the name of the primary unit), district and order, each with its carefully delimited powers and duties, though appearing somewhat grandiose if the utilitarian purpose of the society only is considered, is in fact well adapted to the purposes to be served. In most cases the primary unit, the lodge or court, is directly responsible to the member for all the benefits under his contract, but retains only the liability to provide the sickness benefits, the death benefits being re-assured with the district. The principal function of the central body, in regard to finance, is to aid any local branches which may fall into difficulty. For many years this obligation was never closely defined and amounted in practice to little more than the grant of eleemosynary relief. In this respect the conditions have changed considerably in recent years, both the Manchester Unity of Oddfellows and the Ancient Order of Foresters having taken effective steps to secure (under proper contribution arrangements) the fulfilment of the original benefit undertakings of all their branches. The larger society has achieved its purpose by a small charge on the valuation surpluses of the fully solvent lodges, while the Ancient Order of Foresters has adopted the plan of a modest levy on the contributions of the members generally.

Legislation.—Numerous Acts of Parliament for the encouragement and regulation of friendly societies were passed between 1793 and 1895 but as practically everything that is of permanent value in these measures (all of which have been repealed) is incorporated in the Friendly Societies Act, 1896, it is unnecessary to examine them in any detail. The Act is administered by the Friendly Societies Registry at the head of which is the Chief Registrar, who by the statute, must be a barrister of 12 years' standing, or have been an Assistant Registrar for at least 5 years. In essential matters the Act of 1896 re-enacts the Act of 1875, which was based on the report (issued in 1874) of a Royal Commission appointed in 1870. The privileges which the Act confers are re-

stricted to those societies which register under it and the conditions which it imposes apply to those societies only. Unregistered friendly societies are subject, of course, to common law, but are neither protected nor controlled by statute, and the Registry Office exercises no functions in regard to them. The privilege of registration under the Act has a somewhat wider range than the organizations which are the subject of this article, and includes, for example, working men's clubs and cattle insurance societies.

The condition of registration is the adoption of rules providing, *inter alia*, for the following matters:—

1. The objects of the society; these must be chosen from amongst the objects specified in the Act.
2. The terms of admission of members.
3. The conditions under which a member may become entitled to benefit.
4. The mode of holding meetings, and the right of voting.
5. The manner of making, altering, or rescinding rules.
6. The appointment and removal of trustees, committee of management and other officers.
7. If the society is one with branches, provision is to be made for the composition of the central body, and the conditions under which a branch may secede from the society.
8. The investment of the funds.
9. The keeping of the accounts, and audit thereof.
10. Annual returns to the registrar.
11. The manner in which disputes shall be settled; decisions arrived at in accordance with the rules are binding, are not removable into a court of law, and may be enforced on application by the county court.
12. Provision for the expenses of management.
13. Quinquennial valuation.

The rules, in fact, set out the conditions of the contract which the members of a friendly society mutually make with each other and of the remedies which the law provides to secure its fulfilment. It will be observed that although the society is required to state in its rules what are its benefits and the conditions under which they are payable, no conditions are imposed upon it. There is no compulsion to adopt an actuarially sound table of contributions (except for the insurance of annuities) or to administer the benefits in any particular way. The members, as Sir Edward Brabrook says (*Provident Societies and Industrial Welfare*, p. 52), "are left entirely to their own discretion as to the soundness of the conditions on which they grant insurances." It may be observed also that while every society is required to submit its financial position to valuation at quinquennial intervals (unless exempted by the registrar on the ground that valuation is inapplicable to its undertakings, e.g., a dividing society) there is no compulsion on the members to take steps to rectify any unsoundness which the valuation may reveal. The registrar may do (and does) much, through the influence which his position enables him to exercise, to secure the due consideration of valuation results on which action should be taken, but he has no powers save those which in extremity the requisite number of the members may call upon him to exercise.

A registered friendly society has certain privileges of which the more important are the following:—

1. It can legally hold land and other kinds of property in the names of the trustees.
2. Where the property is stock in the funds, it may be transferred from a deceased or absent trustee by order of the chief registrar, without other legal proceedings.
3. Other property passes from one trustee to another without conveyance or assignment.
4. The trustees can invest the society's money without restriction of amount in a trustee savings-bank, or the Post-office savings-bank.
5. They can discharge a mortgage by merely endorsing a receipt upon it, without a reconveyance.
6. The trustees are entitled to claim priority over creditors in respect of property of the society.
7. Documents of the society are exempt from stamp-duty.
8. Members above sixteen years of age may nominate the recipients of sums not exceeding £100, payable at their death by the society, and the trustees, where a member dies intestate and has made no nomination, may pay to the person who appears to them to be legally entitled, and such payment is a good discharge to the society.
9. Societies can settle disputes in any manner for which the rules provide, and thus avoid the cost of litigation.
10. Societies are free of income-tax on their interest from investments.

Ordinary Friendly Societies.—The primary benefit is the

weekly allowance during sickness, to which is usually added a payment on the death of a member or his wife. The sickness benefit insured is generally from 10s. to 20s. a week; the predominating rates are probably 10s. and 12s. except in and around London where insurances for 18s. and 20s. a week are common. Sickness benefit at the full rate is usually payable for 26 or 52 weeks—after which, if incapacity still continues, it is reduced by one-half. In many cases there is no further reduction, but under the rules of other societies half pay is limited to the same period as full pay and is succeeded by quarter pay. Benefit at the lowest rate is in most cases continued during incapacity, which may extend over many years. Difficult problems have been created by the sickness claims of aged members, in regard to whom it is impossible to distinguish between incapacity due to sickness and the infirmity of old age. Sickness benefit has, in general, been paid continuously to those beyond work, but the strain of permanent claims has everywhere absorbed a disproportionate part of the resources of the societies and the institution of old age pensions by the State is leading them to a wise limitation of the insurance of sickness benefit to the working ages of life (terminating at 65 or 70) so far as new entrants are concerned. In most cases the contributions are graduated according to age at entry, in accordance with actuarial tables. At the age of 18, for instance, a contribution of 5d. a week (to which 1d. a week must be added for management expenses) will provide a man, according to the rules of one society, with a sickness benefit terminable at the age of 70 of 12s. a week for 26 weeks and 6s. a week for the remainder of sickness, together with "funeral benefits" of £12 for himself and £6 for his first wife; the corresponding rate (also subject to addition for management expenses) for an entrant aged 27 is 6d. and for one of 35, is 7½d. Under the stress of the competition of the "deposit" societies the older organizations have in recent years made a notable departure from their original objects and have put forward schemes combining insurance (on a sound actuarial basis) with personal savings. Under this plan the member is free to draw upon his savings account at his option and to withdraw the amount to his credit (less a small deduction) on terminating his membership. The amount accumulated is payable in any case on arrival at a stipulated age, generally 65, and is also payable on the death of the member should that occur before he reaches this age.

As an example of this class of benefit, one society offers to a male entrant of 16 years of age (last birthday) for a contribution of 15s. a quarter, inclusive of management expenses, a sickness benefit of 20s. a week for 26 weeks, followed, if necessary, by 10s. a week for a further 26 weeks, and 5s. a week for the remainder of illness, and at the age of 65 (when contributions and sickness benefit cease) from his personal account a lump sum of over £210 if he is classed as engaged in an "ordinary" occupation, or of about £130 if his occupation is scheduled as "hazardous" and his sickness risk is, in consequence, above the general average. These amounts are subject to possible increase from valuation surplus. In the event of a member's death before he reaches the age of 65 the balance of his account is payable, this being made up, if necessary, to a stipulated minimum.

Schemes such as this premise that the entrant to a friendly society is prepared to contribute on a considerably higher level than was formerly deemed practicable, and is equally prepared, so far as private savings are concerned, to utilize his friendly society as a principal instrument of thrift.

Deposit Societies.—The societies of the deposit class which, as already shown, have advanced remarkably in public favour during the present century constitute a distinct class. All have the common purpose of combining sickness insurance with personal savings, and all eschew the orthodox methods of accumulation of funds in correspondence with the growth of the liabilities of the insurance side of their undertakings. Under the deposit plan which enjoys the widest popularity the members are in general required to contribute monthly the same amount as they desire to insure for as the daily rate of sickness benefit, a contribution of 2s. a month (24s. a year) thus being paid in respect of a sickness benefit of 12s. a week. The contribution so paid is

divided between the member's deposit and the "common sick fund" (with which is linked the small "sickness reserve fund"); the governing body fixes the proportions in which the contributions shall be divided, but it is essential to the main purpose of the system that substantial sums shall be placed to the members' deposits and in the particular case under examination the present practice is to carry to them about two-thirds of the contributions. The member's share of the expenses of management, with certain smaller sums, is charged upon his deposit to which also is debited a proportion, varying with sex and age, but averaging about one-third, of any sickness benefit which he may claim and of the cost of any medical benefit for which he may have contracted. For the other two-thirds of the cost of these benefits (which ordinarily cease at the age of 70) resort is had to the "common sick fund." A member may draw at any time upon his deposit, which carries interest at a low rate, and subject to safeguarding provisions, may add to it by payments in excess of his normal contributions. Any balance standing to his credit at the time of his death is paid to his representatives while if he leaves the society he draws out his deposit, subject to a small fine.

The system lends itself to criticism mainly on two grounds, the uncertainty as to the duration of the benefits in the case of the individual and the provision made for the growing liabilities of the "common sick fund." As regards the first of these points, the member is entitled only to full sickness benefit so long as he has a balance in his deposit from which the prescribed proportion of his benefit can be taken. There is at all times, therefore, a risk of exhaustion of the right to sickness benefit. Any resulting hardship is alleviated by the payment from the "common sick fund" of "grace pay," i.e., sickness benefit at a reduced rate, for a limited period after a member's account is exhausted, but no member is allowed to resort to this benefit more than once in five years. It was observed by Sir Edward Brabrook (at the time Chief Registrar of Friendly Societies) in his *Provident Societies and Industrial Welfare* (p. 68) that under this system "a member who suffers from prolonged sickness may find the relief of the society fail him through the exhaustion of his own bank at a time when he most wants it."

The position of the "common sick funds" is theoretically protected by a power to levy on the members' deposits if the reserves should be exhausted. The need to exercise this power might, however, be attended by serious consequences, and it is matter for regret, in the circumstances, that although the reserves are substantial, their basis is empirical, and their sufficiency not yet established.

In considering the characteristics of the deposit class a distinction must be drawn between the societies whose system may be criticized on the particular grounds just examined and the societies of the "Holloway" group. These latter societies, which are chiefly found (and in considerable strength) in the west of England require a high contribution, relatively to the insurance value of the benefits offered, and increase it as the member passes from age to age between the ages of 30 and 65, when sickness benefit terminates; the object of this novel condition in friendly society finance is to provide, in the absence of specific reserves for sickness benefit, for the growing liability the member brings as his age increases. The claims of each year constitute a first charge on the contribution income of the year, and in normal circumstances are wholly met from this source, there being no recourse to the personal account of a member in respect of his own demands for sickness benefit and no such limitation, consequently, on the amount of benefit that he may draw as the alternative system is held to involve. The balance of the income of each year, after meeting the sickness claims, is divided among the members, and accumulated for their personal advantage. The contribution is so high, in relation to the insurance element of the scheme, that the prospect of a dividend at the end of the year is in all ordinary circumstances considerable.

The system evidently appeals with success to those who are attracted by a combination of insurance and saving, flavoured by an apparently pleasing uncertainty as to what the "dividend" will be.

Railway Benefit Societies.—The societies in this group, some of which are unregistered, limit their membership to the operative staffs of the railway companies. The benefits frequently include substantial pensions after the age of 65, while in some cases allowances are made on withdrawal; the contributions are largely supplemented by subsidies from the companies. No doubt because of the quasi-compulsory character of the membership, the companies have accepted a large measure of responsibility for the financial soundness of the societies and the actuarial valuations have frequently been followed by very substantial grants in the liquidation of deficiencies.

Miners' Permanent Relief Societies.—This is a small group, with, however, a membership of some hundreds of thousands, the object of which is to provide allowances, including permanent pensions, for miners who are injured at work and pensions to the widows (with children's allowances) of miners whose death is due to occupational accident. With responsibilities difficult of assessment in any case and liable, obviously, to great fluctuations, the financial record of these societies leaves much to be desired. They are, nevertheless, of special interest as showing the efforts made by the workman to meet a risk to which he was particularly subject long before it was decided by Parliament, in the Workmen's Compensation Acts, that the liability was one which the employer should be called upon to bear.

Warehousemen's and Clerks' Societies.—This is a very small but interesting group in which the chief subject of insurance is loss of income whether due to sickness or unemployment. The societies of the group originated with the Provident Association of Warehousemen, Travellers and Clerks established for the employees of textile warehouses in the City of London in 1871; the objects being somewhat beyond those which the ordinary friendly society is permitted to adopt, registration has been effected under a section of the Act providing for "specially authorized" societies. The resources of these societies have been found well in advance of the modest financial design of their benefits and from the substantial surpluses which have accrued, annuities to members in need and other benefits have been added to the original plan.

STATISTICS

The report of the Chief Registrar (Great Britain) for 1927 gives a summary from which it appears that the number of returns for the year 1926 received from friendly societies (and branches) of all classes was 21,488 these showing a total of 7,429,506, of whom, however, probably not more than about 5,500,000 were adults insured for sickness benefits. The expenditure on sickness during the year was £4,684,031 and in death claims £1,195,260, the funds at the end of the year amounting to £91,333,723. While the figures of membership are impressively large in total, it is necessary to look at their component items, with the related statistics of earlier years, in order to ascertain the trend of popular favour as between the different types of society. Taking first the class of sickness benefit societies, as the registrar styles them, though payments at death are almost invariably provided in addition to sick pay, it is shown that 1,193 returns were received from societies including nearly 1,140,000 members with funds of £21,200,000. But of this group 25 societies led by the Hearts of Oak Benefit Society, accounted for a membership of 880,000 and funds of £16,200,000, leaving among 1,168 societies about 260,000 members and funds of about £5,000,000. Substantially these represent the survivors of the class of independent local clubs in which the friendly society system originated. The number of societies of this type appears to have fallen by about 1,600 between 1910 and 1916, doubtless as the result of the institution of the system of national health insurance which made it as unnecessary as it was hopeless, to prolong the existence of many weak and decaying societies. It is, however, an interesting fact that over 400 societies of this class became branches of the orders. The disappearance of those local societies continues, and each year sees a further reduction in their number; between 1916 and 1926 nearly 400 of them were removed from the register. The membership of the orders on December 31, 1926, was well over 3,000,000 and

their funds exceeded £43,000,000, the group thus representing nearly one-half of the whole friendly society movement, both in funds and membership. The number of branches making returns was 18,019, the average membership being under 200. So far as numbers are concerned the societies of this type have not made progress in recent years. While funds have grown since 1910 by over £15,000,000 the number of branches making returns has fallen by over 2,000, and little increase in the total number of members is observable. In contrast, the deposit societies, numbering about 100, have achieved continuous and rapid progress. Between 1915 and 1926 their membership increased from 600,000 to over 1,100,000 and their funds from £5,300,000 to £14,200,000. Of the varied other types of society on the register mention need only be made of the statistics of the "dividing" societies. The membership of this group (which is probably exceeded by that of unregistered societies of the same type) is practically stationary at under half a million. The amount of funds in hand—about £600,000—does not increase, in any material degree, from year to year. This is, of course, explained by the leading feature of the constitution of these societies—the yearly "share-out."

Finance.—From the large amount of their funds the friendly societies rank as capitalists of some importance, and much attention is devoted to the subject of investment. Although considerable sums are invested in Government stocks, and in loans to local authorities, the favourite security is the mortgage on house property. In great numbers of cases advances have been made to members to enable them to purchase their dwellings and in some directions the system of repayment in instalments has been in successful operation for many years. The rise in the market value of money since the World War has been quickly appreciated by the friendly societies, and the resulting increase in the rates of interest secured on their funds has been a powerful factor in the financial progress to which reference is made below.

It was inevitable from the circumstances in which the friendly societies originated and developed that they should long have lain under the imputation of financial unsoundness. The very fact that they were conducting insurance business, for which an actuarial basis was essential to security, was but tardily recognized, and it was not until the middle of the 19th century was approaching that tables of an authoritative character were compiled to show the rates of sickness and of mortality to which their members were subject at successive ages. These tables provided the means of framing actuarial estimates of the financial position of the societies, but it was not until the Friendly Societies Act of 1875 enforced them that such estimates—in the form of quinquennial valuations—were generally obtained, and many years had to elapse, and a vast amount of propaganda to be undertaken, before the results of early and long-continued insufficiency in financial arrangements could be overcome. Improvement has been accelerated in recent years by the increase in the rate of interest obtainable on investments and by the decline in sickness claims which set in during the World War and continued for several years afterwards. Valuations (which are not required from deposit and dividing societies) were received in the five years ending Dec. 31, 1926, from 15,030 societies and branches, and these showed surpluses to the amount of about £8,400,000 and deficiencies of about £6,000,000. It is thus evident that while much remains to be done before all the friendly societies of Great Britain are solvent—and for some among them the task may be too great—there is conclusive evidence of soundness, and promise of the enlargement of the contractual benefits, over a great part of the field.

The data providing the rates of sickness and mortality on which valuation tables are based were formerly obtained from returns supplied by the friendly societies, in compliance with a statutory requirement, at quinquennial intervals covering the period between 1836 and 1880. The first returns so received, relating to the period 1836-40, were analysed by a distinguished actuary (Nelson) who himself published the results of his observations and the returns for 1846-50 were dissected, unfortunately on such a theoretical basis as to render the results of little value for prac-

tical purposes, by an actuary in the public service. An analysis of the returns for the period 1856-80 was made by the actuary to the registry of friendly societies, but his report was not available till 1896, by which time the greater part of the data brought under review had become out of date. Meanwhile, the Manchester Unity of Oddfellows taking advantage of the requirement to render quinquennial returns had on three occasions analysed its own experience, the latest of the resulting tabulations, that of the period 1866-70, being generally accepted for many years as the authoritative standard of sickness experience. A similar course was followed by the Ancient Order of Foresters with the quinquennial returns of its branches for the period 1871-75. These societies thus supplied themselves—and the world—with the only authentic bases of valuation that existed for the half century during which the movement was making its greatest progress. The government report of 1896 indicated that according to the latest data of which it treated—that of the years 1876-80—the sickness liabilities of friendly societies had risen seriously. The societies were thus placed in a difficulty, for even this experience was nearly 20 years old at the time the report was published, and as Parliament had in 1882 abolished the quinquennial returns (under advice, presumably, that sickness was more or less static and that a sufficient volume of facts as to its incidence had been collected) and no information as to current conditions was available, either to modify or to confirm the disquieting results which the last official report brought out. In these circumstances the Manchester Unity of Oddfellows decided on independent action and again collected the experience of its branches, the years selected being 1893-97. The data so obtained, for the assemblage and analysis of which Alfred Watson (then one of the actuaries to the society) was responsible, extended over 3,000,000 years of life and included 7,000,000 weeks of sickness. It represented by far the largest body of friendly society records ever brought together, and the report exhibiting its results was issued in 1903. No other investigation of the kind has subsequently been made and the tables obtained from this experience are therefore still in general use as the standard of sickness risks; in this connection they supplied the financial basis of the National Health Insurance Act. The importance to the industrial classes of an adequate provision against the risk of sickness is illustrated by the statistics of this experience from which the following figures are extracted:—

Age	Percentage of members at the age claiming sickness benefit in a year	Average duration of sickness in the year per member claiming benefit	Average duration of sickness in the year, computed over all members at the age
		<i>Weeks</i>	<i>Weeks</i>
20 and under 25	24.5	3.7	.9
30 " " 35	23.6	4.5	1.1
40 " " 45	25.5	6.2	1.6
50 " " 55	29.5	9.3	2.7
60 " " 65	39.8	15.8	6.3
70 " " 75	60.6	28.7	17.4
80 " " 85	85.1	37.9	32.3

It will be seen that while till the age of 50 has been passed there is no material increase in the proportion of members requiring sickness benefit in a year, the average duration of incapacity increases steadily as age advances. Permanent invalidity accounts for much of the weight of sickness at the higher ages but disregarding incapacity beyond a duration of 26 weeks (at which, for the purpose of illustration, a dividing line may be drawn) it is an arresting fact that at the important ages 60-65, where the workman in the normal case must still rely for his maintenance upon his labour, the Manchester Unity experience suggests that about 33% of the insured will have occasion to claim sickness benefit in the course of a year and this for an average period of seven weeks. Partial statistics of National Health Insurance afford some indication that in the early years after the war the percentage of claimants at these ages fell to about 25 (the average duration of seven weeks remaining stable), but there is reason to think that this improvement has not been fully maintained. Whichever fig-

ures be taken, it is evident that sickness insurance on a reliable basis is essential to the security of the wage-earner and those dependent upon him.

War-time Adaptations.—Interesting measures were taken by the friendly societies to adapt themselves to the conditions created by the World War. About 25% of the members went to the colours, and universal measures were taken to relieve them of contributions for the duration of their service. In some cases this was done by levying the civilian members; in other cases the relief was given at the cost of the general funds. The insurance of sickness benefit was unnecessary for serving men and was generally suspended, the contributions being correspondingly reduced. The strain on the civilian members of paying even the reduced contributions of their brethren in the services was, however, considerable, as indicated by the fact that the levies imposed on its members by the largest society reached a total of £475,000.

The death benefit insurances of friendly society members with the forces were maintained in full effect, and the resulting charge upon the societies is estimated to have been about £1,500,000. On this subject a special problem arose. The proportion of the membership of the orders on active service was unevenly distributed, and for the protection of the branches on which the claims fell heaviest, measures of "pooling" were devised. Cognate steps were taken by the creation of a temporary affiliation for this single purpose, of many of the small societies of the dividing type. These plans achieved their object and no case is known of the collapse of a friendly society under the financial stress of war claims.

BRITISH DOMINIONS AND OTHER COUNTRIES

As indicated earlier, the tide of emigration carried the friendly society system overseas at an early period in the history of the orders and a number of the pioneer branches which members of the two great bodies established in Australia, South Africa and New York in the decade 1840-50 are still in existence and apparently flourishing. The subsequent development of the connections of the orders beyond Great Britain has been considerable and branches are to be found in most parts of the Empire, in the United States and in other countries, especially of the American continent. The Manchester Unity of Oddfellows claims more than 1,500 lodges outside the British Isles, of which over 1,200 are in Australasia, and the Ancient Order of Foresters presents an even wider geographical distribution of its 900 courts abroad. It is, however, to be observed that the link between the parent bodies and their branches overseas is simply one of fraternal association. The jurisdiction of the central body of a British order can have no wider scope than that of the Friendly Societies Act of Great Britain, and although (somewhat exceptionally in British legislation) including the Isle of Man and the Channel Islands, it extends no further, the branches, so called, of the orders which are established elsewhere being subject in all respects to the laws of their own States, and possessing, independently of any association with societies in the mother country, such powers of self-government as those laws confer upon them.

Australia.—The friendly societies of Australia include a total membership of about 590,000, in over 5,800 societies and branches, with funds of £12,200,000. The benefits are of the same type as those of the British societies but are more substantial, the usual rate of full sick pay being 20s. or 21s. a week. Their sickness "experience" as actuarially analysed in the various States is distinctly more favourable than that of the British bodies, a feature which in some degree at least may be attributed to the differences between the economic conditions of old and new countries. The Australian legislation was based upon the British Act, but for a considerable period has departed widely from the principle of freedom from State control which underlies that Act, a policy of close official supervision and intervention having been definitely adopted. Each of the six States of Australia has its own registrar of friendly societies and in the three largest States registration is compulsory. The rates of contribution must receive official sanction, the valuations are made by State officers, either under compulsion (as in New South Wales) or under the inducement of a low scale of fees (Victoria), control

is exercised over the distribution of surpluses which valuations disclose, and where deficiency is discovered rectification of the position is, in effect, compulsory. In some of the States, also, the responsible government officer is vested with extensive powers of inspection and of examination of books. Where, as in South Australia, a measure of freedom in regard to finance is left with the societies, the official charged with their oversight is endowed with such powers of comment in his reports as in the long run must amount (as Parliament evidently contemplated) to a very effective form of government pressure. Another interesting development, and one which differentiates the system even more strikingly from its English parent, is that of the State subsidy. This is found in New South Wales where a "subvention" has been granted by Parliament to all societies that choose to apply for it, and, naturally, is almost universal. The subvention takes the form of a grant of part of the cost of benefits and is very substantial in the case of members of ages over 65 (women 60); the amount distributed under the heading of State subvention between 1908 (when the system came into operation) and 1925 is officially stated as over £500,000, the amount for the latest year being nearly £55,000. It does not appear, however, that public control is more complete in the State in which it is accompanied by a subsidy than it is elsewhere, and it is to be inferred, in consequence, that control has the support of public opinion as a matter of principle.

New Zealand.—In New Zealand the Friendly Societies Act is also administered by a registrar, whose last report shows a membership of over 98,000 with funds amounting to the remarkable relative total of three and a half million pounds. The number of separately registered bodies is over 1,000 including some 900 branches of which about 240 lodges of the Manchester Unity of Oddfellows represent the largest group. In this Dominion, also, the registrar is responsible for the valuations, and his report shows that in many cases there is a very considerable surplus of assets over liabilities.

Other Countries.—The description already given of the war-time adaptations of the British friendly societies requires reference to the corresponding action in the Dominions. It will be sufficient in this connection to mention the records as to the State of Victoria. The societies paid the contributions of enlisted members during their absence from Australia at a cost of about £152,000; sickness and mortality benefits of such members amounted to about £286,000, and certain societies received over £46,000 in reimbursement of benefits which had been reinsured with the Government under one of the acts included in the war legislation of the State.

The friendly societies of South Africa, although in some cases of considerable age, are not numerically strong. They have a membership of about 43,000, largely in bodies of the "order" type. Legislation in regard to these societies is not elaborate. So far as Canada is concerned, it is quite sufficient to say that, while the "order system" has been widely extended, its development has proceeded rather on ceremonial and "fraternal" lines, with certain endowment benefits, than in the direction followed by the British friendly society system.

Europe.—Institutions bearing a close analogy to the English friendly society are to be found in various European countries, although in no case has the system developed along quite the same lines in regard to legislation, or with the same attitude towards financial considerations. In France the system appears to be one of considerable antiquity and it was doubtless on the model of the societies existing among the Protestant communities of that country that the component societies of an interesting group established in East London by Huguenot refugees between 1687 and 1750 were founded. It would appear that, in general, greater importance is attached on the continent than in Great Britain to benefits "in kind," e.g., medical, hospital, dental treatment, etc., and especially to the inclusion of the dependants of the insured in the scope of these benefits.

France.—The number of societies of adults which submit returns is about 16,900 and the total of insured persons exceeds two and three-quarter millions. Revenue in 1924 was about 32f.

a head and expenditure on benefits about 22f. These items are nearly double the corresponding amounts of 1913, an increase doubtless due to the depreciation of the currency. The French societies fall into three categories, "independent" (corresponding with the English unregistered societies), "approved" and societies "recognized" as of public utility. The two latter groups are subject to a law of 1898 which in various respects is similar to the British Friendly Societies Act, but provides for a greater degree of State supervision, especially in the case of the recognized societies. There is no requirement of actuarial valuation except in the case of approved societies providing pensions in old age. Approved and recognized societies are entitled to Exchequer grants dependent on the nature of the benefits assured.

Belgium.—Sickness insurance is transacted by over 3,800 societies with 1,200,000 contributors, and invalidity insurance (covering, broadly, permanent sickness as distinct from temporary incapacity) by 135 societies, or funds, with a membership of 900,000.

The Belgian societies were originally confined to workers in particular trades but were later reorganized on a territorial basis. The societies are of two categories, "independent" and "approved." The latter must comply with certain regulations and are subject to some degree of control; they may be aided by grants from the central government or from the local authorities. Pensions in old age and death benefits in excess of 300f. may not be assured directly by approved societies.

In respect of these benefits the societies may act as agents of the State pension and assurance funds. The invalidity funds consist of federations of approved societies. In principle, but not entirely in practice, it would appear, the State grants are reserved for these federations. There are no statutory provisions as to valuation.

Denmark.—There appear to be about 1,650 societies; the membership is reported as about 1,500,000. The societies are self-governing, but receive grants-in-aid from public funds, through the administration of which the Government is able to exercise control and guidance.

The system is so fully developed that the rules of the societies make provision for the transference of members, presumably on migration, from one society to another. Expenditure on benefits in kind, largely incurred in respect of dependants, is between three and four times the sum spent on cash benefits.

Sweden.—There are about 1,300 societies with nearly 900,000 contributors. Expenditure on cash benefits predominates, little being spent on treatment benefits. Many societies are financially weak, and there is lack of co-operation between them.

Switzerland.—The number of societies is given as about 1,000 and membership 1,160,000, of whom, however, over 200,000 are children of school age. Expenditure is about equally divided between "cash" and "treatment" benefits. The "revenue" in 1925 averaged nearly 36f. a member and the payments in benefits over 30f.

THE UNITED STATES

In America the term "fraternal insurance" covers the activities of those bodies included in England under the head of "Friendly

Societies." The forms of organization cover a wide range, from societies like the Improved Order of Red Men, formed in 1771, to what might be called "intramural" benefit groups formed within industrial concerns like the New York Telephone Company. The Associated Employees of Bureaus of Buildings of the Borough of Brooklyn, organized in 1907, with 200 members, indicates the specialized grouping which such bodies may take. Again, organization may centre around racial interests, as in the case of the Bavarian National Association of North America, with the object of providing "mutual insurance to relieve the families of deceased members." Not all fraternal bodies embrace insurance activities, as for example the Freemasons. But all such bodies do provide machinery of some kind for the relief of distress: "homes" for the aged and orphans, hospitals, funds for the relief of indigence and employment services represent their more common activities.

The tendency among fraternal insurance organizations is toward standard commercial insurance. State laws have in some cases pointed the way, but the volume of business made such a change necessary. Originally no legal reserve was carried, members being assessed an amount required to cover current mortality. It was soon found that the average age of the member grew with the age of the order. In several instances societies were discontinued owing to the increased mortality; those that survived followed usually one of two plans: raised their premium rates, or else lowered the benefit schedules. The stronger bodies, too, were able to build up their membership in sufficient volume to relieve the pressure of the growing mortality hazard. Taking a lesson from this experience organizations began to adopt the reserve plan, with such modifications as adapt it to fraternal association needs, together with the use of more or less standard mortality tables. The adoption of these more scientific ideas, with the lower management costs and writing of business, as compared with these factors in commercial insurance, has placed fraternal bodies upon a sound economic basis.

The total business written by these groups in 1928 exceeded \$11,000,000,000, representing over 225 bodies. The societies are in a healthy condition, and new business is being written at the rate of approximately \$1,000,000,000 annually. Among the leading strictly "friendly societies" in point of members are the Fraternal Order of Eagles, with a membership of 520,000; Woodmen of the World, 500,000; Royal Arcanum, 123,500; Ancient Order of Odd-fellows; Knights of the Maccabees; Order of Owls; Fraternal Aid Union; American Order Sons of St. George; Ancient Order of Hibernians; National Union Assurance Society; Fraternal Aid Union.

FRIENDS, SOCIETY OF, the name adopted by a body of Christians, who, in law and general usage, are commonly called QUAKERS. Though small in number, the Society occupies a position of singular interest. To the student of ecclesiastical history it is remarkable as exhibiting a form of Christianity widely divergent from the prevalent types, being a religious fellowship which has no formulated creed demanding definite subscription, and no liturgy, priesthood or outward sacrament, and which gives to women an equal place with men in church organization. The student of English constitutional history will observe the success with which Friends have, by the mere force of passive resistance, obtained, from the legislature and the courts, indulgence for all their scruples and a legal recognition of their customs. In American history they occupy an important place because of the very prominent part which they played in the colonization of New Jersey and Pennsylvania.

The history of Quakerism in England may be divided into three periods:—(1) from the first preaching of George Fox in 1647 to the Toleration Act 1689; (2) from 1689 to the evangelical movement in 1835; (3) from 1835 to the present time.

George Fox: Period 1647-1689.—George Fox (1624-1691), the son of a weaver of Drayton-in-the-Clay (now called Fenny Drayton) in Leicestershire, was the founder of the Society. He

began his public ministry in 1647, but there is no evidence to show that he set out to form a separate religious body. Impressed by the formalism and deadness of contemporary Christianity (of which there is much evidence in the confessions of the Puritan writers themselves) he emphasized the importance of repentance and personal striving after the truth. When, however, his preaching attracted followers, a community began to be formed, and traces of organization and discipline may be noted in very early times. Fox and his fellow-preachers spoke whenever opportunity offered,—sometimes in churches (declining, for the most part, to occupy the pulpit), sometimes in barns, sometimes at market crosses. The insistence on an inward spiritual experience was the great contribution made by Friends to the religious life of the time, and to thousands it came as a new revelation. There is evidence to show that the arrangement for this “publishing of Truth” rested mainly with Fox, and that the expenses of it and of the foreign missions were borne out of a common fund. Margaret Fell (1614–1702), wife of Thomas Fell (1598–1658), vice-chancellor of the duchy of Lancaster, and afterwards of George Fox, opened her house, Swarthmore Hall near Ulverston, to these preachers and probably contributed largely to this fund.

Nearly all their distinctive views (*e.g.* their refusal to take oaths, their testimony against war, their disuse of a professional ministry, and their recognition of women's ministry) were being put forward in England, by various individuals or sects, in the strife which raged during the intense religious excitement of the middle of the 17th century; nevertheless, before the rise of the Quakers, these views were never found in conjunction as held by any one set of people: still less were they regarded as the outcome of any one central principle or belief. Robert Barclay's *Inner Life of the Religious Societies of the Commonwealth*, published in London in 1876, contains much curious and instructive information about these societies (including the Quakers).

Their insistence on the personal aspect of religious experience made it impossible for Friends to countenance the setting apart of any man or building for the purpose of divine worship to the exclusion of all others. The operation of the Spirit was in no way limited to time, or individual or place. The great stress which they laid upon this aspect of Christian truth caused them to be charged with unbelief in the current orthodox views as to the inspiration of the Scriptures, and the person and work of Christ, a charge which they always denied. Contrary to the Puritan teaching of the time, they insisted on the possibility, in this life, of complete victory over sin. Such teaching necessarily brought Fox and his friends into conflict with all the religious bodies of England, and they were continually engaged in strife with the Presbyterians, Independents, Baptists, Episcopalians and the wilder sectaries. Although there was little or no stress laid on either the joys or the terrors of a future life, the movement was not infrequently accompanied by most of those physical symptoms which usually go with vehement appeals to the conscience and emotions of a rude multitude. It was owing to these physical manifestations that the name “Quaker” was either first given or was regarded as appropriate when given for another reason (*see* Fox's *Journal* concerning Justice Bennet at Derby in 1650 and Barclay's *Apology*, Prop. II, § 8). The early Friends definitely asserted that those who did not know quaking and trembling were strangers to the experience of Moses, David and other saints.

The activity of the early Friends was not confined to the British Isles. Fox and others travelled in America and the West India islands, and others, again, in Holland, Germany, Austria, Hungary, and Italy. Such efforts were the outcome of individual enthusiasm. Much later (*see* reference below to *service in foreign lands*) the work was revived and organized.

It was only gradually that the Quaker community clothed itself with an organization. The beginning of this appears to be due to William Dewsbury (1621–1688) and George Fox; it was not until 1668 that a complete system of church organization was definitely established, by the introduction of Fox's rules for the management of meetings. An ordered system and discipline was naturally viewed with some suspicion by people taught to believe that the inward light of each man was the only true guide for his conduct; there was determined opposition, and a number of secessions took place.

Persecutions.—During the whole time between their rise and the passing of the Toleration Act in 1689 the Quakers were the subject of almost continuous persecution, which they endured with extraordinary patience and fortitude. They insisted on the duty of meeting openly in time of persecution, declining to hold secret assemblies for worship as other Nonconformists were doing. They were liable not only to the dangers in which all dissenters from the established church were involved, but to special misunderstanding, slander, and persecution because of their refusal to take an oath. After the Restoration, one of the most common causes of imprisonment was the practice adopted by judges and magistrates of tendering to Friends (particularly when no other charge could be proved against them) the oaths of supremacy and allegiance. The Toleration Act of 1689 put an end to the persecution of Quakers (along with other dissenters) for non-attendance at church. But for many years after this they were liable to imprisonment for non-payment of tithes, and, together with other Dissenters, they remained under various civil disabilities, the gradual removal of which is part of the general history of England.

Period 1689–1835.—From the beginning of the 18th century the zeal of the Quaker body abated. Although many “general” and other meetings were held in different parts of the country for the purpose of setting forth Quakerism, the notion that the whole Christian church would be absorbed in it, and that the Quakers were, in fact, the church, gave place to the conception that they were “a peculiar people” to whom, more than to others, had been given an understanding of the will of God. The Quakerism of this period was largely of a traditional kind; it dwelt with increasing emphasis on the peculiarities of its dress and language; it rested much upon discipline, which developed and hardened into rigorous forms; and the correction or exclusion of its members occupied more attention than did the winning of converts.

Excluded from political and municipal life by the laws which required either the taking of an oath or joining in the Lord's Supper according to the rites of the Established Church, excluding themselves not only from the frivolous pursuits of pleasure, but from music and art in general, attaining no high average level of literary culture (though producing some men of eminence in science and medicine), the Quakers occupied themselves mainly with trade, the business of their Society, the calls of philanthropy, and the foundation of schools.

Period From 1835.—During the 18th century the doctrine of the Inward Light acquired such exclusive prominence as to bring about a tendency to disparage, or, at least, to neglect, the written word (the Scriptures) as being “outward” and non-essential. In the early part of the 19th century an American Friend, Elias Hicks, pressed this doctrine to its furthest limits, and, in doing so, he laid stress on “Christ within” in such a way as practically to take little account of the person and work of the “outward,” *i.e.*, the historic Christ. The result was a separation of the Society in America into two divisions which persist to the present day (*see* section below, United States). This led to a counter-movement in England, known as the Beacon Controversy, from the name of a warning publication issued by Isaac Crewdson of Manchester in 1835, advocating views of a pronounced “evangelical” type. Much controversy ensued, and a certain number of Friends departed from the parent stock, most of them joining one or other of the orthodox evangelical churches. They left behind them, however, many influential members, who may be described as a middle party, and who strove to give a more “evangelical” tone to Quaker doctrine. Joseph John Gurney of Norwich, a brother of Elizabeth Fry, by means of his high social position and his various writings (some published before 1835), was the most prominent actor in this movement, the effects of which were felt throughout the 19th century. Other causes have been at work modifying the Quaker society. The repeal of the Test Act, the admission of Quakers to Parliament in consequence of their being allowed to affirm instead of taking the oath (1833, when Joseph Pease was elected for South Durham), the establishment of the University of London, and, more recently, the opening of the universities of Oxford and Cambridge to Nonconformists, have all had their effect upon the body. It has abandoned its peculiarities of dress and language, as well as its hostility to music and

art, and it has cultivated a wider taste in literature. In fact, the number of men, either Quakers or of Quaker origin and proclivities, who occupy positions of influence in English life is large in proportion to the small numbers of the body with which they are connected.

Public Worship.—There is not now the sharp distinction which formerly existed between Friends and other non-sacerdotal evangelical bodies; these have, in theory at least, largely accepted the spiritual message of Quakerism. By their special insistence on the fact of immediate communion between God and man, Friends have been led into those views and practices which still mark them off from their fellow-Christians. It is rather in their emphasis on this thought of Divine communion, in their insistence on its reasonable consequences (as it seems to them), that Friends constitute a separate community. The appointment of one man to preach, to the exclusion of others, is regarded as a limitation of the work of the Spirit and an undue concentration of that responsibility which ought to be shared by a wider circle. For the same reason they refuse to occupy the time of worship with an arranged programme of vocal service; they meet in silence, desiring that the service of the meeting shall depend on spiritual guidance. Thus it is left to any man or woman to offer vocal prayer, to read the Scriptures, or to utter such exhortation or teaching as may seem to be called for. Of late years, in certain of their meetings on Sunday evening, it has become customary for part of the time to be occupied with set addresses for the purpose of instructing the members of the congregation, or of conveying the Quaker message to others who may be present, all their meetings for worship being freely open to the public. Occasionally hymns are sung, very rarely as part of any arrangement, but almost always upon the request of some individual for a particular hymn appropriate to the need of the congregation. The periods of silence are regarded as times of worship equally with those occupied with vocal service, inasmuch as Friends hold that robustness of spiritual life is best promoted by earnest striving on the part of each one to know the will of God for himself, and to be drawn into Christian fellowship with the other worshippers. The idea which ought to underlie a Friends' meeting is thus set forth by Robert Barclay: "When I came into the silent assemblies of God's people, I felt a secret power among them, which touched my heart, and as I gave way unto it, I found the evil weakening in me and the good raised up" (*Apology*, xi. 7). In many places Friends have felt the need of bringing spiritual help to those who are unable to profit by the somewhat severe discipline of their ordinary manner of worship. To meet this need they hold (chiefly on Sunday evenings) meetings which are not professedly "Friends' meetings for worship," but which are services conducted on lines similar to those of other religious bodies, with, in some cases, a portion of time set apart for silent worship, and freedom for any one of the congregation who wishes to, to utter words of exhortation or prayer.

From the beginning Friends have not practised the outward ordinances of Baptism and the Lord's Supper, even in a non-sacerdotal spirit. They attach, however, supreme value to the realities of which the observances are reminders or types. Their testimony is not *primarily* against these outward observances; their disuse of them is due to a sense of the danger of substituting the shadow for the reality. They hold that every event in life, important or unimportant, may be turned into a sacrament, a means of grace.

When the ministry of any man or woman has been found to be helpful to the congregation, the Monthly Meeting (*see* below) may after solemn consideration, record the fact that it believes the individual to have a divine call to the ministry, and that it encourages him or her to be faithful to the gift. Such ministers are said to be "acknowledged" or "recorded"; they are emphatically *not* appointed to preach, and the fact of their acknowledgment is not regarded as conferring any special status upon them. Indeed the practice of recording Friends as ministers has ceased in most Monthly Meetings, from some concern lest it should hinder the free course of the Gospel ministry. The various Monthly Meetings appoint Elders, or some body of Friends, to give advice of encouragement or restraint as may be needed, and, generally, to take the ministry under their care. With regard

to the ministry of women, Friends hold that there is no evidence that the gifts of prophecy and teaching are confined to one sex.

Doctrine.—With regard to the fundamental doctrines of Christianity, the belief of the Society of Friends does not essentially differ from that of other Christian bodies. At the same time their avoidance of exact definition embodied in a rigid creed, together with their disuse of the outward ordinances of Baptism and the Supper, has laid them open to considerable misunderstanding. As will have been seen, they hold an exalted view of the divinity and work of Christ as the Word become flesh and the Saviour of the world; but they have always shrunk from rigid Trinitarian *definitions*. They believe that the same Spirit who gave forth the Scriptures still guides men to a right understanding of them. "You profess the Holy Scriptures: but what do you witness and experience? What interest have you in them? Can you set to your seal that they are true by the work of the same spirit in you that gave them forth in the holy ancients?" (William Penn, *A Summons or Call to Christendom*). This doctrine has enabled Friends to face fearlessly the conclusions of modern criticism, and has contributed to a largely increased interest in Bible study. During the past few years a new movement has been started in the shape of lecture schools, lasting for longer or shorter periods, for the purpose of studying Biblical, ecclesiastical and social subjects. In 1903 there was established at Woodbrooke, an estate at Selly Oak on the outskirts of Birmingham, a permanent settlement for men and women, for the study of these questions on modern lines. The outward beginning of this movement was the Manchester Conference of 1895, a turning-point in Quaker history. Speaking generally, it may be noted that the Society includes various shades of opinion, from that known as "evangelical," with a certain hesitation in receiving modern thought, to the more "advanced" position which finds greater freedom to consider and adopt new suggestions of scientific, religious or other thinkers. The differences, however, are seldom pressed, and rarely become acute. Apart from points of doctrine which can be more or less definitely stated (not always with unanimity) Quakerism is an *atmosphere*, a manner of life, a method of approaching questions, a habit and attitude of mind. They have always held that war is contrary to the spirit and precepts of the Gospel; and that the attempts to enforce truth-speaking by means of an oath, in courts of law and elsewhere, tend to create a double standard of truth. "When the Quakers entered into history, it was indeed high time, for the worst of Puritanism was that in so many of its phases it dropped out the Sermon on the Mount. Quakerism has undergone many developments, but in all of them it has been the most devout of all endeavours to turn Christianity into the religion of Christ" (John Morley, *Oliver Cromwell*, p. 429).

Periodic "Meetings."—The present organization of the Quaker church is essentially democratic; every person born of Quaker parents is a member, and, together with those who have been admitted on their own request, is entitled to take part in the business assemblies of any meeting of which he or she is a member. The Society is organized as a series of subordinated meetings which recall to the mind the Presbyterian model. The "Preparative Meeting" usually consists of a single congregation; next in order comes the "Monthly Meeting," the executive body, usually embracing several Preparative Meetings called together, as its name indicates, monthly (in some cases less often); then the "Quarterly Meeting," embracing several Monthly Meetings; and lastly the "Yearly Meeting," embracing the whole of Great Britain (but not Ireland). After several yearly meetings had been held in different places at irregular intervals as need arose, the first of an uninterrupted series met in January, 1669. From that date until 1904 it was held in London. In 1905 it met in Leeds, and in 1908 in Birmingham. Its official title is "London Yearly Meeting." It is the legislative body of Friends in Great Britain. It considers questions of policy, and some of its sittings are conferences for the consideration of reports on religious, philanthropic, educational and social work which is carried on. Its sessions occupy a week in May of each year. Representatives are sent from each inferior to each superior meeting, but they have no precedence over others, and all Friends may attend any meeting and take part in any of which they are members. Formerly the system was double, the

men and women meeting separately for their own appointed business. Of late years the meetings have been, for the most part, held jointly, with equal liberty for all men and women to state their opinions, and to serve on all committees and other appointments. The mode of conducting these meetings is noteworthy. A secretary or "clerk," as he is called, acts as chairman or president; there are no formal resolutions; and there is no voting or applause. The clerk ascertains what he considers to be the judgment of the assembly, and records it in a minute. The permanent standing committee of the Society is known as the "Meeting for Sufferings" (established in 1675), which took its rise in the days when the persecution of many Friends demanded the Christian care and material help of those who were able to give it. It is composed of representatives (men and women) sent by the quarterly meetings, and of all recorded Ministers and Elders. Its work is not confined to the interests of Friends; it is sensitive to the call of oppression and distress (e.g., a famine) in all parts of the world, it frequently raises large sums of money to alleviate the same, and intervenes, often successfully, and mostly without publicity, with those in authority who have the power and the will to bring about an amelioration.

The offices known to the Quaker body are: (1) that of *minister*; (2) of *elder*, whose duty it is "to encourage and help young ministers, and advise others as they, in the wisdom of God, see occasion"; (3) of *overseer*, to whom is especially entrusted that duty of Christian care for and interest in one another which Quakers recognize as obligatory in all the members of a church. In most Monthly Meetings the care of the poor is committed to the overseers who hold, from time to time, meetings separate from the general assemblies of the members.

A genuine vein of *philanthropy* has always existed in the Quaker body. In nothing has this been more conspicuous than in the matter of slavery. George Fox and William Penn laboured to secure the religious teaching of slaves. As early as 1676 the assembly of Barbados passed "An Act to prevent the people called Quakers from bringing negroes to their meetings." On the attitude of Friends in America toward slavery, see PENN, WILLIAM. It was in 1783 that the first petition to the House of Commons for the abolition of the slave trade and slavery went up from the Quakers; and in the long agitation which ensued the Society took a prominent part. In 1798 Joseph Lancaster, himself a Friend, opened his first school for the education of the poor; and the cause of unsectarian religious education found in the Quakers steady support. They also took an active part in Sir Samuel Romilly's efforts to ameliorate the penal code, in prison reform, with which the name of Elizabeth Fry (a Friend) is especially connected, and in the efforts to ameliorate the condition of lunatics in England (the Friends' Retreat at York, founded in 1792, was the earliest example in England of kindly treatment of the insane). It is noteworthy that Quaker efforts for the education of the poor and philanthropy in general, though they have always been Christian in character, have not been undertaken primarily for the purpose of bringing proselytes within the body, and have not done so to any great extent.

By means of the *Adult Schools*, Friends have been able to exercise a religious influence beyond the borders of their own Society. The movement began in Birmingham in 1845, in an attempt to help the loungers at street corners; reading and writing were the chief inducements offered. The schools are unsectarian in character and mainly democratic in government; the aim is to draw out what is best in men and to induce them to act for the help of their fellows. Whilst the work is essentially religious in character, a well-equipped school also caters for the social, intellectual and physical parts of a man's nature. Bible teaching is the central part of the school session: the lessons are mainly concerned with life's practical problems. The spirit of brotherliness which prevails is largely the secret of the success of the movement, and which is no longer exclusively under the control of Friends, is rapidly becoming one of the chief means of bringing about a religious fellowship among a class which the organized churches have largely failed to reach. The effect of the work upon the Society itself may be summarized thus: some addition to membership; the creation of a sphere of usefulness for the younger and more active members; and a general stirring of interest in social questions

wherever the work has been developed.

A strong interest in *Sunday schools* for children preceded the Adult School movement. The earliest schools which are still existing were formed at Bristol, for boys in 1810 and for girls in the following year. Several isolated efforts were made earlier than this; it is evident that there was a school at Lothersdale near Skipton in 1800 "for the preservation of the youth of both sexes, and for their instruction in useful learning"; and another at Nottingham. Even earlier still were the Sunday and day schools in Rossendale, Lancashire, dating from 1793. A "provisional committee" of members of the Society of Friends was formed in 1865 to deal with offers of *service in foreign lands*; this work is now organized by the Friends' Foreign Mission Committee, and much information respecting its development is given by H. T. Hodgkin in a volume of essays, *Friends beyond Seas*, issued in 1916. The central offices for the Friends for Great Britain are at the Friends' House, Euston Road, London, N.W. 1; and for Ireland, 6, Eustace Street, Dublin.

BIBLIOGRAPHY.—The following list, which is far from exhaustive, is based on a Bibliography prepared by the Literature Committee of the Society of Friends, Friends' House, London, N.W. 1, from whom further information may be obtained.

Harvey, *Silence and Worship* (1923); A. Kemp Brown, *Sacraments* (1924); Herbert G. Wood, *Quakerism and the Future of the Church* (1920); Carl Heath, *Religion and Public Life* (1922); G. K. Hibbert, *The Inner Light and Modern Thought* (1924); A. N. Brayshaw, *The Things that are Before Us* (1926). On the "church discipline" of the Society, see *Christian Life, Faith and Thought* (1922); *Christian Practice* (1925), and *Church Government* (1917; under revision).

The above-named references are almost limited to books of comparatively recent date, but these give many references to earlier sources of information. Mention must however be made here of the famous classical work on Christian doctrine from the Quaker point of view, *Apology for the True Christian Divinity*, by Robert Barclay the elder (in Latin, 1676; in English, 1678, and many later editions to 1886; in Dutch, 1683; in German, 1684; in French, 1702; in Spanish, 1710; in Arabic, in part, 1881); and of Sewel's *History of the Rise, Increase, and Progress of the People Called Quakers* (in Dutch, 1717; in English, 1722, and later editions; in German, 1742). An extensive and important collection of the literature of the subject, of great value to those interested, is contained in the Reference Library at the Friends' House, London. (X.)

THE UNITED STATES

The Colonial Period.—Between 1656 and 1658 Quaker missionaries arrived in Massachusetts Bay, Rhode Island, New Amsterdam, Maryland and Virginia, where they made converts and established meetings. The visit of George Fox to America in 1672 gave fresh impetus to the movement. By 1700 the Friends had acquired New Jersey and Delaware, founded Pennsylvania, were politically powerful in Rhode Island, North Carolina and Maryland, had organized meetings in all the Colonies except Con-

necicut and South Carolina and had established six yearly meetings.

Friends were persecuted in all the non-Quaker Colonies except Rhode Island. In New England and Virginia this was primarily due to their religious nonconformity. Four Friends were hanged on Boston Common in 1661 and one died in Virginia as the result of flogging and subsequent neglect in prison. Their refusal to pay tithes, take oaths or render military service brought on them fines and civil disabilities in most of the Colonies. Pennsylvania Colony (*q.v.*) was founded by William Penn in 1682 as a "holy experiment" in the application of Quaker ideals to the State, but the Friends were not able to give their principles a full expression in Pennsylvania, because the Crown imposed limitations on the Colony's policy. The later settlers were hostile to the Quaker ideals, and at the outbreak of the French and Indian War the Friends voluntarily gave up control of the Government. They used their influence to keep peace with the Indians and to protect them from fraud and debauchery. They worked for popular education, peace, temperance and democracy and championed effectively the cause of religious liberty. Chiefly through the patient work of John Woolman the Society had cleared itself of slavery, without a war or division, before 1800.

By the end of the colonial period Friends had retired from public life generally, and during the next century, chiefly on account of the neglect of higher education and the prevailing quietism, the society declined in numbers and in influence. But they pioneered in prison reform, the care of the insane, and the anti-slavery movement.

Migrations.—Between 1725 and 1775 there were considerable migrations of the Quaker population from New England, Pennsylvania and New Jersey southward into North and South Carolina. Toward the end of the 18th century large numbers of southern Friends, finding it difficult to live in a slave-holding society after freeing their own slaves, emigrated to the free territories of Ohio and Indiana.

Divisions.—In 1827-28 came the great disruption of the society, due to the clashing of new forces which made themselves felt after the Revolutionary War. Elias Hicks (*q.v.*), alarmed at the intolerant spirit and new methods of the newly felt Evangelical influences, became the champion of the older quietism. In the effort to rationalize and defend the sufficiency of the doctrine of the Inner Light, he built a theology of his own. The opposition of the city elders to his views made him the champion of the democratic opposition to their authority, particularly on the part of the country Friends. The result was a division in five of the yearly meetings. The resulting groups, usually, but not officially, called Orthodox and Liberal (Hicksite), were about equal in numbers, but since the westward migrations were mainly from the undivided yearly meetings of Virginia and North Carolina, which sided with the Orthodox, the latter have since greatly outstripped the Liberals in numbers.

The Liberal yearly meetings never adopted the theology of Elias Hicks, their position being that theology is not the essence of Christianity but a matter of individual opinion. There are seven Liberal yearly meetings with a total membership (1927) of 16,576, of whom 10,425 belong to the Philadelphia Yearly Meeting and 400 are residents of Canada. In 1902 they united in the Friends General Conference, which meets biennially but has no legislative authority. Through standing committees it carries on First-day schools, philanthropic labour, education, the advancement of Friends' principles, young Friends and foreign service. The central offices are in Philadelphia, where they publish *The Friends Intelligencer*.

Among the Orthodox Friends the Evangelical tendencies developed most readily in the new western yearly meetings, and they were powerfully stimulated by the visit of Joseph John Gurney, a prominent English Friend, in 1836. He laid emphasis on the authority of the Scriptures, favoured Bible study and Bible schools and gave an impetus to higher education. The opposition of John Wilbur of New England to his work led finally to small separations in New England and Ohio. The resulting groups are called unofficially, Orthodox (Gurneyite or Progressive) and Con-

servative (Wilburite). After the Civil War a great revival movement began among Progressive Friends. The leaders introduced innovations in methods and in theological expression. In consequence, there were small conservative separations in Iowa, Kansas, Western, and Canada yearly meetings (1877-84) and later in North Carolina (1905). These seven Conservative yearly meetings "recognize" one another and have an estimated membership of 2,600 of whom about 1,000 belong to the Ohio Yearly Meeting.

Reorganization.—Among the Progressive (Orthodox, Gurneyite) Friends the Evangelical emphasis on the outward authority of the Bible and other influences produced a movement toward the practice of water baptism, especially in the Ohio Yearly Meeting. To consider this tendency a conference of the Orthodox Yearly Meetings in America and Great Britain was held at Richmond, Ind., in 1887. It issued a "Declaration of Faith" which reaffirmed the historic position of the society in regard to the outward ordinances and restated its doctrinal position in mildly evangelical terms. The Great Revival occasioned marked changes in the Progressive yearly meetings. The peculiarities of dress and speech have been abandoned almost entirely. Music was introduced into the public worship, which now conforms closely to the general type of "low church" Protestantism, without, however, using a fixed liturgy or abandoning the theory of Spirit-led worship. Pastors are generally employed to preach.

In 1902 a uniform discipline was adopted which set up a Five Years Meeting with legislative powers, to which all the Orthodox Yearly Meetings belong except Ohio, Oregon and Philadelphia. The work of this body is carried on through the following boards: finance, foreign missions, home missions, peace association, prohibition and public morals, religious education, publication, education and young Friends' activities. It is also represented on the American Friends Service committee. The executive committee is composed of the chairmen or of representatives appointed by the boards. The central offices are in Richmond, Ind., where the official organ, *The American Friend*, is published. The Five Years Meeting is a member of the Federal Council of the Churches of Christ in America. The total membership (1927) of the Five Years Meeting was 80,663.

Together with the Oregon Yearly Meeting the Five Years Meeting had (1926) mission stations in Mexico, Jamaica, Cuba, Palestine, east Africa and west China with 43 missionaries, 375 native helpers and 6,295 members. Ohio has stations in China and India; Philadelphia in Japan, and California in Central America and Alaska.

Education and Philanthropy.—The Quaker pioneers usually established elementary schools and academies in their communities, which had a marked influence in shaping the public school systems in North Carolina, Ohio, Indiana and Kansas. In the eastern yearly meetings Friends of both the larger branches still maintain both elementary and high schools. There are several Quaker colleges.

In 1869, at the request of President Grant, Friends of both branches began to take charge of many of the Indian agencies. This work was finished in 1885, but missions and schools for the Indians are still maintained in Oklahoma and a school at Tunesasa, N.Y., is under the care of the Philadelphia Yearly Meeting (Orthodox). Friends were active in the work of the Freedmen's Bureau after the Civil War and have contributed much to negro education. In 1917 Friends of all branches united in forming the American Friends Service Committee, with headquarters in Philadelphia, for relief and reconstruction work in the war-torn world. In co-operation with British Friends it helped in the restoration of the devastated districts in northern France, Poland and Serbia; provided hospitals in France and Russia and orphanage-schools for the children of war victims in Serbia, Poland and Syria. It co-operated with the American Relief Administration in feeding the Russian peasants in the Volga basin and supervised the feeding of two million underfed German children. It assisted the Greek refugees, the earthquake victims in Japan and the families of starving miners in West Virginia. It maintains, in conjunction with British Friends, goodwill centres in Paris, Geneva, Berlin, Vienna, Warsaw, Moscow and Salonika to promote international

understanding and co-operation and to aid oppressed minorities in Europe. In recent years there has been a great increase in co-operation and unity between the different branches of Friends. In 1920 they joined in the All-Friends conference held in London to review the Quaker peace testimony in the light of the experiences of the World War. A joint young Friends' conference is held each summer in the Middle West. (E. R.L.)

FRIES, ELIAS MAGNUS (1794-1878), Swedish botanist, was born at Femsjö, Småland, on Aug. 15, 1794. He studied at Lund, where in 1814 he was elected *Dozent* of botany and in 1824 professor. In 1834 he became professor of practical economy at Uppsala, and in 1851 professor of botany. He died on Feb. 8, 1878.

Fries was an authority on the Cryptogamia. He wrote *Novitiae florae Suecicae* (1814); *Flora Hollandica* (1817); *Systema mycologicum* (1821-29) and many other works.

FRIES, JAKOB FRIEDRICH (1773-1843), German philosopher, was born at Barby, Saxony, on Aug. 23, 1773. Having studied at Niesky, Leipzig and Jena, in 1806 he became professor of philosophy and elementary mathematics at Heidelberg. His philosophical position with regard to his contemporaries is set forth in *Reinhold, Fichte und Schelling* (1803; reprinted 1824 as *Polemische Schriften*), *System der Philosophie als evidente Wissenschaft* (1804) and *Wissen, Glaube und Ahnung* (1805). His important *Neue oder anthropologische Kritik der Vernunft* (3 vols. 1807) attempted to give a new foundation of psychological analysis to the critical theory of Kant. In 1811 appeared his *System der Logik* and five years later, he accepted the chair of theoretical philosophy at Jena. In politics he was a strong Liberal and Unionist, and did much to inspire the organization of the *Burschenschaft*. In 1816 he published *Vom deutschen Bund und deutscher Staatsverfassung*, and his influence gave a powerful impetus to the agitation which in 1819 led to the issue of the Carlsbad Decrees by the representatives of the German governments. He was condemned by the Mainz Commission and the grand-duke of Weimar was compelled to deprive him of his professorship. In 1824 he was recalled to Jena as professor of mathematics and physics, and in 1838, the right of lecturing on philosophy was restored to him. He died at Jena on Aug. 10, 1843.

The most important works of his Jena professorate are the *Handbuch der praktischen Philosophie* (1817-32), *Handbuch der psychischen Anthropologie* (1820), *Die mathematische Naturphilosophie* (1822), *System der Metaphysik* (1824), *Die Geschichte der Philosophie* (1837-40). In philosophy Fries attempted to reconcile the criticism of Kant and Jacobi's philosophy of belief.

See E. L. Henke, *J. F. Fries* (1867); C. Grapengiesser, *J. F. Fries, ein Gedenkblatt und Kant's "Kritik der Vernunft" und deren Fortbildung durch J. F. Fries* (1882); H. Strasosky, *J. F. Fries als Kritiker der Kantischen Erkenntnistheorie* (1891); G. Weiss, *Fries' Lehre v. der Ahnung in Ästhetik, Religion u. Ethik* (Göttingen, 1912); G. Hessenberg, *Abhandlungen der Fries'schen Schule*. 4 vols., 1906.

FRIESLAND or VRIESLAND, a province of Holland, bounded south-west, west and north by the Zuider Zee and the North sea, east by Groningen and Drente, and south-east by Overijssel. It also includes the islands of Ameland and Schiermonnikoog (see **FRISIAN ISLANDS**). Area, 1,248 sq.m.; pop. (1926), 401,388. The soil of Friesland falls naturally into three divisions consisting of sandy clay in the north and north-west, of a median belt of low-fen between the south-west and north-east, and of a comparatively small area of high-fen in the south-east. The clay and low-fen furnish good meadow-land for the world-famed breed of Frisian cattle, noted especially for butter production. Horse-breeding is also practised. In the high-fen district peat-digging is still important but cultivation remains difficult. Droughts are specially serious in the absence of flowing rivers, and this difficulty interferes seriously with milk production at times. The water system is entirely canalized, and there is a vast network of canals, waterways and lakes in the whole north and west. The principal lakes are Tjeuke Meer, Sloter Meer, De Fluessen and Sneker Meer. The tidal range being small on the north coast, the Waterstaat (see **NETHERLANDS**) provides for

the largest removal of superfluous surface water into the Lauwers-zee. The drainage problem has always been a peculiarly difficult one.

The population of the province is evenly distributed in small villages. The principal centres are Leeuwarden, Sneek, Bolsward, Franeker, Dokkum, and Heerenveen. With the exception of Franeker and Heerenveen all these towns originally arose on the inlet which has become the Zuider Zee. The seaport towns are more or less decayed; they include Stavoren, Hindeloopen, Workum, Harlingen and Makkum; the increased draught of modern vessels is largely responsible for this.

For history see **FRISIANS**.

FRIESY, EMILE OTHON (1879-) French painter, born at Le Havre. He was a pupil at the École des Beaux-Arts and of L. Bonnat, but came under the influence of Cézanne and Matisse. He is one of the leaders of the French Post-Impressionism. His paintings of landscapes, with views of harbours and villages in Normandy are summary stylistic arrangements, full of life and vigour.

FRIEZE, in architecture, the middle of the three divisions of a classic entablature above the architrave and below the cornice (see ORDER); also any long, narrow, horizontal panel or band used for decorative purposes. The frieze probably developed from the necessity of carrying the cross beams of a ceiling upon the tops of the architrave beams, but below the cornice eaves; the stone triglyphs (q.v.) of the Doric frieze are reminiscent of the beam ends of a primitive wood construction. In the Ionic, Corinthian and Composite orders the frieze has no architectural membering, but is frequently richly ornamented. In Greek work this ornamentation consists of figures, as in the treasury of the Cnidians at Delphi (early 5th century B.C.) or the monument of Lysicrates at Athens (310 B.C.); in Roman and Renaissance work of anthemions, acanthus foliage or garlands, as in the temple of Vesta at Tivoli (c. 80 B.C.) and the Maison Carrée at Nîmes (early 1st century A.D.). In late Roman work and many Renaissance examples the profile of the frieze is a convex curve, and is known as a *pulvinated* frieze.

The most famous of all decorative friezes is undoubtedly that carved on the top of the outer wall of the cella of the Parthenon, just under the ceiling of the portico. This frieze, 40 in. high and 525 ft. long, bearing a representation of the ritual procession of the Pan-athenaic festival, is characterized by superb rhythmic design and faultless execution; sculptured probably from the designs and under the supervision of Pheidias it is a perfect expression of Greek sculpture of the middle of the 5th century B.C. and one of the most praise-worthy examples of architectural sculpture of all time.

FRIGATE, originally a small swift, undecked vessel, propelled by oars or sails, in use on the Mediterranean. The word is thus used of the large open boats, without guns, used for war purposes by the Portuguese in the East Indies during the 16th and 17th centuries. The French first applied the term to a particular type of ships of war during the second quarter of the 18th century. The Seven Years' War (1756-1763) marked the definite adoption of

FROM "THE KING'S SHIPS," BY COURTESY OF COMMANDER H. S. LECKY, R.N.

THREE-MASTED FRIGATE, THE "CRUISER" OF SAILING-SHIP DAYS. Adopted as a standard class of vessel during the Seven Years War (1756-1763), the frigate was three-masted, full-rigged, and carried from 30 to 50 guns.

the "frigate" as a standard class of vessel, coming next to ships of the line, and used for cruising and scouting purposes. They were three-masted, fully rigged, fast vessels, with the main armament carried on a single deck, and additional guns on the poop and fore-castle. The guns varied from 24 to 50, but between 30 and 40 guns was the usual number carried. "Frigate" continued to be used as the name for this type of ship, even after the introduction of steam and of ironclad vessels, but the class is now represented by the cruiser.

FRIGATE-BIRD, the name given by British sailors to a large sea-bird (*Fregata aquila*) and its ally *F. minor*. They form the family *Fregatidae*, allied to the pelicans (q.v.). The species differ only in size and geographical distribution, *F. minor* being restricted to the Indian Ocean, while *F. aquila* is found in the

tropics all round the world. They obtain their food largely by robbing other birds, especially the boobies, of their prey and their speed and dexterity upon the wing are astonishing. Usually solitary, the birds breed in large companies on mangrove trees; a single white egg is laid and the nestlings are clad in white down. In the adult, the plumage is dark brown above, and in the males, below also, with a scarlet pouch which is inflated to a large size in courtship; the females are white below.

FRIGG, the wife of the god Odin (Woden) in northern mythology, was known also to other Teutonic peoples (O.H. Ger. *Friia*, Langobardic *Frea*); in English her name still survives in Friday (O.E. *Frigeðæg*). (See TEUTONIC PEOPLES, *ad fin.*)

FRIGIDARIUM, the cold room, often containing a swimming pool, of the ancient Roman baths (see BATHS).

FRIIS, JOHAN (1494-1570), Danish statesman, was born in 1494, and was educated at Odense and at Copenhagen, completing his studies abroad. He was one of the first of the magnates to adhere to the Reformation and its promoter King Frederick I. (1523-1533). Friis, who made a fortune out of the church lands, succeeded Claus Gjoosden as imperial chancellor in 1532, and held that dignity till his death. He promoted the election of Christian III. (1533-1559), but in the course of the "Count's War" he was taken prisoner by Count Christopher, the Catholic candidate for the throne, and forced to do him homage. He made his escape to Germany, and then rejoined Christian III. He was one of the plenipotentiaries who concluded peace with Lübeck at the congress of Hamburg, and subsequently took part in the national reconstruction necessitated by the Reformation, acting as mediator between the Danish and the German parties who were contesting for supremacy during the earlier years of Christian III. Friis was a patron of learning. He encouraged Hans Svaning to complete Saxo's history of Denmark, and Anders Vedel to translate Saxo into Danish. Under King Frederick II. (1559-1588), Friis was well-nigh omnipotent. He was largely responsible for the Scandinavian Seven Years' War (1562-70), which did so much to exacerbate the relations between Denmark and Sweden. Friis died on Dec. 5, 1570, a few days before the peace of Stettin.

FRILLED LIZARD (*Chlamydosaurus kingi*), a tropical Australian lizard, remarkable for the large erectile frill round the neck and for its bipedal mode of progression. It is arboreal and insectivorous. (See LIZARD.)

FRIMLEY, an urban district in the Farnham parliamentary division of Surrey, England, 3½ m. W.S.W. from London by the Southern railway, and 1 m. N. of Farnborough in Hampshire. Pop. of urban district (1931) 16,472. Its healthy climate, its position in the sandy heath-district of the west of Surrey, and its proximity to Aldershot Camp have contributed to its growth as a residential township. To the east the moorland rises in the picturesque elevation of Chobham Ridges; and 3 m. N.E. is Bagshot, another village which has grown into a residential district, on the heath of the same name extending into Berkshire. Bisley Camp, to which in 1890 the meetings of the National Rifle association were removed from Wimbledon, is 4 m. east. Coniferous trees and rhododendrons are characteristic products of the soil, and large nurseries are devoted to their cultivation.

FRIMONT, JOHANN MARIA PHILIPP, COUNT OF PALOTA, PRINCE OF ANTRODOCCO (1759-1831), Austrian general, entered the Austrian cavalry as a trooper in 1776, won his commission in the War of the Bavarian Succession, and took part in the Turkish wars and in the early campaigns against the French Revolutionary armies in Italy. He served in the Russian campaign of 1812, and in the campaigns of 1813-14. In 1815 he was commander-in-chief of the Austrians in Italy, and his army penetrated France as far as Lyons (July 11). With the army of occupation he remained in France for some years, and in 1819 he commanded at Venice. In 1821 he led the Austrian army which was employed against the Neapolitan rebels, and received from King Ferdinand of Naples the title of prince of Antrodocco and a sum of money, and from his own master the rank of general of cavalry. After this he commanded in North Italy, and repressed many out-

breaks of the Italian patriots. He became president of the Aulic council in 1831, but died a few months later.

FRINGILLIDAE: see GROSBEAK; FINCH; BUNTING.

FRIOUL, one of several dialects of the Rhaeto-Romance subdivision of the Italo-Celtic family of speech. It is akin to Ladin (*q.v.*), the speech most typical of this subdivision and presents many peculiar divergences from its Romance parents.

See *Rhaeto-Romance Languages* and R. Brandstetter, *Rätoromanische Forschungen* (1905).

FRISCHE HAF, a lagoon on the Baltic coast of Germany, between Danzig and Königsberg. It is 52 m. in length, from 4 to 12 m. broad, 332 sq.m. in area, and is separated from the Baltic by a narrow spit, the Frische Nehrung. This barrier was torn open by a storm in 1510, and the channel thus formed, now dredged out to a depth of 22 ft., affords a navigable passage for vessels. Into the Haff flow the Nogat, the Elbing, the Passarge, the Pregel and the Frisching.

FRISCHLIN, PHILIPP NIKODEMUS (1547-1590), German philologist and poet, was born on Sept. 22, 1547, at Balingen, Württemberg, where his father was parish minister. He was educated at Tübingen, where he became (1568) professor of poetry and history. In 1575 for his comedy of *Rebecca*, which he read at Regensburg before the emperor Maximilian II., he was rewarded with the laureateship, and in 1577 he was made a count palatine (*comes palatinus*) or *Pfalzgraf*. In 1582 he had to leave Tübingen, and spent two years teaching at Laibach. Shortly after his return to Tübingen in 1584, he was threatened with a criminal prosecution for immoral conduct, and fled to Frankfurt-on-Main (1587). For 18 months he taught in the Brunswick gymnasium, and he appears also to have resided occasionally at Strasbourg, Marburg and Mainz. From Mainz he wrote libellous letters, which led to his arrest in March 1590. He was imprisoned in the fortress of Hohenurach, near Reutlingen, where, on the night of Nov. 29, 1590, he was killed by a fall in attempting to let himself down from the window of his cell.

In his Latin verse Frischlin often successfully imitated the classical models; his comedies have freshness and vivacity, and his commentaries on the *Georgics* and *Bucolics* of Virgil were important contributions to the scholarship of his time. His *Opera poetica* were published 12 times between 1535 and 1636. See D. F. Strauss, *Leben und Schriften des Dichters und Philologen Frischlin* (1856).

FRISI, PAOLO (1728-1784), Italian mathematician and astronomer, was born at Milan and educated at the Barnabite monastery there and at Padua. He made his reputation by his *Disquisitio mathematica in causam physicam figurae et magnitudinis terrae* (1751), and became professor of philosophy in the College of Casale, and subsequently in the Barnabite college of St. Alexander at Milan. He was professor of mathematics at Pisa (1756-64) and in the palatine schools at Milan (1764-77), where he obtained papal release from ecclesiastical jurisdiction and authority to become a secular priest. In 1777 he became director of a school of architecture at Milan. He had a European reputation as a consulting authority on hydraulics, and through him lightning-conductors were introduced into Italy.

His other works include:—*Saggio della morale filosofia* (Lugano, 1753); *Nova electricitatis theoria* (1755); *Dissertatio de motu diurno terrae* (Pisa, 1758); *Dissertationes variae* (Lucca, 1759, 1761); *Del modo di regolare i fiumi e i torrenti* (Lucca, 1762); *Cosmographia physica et mathematica* (1774, 1775 his chief work); *Dell'architettura, statica e idraulica* (1777); and other treatises.

FRISIAN ISLANDS, a chain of islands, lying from 3 to 20 m. from the mainland, and stretching from the Zuider Zee east and north as far as Jutland, along the coasts of Holland and Germany. They are divided into three groups:—(1) The West Frisian, (2) the East Frisian, and (3) the North Frisian.

The islands mark the outer fringe of the former continental coast-line, and are separated from the mainland by shallows, known as *wadden*. Notwithstanding the protection afforded by sand-dunes and artificial embankments, the Frisian islands are slowly disappearing through marine erosion. Many of the Frisian legends and folk-songs deal with submerged villages and hamlets. The German and Dutch governments annually expend large sums

for the protection of the islands, and in some cases the erosion on the seaward side is counterbalanced by the accretion of land on the inner side, fine sandy beaches being formed well suited for sea-bathing, which attracts many visitors in summer. The inhabitants support themselves by seafaring, pilotage, grazing of cattle and sheep, fishing and a little agriculture, chiefly potato-growing.

West Frisian.—The West Frisian islands belong to the kingdom of the Netherlands, and embrace Texel (71 sq.m.), Vlieland (19 sq.m.), Terschelling (41 sq.m.), Ameland (23 sq.m.), Schiermonnikoog (19 sq.m.), as well as the much smaller islands of Boschplaat and Rottum, which are practically uninhabited. The northern end of Texel is called Eierland, or "island of eggs," in reference to the large number of sea-birds' eggs which are found there. It was joined to Texel by a sand-dike in 1629-1630, and is now undistinguishable from the main island. Texel was already separated from the mainland in the 8th century, but remained a Frisian province and countship, which once extended as far as Alkmaar in North Holland, until it came into the possession of the counts of Holland.

The island of Terschelling once formed a separate lordship, but was sold to Holland. As early as the beginning of the 9th century Ameland was a lordship belonging to the Cammingha family, who held immediately of the emperor and in recognition of their independence the Amelanders were in 1369 declared to be neutral in the fighting between Holland and Friesland, while Cromwell made the same declaration in 1654. The castle of the Camminghas in Ballum remained until 1829. This island is joined to the mainland of Friesland by a stone dike built in 1873 to promote the deposit of mud. Schiermonnikoog has a village and a lighthouse. Rottum was once the property of the ancient abbey at Rottum, 8 m. N. of Groningen, of which there are slight remains.

East Frisian.—The East Frisian group belongs to Germany and comprises Borkum (12½ sq.m.), Memmert, Juist (2¼ sq.m.), Norderney (5½ sq.m.), Baltrum, Langeoog (8 sq.m.), Spiekeroog (4 sq.m.), and Wangeroog (2 sq.m.). All these islands are visited for sea-bathing. Many have lighthouses and lifeboat stations. In the beginning of the 18th century Wangeroog comprised eight times its present area. Borkum and Juist are two surviving fragments of the original island of Borkum (computed at 380 sq.m.), known to Drusus as *Fabaria*, and to Pliny as *Burchana*, which was rent asunder by the sea in 1170. Neuwerk and Scharhörn are situated off the mouth of the Elbe, the former contains some marshland protected by dikes and has two lighthouses and a lifeboat station.

North Frisian.—About the year 1250 the area of the North Frisian islands was estimated at 1,065 sq.m.; by 1850 this had diminished to only 105 sq.m. This group embraces the islands of Nordstrand (17¼ sq.m.), which up to 1634 formed one larger island with the adjoining Pohnshallig and Nordstrandisch-Moor; Pellworm (16¼ sq.m.), protected by a circle of dikes and connected by steamer with Husum on the mainland; Amrum (10½ sq.m.); Föhr (32 sq.m.); Sylt (38 sq.m.); Röm (16 sq.m.), with several villages, the principal of which is Kirkeby; Fanö (21 sq.m.); and Heligoland (¼ sq.m.). With the exception of Fanö and Röm which are Danish, these islands belong to Germany. In the North Frisian group there are also several smaller islands called Halligen, rising generally only a few feet above the level of the sea.

FRISIANS, a people who in the first century of our era were found by the Romans in occupation of the coast lands stretching from the mouth of the Scheldt to that of the Ems. The first historical notices of the Frisians are found in the *Annals* of Tacitus. They (or a portion of them) were rendered tributary by Drusus, and became *socii* of the Roman people, but soon after A.D. 47 the emperor Claudius ordered the withdrawal of all Roman troops to the left bank of the Rhine. In 58 the Frisians tried unsuccessfully to appropriate certain districts between the Rhine and the Yssel and in 70 they took part in the campaign of Claudius Civilis. Ptolemy states that they inhabited the coast above the Bructeri as far as the Ems. Tacitus speaks of them as adjacent to the Rhine. But there is some reason for believing that the part

of Holland which lies to the west of the Zuider Zee was at first inhabited by a different people, the Canninefates, whose name is perhaps preserved in the name Kennemerland or Kinnehem formerly applied to the same district.

In connection with the movements of the migration period the Frisians are hardly ever mentioned, though some of them are said to have surrendered to the Roman prince Constantius about the year 293. Procopius speaks of the Frisians as one of the nations which inhabited Britain in his day, but we have no evidence from other sources to bear out his statement. In Anglo-Saxon poetry mention is frequently made of a Frisian king named Finn, the son of Folcwalda, who came into conflict with a certain Hnaef, a vassal of the Danish king, Healfdene, about the middle of the 5th century. The incident is obscure, but it is worth noting that Hnaef's chief follower, Hengest, may quite possibly be identical with the founder of the Kentish dynasty. About the year 520 the Frisians are said to have joined the Frankish prince Theodberht in destroying a piratical expedition which had sailed up the Rhine under Chocilaicus (Hygelac), king of the Götar. Towards the close of the century they begin to figure much more prominently in Frankish writings. It is probable that the Frisians were to some extent associated with the Angles and Saxons in the invasion of Britain. In any case, the Frisian language, by its close resemblance to English, proves an ancient and intimate connection between these peoples.

The northward extension of Frankish dominion brought on a collision with the Frisians. Under the protection of the Frankish king Dagobert (622-638), the Christian missionaries Amandus (St. Amand) and Eligius (St. Eloi) attempted the conversion of the southern Frisians, but farther north the building of a church by Dagobert at Trajectum (Utrecht) at once aroused the fierce hostility of the heathen tribesmen of the Zuider Zee. Utrecht was attacked and captured, and the church destroyed. Wilfrid bishop of York who visited Frisia in 678 was allowed to preach Christianity by Aldgils, then king. Radbod, his successor, who was hostile to Christianity, was beaten by Pippin of Heristal in the battle of Dorstadt (689), and was compelled to cede west Frisia from the Scheldt to the Zuider Zee to the conqueror. Although Frankish supremacy over Frisia was not completely established until the time of Charles the Great, it was under Frankish protection that Christianity was established in Frisia by the Englishman Willibrord, between 690 and 739. The see of Utrecht which he founded has remained the chief see of the northern Netherlands from his day to our own, though many Frisians were still heathen when the more famous English missionary Boniface was martyred at Dokkum in Frisia shortly after 750.

Charles the Great granted the Frisians important privileges under a code known as the *Lex Frisionum*, based upon the ancient laws of the country. In this text three districts are clearly distinguished: west Frisia from the Zwin to the Vlie; middle Frisia from the Vlie to the Lauwers; east Frisia from the Lauwers to the Weser. At the treaty of Verdun (843) Frisia became part of Lotharingia; at the treaty of Mersen (870) it was divided between the kingdoms of the East Franks and the West Franks; in 880 the whole country was united to the latter; in 911 it fell under the dominion of Charles the Simple, king of the West Franks, but the districts of East Frisia asserted their independence and for a long time governed themselves after a very simple democratic fashion. The history of West Frisia gradually loses itself in that of the countship of Holland and the see of Utrecht (*see HOLLAND and UTRECHT*).

The influence of the Frisians during the interval between the invasion of Britain and the loss of their independence must have been greater than is generally recognized. They were a seafaring people and engaged largely in trade, especially perhaps the slave trade, their chief emporium being Wyk te Duurstede. During the period in question there is considerable archaeological evidence for intercourse between the west coast of Norway and the regions south of the North sea, and it is worth noting that this seems to have come to an end early in the 9th century. Probably it is no mere accident that the first appearance, or rather reappearance, of Scandinavian pirates in the west took place shortly after the

overthrow of the Frisians.

Besides the Frisians discussed previously, a people called North Frisians inhabited the west coast of Schleswig. In historical times these North Frisians were subjects of the Danish kingdom and not connected in any way with the Frisians of the empire. It seems not unlikely that the original settlers were Frisians who had been driven northwards by the Franks in the 8th century. The inhabitants of the neighbouring islands, Sylt, Amrum and Föhr, who speak a kindred dialect, have apparently never regarded themselves as Frisians, and it is the view of many scholars that they are the direct descendants of the ancient Saxons.

In 1248 William of Holland, having become emperor, restored to the Frisians in his countship their ancient liberties in reward for the assistance they had rendered him in the siege of Aachen; but in 1254 they revolted, and William lost his life in the contest which ensued. After many struggles west Friesland became completely subdued, and was henceforth virtually absorbed in the county of Holland. But the Friesland east of the Zuider Zee obstinately resisted repeated attempts to bring them into subjection. In the course of the 14th century the country was in a state of anarchy, which favoured the attempts of the counts of Holland to push their conquests eastward, but the main body of the Frisians was still independent when the countship of Holland passed into the hands of Philip the Good of Burgundy. Philip laid claim to the whole country, but the people appealed to the protection of the empire, and Frederick III., in Aug. 1457, recognized their direct dependence on the empire. The marriage of Maximilian of Austria with the heiress of Burgundy produced a change in the fortunes of that part of Frisia which lies between the Vlie and the Lauwers. In 1498 Maximilian reversed the policy of his father Frederick III. and gave it to Albert of Saxony, who thoroughly crushed out all resistance. In 1523 it passed with all the rest of the provinces of the Netherlands to the emperor Charles, the grandson of Maximilian and Mary of Burgundy.

The part of Frisia which lies to the east of the Lauwers had a divided history. The portion which lies between the Lauwers and the Ems after some struggles for independence had, like the rest of the country, to submit itself to Charles. It became ultimately the province of the town and district of Groningen (*q.v.*). The easternmost part between the Ems and the Weser, which had since 1454 been a county was ruled by the descendants of Edzard Cirksema, and was attached to the empire. The last of the Cirksemas, Count Charles Edward, died in 1744 and in default of heirs male the king of Prussia took possession of the county.

The province of Friesland was one of the seven provinces which by the treaty known as the Union of Utrecht bound themselves together to resist the tyranny of Spain. From 1579 to 1795 Friesland remained one of the constituent parts of the republic of the United Provinces, but it always jealously insisted on its sovereign rights, especially against the encroachments of the predominant province of Holland. It maintained throughout the whole of the republican period a certain distinctiveness of nationality, which was marked by the preservation of a different dialect and of a separate stadtholder. Count William Lewis of Nassau-Siegen, nephew and son-in-law of William the Silent, was chosen stadtholder, and throughout the 17th and 18th centuries the stadtholdership was held by one of his descendants. Frederick Henry of Orange was stadtholder of six provinces, but not of Friesland, and even during the stadtholderless periods which followed the deaths of William II. and William III. of Orange the Frisians remained stanch to the family of Nassau-Siegen. Finally, by the revolution of 1748 William of Nassau-Siegen, stadtholder of Friesland (who by default of heirs male of the elder line, had become William IV., prince of Orange), was made hereditary stadtholder of all the provinces. His grandson in 1815 took the title of William I., king of the Netherlands. The male line of the "Frisian" Nassaus came to an end with the death of King William III. in 1890.

FRIT-FLY (*Oscinella frit*), a fly extremely destructive to barley crops in northern Europe and North America. It is a small, greenish-black insect, the larvae of which live in the grains of the barley, which they destroy. (See ENTOMOLOGY, ECONOMIC; DIPTERA.)

FRITH (or **FRYTH**), **JOHN** (c. 1503-1533), English Reformer and Protestant martyr, was born at Westerham, Kent. He was educated at Eton and King's College, Cambridge, where Gardiner, afterwards bishop of Winchester, was his tutor. At the invitation of Cardinal Wolsey, after taking his degree he migrated (Dec. 1525) to the newly founded college of St. Frideswide or Cardinal College (now Christ Church), Oxford. The sympathetic interest which he showed in the Reformation movement in Germany caused him to be suspected as a heretic, and led to his imprisonment for some months. Subsequently he appears to have resided chiefly at the newly founded Protestant university of Marburg, where he became acquainted with several scholars and reformers of note, especially Patrick Hamilton (*q.v.*). Frith's first publications were printed at Marburg. His *Disputacyon of Purgatorye*, a treatise in three books, against Rastell, More and Fisher (bishop of Rochester) respectively, was published at the same place in 1531. While at Marburg, Frith also assisted Tyndale, whose acquaintance he had made in England, in his literary labours. In 1532 he ventured back to England. Warrants for his arrest were almost immediately issued at the instance of More, then lord chancellor, and he ultimately fell into the hands of the authorities as he was on the point of escaping to Flanders. Frith was examined by the king's order; he was afterwards tried and found guilty of having denied that the doctrines of purgatory and transubstantiation were necessary articles of faith. On June 23, 1533 he was handed over to the secular arm, and was burnt at the stake at Smithfield on July 4. During his captivity he wrote a reply to More's letter against his own "lytle treatise"; also two tracts entitled *A Mirror or Glass to know thyself*, and *A Mirror or Looking-glass wherein you may behold the Sacrament of Baptism*.

Burnet, *Hist. of the Reformation of the Church of England* (ed. N. Pocock, 1865), i. p. 273; L. Richmond, *The Fathers of the English Church*, i. (1807); *Life and Martyrdom of John Frith* (Church of England Tract Society, 1824); Deborah Alcock, *Six Heroic Men* (1906).

FRITH, WILLIAM POWELL (1819-1909), English painter, was born at Aldfield, in Yorkshire, on Jan. 9, 1819. In 1835 he entered Henry Sass's school in Bloomsbury, from which he passed to the Royal Academy schools. In 1840 his first picture, "Malvolio, cross-gartered before the Countess Olivia," was exhibited at the Royal Academy. He was elected an Associate of the Royal Academy in 1845. His promotion to the rank of Academician followed in 1852, when he was chosen to fill the vacancy caused by Turner's death. A succession of large compositions of every-day English life gained for the artist an extraordinary popularity. "Life at the Seaside," better known as "Ramsgate Sands," was exhibited in 1854, and was bought by Queen Victoria; "The Derby Day," in 1858; "Claude Duval," in 1860; "The Railway Station," in 1862; "The Marriage of the Prince of Wales," painted for Queen Victoria, in 1865. He also painted a number of portraits. His "Derby Day" is in the National Gallery, London. Frith died on Nov. 2, 1909.

See his *Autobiography and Reminiscences* (1887); *Further Reminiscences* (1889).

FRITILLARY (*Fritillaria*), a genus of hardy bulbous plants of the family Liliaceae, containing upwards of 50 species widely distributed in the northern hemisphere. The genus is represented in Great Britain by the fritillary or snakeshead (*F. Meleagris*), which occurs in moist meadows in the southern half of England. A much larger plant is the crown imperial (*F. imperialis*), a native of western Asia and well known in gardens. This grows

THE FRITILLARY OR SNAKESHEAD, A BULBOUS, LILY-LIKE PLANT, BLOOMING IN ENGLISH MEADOWS IN LATE APRIL OR EARLY MAY

to a height of about 3 ft., the lower part of the stoutish stem being furnished with leaves, while near the top is developed a crown of large pendent flowers surmounted by a tuft of bright green leaves. The flowers are bell-shaped, yellow or red, and in some of the forms double. The plant grows freely in good garden soil, preferring a deep well-drained loam.

About 15 species are native to western North America, chiefly California, and mostly with handsome flowers, among which are the white fritillary (*F. liliacea*), the yellow fritillary (*F. pudica*), mission bells (*F. biflora*), brown bells (*F. parviflora*) and the checker-lily (*F. lanceolata*).

Fritillary is also the name of several species of butterfly.

FRITZLAR, a town in the Prussian province of Hesse-Cassel, on the left bank of the Eder, 16 m. S.W. from Cassel by rail. Pop. (1925) 3,888. As early as 732 Boniface, the apostle of Germany, established the church of St. Peter and a small Benedictine monastery at Frideslar. Among the earlier scholars of the famous monastery school were Sturm, abbot of Fulda, and Megingod, second bishop of Würzburg. Boniface later entrusted the office to Wigbert of Glastonbury, who thus became the first abbot of Fritzlar. In 774 the little settlement was burnt by the Saxons, but soon recovered. Soon after 786 it was the seat of the bishopric of Buraburg, founded by Boniface in 741. At the diet of Fritzlar in 919 Henry I. was elected German king. Early in the 13th century the village received municipal rights. As a principality Fritzlar continued subject to the archbishopric of Mainz till 1802, when it was incorporated with Hesse. In 1866 it passed with Hesse-Cassel to Prussia.

FRITZSCHE, OTTO FRIDOLIN (1812-96), German theologian, was born on Sept. 23, 1812, at Dobrilugk, and studied at Halle. From 1837 to 1893 he was professor of theology at the University of Zürich, where he died on March 9, 1896.

His chief publications were his edition of the Apocrypha of the Old Testament (1871) and his *Kurzfassstes exegetisches Handbuch zu den Apokryphen des Alten Testaments* (6 vols., 1851-60). For his other works, including his text editions, see Herzog's *Realencyklopädie*.

FRIULI, a district at the head of the Adriatic Sea, partly included in Venetia proper (province of Udine) and partly in Venetia Julia (province of Gorizia). In the north and east Friuli includes portions of the Julian and Carnic Alps, while the south is the alluvial plain of the Isonzo, Tagliamento, and lesser streams which come down in enormous floods after rain or thaw. The inhabitants, known as Furlanians or Friulani, speak a dialect with Celtic elements, one of the Latin dialects (others being those of the Dolomite valleys and of the Engadine). The area of the country is about 3,300 sq.m. Silkworms are very largely bred.

Friuli derives its name from the Roman town of Forum Iulii, or Foroiulium, the modern Cividale (*q.v.*). In the 2nd century B.C. the district was subjugated and became part of Gallia Transpadana. During the Roman period, besides Forum Iulii, its principal towns were Concordia and Aquileia. The Lombards (6th

century) made it one of their thirty-six duchies, the capital being Forum Iulii or, as they called it, Civitas Austriae. The discovery of the grave of Gisulf (d. 611) at Cividale is an interesting proof of the veracity of Paulus Diaconus' *Historia Langobardorum*. In the 11th century the ducal rights over the greater part of Friuli were bestowed by the emperor Henry IV. on the patriarch of Aquileia; but towards the close of the 14th century the nobles called in the assistance of Venice, which, after defeating the archbishop, secured possession of the country for itself in 1420. The eastern part of Friuli was held by the counts of Gorizia till 1500, when on the failure of their line it was appropriated by Maximilian I., and became the possession of the house of Austria. By the peace of Campo Formio in 1797 the Venetian district also came to Austria, and on the formation of the Napoleonic kingdom of Italy in 1805 the department of Passariano was made to include the whole of Venetian and part of Austrian Friuli, and in 1809 the rest was added to the Illyrian provinces. The title of duke of Friuli was borne by Marshal Duroc. In 1815 the whole country was recovered by the emperor of Austria, who himself assumed the ducal title and coat of arms. In 1866 the Venetian portion was again ceded to Italy by the peace of Prague, and the rest recovered in 1918.

(T. A.)

FROBEN [FROBENIUS], **JOANNES** (c. 1460-1527), German printer and scholar, was born at Hammelburg in Bavaria. After completing his university career at Basel, where he made the acquaintance of the famous printer Johannes Auerbach (1443-1513), he established there about 1491 a printing house which had a European reputation for accuracy and for taste. In 1500 he married the daughter of the bookseller Wolfgang Lachner, who entered into partnership with him. He was a friend of Erasmus (q.v.), who not only had his own works printed by him, but superintended Frobenius's editions of St. Jerome, St. Cyprian, Tertullian, Hilary of Poitiers and St. Ambrose. His *Neues Testament* in Greek (1516) was used by Luther for his translation. Frobenius employed Hans Holbein to illuminate his texts. It was part of his plan to print editions of the Greek Fathers. He did not, however, live to carry out this project, but it was very creditably executed by his son Jerome and his son-in-law Nikolaus Episcopus. Frobenius's work in Basel made that city in the 16th century the leading centre of the German book trade. An extant letter of Erasmus gives an epitome of his life.

FROBERGER, JOHANN JACOB (1605-1667), German organist and composer, was born at Halle and died near Montbéliard on May 7, 1667. He was appointed court organist at Vienna in 1637, but did not immediately enter on his functions as he spent the years 1637-41 at Rome studying under the great master Frescobaldi. He was in Vienna from 1641 to 1645, and again from 1653 to 1657, when he left the emperor's service. After this time he seems to have fallen into extreme poverty, for it is said that Christopher Gibbons offered him the post of organ blower at Westminster Abbey in 1662. Froberger is important as being the link between the 17th century Italian school of organ playing and Buxtehude and others who led on to the Bach school. His organ and piano works were collected by G. Adler in *Denkmäler der Tonkunst in Oesterreich* (1903).

See Franz Beier, *Über J. Frobergers Leben und Bedeutung* (1884).

FROBISHER, SIR MARTIN (c. 1535-1594), English navigator and explorer, was the son of Bernard Frobisher of Althofts, Normanton, Yorkshire. In 1544 he was placed on board a ship sailing to Guinea. By 1565 he is referred to as Captain Frobisher, and in 1571-72 as being in the public service at sea off the coast of Ireland. He married in 1559. As early as 1560 or 1561 Frobisher had resolved to undertake a voyage in search of a north-west passage to Cathay and India, and in 1576, by help of the earl of Warwick, he was put in command of an expedition consisting of two tiny barques, the "Gabriel" and "Michael."

He weighed anchor at Blackwall, and set sail on June 7 by way of the Shetland islands. The pinnacle was lost in a storm and some time afterwards the "Michael" deserted; but on July 28 the "Gabriel" sighted the coast of Labrador. Some days later the mouth of Frobisher bay was reached, and a farther advance northwards being prevented by ice and contrary winds, Frobisher determined to sail westward up this passage (which he conceived to be a strait) to see "whether he mighte carrie himself through the same into some open sea on the backe syde." Butcher's island was reached on Aug. 18 and some natives then decoyed away five of his men. After vainly trying to get them back, Frobisher turned homewards, and reached London on Oct. 9.

Among the things Frobisher's men brought back was some "black earth," and a rumour arose that this was gold ore. The result was great interest in the commercial world; and next year a much more important expedition than the former was fitted out, the queen lending the "Aid" from the royal navy and subscribing £1,000 towards the expenses of the expedition. A company of Cathay was established with a charter from the Crown and Frobisher was appointed high admiral of all lands and waters that might be discovered by him. On May 26, 1577, the expedition, consisting besides the "Aid," of the ships "Gabriel" and "Michael" with boats, pinnaces and an aggregate complement of 120 men, including miners, refiners, etc., left Blackwall, and sailing by the north of Scotland reached Hall's island at the mouth of Frobisher bay on July 17. The south side of the bay was taken possession of in the queen's name. The time was spent in collecting ore, and very little discovery was achieved. The return was begun on Aug. 23 and the "Aid" reached Milford Haven on Sept. 23, the "Gabriel" and "Michael," having separated, arrived later at Bristol and Yarmouth.

Frobisher was received by the queen at Windsor. She still believed in the value of the new territory, and it was resolved to send out a larger expedition, and establish a colony. On May 31, 1578, the expedition, consisting in all of 15 vessels, left Harwich, and sailing by the English channel reached the south of Greenland on June 20. On July 2 the foreland of Frobisher bay was sighted, but stormy weather and dangerous ice caused the wreck of the barque "Dennis" and drove the fleet unwittingly up a new (Hudson) strait. After proceeding about 60m. up this "mistaken strait," Frobisher turned back, and the fleet at last came to anchor in Frobisher bay. Some attempt was made at founding a settlement, and a large quantity of ore was shipped; but the venture was not a success, and on the last day of August the fleet set out for England, which was reached in the beginning of October. In 1585 Frobisher commanded the "Primrose," as vice-admiral to Sir Francis Drake in his expedition to the West Indies, and for his services in the "Triumph," in the dispersion of the Armada, he was knighted. He continued to cruise about in the Channel until 1590 when he was sent in command of a small fleet to the coast of Spain. In 1591 he married again and settled down in Yorkshire. He found, however, little leisure for a country life, and the following year took charge of the fleet fitted out by Sir Walter Raleigh to sail to the Spanish coast, returning with a rich prize. In Nov. 1594 he was engaged with a squadron in the siege and relief of Brest, when he received a wound at Fort Crozon, from which he died at Plymouth on Nov. 22. His body was taken to London and buried at St. Giles', Cripplegate. Though he appears to have been somewhat rough in his bearing, and too strict a disciplinarian to be much loved, Frobisher was undoubtedly one of the most able seamen of his time, and justly takes rank among England's great naval heroes.

See Hakluyt's *Voyages*; the Hakluyt Society's *Three Voyages of Frobisher* (vol. xxxviii., 1868); F. Jones, *Life of Frobisher* (1878); Julian Corbett, *Drake and the Tudor Navy* (1898); *The North-West and North-East Passages, 1576-1611* edited by P. F. Alexander (1915).

FROCK, originally a long, loose gown with broad sleeves, worn by members of the religious orders. The word is derived from the O.Fr. *froc*, of obscure origin. The formal stripping off of the frock became part of the ceremony of degradation in the case of a condemned monk; hence the expression "to unfrock." In the middle ages "frock" was also a long loose coat worn by men, or a

coat of mail, and the word survived into the 19th century for a coat with long skirts, the "frock coat." It is now chiefly used in English for a child's or young girl's dress.

FROEBEL, FRIEDRICH WILHELM AUGUST (1782-1852), German educational reformer, was born at Oberweissbach, Thuringia, on April 21, 1782. Like Comenius, with whom he had much in common, he was neglected in his youth until a maternal uncle gave him a home at Stadt-Ilm. He went to the village school, but like many thoughtful boys he passed for a dunce, and was apprenticed to a forester (1797-99).

In the Thuringian forest, Froebel obtained a profound insight into the uniformity and unity of nature's laws. No training could have been better suited to his tendency to mysticism; and when he left the forest at 17, he seems to have possessed the main ideas which influenced him all his life. He was dominated by the idea of the unity of nature, and longed to study natural sciences to find in them various applications of nature's universal laws. To this end, he went to Jena, but his allowance was small, and his university career ended in an imprisonment of nine weeks for a debt of 30 shillings. He returned home more intent on what he called "self-completion" than on getting on in a worldly sense. During his various employments, as surveyor, accountant and private secretary, he became more and more conscious that a great task lay before him for the good of humanity. While studying architecture in Frankfurt-on-Main, he met the director of a model school, who had caught some of the enthusiasm of Pestalozzi, and who induced him to take a post in his school. From 1807 till 1809 Froebel was attached to Pestalozzi's celebrated institution at Yverdon, near Neuchâtel. But holding that man and nature, inasmuch as they proceed from the same source, must be governed by the same laws, he longed for more knowledge of natural science than Pestalozzi advocated. In 1811 he began to study at Göttingen, whence he proceeded to Berlin. But this time his studies were interrupted by the king of Prussia's call "to my people." Though not a Prussian, Froebel was heart and soul a German. He enlisted in Lützow's corps, and went through the campaign of 1813, his experience showing him the value of discipline and united action, how the individual belongs not to himself but to the whole, and how the whole supports the individual.

Froebel was rewarded for his patriotism by the friendship of two men whose names will always be associated with his, Langethal and Middendorff. These young men were ever afterwards his devoted followers, sacrificing all their prospects to carry out his ideas. After the peace of Fontainebleau (May 1814) Froebel returned to Berlin, and became curator of the museum of mineralogy under Weiss. Langethal and Middendorff were in Berlin, engaged in tuition. Froebel instructed them in his theory, and at length in 1816 resolved to realize his own idea of "the new education." He went to Griesheim, a village on the Ilm, but two years later moved to Keilhau, a Thuringian village which became the Mecca of the new faith.

In Keilhau Froebel, Langethal, Middendorff and Barop, a relation of Middendorff's, all married and formed an educational community. The school gradually increased, though for many years its teachers, with Froebel at their head, were short of money and of food. After 14 years' experience he determined to start other institutions to work in connection with the parent institution at Keilhau. Leaving the Keilhau institution under the direction of Barop, he opened another school at a castle on the Wartensee, Lucerne, offered to him by a friend. But the Catholic clergy resisted what they considered a Protestant invasion, and the experiment on the Wartensee and at Willisau in the same canton, to which the institution was moved in 1833, never had a fair chance.

The Swiss Government, however, sent young teachers to Froebel for instruction, and finally Froebel moved to Burgdorf (famous for Pestalozzi's activities there 30 years earlier) to establish a public orphanage and superintend a course for schoolmasters. The elementary teachers of the canton were to spend three months every alternate year at Burgdorf, and compare experiences, and receive instruction from distinguished men such as Froebel and Bitzius. In his conferences with these teachers Froebel found that

the schools suffered because up to school age the children were entirely neglected. Froebel's conception of harmonious development attached much importance to the earliest years, and his great work on *The Education of Man* (1826) deals chiefly with the child up to the age of seven. His thoughts were occupied with the proper treatment of young children, and in scheming for them a graduated course of exercises, modelled on the games which interested them. Official restraints led him to return to Keilhau, where he opened the first *Kindergarten* or "Garden of Children," in the neighbouring village of Blankenburg (1837). It had to be given up for lack of funds and Froebel carried on his courses first at Keilhau, and from 1848 to 1852 near Liebenstein, in the Thuringian forest, and in the duchy of Meiningen. In 1849 he attracted within the circle of his influence a woman of great intellectual power, the baroness von Marenholtz-Bülow, who wrote *Recollections of Friedrich Froebel* (Eng. trans. 1877), the only lifelike portrait we possess.

In the great year of revolutions (1848) Froebel had hoped to turn to account the general eagerness for improvement, and Middendorff had presented an address on Kindertagens to the German parliament. A nephew of Froebel's, however, Professor Karl Froebel of Zürich, published books which were supposed to teach socialism, and the uncle and nephew were regarded as the united advocates of some new thing. Froebel found himself suspected of socialism and irreligion, and in 1851 the education minister, von Raumer, issued an edict forbidding the establishment of schools "after Friedrich and Karl Froebel's principles" in Prussia. This was a heavy blow to the old man, who did not long survive the decree. He died on June 21, 1852, and was buried at Schweina, a village near Bad-Liebenstein.

"All education not founded on religion is unproductive." This conviction followed naturally from Froebel's conception of the unity of all things, a unity due to the original Unity from whom all proceed and in whom all "live, move and have their being." As man and nature have one origin they must be subject to the same laws. Hence Froebel, like Comenius two centuries earlier, looked to the course of nature for the principles of human education. As the cultivator creates nothing in the trees and plants, so the educator creates nothing in the children,—he merely superintends the development of inborn faculties. Pestalozzi said that the faculties were developed by exercise. Froebel added that the function of education was to develop the faculties by arousing *voluntary activity*.

The prominence which Froebel gave to action and his doctrine that man is primarily a doer and an originator, learning only through "self-activity," has its importance throughout the entire period of education. But it was to the first stage that Froebel paid the greatest attention. He held with Rousseau that each age has a completeness of its own, and that the perfection of the later stage rests upon the perfection of the earlier. Impressed with the importance of the first stage, Froebel like Pestalozzi devoted himself to the instruction of mothers. But he rejected Pestalozzi's view that the child belonged to the family. Fichte had claimed it for society and the state. Froebel who believed that "all progress lay through opposites to their reconciliation," maintained that the child belonged both to the family and to society, and that he should spend some part of the day in a common life and in common employments. Since these assemblies were for children not old enough for schooling, he invented the name *Kindergarten*, garden of children, and desired that the children's employment should be *play*. Any occupation in which children delight is play, and Froebel invented a series of employments, which, while they are in this sense play to the children, have nevertheless a distinct educational object, namely, to strengthen their bodies, to exercise their senses, to engage their awakening minds, and through their senses to acquaint them with nature and their fellows; it is especially to guide aright the heart and the affections, and to lead them to the basis of all life, to unity with themselves.

Froebel's works are: *Menschenziehung* (1826 Eng. trans., 1885); *Pädagogik d. Kindergartens*; *Kleinere Schriften und Mutter- und Kostlieder*; collected editions have been edited by Lange (1862) and Seidel (1883). There are English translations of the *Autobiography* (last ed. 1903), of his chief writings on education (1912) and of the *Mother's*

Songs (1895). See A. B. Hauschmann, *F. Fröbel*; E. Shirreff, *Principles of Froebel's System*; H. Barnard, *Papers on Froebel's Kindergarten* (1881); R. H. Quick, *Educational Reformers* (1890); J. White, *The Educational Ideas of Froebel* (1905); R. D. Chalke, *A Synthesis of Froebel and Herbart* (1912); E. R. Murray, *Froebel as a Pioneer in Modern Psychology* (1914); W. H. Kilpatrick, *Froebel's Kindergarten Principles* (1916). (R. H. Q.; X.)

FROESCHWILLER, BATTLE OF. The name given by the French to the Battle of Wörth (*q.v.*) in the Franco-German War (*q.v.*), which is the name commonly adopted, following German practice.

FROG, a name of wide application, strictly for an animal belonging to the family *Ranidae*, but also used of some other families of the order Anura of the class Amphibia (*q.v.*).

Frogs proper are typified by the common British species, *Rana temporaria*, the edible frog, *R. esculenta*, and the American bull-frog, *R. catesbiana*. The genus *Rana* includes in all about 200 species, distributed over the whole world with the exception of the greater part of South America and Australia. Some of the species are permanently aquatic and have fully webbed toes, others are terrestrial, except during the breeding season, others are adapted for burrowing, by means of the much-enlarged and sharp-edged tubercle at the base of the inner toe, while not a few have the tips of the digits dilated into disks by which they are able to climb on trees. The tree-frogs, *Hylidae*, show in their anatomical structure a close resemblance to the toads, *Bufo*idae.

Some frogs grow to a large size. The bull-frog of eastern North America grows to nearly 8 in. from snout to vent, *R. guppyi* of the Solomon Islands to 8½ in. and *R. goliath*, the South Cameroons to 10 inches. Among species belonging to other genera of the family may be mentioned the hairy frog of West Africa, *Trichobatrachus robustus*, some specimens of which have the sides of the body and of the hind limbs covered with long villousities and its ally *Gampsosteonyx batesi*, in which the last phalanx of the fingers and toes is sharp and claw-like and perforates the skin. To this family also belongs the arboreal genus *Rhacophorus* of eastern Asia, some species of which are remarkable for the extremely developed webs between the fingers and toes, which are believed to act as a parachute (flying-frog of A. R. Wallace), while others have been observed to make aerial nests between leaves overhanging water, a habit which is shared by their near allies, the *Chiromantis* of tropical Africa. *Dimorphognathus*, from West Africa, is the unique example of a sexual dimorphism in the dentition, the males being provided with a series of large sharp teeth in the lower jaw, which in the female is edentulous. The curious horned frog of the Solomon Islands, *Ceratobatrachus guentheri*, has teeth in the lower jaw in both sexes, while a few forms, such as *Dendrobates* and *Cardioglossa*, have no teeth at all.

FROG-BIT, in botany, the English name for a small rootless plant with floating leaves known botanically as *Hydrocharis morsus-ranae*, a member of the family *Hydrocharitaceae*. The plant has rosettes of roundish floating leaves, and multiplies like the strawberry plant by runners, at the end of which new leaf-rosettes develop. Staminate and pistillate flowers are borne on different plants; they have three small green sepals and three broadly ovate white membranous petals. The fruit, which is fleshy, is not found in Great Britain. The plant occurs in ponds and ditches in England and is rare in Ireland.

FROG-MOUTH or **MOREPORK**, an Australian bird (*Podargus curvieri*), so-called from its cry, resembles the nightjar (*q.v.*) in appearance and habits and belongs to the same order, Coraciiformes. Some 24 species of the *Podargidae* are distributed from Southern India to Australia.

FRÖHLICH, ABRAHAM EMANUEL, a Swiss poet, pastor and professor, was born at Brugg (Feb. 1, 1796) and died at Baden (Dec. 1, 1865), both in the canton of Aargau. His earliest literary work was in the form of versified apologies (*Fabeln*; 1825), which achieved great popularity for their satirical humour and sound morality. Among his other works were *Hymns*, the ultra-Protestant epics of *Ulrich Zwingli* (1840) and *Ulrich von Hutten* (1845), and *Der Junge Deutsch-Michel* (1846), an attack on the youth of his day. Fröhlich was highly

conservative and orthodox in his views.

His collected works were issued in 1853, in 5 volumes, with a 6th added in 1861. See *Life* by R. Faesi (1907).

FROHMAN, CHARLES (1860–1915), American theatrical manager, was born at Sandusky, O., on June 17, 1860. At the age of 12 he started to work at night in the office of the *New York Tribune*, attending school by day. In 1874 he began work for the *Daily Graphic*. In 1877 he entered the theatrical business, being for a time associated with his brother Daniel in managing the Madison Square theatre, New York. In 1890 he organized the Charles Frohman Stock Company. On Jan. 25, 1893, he opened his Empire theatre, New York. Other New York theatres with which he was at various times connected were the Criterion, Garrick, Knickerbocker, Lyceum and Savoy.

He was an adept in developing talent. Among his successful players were Maude Adams, Ethel Barrymore, Julia Marlowe, Billie Burke, William Gillette, and Otis Skinner. He was one of the organizers of the syndicate which for several years controlled the American theatres. Beginning in 1897 he presented many plays in London, leasing at different times such houses as the Duke of York's, Globe, Comedy, Vaudeville, and Adelphi. He perished when the "Lusitania" was sunk by a German submarine May 7, 1915.

FROHSCHAMMER, JAKOB (1821–1893), German theologian and philosopher, was born at Illkofen, near Regensburg, on Jan. 6, 1821. He studied theology at Munich and in 1847 became a priest. In 1850 he published *Beiträge zur Kirchengeschichte*, which was placed on the Index Expurgatorius, and in 1854, his *Über den Ursprung der menschlichen Seelen*, which maintained that the human soul was not individually created, but was the result of a secondary creative act on the part of the parents, and that soul like body was subject to the laws of heredity. This was supplemented in 1855, the year in which he became professor of philosophy in Munich, by the controversial *Menschenseele und Physiologie*. The *Einleitung in die Philosophie und Grundriss der Metaphysik*, of 1858, assailed the doctrine of Thomas Aquinas, that philosophy was the handmaid of theology. In 1861 appeared *Über die Aufgabe der Naturphilosophie und ihr Verhältnis zur Naturwissenschaft*, and *Über die Freiheit der Wissenschaft*, in which he declared the independence of science from authority, and reproached the excessive respect for the latter in the Roman Church. In 1862 he founded *Athenäum* as organ of Liberal Catholicism, writing for it the first adequate German account of the Darwinian theory of natural selection. Excommunicated in 1871, he replied with *Der Fels Petri in Rom* (1873), *Der Primat Petri und des Papstes* (1875), and *Das Christentum Christi und das Christentum des Papstes* (1876). Of his later philosophical works, the most important are: *Die Phantasie als Grundprinzip des Weltprocesses* (1877), *Über die Genesis der Menschheit* (1883), and *Über die Organisation und Cultur der menschlichen Gesellschaft* (1885). He died at Bad Kreuth, Bavaria, on June 14, 1893.

Frohschammer's autobiography was published in A. Hinrichsen's *Deutsche Denker* (1888). See also E. Reich, *Weltanschauung und Menschenleben; Betrachtungen über die Philosophie J. Frohschammers* (1894); B. Münz, *J. Frohschammer* (1894) and *Briefe von und über J. Frohschammer* (1897); J. Friedrich, *J. Frohschammer* (1896) and *Systematische und kritische Darstellung der Psychologie J. Frohschammers* (1899); A. Attensperger, *J. Frohschammers philosophisches System* (1899).

FROISSART, JEAN (1338–1410?), French chronicler and raconteur, historian of his own times. His forefathers were *jurés* (aldermen) of the little town of Beaumont, lying near the river Sambre, to the west of the forest of Ardennes. His father, who seems to have been a painter of armorial bearings, migrated to Valenciennes. The date generally adopted for his birth is 1338. His native city of Valenciennes was rich in romantic associations. Not far from its walls was the western fringe of the great forest of Ardennes, sacred to the memory of Pepin, Charlemagne, Roland and Ogier. Along the banks of the Scheldt stood, one after the other, not then in ruins, but bright with banners, the gleam of armour, and the liveries of the men at arms, castles whose seigneurs, now forgotten, were famous in their day for

many a gallant feat of arms. The castle of Valenciennes itself was illustrious in the romance of *Perceforest*. There was born that most glorious and most luckless hero, Baldwin, first emperor of Constantinople. All the splendour of mediaeval life was to be seen in Froissart's native city: on the walls of the Salle le Comte glittered—perhaps painted by his father—the arms and scutcheons beneath the banners and helmets of Luxembourg, Hainaut and Avesnes; the streets were crowded with knights and soldiers, priests, artisans and merchants; the churches were rich with stained glass, delicate tracery and precious carving; there were libraries full of richly illuminated manuscripts on which the boy could gaze with delight; every year there was the *fête* of the *pur d'Amour de Valenciennes*, at which he would hear the verses of the competing poets; there were festivals, masques, mummeries and moralities.

The moon, he says, rules the first four years of life; Mercury the next ten; Venus follows. He was 14 when the last goddess appeared to him in person, as he tells us, after the manner of his time, and informed him that he was to love a lady, "belle, jone, et gente." Meanwhile he was placed in some commercial position which he very soon abandoned, for he had resolved on becoming a learned clerk. He then naturally began to make verses, like every other learned clerk, and fell in love. He found one day a *damoiselle* reading a book of romances. It was the romance of *Cleomades*. He remarks the singular beauty of her blue eyes and fair hair, while she reads a page or two, and then—one would almost suspect a reminiscence of Dante—"Adont laissames nous le lire." She was rich and he was poor; she was nobly born and he obscure; it was long before she would accept the devotion, even of the conventional kind, which Froissart offered her.

In England.—He was 18 years of age when he left Valenciennes for the court of England, taking with him letters of recommendation from the king of Bohemia and the count of Hainaut to Queen Philippa, niece of the latter. He was well received by the queen, always ready to welcome her own countrymen; he wrote ballades and virelays for her and her ladies. But after a year he began to pine for another sight of "la très douce, simple, et quoie," whom he loved loyally. Good Queen Philippa gave him his *congé* on the condition that he was to return. The conclusion of his single love adventure is simply and unaffectedly told in his *Trettie de l'espinette amoureuse*. It was a passion conducted on the well-known lines of conventional love; it ended with calumny and a complete rupture. The *damoiselle* not only scornfully refused to speak to her lover or acknowledge him, but even seized him by the hair and pulled out a handful. Nor would she ever be reconciled to him again.

Perhaps to get healed of his sorrow, Froissart began those wanderings in which the best part of his life was to be consumed. He first visited Avignon in 1360, and in 1361 he returned to England after an absence of five years. He brought with him as a present to Queen Philippa a book of rhymed chronicles of the wars of his time written by himself. The queen now made young Froissart one of her secretaries, and he began to serve her with "beaux ditties et traités amoureux." She seems to have suggested to him the propriety of travelling in order to get information for more rhymed chronicles. It was at her charges that Froissart travelled to Scotland, where he was well received by King David, William of Douglas, and the earls of Fife, Mar, March and others. His travels in Scotland lasted for six months. Returning southwards he rode along the whole course of the Roman wall, showing the true spirit of an archaeologist; he thought that Carlisle was Carlyon, King Arthur's capital; he calls Westmorland, where the common people still spoke the ancient British tongue, North Wales; he rode down the banks of the Severn, and returned to London by way of Oxford—"l'escole d'Asque-Suffort." In London Froissart entered the service of King John of France as secretary, and probably acquired at this period that art, in which he has probably never been surpassed, of making people tell him all they knew. He liked the story of a battle from both sides and from many points of view; he wanted the details of every little cavalry skirmish, every capture of a castle, every gallant action and brave deed. And he forgot nothing.

At the age of 29, in 1366, Froissart left England for Brussels, where there was a great concourse of minstrels from all parts, from the courts of the kings of Denmark, Navarre and Aragon, from those of the dukes of Lancaster, Bavaria and Brunswick. Froissart received a gift of money, as appears from the accounts: "uni Fritsardo, dictori, qui est cum regina Angliae, dicto die, vi. mottones." He then went to Brittany, where he heard from eyewitnesses details of the battles of Cocherel and Auray, the Great Day of the Thirty and the heroism of Jeanne de Montfort. Windsor Herald told him something about Auray, and a French knight, one Antoine de Beaujeu, gave him the details of Cocherel. From Brittany he went southwards to Nantes, La Rochelle and Bordeaux, where he arrived a few days before the visit of Richard (afterwards Richard II.). He accompanied the Black Prince to Dax, and hoped to go on with him into Spain, but was despatched to England on a mission. He next formed part of the expedition which escorted Lionel duke of Clarence to Milan, to marry the daughter of Galeazzo Visconti. Chaucer was also one of the prince's suite. At the wedding banquet Petrarch was a guest sitting among the princes. From Milan Froissart, accepting gratefully a *cotte hardie* with 20 florins of gold, went to Bologna, and met Peter king of Cyprus, from whose follower and minister, Eustache de Confians, he learned particulars of the king's exploits. He accompanied Peter to Venice, where he left him after receiving a gift of 40 ducats. At Rome he learned of the death of his friend King Peter of Cyprus, and of the good Queen Philippa, of whom he writes, in grateful remembrance—

Propices li soit Diex à l'âme!
J'en suis bien tenus de pryer
Et ses larghesces escuyer,
Car elle me fist et créa.

Philippa dead, Froissart returned to Flanders and presented himself, with a new book in French, to the duchess of Brabant, from whom he received the sum of 16 francs, given in the accounts as paid *uni Frissardo dictatori*. Froissart may also have found a patron in Yolande de Bar, grandmother of King René of Anjou. In any case he received a substantial gift from some one in the shape of the benefice of Lestines, a village near Binche. He was placed upon the duke of Brabant's pension list, and was entitled to a yearly grant of grain and wine, with some small sum in money. Froissart was not the man to sit down at ease to discharge the duties of parish priest, to say mass, to bury the dead, to marry the villagers and to baptize the young. From time to time he repaired to the court of Coudenberg, and became "moult frère et accointé" with the duke of Brabant. And then came Gui de Blois, one of King John's hostages in London in the old days. He had been fighting in Prussia with the Teutonic knights, and now proposed to settle down for a time in his castle of Beaumont. This prince, in emulation of its grandfather, the patron of Jean le Bel, advised Froissart seriously to take in hand the history of his own time.

THE CHRONICLE

He began his career by rewriting the work of the chronicler Jean le Bel; Gui de Blois, among others, supplied him with additional information. His own notes, taken from information obtained in his travels, gave him more details, and when in 1374 Gui married Marie de Namur, Froissart found in the bride's father, Robert de Namur, one who had himself largely shared in the events which he had to relate. He, for instance, is the authority for the story of the siege of Calais and the six burgesses. Froissart remained for twelve years at Lestines, or at Beaumont, arranging and writing his chronicles. During this period, too, he composed his *Espinette amoureuse*, and the *Joli Buisson de jonesce*, and his romance of *Méliador*. He also became chaplain to the count of Blois, and obtained a canonry of Chimay. After this appointment we hear nothing more of Lestines, which he probably resigned.

In 1386 his travels began again, when he accompanied Gui to his castle at Blois, in order to celebrate the marriage of his son Louis de Dunois with Marie de Berry. He wrote a *pastourelle* in honour of the event. Then he attached himself for a few days to the duke of Berry, from whom he learned certain particulars of current events, and then, becoming aware of what promised to be

the most mighty feat of arms of his time, he hastened to Sluys, where the French were collecting an enormous fleet, and making preparations to repeat the invasion of William the Conqueror. But there was no invasion of England. In Flanders Froissart met many knights who had fought at Rosebeque, and could tell him of the troubles which in a few years desolated that country, once so prosperous. He stayed at Ghent, among those ruined merchants and mechanics, for whom, as one of the same class, he felt a sympathy never extended to English or French, perhaps quite as unfortunate, and he devotes 300 chapters to the Flemish troubles. This portion of the chronicle was written at Valenciennes. During this residence in his birthplace his verses were crowned at the "puys d'amour" of Valenciennes and Tournay.

This part of his work finished, he determined on making a journey to the south of France in order to learn something new. On this occasion he rode first to Blois; on the way he fell in with two knights who told him of the disasters of the English army in Spain; one of them also informed him of the splendid hospitality of Gaston Phoebus, count of Foix, on hearing of which Froissart resolved to seek him out. Arrived at Foix he discovered that the count was at Orthez, whither he proceeded in company with a knight named Espaing de Lyon, who, Froissart found, had not only fought, but could describe.

The account of those few days' ride with Espaing de Lyon is the most charming, the most graphic, and the most vivid chapter in the whole of Froissart. Every turn of the road brings with it the sight of a ruined castle, about which this knight of many memories has a tale or a reminiscence. The whole country teems with fighting stories. Froissart never tires of listening nor the good knight of telling. "Sainte Marie!" cries Froissart in mere rapture. "How pleasant are your tales, and how much do they profit me while you relate them! And you shall not lose your trouble, for they shall all be set down in memory and remembrance in the history which I am writing." Arrived at length at Orthez, Froissart introduced himself to the count as a chronicler. He heard much from the count, and there was a good deal, too, to be learned of people about the court. One knight recently returned from the East told about the Genoese occupation of Famagosta; two more had been in the fray of Otterbourne; others had been in the Spanish wars.

Leaving Gaston at length, Froissart assisted at the wedding of the old duke of Berry with the youthful Jeanne de Bourbon, and was present at the reception given to Isabeau of Bavaria by the Parisians. He then returned to Valenciennes, and sat down to write his fourth book. While engaged in the events of the year 1385 he found that his notes taken at Orthez and elsewhere on the affairs of Castile and Portugal were incomplete. He hastened to Bruges, where, he felt certain, he should find some one who would help him. There was, in fact, at this great commercial centre, a colony of Portuguese. From them he learned that a certain Portuguese knight, Dom Juan Fernand Pacheco, was at the moment in Middelburg on the point of starting for Prussia. He instantly embarked at Sluys, reached Middelburg in time to catch this knight, introduced himself, and conversed with him uninterruptedly for the space of six days, getting his information on the promise of due acknowledgment. During the next two years he seems to have had trouble with his seigneur Gui de Blois, and even to have resigned his chaplaincy. He next calls Robert de Namur his seigneur, and dedicates to him, in a general introduction, the whole of his chronicles. We then find him at Abbeville, trying to learn all about the negotiations pending between Charles VI. and the English. He was unsuccessful, either because he could not get at those who knew what was going on, or because the secret was too well kept. He next made his last visit to England, where, after 40 years' absence, he naturally found no one who remembered him. He stayed in England some months, seeking information on all points from his friends Henry Chrystead and Richard Stury, from the dukes of York and Gloucester, and from Robert the Hermit.

On his return to France, he found preparations going on for that unlucky crusade, the end of which he describes in his *Chronicle*. It was headed by the count of Nevers. After him floated

many a banner of knights, descendants of the crusaders, who bore the proud titles of duke of Athens, duke of Thebes, sire de Sidon, sire de Jericho. They were going to invade the sultan's empire by way of Hungary; they were going to march south; they would reconquer the holy places. And presently we read how it all came to nothing, and how the slaughtered knights lay dead outside the city of Nikopoli. In almost the concluding words of the *Chronicle* the murder of Richard II. of England is described. His death ends the long and crowded *Chronicle*, though the pen of the writer struggles through a few more unfinished sentences.

The Man and His Work.—The rest is vague tradition. He is said to have died at Chimay in 1410 and to have been buried at the church of St. Monegunda. It is further said that he died in poverty so great that his relations could not even afford to carve his name upon the headstone of his tomb; not one of his friends, not even Eustache Deschamps, writes a line of regret in remembrance; the greatest historian of his age had a reputation so limited that his death was no more regarded than that of any common monk or obscure priest. Among his friends were Guillaume de Machault, Eustache Deschamps and Cuvelier, a follower of Bertrand du Guesclin. It is probable that he knew Chaucer, with whom Deschamps maintained a poetical correspondence; there is nothing to show that he ever made the acquaintance of Christine de Pisan. The selection of his own poems published by Buchon in 1829 includes the *Dit dou florin*; the *Débat dou cheval et dou levrier*, written during his journey in Scotland; the *Dittie de la fleur de la Margherite*; a *Dittie d'amour* called *L'Orlose amoureux*, in which he compares himself, the imaginary lover, with a clock; the *Espinette amoureuse*, which contains a sketch of his early life, freely and pleasantly drawn, accompanied by rondeaux and virelays; the *Buisson de jonesce*, in which he returns to the recollections of his own youth; and various smaller pieces.

There has never been any difference of opinion on the distinctive merits of his *Chronicle*. It presents a vivid and faithful drawing of the things done in the 14th century. No more graphic account exists of any age. No historian has drawn so many and such faithful portraits. They are, it is true, portraits of men as they seemed to the writer, not of men as they were. Froissart was uncritical; he accepted princes by their appearance. Who, for instance, would recognize in his portrait of Gaston Phoebus de Foix the cruel voluptuary, stained with the blood of his own son, which we know him to have been? Froissart, again, had no sense of historical responsibility; he was no judge to enquire into motives and condemn actions; he was simply a chronicler. He has been accused by French authors of lacking patriotism. Yet it must be remembered that he was neither a Frenchman nor an Englishman, but a Fleming. He has been accused of insensibility to suffering. Indignation against oppression was not, however, common in the 14th century; why demand of Froissart a quality which is rare enough even in our own time? Yet there are moments when, as in describing the massacre of Limoges, he speaks with tears in his voice.

As regards his personal character, Froissart depicts it himself for us. Such as he was in youth, he tells us, so he remained in more advanced life; rejoicing mightily in dances and carols, in hearing minstrels and poems; inclined to love all those who love dogs and hawks; pricking up his ears at the uncorking of bottles,—"*Car au voire prens grand plaisir*"; pleased with good cheer, gorgeous apparel and joyous society, but no commonplace reveller or greedy voluptuary,—everything in Froissart was ruled by the good manners which he set before all else; and always eager to listen to tales of war and battle. As we have said above, he shows, not only by his success at courts, but also by the whole tone of his writings, that he possessed a singularly winning manner and strong personal character. He lived wholly in the present, and had no thought of the coming changes. Born when chivalrous ideas were most widely spread, but the spirit of chivalry itself, as inculcated by the best writers, in its decadence, he is penetrated with the sense of knightly honour, and ascribes to all his heroes alike those qualities which only the ideal knight possessed.

The first edition of Froissart's *Chronicle* was published in Paris. It bears no date; the next editions are those of the years 1505, 1514, 1518

and 1520. The edition of Buchon, 1924, was a continuation of one commenced by Dadier. The best modern editions are those of Kervyn de Lettenhove (1863-77) and Siméon Luce (1869-88); for bibliography see Potthast, *Bibliotheca hist. mediæ ævi*, i. (1896). An abridgment was made in Latin by Belleforest, and published in 1672. An English translation was made by Bouchier, Lord Berners, and published in London, 1525. See the "Tudor Translations" edition of Berners (1901), with introduction by W. P. Ker; and the "Globe" edition, with introduction by G. C. Macaulay (1913). The translation by Thomas Johnes was originally published in 1802-05. For Froissart's poems see Scheler's text in K. de Lettenhove's complete edition; *Méliador* has been edited by Longnon for the Société des Anciens Textes (1895-99). See also Madame Darmesteter (Duclaux), *Froissart* (1894). *Froissart's Cronycles*, translated out of the French by Sir John Bouchier, Lord Berners, 7 vol. Oxford (1927-28).

FROME, a market town in the Frome parliamentary division of Somersetshire, England, 101½ m. W. by S. of London by the G.W.R., at the junction of a branch line to Bristol (24½ m. N.W. by N.). Pop. of urban district (1931) 10,738. It is unevenly built on high ground above the river Frome and was formerly called Frome (or Froome) Selwood, after the neighbouring forest of Selwood; the country round is richly wooded and picturesque. The parish church of St. John the Baptist, with its fine tower and spire, was rebuilt about the close of the 14th century, and, though largely restored, has a beautiful chancel, Lady chapel and baptistery. The market-hall, museum, school of art, mechanics institute and a free grammar school, founded under Edward VI., may be noted. The chief industries are woollen cloth manufactures, brewing and art metal-working, also printing, metal-founding, and the manufacture of silk, tools and cards for wool-dressing. Selwood forest was long a favourite haunt of brigands and highwaymen. The Saxon occupation of Frome (From) is the earliest of which there is evidence, the settlement being due to the foundation of a monastery by Aldhelm in 705. A witenagemot was held there in 934, so that Frome must already have been a place of some size. At the time of the Domesday Survey the manor was owned by King William. Local tradition asserts that Frome was a mediaeval borough, and the reeve of Frome is mentioned in documents after the reign of Edward I. It was not represented in parliament until given one member by the Reform act of 1832; its separate representation was merged in that of the county in 1885. A charter of Henry VII. to Edmund Leversedge, then lord of the manor, granted the right to have two fairs and in the 18th century two others were held. An agricultural show and cheese fair is held on the last Wednesday in September. The manufacture of woollen cloth has flourished since the 15th century.

FROMENTIN, EUGÈNE (1820-1876), French painter, was born at La Rochelle on Oct. 24, 1820. He studied under Louis Cabat, the landscape painter. Fromentin was one of the earliest pictorial interpreters of Algeria, having been able repeatedly to visit the land and people that suggested the subjects of most of his works. Among his more important early works are—"Moisson en Algérie"; "Diffa, reception du Soir"; "Chasse à la gazelle" and "Enterrement maure." They are somewhat stiff in design and execution. The second period extends till 1859 and includes the following works—"Les Bateleurs nègres"; "Le Simoun"; and "La Lisière d'oasis." They are grey in tone and were executed under Corot's influence. After 1860 Fromentin's colour becomes bright and luminous—"Fauconnier arabe"; "Chasse au héron"; "La curée"; "Centaures et centaresses"; here Fromentin was influenced by Eugène Delacroix. In these pictures is given with great truth and refinement the unconscious grandeur of barbarian and animal attitudes and gestures. Fromentin's paintings show only one side of a genius that was perhaps even more felicitously expressed in literature; "Dominique," first published in the *Revue des deux mondes* in 1862, and dedicated to George Sand, is remarkable among the fiction of the century for delicate and imaginative observation and for emotional earnestness. Fromentin's other literary works are—*Visites artistiques* (1852); *Simplex Pèlerinages* (1856); *Un Été dans le Sahara* (1857); *Une Année dans le Sahel* (1858); and *Les Maîtres d'autrefois* (1876). In 1876 he was an unsuccessful candidate for the Academy. He died suddenly at La Rochelle on Aug. 27, 1876.

See L. Gonse, *Eug. Fromentin* (1881).

FROMMEL, GASTON (1862-1906), Swiss theologian, professor of theology in Geneva from 1894 to 1906. An Alsatian by birth, he belonged mainly to French Switzerland. He may best be described as continuing the spirit of Vinet (*q.v.*) amid later mental conditions. Like Vinet, he derived his philosophy of religion from a deeply personal experience of the Gospel of Christ as meeting the demands of the moral consciousness; but he developed even further than Vinet the psychological analysis of conscience and the method of verifying every doctrine by direct reference to spiritual experience. Both made much of moral individuality or personality as the criterion of reality, believing that its correlation with Christianity, both historically and philosophically, was most intimate. But while Vinet's stress was on the liberty from human authority essential to the moral consciousness, the changed needs of the age caused Frommel to develop rather the aspect of man's dependence on God's spiritual initiative, "the conditional nature of his liberty." "Liberty is not the primary, but the secondary characteristic" of conscience; "before being free, it is the subject of obligation."

Frommel claimed that a deeper analysis carries us beyond the subjectivity of Kant's categorical imperative, since consciousness of obligation was "une expérience imposée sous le mode de l'absolu." By *imposée* (Malan's phrase) he emphasized the priority of man's sense of obligation to his moral consciousness either of self or of God. He appealed to the psychology of the subconscious for confirmation of his analysis, insisting on priority to self-conscious thought as a mark of metaphysical objectivity in the case of moral, no less than of physical experience. He found in the Christian revelation the same characteristics as belonged to the universal revelation in conscience, viz. 'God's sovereign initiative and his living action in history. From this standpoint he argued against a purely psychological type of religion (*agnosticisme religieux*, as he termed it)—a tendency to which he saw even in A. Sabatier and the *symbolofidisme* of the Paris School—as giving up a real faith. Like Vinet, Frommel was a man of letters and a penetrating critic of men and systems: see his *Études littéraires et Morales* (1907).

LITERATURE.—G. Godet, *Gaston Frommel* (Neuchâtel, 1906), a sketch, with citation of sources; for a complete edition of his writings see *Oeuvre Systematique* (Neuchâtel, 1910-16); *The Psychology of Christian Faith* (London, Stud. Chr. Mov., 1928), a selection in English with introductory study. (J. V. B.)

FRONDE, THE, the name given to a civil war in France which lasted from 1648 to 1652, and to its sequel, the war with Spain in 1653-59. The word means a sling, and was applied to this contest from the circumstance that the windows of Cardinal Mazarin's adherents were pelted with stones by the Paris mob. Its original object was the redress of grievances, but the movement soon degenerated into a factional contest among the nobles, who sought to reverse the results of Richelieu's work and to overthrow his successor Mazarin. In May 1648 a tax levied on judicial officers of the *parlement* of Paris was met by that body, not merely with a refusal to pay, but with a condemnation of earlier financial edicts and even with a demand for the acceptance of a scheme of constitutional reforms framed by a committee of the *parlement*. This charter was somewhat influenced by contemporary events in England. But there is no real likeness between the two revolutions, the French *parlement* being no more representative of the people than the Inns of Court were in England. The political history of the time is dealt with in the article FRANCE: *History*, the present article being concerned chiefly with the military operations of what was perhaps the most costly and least necessary civil war in history.

The military record of the first or "parliamentary" Fronde is almost blank. In Aug. 1648, strengthened by the news of Condé's victory at Lens, Mazarin suddenly arrested the leaders of the *parlement*, whereupon Paris broke into insurrection and barricaded the streets. The court, having no army at its immediate disposal, had to release the prisoners and to promise reforms, and fled from Paris on the night of Oct. 22. But the signing of the peace of Westphalia set free Condé's army, and by Jan. 1649 it was besieging Paris. The peace of Rueil was signed in March, after little blood had been shed. The Parisians, though still and always

anti-cardinalist, refused to ask for Spanish aid, as proposed by their princely and noble adherents, and having no prospect of military success without such aid, submitted and received concessions. Thenceforward the Fronde becomes a story of sordid intrigues and half-hearted warfare, losing all trace of its first constitutional phase. The leaders were discontented princes and nobles—Monsieur (Gaston of Orléans, the king's uncle), the great Condé and his brother Conti, the duc de Bouillon and his brother Turenne. To these must be added Gaston's daughter, Mademoiselle de Montpensier (La grande Mademoiselle), Condé's sister, Madame de Longueville, Madame de Chevreuse, and the astute intriguer Paul de Gondî, later Cardinal de Retz. The military operations fell into the hands of war-experienced mercenaries, led by two great, and many second-rate, generals, and of nobles to whom war was a polite pastime. The feelings of the people at large were enlisted on neither side.

This peace of Rueil lasted until the end of 1649. The princes, received at court once more, renewed their intrigues against Mazarin, who, having come to an understanding with Monsieur, Gondî and Madame de Chevreuse, suddenly arrested Condé, Conti and Longueville (Jan. 14, 1650). The war which followed this *coup* is called the "Princes' Fronde." This time it was Turenne, before and afterwards the most loyal soldier of his day, who headed the armed rebellion. Listening to the promptings of his Egeria, Madame de Longueville, he resolved to rescue her brother, his old comrade of Freiburg and Nördlingen. It was with Spanish assistance that he hoped to do so; and a powerful army of that nation assembled in Artois under the archduke Leopold, governor-general of the Spanish Netherlands. But the peasants of the country-side rose against the invaders, the royal army in Champagne was in the capable hands of César de Choiseul, comte du Plessis-Praslin, and the little fortress of Guise successfully resisted the archduke's attack. Thereupon, however, Mazarin drew upon Plessis-Praslin's army for reinforcements to be sent to subdue the rebellion in the south, and the royal general had to retire. Then, happily for France, the archduke decided that he had spent sufficient of the king of Spain's money and men in the French quarrel. The magnificent regular army withdrew into winter quarters, and left Turenne to deliver the princes with a motley host of Frondeurs and Lorrainers. Plessis-Praslin by force and bribery secured the surrender of Rethel on Dec. 13, 1650, and Turenne, who had advanced to relieve the place, fell back hurriedly. But he was a terrible opponent, and Plessis-Praslin and Mazarin himself, who accompanied the army, had many misgivings as to the result of a lost battle. The marshal chose nevertheless to force Turenne to a decision, and the battle of Blanc-Champ (near Somme-Py) or Rethel was the consequence. Both sides were at a standstill in strong positions, Plessis-Praslin doubtful of the trustworthiness of his cavalry, Turenne too weak to attack, when a dispute for precedence arose between the *Gardes françaises* and the *Picardie* regiment. The royal infantry had to be rearranged in order of regimental seniority, and Turenne, seeing and desiring to profit by the attendant disorder, came out of his stronghold and attacked with the greatest vigour. The battle (Dec. 15, 1650) was for a time doubtful, but Turenne's Frondeurs gave way in the end, and his army, as an army, ceased to exist. Turenne himself, undecieved as to the part he was playing in the drama, asked and received the young king's pardon, and meantime the court, with the *maison du roi* and other loyal troops, had subdued the minor risings without difficulty (March–April 1651). Condé, Conti and Longueville were released, a few months of hollow peace followed, and the court returned to Paris. Mazarin, an object of hatred to all the princes, had already retired into exile. "*Le temps est un galant homme*," he remarked, "*laissons le faire!*" and so it proved. His absence left the field free for mutual jealousies, and a state of anarchy soon reigned. In December Mazarin returned with a small army, the war began again, and this time Turenne and Condé were pitted against one another. After the first campaign, as we shall see, the civil war ceased, but for several other campaigns the two great soldiers were opposed to one another, Turenne as the defender of France, Condé as a Spanish invader. Their personalities alone give threads of con-

tinuity to these seven years of wearisome manoeuvres, sieges and combats, though for a right understanding of the causes which were to produce the standing armies of the age of Louis XIV. and Frederick the Great the military student should search deeply into the material and moral factors that here decided the issue.

The début of the new Frondeurs took place in Guyenne (February–March 1652), while their Spanish ally, the archduke Leopold William, captured various northern fortresses. On the Loire, whither the centre of gravity was soon transferred, the Frondeurs were commanded by intriguers and quarrelsome lords, until Condé's arrival from Guyenne. His bold trenchant leadership brought initial success in the action of Bléneau (April 7, 1652), but fresh troops came up to oppose him, and from the skilful dispositions made by his opponents Condé felt the presence of Turenne and broke off the action. The royal army did likewise. Condé invited the commander of Turenne's rearguard to supper, chaffed him unmercifully for allowing the prince's men to surprise him in the morning, and by way of farewell remarked to his guest, "*Quel dommage que des braves gens comme nous se coupent la gorge pour un faquin*"—an incident and a remark that thoroughly justify the iron-handed absolutism of Louis XIV. There was no hope for France while tournaments on a large scale and at the public's expense were fashionable amongst the *grands seigneurs*. After Bléneau both armies marched to Paris to negotiate with the *parlement*, de Retz and Mlle. de Montpensier, while the archduke took more fortresses in Flanders, and Charles IV., duke of Lorraine, with an army of plundering mercenaries, marched through Champagne to join Condé. But Turenne manoeuvred past Condé and planted himself in front of the mercenaries, and their leader, not wishing to expend his men against the old French regiments, consented to depart with a money payment and the promise of two tiny Lorraine fortresses. A few more manoeuvres, and the royal army was able to hem in the Frondeurs in the Faubourg St. Antoine (July 2, 1652) with their backs to the closed gates of Paris. The royalists attacked all along the line and won a signal victory in spite of the knightly prowess of the prince and his great lords, but at the critical moment Gaston's daughter persuaded the Parisians to open the gates and to admit Condé's army. She herself turned the guns of the Bastille on the pursuers. An insurrectional government was organized in the capital and proclaimed Monsieur lieutenant-general of the realm. Mazarin, feeling that public opinion was solidly against him, left France again, and the bourgeois of Paris, quarrelling with the princes, permitted the king to enter the city on Oct. 21, 1652. Mazarin returned unopposed in Feb. 1653.

The Fronde as a civil war was now over. The whole country, wearied of anarchy and disgusted with the princes, came to look to the king's party as the party of order and settled government, and thus the Fronde prepared the way for the absolutism of Louis XIV. The general war continued in Flanders, Catalonia and Italy wherever a Spanish and a French garrison were face to face, and Condé with the wreck of his army openly and definitely entered the service of the king of Spain. The "Spanish Fronde" was, except for a few outstanding incidents, a dull affair. In 1653 France was so exhausted that neither invaders nor defenders were able to gather supplies to enable them to take the field till July. At one moment, near Péronne, Condé had Turenne at a serious disadvantage, but he could not galvanize the Spanish general Count Fuensaldana, who was more solicitous to preserve his master's soldiers than to establish Condé as mayor of the palace to the king of France, and the armies drew apart again without fighting. In 1654 the principal incident was the siege and relief of Arras. On the night of Aug. 24–25 the lines of circumvallation drawn round that place by the prince were brilliantly stormed by Turenne's army, and Condé won equal credit for his safe withdrawal of the besieging corps under cover of a series of bold cavalry charges, led by himself as usual, sword in hand. In 1655 Turenne captured the fortresses of Landrecies, Condé and St. Ghislain. In 1656 Condé revenged himself for Arras by storming Turenne's circumvallation around Valenciennes (July 16), but Turenne drew off his forces in good order. In the campaign of 1657 a body of 6,000 British infantry, sent by Cromwell in pur-

suance of his treaty of alliance with Mazarin, took part. The presence of the English contingent and its very definite purpose of making Dunkirk a new Calais, to be held by England for ever, gave the next campaign a character of certainty and decision which is entirely wanting in the rest of the war. Dunkirk was besieged promptly and in great force, and when Don Juan of Austria and Condé appeared with the relieving army from Furnes, Turenne advanced boldly to meet him. The battle of the Dunes (*q.v.*) fought on June 14, 1658, was the first real trial of strength since the battle of the Faubourg St. Antoine, ended in Turenne's victory. Here the "red-coats" made their first appearance on a continental battlefield, under the leadership of Sir W. Lockhart, Cromwell's ambassador at Paris, and astonished both armies by the stubborn fierceness of their assaults, for they were the products of a war where passions ran higher and the determination to win rested on deeper foundations than in the *dégringolade* of the feudal spirit in which they now figured. Dunkirk fell, as a result of the victory, and flew the St. George's cross till Charles II. sold it to the king of France. A last desultory campaign followed in 1659—the 25th year of the Franco-Spanish War—and the peace of the Pyrenees, was signed on Nov. 5. On Jan. 27, 1660, the prince asked and obtained at Aix the forgiveness of Louis XIV. The later careers of Turenne and Condé as the great generals—and obedient subjects—of their sovereign are described in the article DUTCH WARS. (For their earlier careers see THIRTY YEARS' WAR.)

BIBLIOGRAPHY.—For the many memoirs and letters of the time see the list in G. Monod's *Bibliographie de l'histoire de France* (Paris, 1888). The *Lettres du cardinal Mazarin* have been collected in nine volumes (Paris, 1878–1906). See P. Adolphe Chéruel, *Histoire de France pendant la minorité de Louis XIV.* (4 vols., 1879–80), and his *Histoire de France sous le ministère de Mazarin* (3 vols., 1883); L. C. de Beupoil de Sainte-Aulaire, *Histoire de la Fronde* (2nd ed., 2 vols., 1860); "Arvède Barine" (Mme. Charles Vincens), *La Jeunesse de la grande mademoiselle* (Paris, 1902); Duc d'Aumale, *Histoire des princes de Condé* (Paris, 1889–96, 7 vols.). The most interesting account of the military operations is in General Hardy de Périni's *Turenne et Condé (Batailles françaises vol. iv.)*; G. Patin, *Lettres du temps de la Fronde* (Paris, 1922).

FRONTENAC ET PALLUAU, LOUIS DE BUADE, COMTE DE (1620–1698), French-Canadian statesman, governor and lieutenant-general for the French king in *La Nouvelle France* (Canada), son of Henri de Buade, colonel in the regiment of Navarre, was born in the year 1620. Louis de Buade served in 1635 under the prince of Orange in Holland, and fought in many engagements in the Low Countries and in Italy. His service seems to have been continuous until the conclusion of the peace of Westphalia in 1648, when he returned to his father's house in Paris and married Anne de la Grange-Trianon, a girl of great beauty, who later became the friend and confidante of Madame de Montpensier. Incompatibility of temper led to a separation, the count retiring to his estate on the Indre, where by an extravagant course of living he became hopelessly involved in debt. In 1669, when France sent a contingent to assist the Venetians in the defence of Crete against the Turks, Frontenac was placed in command of the troops on the recommendation of Turenne. In this expedition he won military glory; but his fortune was not improved.

At this period the affairs of New France claimed the attention of the French Court. Frontenac was appointed to succeed Rémy de Courcelle as governor, and arrived in Quebec on Sept. 12, 1672. It was immediately evident that he proposed to pursue a policy of colonial expansion, and to exercise an independence of action that did not coincide with the views of Louis XIV., or of his minister Colbert. One of the first acts of the governor, by which he sought to establish in Canada the three estates—nobles, clergy and people—met with the disapproval of the French court, and measures were adopted to curb his ambition by increasing the power of the sovereign council and by reviving the office of intendant. Frontenac soon became involved in quarrels with the intendant touching questions of precedence, and with those priests who ventured to criticize his proceedings. The church in Canada had been administered for many years by the religious orders; for the see of Quebec had not yet been erected. But three years

after the arrival of Frontenac a former vicar apostolic, François Xavier de Laval de Montmorenci, returned to Quebec as bishop, with a jurisdiction over the whole of Canada. In him the governor found a vigorous opponent who was determined to render the state subordinate to the church. Frontenac had issued trading licences which permitted the sale of intoxicants. The bishop, supported by the intendant, endeavoured to suppress this trade, and sent an ambassador to France to obtain remedial action. The views of the bishop were upheld, and henceforth authority was divided. Troubles ensued between the governor and the sovereign council, most of the members of which sided with the one permanent power in the colony—the bishop; while the intrigues of the intendant, Duchesneau, were a constant source of strife. At last both governor and intendant were recalled to France in the year 1682.

During Frontenac's first administration many improvements had been made in the country. The defences had been strengthened, a fort was built at Cataragui (now Kingston), Ontario, bearing the governor's name, and conditions of peace had been fairly maintained between the Iroquois on the one hand and the French and their allies, the Ottawas and the Hurons, on the other. The recall of the governor was ill-timed. The Iroquois were assuming a threatening attitude towards the inhabitants, and Frontenac's successor, La Barre, was quite incapable of leading an army against such cunning foes. At the end of a year La Barre was replaced by the marquis de Denonville, a man of ability and courage, who, though he showed some vigour in marching against the western Iroquois tribes, angered rather than intimidated them, and the massacre of Lachine (5th of August, 1689) must be regarded as one of the unhappy results of his administration.

The affairs of the colony were now in a critical condition, and Louis XIV. once more sent out Frontenac. He arrived in Quebec as governor for the second time on Oct. 15, 1689, and confidence was at once restored. But on Oct. 16, 1690, several New England ships under the command of Sir William Phipps appeared off the Island of Orleans, and an officer was sent ashore to demand the surrender of the fort. Frontenac repulsed the enemy and prepared to follow up his advantage by an attack on Boston from the sea, but his resources were inadequate for the undertaking. In 1696 Frontenac, now 76 years of age, decided to take the field against the Iroquois. On July 6 he left Lachine for the village of the Onondagas, where he arrived a month later. In the meantime the Iroquois had abandoned their villages, and as pursuit was impracticable the army commenced its return march on Aug. 10. Frontenac died on Nov. 28, 1698 at the Château St. Louis after a brief illness, deeply mourned by the Canadian people. He was fearless, resourceful and decisive, and triumphed as few men could have done over the difficulties and dangers of a most critical position.

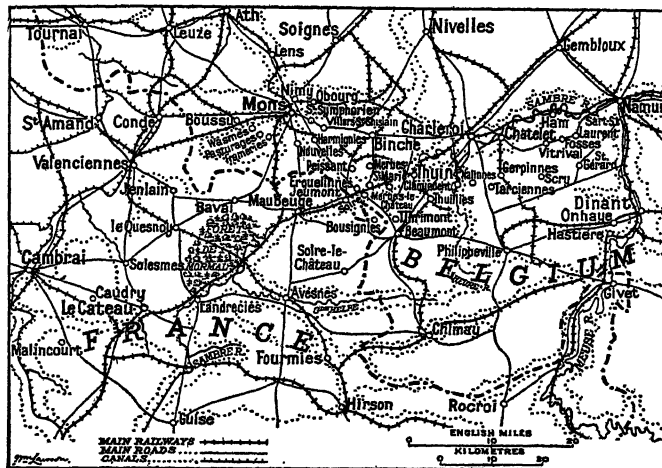

See *Count Frontenac*, by W. D. Le Sueur (Toronto, 1906); *Count Frontenac and New France under Louis XIV.*, by Francis Parkman (Boston, 1878); *Le Comte de Frontenac*, by Henri Lorin (Paris 1895); *Frontenac et ses amis*, by Ernest Myrand (Quebec, 1902). (A. G. D.)

FRONTIER, BATTLES OF THE. The generic name of "battles of the frontier" covers the whole of the actions fought at the opening of the World War in Aug. 1914, on or near the French frontiers. For convenience, these are here divided into six sections, each of which deals with a more or less distinct part of the series of operations. These are: I. Early battles in Upper Alsace; II. First battles in Lorraine; III. Battle of the Ardennes; IV. Charleroi and Mons; V. Le Cateau; and VI. Guise.

I. EARLY BATTLES IN UPPER ALSACE

It was laid down in the original French plan (see WORLD WAR) that the action of their right wing would be much assisted by a preliminary operation in Upper Alsace to be carried out by the VII. Corps and 8th Cavalry Division; this force was to advance by Mulhouse on Colmar, so holding fast the hostile forces in that area, besides encouraging the Francophile elements of the population to throw off the German yoke. In accordance with this plan, Gen. Dubail, commanding the I. Army on the right of the French line, issued orders on Aug. 5 for this operation to commence on

the 7th, and by the evening of the 8th the French had secured Mulhouse and taken up a defensive position around that town, the weak German covering troops falling back before them to the east bank of the Rhine. Their success, however, was short-lived; Gen. von Heeringen, commanding the German VII. Army, was already planning a counter offensive with the XIV. and XV. Corps, then detaining in the area Colmar-Breisach, and on the 10th the

MAP OF "BATTLE OF THE FRONTIERS" IN THE WORLD WAR, SHOWING MONS, CHARLEROI AND LE CATEAU, WHERE ENGAGEMENTS OCCURRED IN AUGUST 1914

French, heavily attacked by these superior forces, were forced to evacuate Mulhouse and commence a retreat which by the 12th had brought them back to within 100 m. of Belfort. On neither side had the conduct of the operations been a model of skill, but the Germans had at least the satisfaction of having scored the advantage in the first clash of arms.

The French high command now decided to entrust the execution of the task in which the VII. Corps had so completely failed to a newly formed army of Alsace under Gen. Pau, comprising, besides that corps, one additional regular division, and three reserve divisions. The concentration of this new army and the preparations for a renewed advance could not be completed before Aug. 14, by which date the German VII. Army, in expectation of the main French offensive in Lorraine, was concentrating all its forces to the north, leaving in Upper Alsace only three weak brigades of second line troops. These were, of course, easily driven back by Pau's army, which by Aug. 20 had reoccupied Mulhouse, together with Munster to the north and Altkirch to the south, and had cleared Upper Alsace entirely of the enemy. But the object of holding to their ground important hostile forces and so assisting Dubail's army now engaged in the main offensive had not been achieved; nor could Pau from his present position even cover its right flank effectively. It was therefore decided to withdraw him. On Aug. 20 the short-lived Army of Alsace was dissolved, the troops comprising it being placed under Dubail or despatched to other parts of the front. The early French operations in Upper Alsace had been unproductive of either political or military advantage and had absorbed forces which might have found more useful employment elsewhere. (E. W. S.)

II. FIRST BATTLES IN LORRAINE

The first French plan (General Instruction No. 1 of Aug. 8, 1914) was purely offensive. It proposed to seek action with all forces united with the right on the Rhine. The two armies of Lorraine (I. and II.) were to lead, the I. (Gen. Dubail) in the direction of Saarburg, after having thrown back the German VII. Army towards Strasbourg and Lower Alsace, while an isolated corps would make a diversion to the east of the Vosges. The II. Army (Gen. de Castelnau), covering itself from Metz, was to attack in the direction of Saarbrück, pivoting on Dubail's in the neighbourhood of Étangs. The two left corps were to the west of the Moselle, with a view to their eventual employment in the north.

Disposition of Forces.—In front of Dubail's and De Castel-

nau's armies the Germans had approximately equal strength (VI and VII. Armies). They would at first keep to the defensive, acting as a pivot to the huge wheel being made by their centre and right. The rapidity of the invasion of Belgium determined the French to hasten the operations in the east in order to make a diversion. On Aug. 13 Dubail's army had two corps on the Meurthe (VIII. and XIII.). Dubail counted besides on the co-operation of the two right corps of De Castelnau's army and on that of the XXI. Corps descending from the Vosges on his right. On Aug. 16 the II. Cavalry Corps was placed under his orders. The final concentration of the complete fighting force, however, could not be complete until the 18th. Nevertheless, the XIII. and VIII. Corps moved on the 14th, and on the 15th entered Cirey and Blamont, pushing back the I. Bavarian Corps, which retired toward Saarburg.

By the evening of the 17th the two French corps had reached the line Vasperviller-Aspach-St. Georges, and the XXI. extended the line toward the Vosges. The II. Cavalry Corps had orders to go ahead on the 18th towards Saarburg, which was entered after a skirmish. The XXI. Corps pushed to the north-east as far as Walscheid; the XIII. held the heights north and east of Saarburg; the VIII., marching on Heming, seized the passage of the Marne-Rhine Canal and entered Saarburg. The II. Cavalry Corps bivouacked toward Diane-Capelle, in liaison with De Castelnau's army, which had reached the line Bisping-Château Salins. The Germans held entrenched positions on a front of 40 m., from the neighbourhood of Dobbenheim to Biberkirch.

Dubail's Offensive.—It was decided that Dubail's army should attack with its left north-west of Saarburg, its centre and right standing fast to repulse an eventual counter-attack in the Vosges. The II. Cavalry Corps was to move on Saar-Union in order to operate south of the Saar. On Aug. 19 the VIII. Corps commenced the attack before dawn, gained the terrain north-west of Saarburg, and repulsed a counter-attack. On the 20th it resumed the offensive, but during the morning it became evident that it was incapable of opening a passage for the Cavalry Corps; indeed, it was necessary to bring back a division on the canal with heavy losses. In the centre and on the right the French were more fortunate. The XXI. Corps met no resistance on the 19th, and the XIII. had not yet been engaged.

On Aug. 20, the XXI. Corps, attacked by the German XIV. Corps, inflicted on it a serious check near Walscheid; the XIII. Corps, coming into line, attacked to the north-east of Saarburg, disengaging the right of the VIII. Corps, which held the town till nightfall. Dubail's intention was to entrench on the front Kerprich-Soldatenkopf, and to undertake afterwards a methodical advance; but the check to De Castelnau's army led Joffre to direct a retreat in Lorraine. On the morning of Aug. 21 Dubail's army retired slowly towards Blamont. Afterwards it was necessary to accelerate the movement on account of the rapidity of De Castelnau's retreat. On the evening of the 23rd, Dubail held a front from Dames-aux-Bois to the Col du Bonhomme. His army had suffered heavy losses, the casualties in the VIII. Corps amounting to more than 50%.

De Castelnau's Offensive.—The offensive of De Castelnau's army had been still less fortunate. On Aug. 14 the XVI. and XV. Corps moved in the direction of Avricourt, with the bulk of the XX., the remainder covering the front to the north. In the evening the army faced to the north-east on the high ground at Gondrexon, the XV. Corps alone having been stopped by the enemy at Moncourt. On the 15th the advance still suffered a brake by the condition of the XV. Corps, which had suffered heavily, but the XVI. and XX. Corps made fair progress. The IX. Corps remained on the Grand Couronné east of Nancy and sent out detachments toward the north-east.

On Aug. 16 the Germans continued their retreat and the French followed rapidly as far as Morhange, north-west of Donnelay. On the 17th the army was to swing round to the north-west toward Delme-Château Salins-Dieuze. The XVI. Corps progressed without difficulty; the XV. occupied Marsal, but could not bring its main body beyond the Seille; the XX. Corps, in possession of Château Salins, reconnoitred toward the north. Rearguard fights

only were expected, but on the 18th the XVI. Corps from the early morning met the enemy in strength. The German artillery held the XV. Corps in the valley of the Seille and prevented it from occupying Dieuze. The XVI. Corps had to fall back on Angviller, and only the XX. advanced to the north of Morville-les-Vic and Château Salins. In spite of the loss of the IX. Corps, sent to the IV. Army on Aug. 18, De Castelnau ordered for the 19th the continuation of the offensive in the direction of Loudrefing, Bendsdorf and Morhange.

Retreat: Aug. 19-20.—From the morning of Aug. 19 the XVI. Corps was stopped on the Salines canal; the XV. could not pass Zommange and Vergaville; and only the XX. could make a real advance, pushing a brigade as far as Morhange. The 68th Reserve Division, which had relieved the IX. Corps, insufficiently covered the left of the XX. Corps. De Castelnau ordered for Aug. 20 a combined attack by the two other corps on the line Cutting-Dommon-Bassing; the XX. was to consolidate its positions, ready to march to the north or north-east. On the 20th the corps on the right, instead of progressing, was attacked and even thrown back. The XX., having attacked and not having improved its position, was stopped by De Castelnau, but the Germans, taking the offensive in turn, threw the left back on Château Salins. The right followed this movement on Lidrequin and the 68th Division resumed its position of the previous day. At 4 P.M. the general ordered a retirement, which began during the night and continued through Aug. 21 under the protection of the XX. Corps and the 68th Division. In spite of the arrival of two new reserve divisions and the II. Cavalry Corps, De Castelnau had to retire to the west of the Meurthe, his left to St. Nicholas. To the north, three divisions held the Grand Couronné.

Dubail's Action.—On Aug. 23, Dubail's army commenced a three weeks' battle destined to stop the enemy and aid De Castelnau, who was heavily attacked. To effect this, it took the offensive on the 24th and 25th, while De Castelnau's army threw back the Germans to the north-east. From the 28th to the 31st the Germans held up Dubail's advance, and their VI. and VII. Armies even aimed at forcing "the gap of Charmes," in such a manner as to carry out an enveloping movement to the west of the Vosges. This action was helped by the French XXI. Corps being despatched to take part in the battle of the Marne.

From these circumstances there resulted a series of very confused fights extending over a large front between the Grand Couronné and the Vosges. On Sept. 6, the German VII. Army, facing Dubail, was broken up, divided between the VI. Army, and the main German right wing was then engaged on the Ourcq against Maunoury. But Dubail's army was also enfeebled by the removal, westwards also, of the XIII. Corps; and at the same time De Castelnau lost the 18th Division and the XV. Corps. Clearly both sides had given up the idea of striking seriously in Lorraine. After having gloriously held its positions to the east of Nancy and on the Meurthe, De Castelnau's Army was itself to be broken up, to be reconstituted on the left of the French armies in the "race to the sea."

Thus, after checks resulting from an inopportune offensive, Dubail's and De Castelnau's armies had been first able to stop the German progress, then to throw the enemy back to the frontier. Moreover, their merit was all the greater as they had been constantly weakened by the withdrawal of their best units. During the battle of the Marne they provided the unshakable pivot of the vast movement undertaken by the Allies. It was thanks to their efforts that that movement succeeded. But they had paid the price. A single reserve division between Aug. 24 and Sept. 12 lost 140 officers and more than 5,000 men.

III. BATTLE OF THE ARDENNES

On the outbreak of the World War, the French III., IV. and V. Armies concentrated towards the frontier, west of the Meuse. On

hearing of the German attack on Liège, Gen. Joffre decided to post the V. Army (Gen. Lanrezac) toward the Sambre and to direct the IV. Army, which he had grouped between Vitry-le-Français and Sainte-Menehould, in the region of Stenay. The concentration, which had scarcely begun on Aug. 8, was nearly finished on the 14th. Until the commander-in-chief had all his forces at hand, the covering troops were not to be drawn into an important action. The German high command had made a similar decision, hence the battle of the Ardennes was the "battle of the two blind men."

French Plan of Attack.—The German plan of operations placed the V. Army between Thionville and Tintigny, the IV. between Tintigny and the Meuse de Dinant (the Meuse between Mezières and Namur), the III. Army between Dinant and the Sambre, the II. on the Sambre, and the I. in the neighbourhood of Mons. The III. Army was still in the Ardennes behind the IV., and the I. Army was hastening towards Brussels and Antwerp, when on Aug. 22 Joffre decided to attack. It was certainly a strategic success to bring about a battle with all his forces in the Ardennes, while the German III. Army was unable to take part in it. Joffre had disposed his III. and IV. Armies in échelon, the left in front, so that he could face the north or east as he wished. On Aug. 16 he decided to attack towards the north with these two armies massed, while the 7th Cavalry Division reconnoitred towards Thionville, and the 4th and 9th Cavalry Divisions to the north towards the Meuse. The result was that in front, and almost everywhere, the Army Corps had only weak and insufficient cavalry for reconnoitring purposes.

During the night of Aug. 20-1 the whole mass moved forward. The only instructions given by Joffre were "to attack the enemy wherever met." He estimated that the IV. Army would have almost nothing in front of it, and yet it was precisely there that the Germans had their IV. and III. Armies, the III. being behind the IV. The French Lorraine army, which consisted of groups of reserve divisions, was placed under the command of Gen. Maunoury with orders to defend the Hauts de Meuse, or eventually, in the event of the advance of the III. Army, to besiege Metz and Thionville. These reserve divisions were mobilized after the active forces, the men were elderly, they had few officers, and their staffs were inexperienced, so that the III. Army could get little help from them.

On the evening of Aug. 21, after a long period, during which only patrols had been encountered, the III. Army arrived on the line Conz-Lagranville-Tellancourt-Virton. At Virton, the left corps tried to get in touch with the right of the IV. Army. The line continued by Villers-la-Loue, Geronville, Florenville and the Semoy. The IV. Army (De Langle de Cary) was to push on towards the north, while the III. Army was to cover its right against any attack coming from the north or east. Everywhere the advance was made in divisions except one corps, which marched entire on a single road.

On Aug. 22 all the columns started in a fog at a very early hour for a long march with the idea of "attacking the enemy wherever met." To march quickly rather than to take precautions was the order of the day, and almost everywhere the presence of the Germans was only discovered by receiving shell fire. In the III. Army, the V. Corps sent its infantry to the attack without the support of artillery, and it suffered such terrible losses that the leaders became completely unnerved, and Gen. Grossetti, chief of the staff, had to intervene to prevent a precipitate retreat. In the IV. Army the Colonial Corps exposed a division in column-of-route to the German guns. The XVII. Corps also suffered from a sanguinary surprise. But the most serious danger arose on the right wing of the IV. Army, uncovered by the premature check of the IV. Corps at Virton, and on the exposed right wing of the III. Army.

Fortunately, the II. Corps was in a single column, so that the rear division was able to make up for the absence of the IV. Corps. On the right of the III. Army there was a leader, Gen. Hache, who with his heroic division gained the necessary time for the other divisions to fall back. The Germans did not exploit their tactical success but remained practically stationary in their

positions. This battle of the Ardennes taught the French the necessity for co-operation of all arms in the field of battle. On Aug. 23, 24 and 25 the two armies retired slowly without being disturbed.

Lorraine Army Dissolved.—On the morning of Aug. 25, the right of the IV. Army retired between the Chiers and the Meuse; the III. Army also approached the Meuse facing eastwards. Thus the two armies practically became one, and it is regrettable that from this time they were not placed under one leader. On the same day, the IV. Corps (III. Army) suffered a severe reverse at Marville and they feared they would lose their corps artillery, but the II. Corps came to their assistance and convoyed this artillery to Stenay, where they crossed the Meuse. This shows how intimate was the co-operation between the two armies. It was on Aug. 25 also that Joffre decided to reinforce the left of the Allied Armies and to lose ground in order to gain the necessary time for his strategic plans. The Lorraine Army was dissolved; one group of divisions was to defend the Hauts-de-Meuse; the 55th and 56th Divisions were entrained for Montdidier. Gen. Maunoury had in these two divisions the nucleus of that VI. Army which determined the victory of the Marne.

On the morning of Aug. 26 the entire IV. Army was on the left bank of the Meuse, with cavalry connecting it with the V. Army. On its right flank it was in immediate contact with the III. Army. So much feared was the envelopment of the III. Army's right, that a cavalry division was sent to the rear to Dombasle, between Verdun and Clermont, as if an extensive enemy movement was expected to take place south of Verdun. The III. Army took no part in the battle of the Meuse.

Defence of the Meuse.—On Aug. 26 the orders ran: "From to-morrow the IV. Army will fight a decisive battle on the Meuse . . . The corps will make every effort to prevent any attempt of the enemy to cross the river." Generally speaking, this army was some distance from the left bank. Its object was to carry out vigorous counter-attacks against German infantry who had passed the river before its artillery could come to its support. The Colonial Corps was somewhat driven back by the Germans, who had crossed at Inor and Pouilly, but the arrival of reinforcements from the II. Corps soon checked this. The struggle was severe on the whole front. On the right wing the II. Corps had decided successes, three times throwing the Germans back into the river at Cesse and Luzuy. On the left wing, the success was still more marked. There the XI. Corps, reinforced by two reserve divisions, gained the battle of La Marfée. A German division, making the same mistake as did the French at the battle of the Ardennes, advanced in massed formation without artillery support and was crushed.

On the evening of Aug. 27, De Langle de Cary gave the following order: "At all costs the Germans must be thrown back into the river Meuse." However, Aug. 28 was not so active as the previous day; the Germans scarcely attacked at all, and the orders given by Joffre for the coming retirement to the Aisne kept the IV. Army to its ground. On the 29th the retirement towards the Aisne commenced—the battle of the Meuse was ended. The French IV. Army had repulsed the German IV. Army—a victory without a to-morrow, but certainly a victory.

Battle of Signy l'Abbaye.—The French V. Army, having been beaten by the German II. Army on Aug. 22 and 23, had to retreat, leaving a gap 25m. wide between it and the IV. Army. The Germans of Hausen's III. Army poured into this open space. Gen. Dubois was ordered to fill up this gap and to cover the left of the IV. Army, and was given command of the IX. Corps, composed of the 17th Division, the Moroccan Division, and the 9th Cavalry Division. Two roads led to the region occupied by the Germans at Rethel. The road Mezières-Rethel was barred by the 17th Division and the 9th Cavalry Division at Guignicourt, the road from Rocroi to Rethel by the Moroccan Division at Signy l'Abbaye and Launois.

On Aug. 28, the 17th Division, hearing the guns from La Marfée, had its attention drawn in that direction. On the same day, at 3 A.M., the advanced posts of the Moroccan Division were attacked by the XII. (Saxon) Corps. At 11 A.M. the Moroccan

Division was turned in the west by the enemy, who seized Signy l'Abbaye and so opened up the way to Rethel. But the Germans did not exploit their success and allowed themselves to be checked at Novion-Porcien. The battle manoeuvres lasted through Aug. 29 and 30. Dubois, by clever movements, brought his forces to the north of Rethel, having thus accomplished his difficult mission. Again German strategy had not made the best use of its superior strength. (V. L. E. C.)

IV. BATTLES OF CHARLEROI AND MONS

The series of encounters between the Allied left and German right wings in southern Belgium during the third week in Aug. 1914 may be sub-divided into the battle of Charleroi, in which the V. French Army was attacked and defeated by the German II. and III. Armies, and the battle of Mons, subsequent to which the British Expeditionary Force retired southwards before the German I. Army.

1. THE PRELUDE TO THE BATTLES

(a) **German Movements Prior to the Battles.**—The German plan of campaign in 1914, which in its general lines followed that drawn up some ten years before by Schlieffen, the then chief of the great general staff, involved an advance with a strong right wing through Belgium, so as to turn the fortresses on the French eastern frontier, and with the centre through the Belgian Ardennes and Luxembourg, pivoting on the fortified area Thionville-Metz. The three German right wing armies concentrated in the area between the German western frontier with Holland, Belgium and Luxembourg, and the line of the lower Rhine and Moselle from Duisburg to Treves. The I. Army (Kluck) on the extreme right, comprising four first line corps and two second line corps, assembled to the north-east of Aix-la-Chapelle; the II. Army (Bülow) on its left, comprising three first line corps and three second line corps, to the east and south of Aix-la-Chapelle; the III. Army (Hausen), comprising three first line corps and one second line corps, to the east of the line St. Vith-Bitburg. Two cavalry corps were also allotted to the right wing, together with certain ancillary troops. In all, the three armies therefore comprised 20 first line and 12 second line infantry divisions and five cavalry divisions, and their concentration was completed by Aug. 14. The fall of the last forts of Liège early on the 16th having opened the way for their advance, the I. and II. Armies crossed the Meuse between the Dutch frontier and Huy during the course of the next few days, and came into contact with the main body of the Belgian army deployed behind the line of the Geete between Diest and Tirlemont. By the evening of the 20th the Belgians had been forced to seek shelter in Antwerp; the I. Army had occupied Brussels and the country to the south as far as Waterloo; the II. Army on its left continued the line south-eastwards towards the Belgian fortress of Namur, which its two left wing corps were observing; and the III. Army east of the Meuse, having made its way through the northern Ardennes, was approaching the line of that river between Namur and Givet. At the headquarters of Bülow, who had been placed in general control of the operations of both the I. and II. Armies, it was believed that strong French forces (about five corps) were moving forward into the angle between the Sambre and the Meuse, that the British would shortly complete their landing at Boulogne and move thence on Lille, though their arrival in the near future was not to be expected. On the morning of the 20th Bülow received orders from the German Supreme Command that his two armies should co-operate with the III. Army in an attack on the French forces west of Namur; the details of the combined attack were left to be mutually arranged between him and Hausen.

(b) **French Movements Prior to the Battle of Charleroi.**—The French V. Army, the rôle of which as laid down in plan 17, was to act offensively in conjunction with the IV. and III. Armies on its right, to the north of the line Verdun-Metz against the enemy right wing, concentrated on the Franco-Belgian frontier between Longwy and Hirson; it comprised four corps (each of two divisions), two Algerian divisions, and a cavalry corps of

three divisions.

The army commander, Gen. Lanrezac, from the first believed that the main strength of the forces opposed to him was to be expected north of the Meuse, and that the projected offensive across that river through the Ardennes would therefore be impracticable; and he took every opportunity of impressing this view on Gen. Joffre. The latter, on the other hand, adhered to his plan for an offensive across the Meuse into the Ardennes, which he estimated would break in the enemy's centre, nullify any advantage gained by their right wing in Belgium, and even force its withdrawal. All he considered necessary was to extend the left wing of Lanrezac's Army to the north towards Namur and place a group of three reserve divisions behind it around Vervins. A hostile attack on Dinant on Aug. 14 and increasing evidence of the great German strength north of the Meuse finally induced him, while still maintaining his project for an offensive by the III. and IV. Armies, to move Lanrezac's Army northward to the area Mariembourg-Philippeville, so as to be in a position to meet the danger from the north.

Between Aug. 16 and 20, therefore, Lanrezac's Army carried out a change of front and a flank march which brought it to a new position south of the Sambre between the western defences of Namur and Thuin, with advanced guards holding the bridges, and one corps (I.) facing east along the Meuse between Givet and Namur to guard its right flank. Its further action as laid down by Joffre on the 18th was, in conjunction with the British and Belgian armies, either directly to oppose a hostile advance astride the Meuse between Givet and Brussels, or, if the main enemy strength lay south of that river, to act against his right flank in the northern Ardennes. On the 20th, however, it became known that the Belgian army was in full retreat on Antwerp, while Sir John French had informed Lanrezac at an interview on the 17th that the British Expeditionary Force would not be ready for action before the 24th. As regards the enemy, Lanrezac believed them to have nine or ten corps available for active operations against him north of the Meuse and another two in the angle south-east of Namur. His intention was now to close up his army on the 21st and 22nd, establish himself in a defensive position, and cross the Sambre early on the 23rd, and orders to this effect were issued on the evening of the 20th.

(c) **British Movements Prior to the Battle of Mons.**—The mobilization of the British Expeditionary Force (B.E.F.) was completed by Aug. 9 and the transport across the Channel of its four infantry divisions and five cavalry brigades took place without interruption between the 12th and 17th. Field Marshal Sir John French, the commander-in-chief, had received instructions to co-operate with the French but as an independent commander only, and to be cautious of exposing his small and precious force to serious danger or losses. After a series of conferences with Joffre and Lanrezac, it was agreed that the B.E.F. should take part in Lanrezac's offensive, moving on the left of Lanrezac by Soignies on Nivelles, and as a preliminary should move forward from its concentration area east of the general line Maubeuge-Landrecies-Bohain to a position of assembly about Mons. On the evening of the 20th, orders were issued for the advance to begin on the morrow.

2. THE BATTLE OF CHARLEROI

(a) **Aug. 21.**—During the 21st the I. German Army continued its south-westerly advance and the III. Army closed up to a line a few miles east of the Meuse. Bülow's orders for the 21st were that the II. Army on the 21st would continue its advance to the Sambre, but as the III. Army was not yet in position, it was agreed between the two commanders that the combined attack by the two armies against the enemy south-west of Namur should not take place until the 23rd. The right wing of the II. Army reached the line of the Canal du Centre west of Gosselies, driving back the French cavalry, while the left began operations against the eastern forts of Namur. The centre, however, early in the afternoon came into contact with the right of the French V. Army on the line of the Sambre and forced its way across the river. Thus on the evening of the 21st the German II.

Army secured the crossings both of the Canal du Centre and of the Sambre, and was in position ready to carry out its part in the combined attack arranged with the III. Army for the 23rd.

The French right on this evening had taken up a new defensive position running from Fosse to Marchienne au Pont. The left was approaching Thuin, with the cavalry covering its western flank. Of the group of three reserve divisions which had de-trained around Vervins, one was on its way to relieve the I. Corps, still guarding the army right on the Meuse south of Namur; the other two were moving north and had reached Avesnes. In these positions Lanrezac decided to await further hostile attacks on the morrow.

(b) **Aug. 22.**—Bülow's orders for the 22nd envisaged nothing more than a general closing up of the II. Army on the north bank of the Sambre and preparations for an advance across that river on the 23rd, so as to open the passage of the Meuse for the III. Army. The I. Army was directed to close up to a position whence it could support the right of the II. Army. News which arrived at II. Army H.Q. in the course of the morning, however, caused a radical change of plan; it appeared from this that the French immediately south of the Sambre were chiefly cavalry and that their main forces were no farther north than the line Beaumont-Philippeville. Bülow, faced with the alternative of throwing overboard his pre-arranged scheme of co-operation with the I. and III. Armies, or of losing so apparently favourable a chance of securing the passage of the Sambre at little cost, decided about noon to attack forthwith. Orders were accordingly issued to all corps; the III. Army was asked also to push forward.

The right of the II. German Army encountered no very serious opposition, and by the evening, had succeeded in setting foot on the right bank of the river. In the centre, however, the struggle was much more severe. In the early morning the French right wing launched a series of counter attacks in the hope of regaining the ground lost on the 21st; these met with only partial success, and were finally beaten back with heavy loss. A stand was made on the line Fosse-Gerpinnes; where for some hours the fight swayed to and fro without any decided success on either side. Finally, however, the Germans succeeded in breaking into the positions held by the French, who were driven back once more to the line St. Gerard-Nalinnes, where they reorganized and prepared for a new defence on the morrow. Their left wing was not seriously attacked and maintained its positions.

For the 22nd, the German III. Army had been ordered merely to close up on the east bank of the Meuse, and began preparations for the passage of the river on the morrow. During the day news came in to Hausen that the II. Army, contrary to its commander's previous arrangement with him, had crossed the Sambre that day and asked urgently for his co-operation by an advance across the Meuse. Orders were therefore issued for the III. Army to force the passage of the river early on the morrow.

(c) **Aug. 23.**—The morning of the 23rd passed without any renewal of fighting on the French V. Army front; Bülow was apparently waiting till the effects of the III. Army attack should make themselves felt. It was not till afternoon that his centre began to work forward towards Mettet and forced back the French line some little distance by nightfall. Fighting on the left was more serious and sustained; the Germans forced the passage of the Sambre in this sector, and after repeated attacks drove back their opponents some miles to the south. On the extreme left the troops of the Reserve Divisions, relieving the cavalry, came into line along the south bank of the Sambre between Merbes le Chateau and Maubeuge.

Despite the progress made by the II. Army during the fighting of the last three days, the view of the situation taken at Bülow's headquarters on this evening was gloomy. The expected co-operation of the I. Army had failed to materialize, and that of the III. Army seemed to have had little effect. The enemy was believed to be in superior force on the army front; he had fought well and might be expected at any time to undertake a general counter-offensive, which the German troops, exhausted by three days' incessant fighting, could hardly hope to resist. Nevertheless, the army orders for the 24th laid down a continuance of the

attack.

The III. Army had begun its attack east of the Meuse early in the morning. The French positions were strong and well adapted for defence, and their resistance stubborn; but before noon the German left had effected a crossing and observed signs of a hostile retirement, which were attributed to the effect of the II. Army's victorious advance. In accordance, therefore, with an order from the German Supreme Command, Hausen instructed his left to move on Fumay so as to cut off the hostile retreat to the south. But the task of the army was far from accomplished; its centre met with fierce resistance at Dinant and only got across late in the day; the left, pushing forward to Onhay, was counter-attacked and driven back by part of the French I. Corps, sent back to restore the threatening situation on this front; while the column sent towards Fumay, by reason of the natural difficulties of the route, failed to reach its objective. Still, the III. Army was across the Meuse, and Hausen had ordered it to undertake a pursuit next day in a south-westerly direction, when a staff officer from the II. Army arrived bearing an urgent request for his assistance in the form of an advance due west against the flank of the French V. Army. To this alteration of his plan Hausen consented and issued new orders directing his right wing on Mettet.

Meanwhile, Lanrezac, on his side, in view of the threat to his flanks and rear afforded by the fall of Namur, the advance of the III. Army and the defeat of the French in the Ardennes, fearing for his left where the B.E.F. had been engaged all that day, with superior enemy forces, and realizing the state of moral and material exhaustion among his own troops, decided that he had no choice but to retreat. Orders were issued that morning for a withdrawal to the line Givet-Philippeville-Merbes-le-Chateau; which was carried out on the 24th unmolested by the Germans. Their II. Army advanced only a few miles to the southward; the right of their III. Army, advancing due west, found no enemy before it, and its left column, resuming its advance on Fumay, was unable to cross the Meuse there until the 28th, when it was too late to interfere with the French retirement. The battle of Charleroi had thus terminated in a definite German success, the scope and effects of which, however, were so unduly exaggerated in the reports of army and corps commanders, as to assume, quite without warrant, the dimensions of a decisive victory.

3. THE BATTLE OF MONS

On Aug. 21 the British Expeditionary Force began its advance into the line of battle. The cavalry preceded the advance, followed by the II. Corps (Smith-Dorrien) and the I. Corps (Haig) in that order. Reports from aircraft and cavalry on the 21st and 22nd established the presence of hostile cavalry about Nivelles, and of the main enemy forces between Enghien and Charleroi. In rear of the cavalry the British Corps closed up to the line Binche-Mons-Condé canal, the I. Corps on the right as far as Villers St. Ghislain, the II. Corps on the left behind the canal line; one cavalry brigade covered the right of the army, while later in the morning the cavalry division fell back from before the front to a new position south-east of Condé in rear of its left. Sir John French knew on the evening of the 22nd that the French on his right, after heavy fighting, had been forced back from the line of the Sambre, and that strong enemy forces, reckoned at three or four corps, were approaching his own front; he therefore determined to abandon all idea of an offensive, and to stand for battle next day in the positions then held by his army. In view of this, a request from Lanrezac for a British counter-stroke against the flank of the enemy then attacking him could not be complied with; the most that French could promise was that he would hold his ground for at least 24 hours.

On the German side the I. Army, on the evening of Aug. 21, received orders from Bülow to be prepared next day to afford direct support to the II. Army. To this scheme Kluck saw serious objections in view of the uncertainty as to the whereabouts of the British, and a prolonged discussion took place which resulted in the I. Army commander yielding his point, and

agreeing to swing his army on the 22nd more to the south to the line Lessines-Soignies. During this day contact was established, as has already been related, with the British cavalry and Kluck now realized that the B.E.F. was advancing to join up with the left of the French on the Sambre. Once more there arose a divergence of views; Kluck wanted to carry out a wide turning movement to envelop the British left; while Bülow considered he could not dispense with his direct support on the Sambre. Eventually orders were issued for the I. Army to advance on the 23rd across the Canal du Centre to the general line north of Maubeuge, north-east of Condé, a movement which was bound to bring them into conflict with the British.

Early on the morning of the 23rd, the latter had taken up their positions for battle—the I. Corps on the right facing north-east between the Sambre and the Haine south-east of Mons, the II. Corps and the 19th Infantry Brigade facing north along the line of the Canal du Centre from Mons to just east of Condé (which was held by part of the 84th French Territorial Division), and the Cavalry Division in rear of the II. Corps left. The whole front was a very long one—about 27 miles; the ground along the line of the canal was enclosed and much built over, but the heights to the south-east of the Haine afforded strong second positions farther in rear. About 9 A.M. the battle opened on the II. Corps' right, but it was not till 11 A.M. that the action became general all along its front. This pause was due to the fact that early in the morning Kluck, alarmed by a false report that strong hostile forces were detraining at Tournai, well out on his right flank, had ordered his army to halt until the situation there was cleared up—which did not occur till about mid-day. The German attack at first made little progress and suffered heavy casualties from the effective British fire, but in the early afternoon the right of the British Corps was forced to evacuate Mons and the canal bend north of it, and retire to its second position, while a gap in its centre also caused some temporary anxiety. By nightfall it had everywhere fallen or was about to fall back to this new position about 2m. south of the canal. Neither the I. Corps on the right nor the 19th Brigade and the French on the extreme left had been seriously attacked during the day, since the German right wing, which was moving on Condé, failed to reach the battlefield; the British losses had been slight and the *moral* was excellent. None the less, Sir John French, on receipt of news from the French G.O.C. and Lanrezac's French army of the situation on his flanks and the greatly superior enemy force available for use against him, realized that he could not continue to hold his position, and issued orders for a retirement next day to a line running east and west through Bavai, with its right covered by the fortress of Maubeuge.

This withdrawal, commencing before dawn on the 24th, was successfully executed, though not without local fighting in which the B.E.F. actually suffered more heavily than in the previous day's battle. The I. Corps and the right of the II. Corps fell back unmolested, but at Frameries and Elouges the centre and left of the II. Corps and Cavalry Divisions were hard pressed by the enemy, who succeeded in cutting off and capturing the greater part of one battalion at Elouges after a gallant resistance. Nevertheless, by the morning of the 24th the B.E.F. stood, wearied but intact, on the line allotted to it on either side of Bavai. The German I. Army, apart from its pressure on the rear guards of the II. Corps, made little attempt to follow up or molest the retirement. Kluck believed the British would stand fast on this day and await his further attack, arrangements for which he had laid down in his orders issued late on the 23rd; it was not till next morning that he realized the true position, and then it was too late to carry out that enveloping movement with his right wing which alone could have enabled him to secure decisive success. In fact, the results of the two days' fighting around Mons were, from the German point of view, disappointing; the retirement of the British before it was mainly attributable to the course of events elsewhere and in particular to the ill-success of the French V. Army farther east, and there was at no time any question of a true tactical victory on the German I. Army front.

General Considerations.—The operations above described

had thus resulted in a serious Allied defeat which laid open the whole northern frontier of France to invasion. The weight and velocity of the German offensive had been too great and unexpected for the French counter-measures to be effective in stemming its progress; such a result was only to be expected in view of the fact that on this sector of the front the Germans had a numerical superiority of 11 divisions (28 as against 17). The Allies, moreover, were incompletely concentrated for battle and the arrangements for co-operation between them were by no means satisfactory. The V. Army moved forward to the Sambre too late to assist the Belgians and too soon to be able to count on British support, and became involved in an encounter battle before it had time to establish itself in a suitable defensive position. Moreover, its indifferent tactical handling allowed the Germans to make full use of their superior armament, which took heavy toll of the hasty and ill-prepared attacks in which the French at this period of the war were too prone to indulge. The French failure at Charleroi, moreover, nullified the effect of the temporarily successful resistance of the British at Mons against an enemy who had ample additional troops at hand to continue his offensive. The immediate retreat of the whole Allied left wing therefore became the only means of escape from a critical situation.

Fortunately for the Allies, the Germans on their side failed to reap the full fruits of a success so real that it might well have been made decisive. This failure must be attributed to several causes: inadequate information, which lead them unduly to disperse their forces prior to and during the battles; defective organization of command, which placed the general control of the operations in the hands of one army commander who was bound to be unduly influenced by events on his own immediate front; and faulty leadership, which indulged in sudden and ill-considered changes of plan, and let slip its chance of completely destroying its weaker adversary. It seems that while the Allies were fortunate to escape as lightly as they did, for the Germans Charleroi and Mons were at once a real victory and a lost opportunity.

V. BATTLE OF LE CATEAU

In view of the withdrawal of the whole of the French centre and left wing which Sir John French had been informed was to be continued on Aug. 28, the British C.-in-C. ordered on the evening of the 24th a further retirement of the B.E.F. from the Bavai area to a position on either side of Le Cateau. In order to carry out this movement it was necessary to split the army and send the I. Corps to the east and the II. Corps and cavalry to the west of the great Mormal forest, which lay right across the line of retreat and through which no practicable roads were believed to exist. The I. Corps completed its movement unmolested by the enemy, though not without difficulty and trouble owing to the great heat and the presence of French troops along its allotted route, and went into quarters for the night around Landrecies. Here late in the evening a collision took place with German advance guards, which after some confused fighting were beaten off. On the other flank, however, the II. Corps and the cavalry, who were joined in the afternoon by the 4th Division, just detained at Le Cateau, had considerable fighting.

The commander of the German I. Army, who had expected the British to stand for battle, realized in the early morning that they were in fact retiring, but concluded as the result of an erroneous air report that the direction of their retreat was not south-westwards but eastwards with a view of seeking shelter under the guns of Maubeuge—a course of action which Sir John French had in fact considered, but on recollection of the fate of Bazaine in similar circumstances in 1870, had rejected. As a consequence of this inaccurate appreciation of the situation, the I. Army column were switched off from their first direction of advance south-westwards towards a new southward direction, and it was not till the afternoon that the error was recognized and the original direction resumed. By that time, as we have seen, the British I. Corps had got a good start of their adversaries; but the II. Corps and cavalry, partly owing to the passage of the French I. Cavalry Corps across their rear to the new position

allotted to it on their left, were much delayed in starting their retirement, and the German II. and IV. Corps early got contact with their rear guards; so that the retreat of the British left wing resolved itself into a running fight with a vigorously pursuing enemy. The 4th Division, which had just arrived from England and had taken up a position north of Solesmes, effectively assisted the withdrawal, but the bulk of the troops of the II. Corps were unable to reach the positions allotted to them west of Le Cateau until late that night, and some not even till next morning. The 4th Division and the cavalry were in little better position, the former, which was deficient of many essential units, being unable to fall back from Solesmes to its new positions till long after dark, while the cavalry, being scattered on both flanks of the II. Corps, were much exhausted.

About 9 P.M. Gen. Smith-Dorrien, G.O.C. II. Corps, received orders from British G.H.Q. that the army was not to stand to fight on its present position next day, as expected, but was to continue its retreat to the area Busigny-Beaurevoir-Le Catelet. He now found himself called on to make a critical decision. According to reports from his subordinates, his force could not possibly resume its retreat till well after dawn on the 25th; and as the enemy were, according to information from the cavalry, in force close to his front, to attempt a retirement by daylight and over roads encumbered with transport and refugees would probably lead to a disaster. Moreover, the I. Corps was believed to be engaged with the enemy, and the II. Corps, by falling back, would expose its flank and rear. To continue his retirement next day, as ordered, he therefore considered impossible. By standing to fight in conjunction with the 4th Division and the cavalry he might hope to check the hostile advance for a time and utilize the first opportunity to resume his withdrawal before he could be attacked and overwhelmed by greatly superior forces. On this latter course, therefore, Smith-Dorrien eventually decided; and in this decision G.H.Q. concurred. Accordingly, orders were got out for the British left wing to stand for battle, on the heights south of the Le Cateau-Cambrai high road between Le Cateau and Esnes.

The German I. Army halted for the night of the 25th-26th on the general front, east and south edges of Mormal forest—Solesmes-Bouchain, and its orders for the morrow were to continue the pursuit south-westward so as to cut off the British line of retreat between Cambrai and St. Quentin. About 6 A.M. on the 26th, the 4th Division was suddenly attacked by German cavalry and suffered severely before it could effect its withdrawal to its battle position on the line Ligny-Esnes, and there check the German progress. Meanwhile, on the opposite flank the 5th Division in and west of Le Cateau were as suddenly assailed and forced back to the heights south-west and west of the town. An attempt to get round its right in the Selle valley was, however, foiled with the help of the cavalry on that flank; and with the assistance of troops sent up from corps reserve the British positions were maintained intact in this part of the field till noon. The 3rd. Division in the centre had not been seriously attacked. Before long, however, the situation became serious, one fresh German corps, moving west from about Landrecies, was approaching the field and threatened to envelop the British right; while on the left another which had arrived on the field to support the cavalry, resumed the attack in the sector held by the 4th Division. Under these circumstances Smith-Dorrien, at 1.40 P.M., ordered a general retirement commencing with the right, and as soon as these orders reached the troops, about 3 P.M., the withdrawal commenced. On the 5th Division front considerable difficulties were encountered, and some guns had to be abandoned but the bulk of the troops succeeded in getting away. The 3rd Division had no difficulty in effecting their retreat, and the 4th little more, since the attention of the German II. Corps, which, after driving back French Territorial troops through Cambrai, was preparing to fall on the British left, was distracted by the opportune arrival about Crèvecœur, of the French Cavalry Corps, whose artillery effectively prevented the German attack from developing till the 4th Division had got well away to the south. On the whole front small parties which had not received orders to retire or had

received them too late, fought on till finally overwhelmed, and their stubborn resistance prevented any pursuit of the main bodies by the enemy. Marching far into the night despite its intense exhaustion and great congestion and confusion on the various lines of retirement, Smith-Dorrien's command finally halted in the area between Bohain and Le Catelet. It had lost close on 8,000 men and 38 guns, but was still a fighting force. Its escape from the critical position in which it stood on the morning of the battle may be attributed partly to its adversaries' failure to exploit to the full their great superiority in numbers and means; partly to the invaluable help rendered first by the French Territorials and later by their cavalry corps in securing its exposed left flank throughout the day; but most of all to the fine qualities of its leadership and its own soldierly virtues, which made of Le Cateau an episode more creditable than many a victory.

With the conclusion of the battle the crisis through which the B.E.F. had passed since Mons may be said to have ended. Its retreat was continued on the 27th and 28th unmolested by the German I. Army, which now had to swing westward to deal with a new enemy in the shape of French forces assembling in the Somme valley. The II. Corps, 4th Division, and cavalry moved via St. Quentin and Ham behind the line of the Somme and then behind the Oise, where touch was established with the I. Corps, which, after a series of rear-guard encounters with the right wing of the German II. Army, had successfully effected its retreat by way of Etreaux and Guise. Thus, on the 29th, the whole of the B.E.F. stood once more united on the south bank of the Oise between La Fere and Noyon, where it was afforded a short respite to reorganize and refit.

VI. THE BATTLE OF GUISE

Between Aug. 24 and 27 the French V. Army carried out a steady retirement southwards from the area south of the Sambre to south of the Oise, and on the evening of the 26th stood with outposts on the line of that river and the Thon between Aubenton and Guise, and its main bodies farther back. The German II. Army, which had bought its victory at Charleroi at a heavy price in casualties, had followed it up and had reached on a line from east of Bohain to La Capelle; it was now reduced to four corps, the other two having been sent off to the eastern front, where the situation had become menacing for the Germans. No serious contact had taken place between the adversaries during this period.

Meanwhile Joffre, in view of the Allied failure in the frontier battles and the rapid progress of the German right wing, proposed to strengthen his own left wing by the formation of a new VI. Army about and south of Amiens, to check the enemy advance on the general line Laon-La Fere-St. Quentin-the Somme, and ultimately assume the offensive with the V., VI. and British Armies. But the retreat of the B.E.F. as a result of Le Cateau rendered it necessary in his opinion for some immediate assistance to be given to it if it were to be kept in being as a fighting force, and on the 27th the V. Army received orders for an immediate attack north-westwards towards St. Quentin against the enemy who were following up the British on the west bank of the Oise. Accordingly, the French Corps on the 28th closed to their left in preparation for the attack on the 29th, the left wing facing north-west along the Oise between Origny and Mons, the right guard facing north between Guise and Rumigny. The co-operation of the British I. Corps had been asked for and promised by its commander, but Sir John French intervened to forbid this. Meanwhile, Bülow, as before the battle of Charleroi, had come to the conclusion early on the 28th that he had only strong rear guards in front of him south of the Oise. On the 28th, therefore, he pushed his left wing up and over that river between Guise and Étréaupont, while his right was sent off far to the south-westwards beyond St. Quentin towards the upper Somme so as to keep touch with the I. Army and assist it to cut off the retreat of the British. His orders for the 29th dealt mainly with the preparatory measures for the attack on the out-of-date fortress of La Fère, the importance of which seems unduly to have obsessed him; the right wing, however, was to continue its advance south-westwards.

The French advance across the Oise towards St. Quentin thus came as a complete surprise to the Germans; and their right wing, thus menaced on its left flank, was at once checked in its progress and faced hurriedly south-eastwards to meet the unexpected threat. At first only part of one corps was available to stave off the advancing French, who got to within 4m. of St. Quentin, while the wide gap between Bülow's wings for a time caused him grave anxiety. Eventually the arrival of the remainder of his right wing relieved the German situation in this part of the field; the French having received orders that the attack on St. Quentin was not to be pressed, maintained their ground till nightfall, and then fell back east of the Oise.

The reason for this order lay in the changed situation on the northern part of the field, where the German left wing, advancing southwards, had driven in the French forward troops opposed to them, and menaced the flank of columns about to cross the Oise about Mt. d'Origny. Lanrezac's reserve was thrown in; a general counter-stroke took place which not only put a stop to the enemy's advance, but forced him to give ground; and by nightfall the progress of the German left wing had been definitely checked.

The object of the French counter-offensive having been achieved, Joffre ordered Lanrezac to resume his retreat on the 30th, to the line originally laid down, and this movement, which commenced early in the morning, was safely completed under cover of strong rear guards. The Germans did not attempt to resume their attack during the morning, but their right wing, having called up to its assistance a division of the I. Army, advanced in force later in the afternoon across the Oise and established itself on the east bank by nightfall; the left wing also moved forward level with it. By this time the French main bodies had got clear away and no pursuit was undertaken; the II. Army, which was much exhausted, was ordered a rest day on the 30th, leaving to the I. Army the task of following up the retreating enemy by an advance across the Oise south of La Fère. In truth the battle of Guise, if a *victoire sans lendemain* for the French, was a bad set-back for the Germans, and in it was to be found a presage of the turn of the tide a week later on the Marne.

FRONTINUS, SEXTUS IULIUS (c. A.D. 40-103), Roman soldier and author. In 70 he was city praetor, and five years later succeeded Petilius Cerealis as governor of Britain. He subdued the Silures, and held the other native tribes in check till he was superseded by Agricola (78). In 97 he was appointed superintendent of the aqueducts (*curator aquarum*) at Rome. His chief work is *De aquis urbis Romae*, in two books, containing a history and description of the water-supply of Rome, including the laws relating to its use and maintenance, and other matters of importance in the history of architecture. His treatise *De re militari* is lost. His *Strategematicon libri iii.* is a collection of examples of military stratagems from Greek and Roman history; a fourth book, the plan and style of which is different from the rest (more stress is laid on the moral aspects of war, e.g., discipline), is the work of another writer (best edition by G. Gundermann, 1888). Extracts from a treatise on land-surveying ascribed to Frontinus are preserved in Lachmann's *Gromatici veteres* (1848).

A valuable edition of the *De aquis* (text and translation) has been published by C. Herschel (Boston, Mass., 1899; 2nd ed., 1913). It contains illustrations, maps, a photographic reproduction of the only ms. (the Monte Cassino), explanatory chapters, and bibliography, in which special reference is made to P. de Tissot, *Étude sur la condition des agrimensors* (1879). Editions of the works: A. Dederich (1855); Knohn (Leipzig, 1922); the *Strategematica* by R. Scott (1816); *Strategemata* and *De aquis* by C. Bennett (Loeb series, 1925).

FRONTISPIECE, an architectural term for the entrance front of any building, also, more commonly, for a rich decorative

feature of considerable size, sometimes including the entrance door, applied to the principal front of a building. Thus the tall niches containing the doors of many Mohammedan buildings (see *MOHAMMEDAN ARCHITECTURE*) are frontispieces. In common non-architectural usage the word designates the decorative composition or picture placed at the beginning of a book, usually facing the title page, and forming the first, and often the most important of the book's illustrations.

FRONTO, MARCUS CORNELIUS (c. A.D. 100–170), Roman grammarian, rhetorician and advocate, was born of an Italian family at Cirta in Numidia. He came to Rome in the reign of Hadrian, and soon won fame as an advocate, and amassed a large fortune. Antoninus Pius appointed him tutor to his adopted sons Marcus Aurelius and Lucius Verus. In 143 he was consul for two months, but declined the proconsulship of Asia on the ground of ill-health. His talents were greatly admired by his contemporaries, a number of whom formed themselves into a school called after him *Frontoniani*, whose avowed object it was to restore the ancient vigour of the Latin language. The authors recommended include Ennius, Plautus and Sallust. Till 1815 the only extant works ascribed (erroneously) to Fronto were two grammatical treatises, *De nominum verborumque differentiis* and *Exempla elocutionum* (the last being really by Arusianus Messius). In that year, however, Angelo Mai discovered in the Ambrosian library at Milan a palimpsest manuscript from St. Columba at Bobbio (and, later, some additional sheets of it in the Vatican), on which had been originally written some of Fronto's letters to his royal pupils and their replies. These were published at Rome in 1823. The correspondence with Antoninus Pius, Marcus Aurelius and Lucius Verus, shows their character in a very favourable light. The collection also contains letters of recommendation to friends, treatises on eloquence, some historical fragments, and literary trifles on such subjects as the praise of smoke and dust, of negligence, and a dissertation on Arion. Fronto's style is "a laborious mixture of archaisms, a motley cento," the forerunner of the Latin of Apuleius.

The best edition of his works is by S. A. Naber (1867), with an account of the palimpsest; see also G. Boissier, "Marc-Aurèle et les lettres de F." in *Revue des deux mondes* (April 1868); R. Ellis, in *Journal of Philology* (1868) and *Correspondence of Fronto and M. Aurelius* (1904); and the full bibliography in the article by Brzoska in the new edition of Pauly's *Realencyklopädie der classischen Altertumswissenschaft*, iv. pt. i. (1900). Edition with English translation by Haines (Loeb series, 1919); see also M. D. Brock, *Studies in Fronto and his Age* (Girton Coll. Studies V.) (1911)—a more favourable view of Fronto's style.

FROSINONE, a town of Italy (anc. *Frusino*), and the capital of a province 53 m. E.S.E. by rail from Rome. Pop. (1921) town, 5,885; commune, 12,815. The place is picturesquely situated on a hill of 955 ft. above sea-level, but contains no buildings of interest. It was a Volscian, not a Hernican, town; a part of its territory was taken from it and sold about 306–303 B.C. by the Romans, later becoming an unimportant colony. It was situated a little way above the *Via Latina*.

FROSSARD, CHARLES AUGUSTE (1807–1875), French general, was born on April 26, 1807, and entered the army from the *École Polytechnique* in 1827, being posted to the engineers. Napoleon III. made him in 1867 chief of his military household and governor to the prince imperial. He was one of the superior military authorities who in this period 1866–1870 foresaw and endeavoured to prepare for the inevitable war with Germany, and at the outbreak of war he was given by Napoleon the choice between a corps command and the post of chief engineer at headquarters. He chose the command of the II. corps. On Aug. 6, 1870 he held the position of Spicheren against the Germans until the arrival of reinforcements for the latter, and the non-appearance of the other French corps compelled him to retire. He took part in the battles around Metz, and was involved with his corps in the surrender of Bazaine's army. General Frossard published in 1872 a *Rapport sur les opérations du 2 corps*. He died at Château-Villain (Haute-Marne) on Aug. 25, 1875.

FROST, EDWIN BRANT (1866–), American astronomer, was born in Brattleboro, Vt., on July 14, 1866, and gradu-

ated at Dartmouth college in 1886. From 1887 to 1890 he served at Dartmouth as instructor in physics and astronomy and received his M.A. degree in 1889. The following year he studied in Strassburg, Germany, and in 1891–92 served as volunteer and assistant in astrophysics at the observatory at Potsdam. He was assistant professor of astronomy and director of the observatory at Dartmouth, 1892–95, and professor, 1895–1902. In 1898 he became professor of astrophysics at the University of Chicago and astrophysicist at the Yerkes observatory, Williams Bay, Wis., of which in 1905 he was made director. He became editor of the *Astrophysics Journal* in 1902 and is also editor of the publications of Yerkes observatory, in which much of his scientific work has been printed. His chief contributions have been in the field of stellar spectroscopy, especially the spectrographic determination of velocities of stars. He also made researches on sun spots and the thermal radiation of the sun. He edited *A Photographic Atlas of Selected Regions of the Milky Way* (1927).

FROST, ROBERT (1875–), American poet, was born in San Francisco (Calif.), March 26, 1875. His father was a New Englander and his mother was born in Edinburgh. In 1885 he moved with his parents to Lawrence (Mass.), studied in the public schools, and entered Dartmouth college in 1892, remaining there one year. In 1897–99 he was a student at Harvard, and from 1905 to 1911 taught English in the Pinkerton academy, Derry (N.H.), and then for a year taught psychology at the New Hampshire Normal school at Plymouth. In 1912 he went to England, where he remained three years and published his first two volumes of verse. On his return to America he retired to a farm at Derry and gave much time to active farming. During 1916–20 he was professor of English at Amherst college (Mass.), a position which he resumed 1923–25 after an interval spent as poet in residence at the University of Michigan. Later he became fellow in letters at Michigan. His poems portray realistically, yet with a fine reticence, everyday country life in New England, his work as a whole partaking of the dignity and serene beauty of the hills among which much of his life has been passed. Some of the work of his first volume had been denied publication for 20 years, and some of the second for ten years. He is the author of *A Boy's Will* (London, 1913; New York, 1915); *North of Boston* (London, 1914; New York, 1915); *Mountain Interval* (1916); *A Way Out*, a play (1917); *New Hampshire* (1923). *Selected Poems* appeared in 1923, and *West-running Brook*, in 1928; see G. B. Munson, *Robert Frost* (1927); and J. C. Squire, *Contemporary American Authors* (1928).

FROST, WILLIAM EDWARD (1810–1877), English painter, was born at Wandsworth, near London, in Sept. 1810. In 1839 he obtained the gold medal of the Royal Academy for his picture of "Prometheus bound by Force and Strength." His "Nymph disarming Cupid" was exhibited in 1847; "Una and the Wood-Nymphs" of the same year was bought by the queen. This was the time of Frost's highest popularity, which considerably declined after 1850. He died on June 4, 1877.

FROST, water in the atmosphere, which is crystallized by freezing upon exposed objects. Under the broader and more popular conception of frost, the phenomenon also includes the mechanical effects produced by the freezing of the juices of plants, of the water in the soil, in rocks, etc. Frost is a phenomenon most common in the polar regions and during the winter months. But frosts of a milder nature are also quite common, during cold, clear nights in spring and autumn, in temperate regions, and sometimes extend over thousands of square miles, doing great damage by freezing the juices of plants, vegetables, etc. When frosts of this character occur, hoar-frost crystals collect upon the earth and vegetation. The frost crystals, themselves, however, do no damage. It is the freezing of the juices of plants, etc., that injures them. The condition that precedes and favours hoar-frost formation is a cooling of the air near the earth's surface. This may be brought about by seasonal changes in temperature and by radiation of heat from the earth during calm, clear nights. Other factors that tend to favour frosts are the cooling of objects by the evaporation of moisture from them, and in mountain regions the descent of cold air into the valleys.

Hoar-frost, like snow, occurs in two distinct states, the crystalline and the granular. Hoar-frost is not, as some suppose, frozen dew. Granular hoar-frost may properly be termed fog or cloud-frost, as it is produced by the collection and freezing of fog drops upon vegetation, etc. It occurs most frequently upon mountain tops, because clouds often enshroud them. In zero weather, fog drops form in the air around all open springs and streams, and

SOME OF THE FORMS ASSUMED BY HOAR-FROST ON WINDOW PANES
The designs effected by hoar frost on window panes are varied and very often familiar in outline. That in the upper panel, centre, resembles a balsam fir tree; those to the left and directly below suggest jungle ferns, while there is a lace-like delicacy in the pattern at the extreme lower right

collect and freeze upon near-by objects. Hoar-frost of this character is usually of a subcrystalline character, due to colloidal crystallization. It occurs during both windy and calm weather. Its forms assume columnar, needle-like or fernlike shapes, sometimes of considerable size and great beauty. On mountain tops, the cloud-frost crystals often grow outward, mainly in a windward direction, and form lovely fernlike or fluted creations, that impart wondrous beauty to the mountain tops. True crystalline hoar-frost crystals, like the crystalline varieties of snow crystals, form direct from the invisible water vapour in the air. Winds and clouds, and overhanging objects that shield the earth, retard or prevent frosts of this character in the open. Such crystals assume many beautiful and varied forms. Like the snow crystals, most of them can be grouped into one of two classes, those that assume columnar forms, and those that assume tabular forms. In general, the crystals of these respective classes do not form together on a given night, but one or the other will greatly predominate. Columnar shapes usually form the bulk of the hoar-frost crystals during the so-called destructive frosts of spring and autumn. The columns are usually hexagonal in form, are hollow, or have cavities projecting downward from their upper ends, and vary more or less in size, slenderness, etc.

Tabular hoar-frost crystals are most common to the winter months, and to lower temperatures. They form in open branching or in close solid platelike figures, and vary in size, outline, thickness, etc. The individual crystals of tabular frost resemble in some degree similar types of tabular snow crystals. But unlike them, and as a result of their being forced to grow outward in segmental fashion from some support, they rarely assume the perfect symmetry of many of the snow crystals. Copious frosts of this description coat the trees and other objects with glittering hosts of butterflylike or fernlike crystals, giving them a white frosted appearance, and thus convert forested regions into the semblance of fairyland. In the winter time, when ice covers pond and river, beautiful clusters or rosettes of fernlike or jewel-like frost collect upon the surface of the ice. Among the rarer of the frost forms are those which assume the funnel or cubical form.

The most varied and beautiful of all the frost forms, however, occur during zero weather, upon the window-panes of buildings. The more delicate and varied effects are due to a crystallization of the moisture in the air of a room, upon dry glass in cold unheated rooms. The bolder and larger so-called window-frost

effects, however, that form in warm moist rooms, are really window-ice crystallization, as they form upon wet window-panes, and crystallize within the thin film of fluid water that often covers such panes. Window-frost and window-ice assume a bewildering variety of designs, some of them in the semblance of castles, tropical forest effects, starry firmaments, trees, ferns, corals, stars, etc. Some of the designs, as those that form within tiny scratches or strictions in the glass, are repeated from time to time. Others have a much more obscure origin. The temperature and degree of humidity of the air, the varying thickness of the glass, the dust, etc., on it, the tiny air currents and eddies that flow over it, the presence or absence of other closely lying frost crystals, each doubtless tends to determine or modify the shape, size, and form of the frost crystals forming on windows. When considered in its broader aspects, frost plays an important rôle, both beneficent and otherwise, in nature's plan. Its destructive effects, when early or late frosts occur and injure crops and vegetation, are well known. Various devices are now used to lessen or prevent frost damage, such as tentlike coverings, oil heaters and smudge pans, etc. The beneficent services of frost are very important. It acts as an erosive agent, in tearing down mountains, and converting rocks into soil. This is accomplished by means of the expansive action of water when it freezes within crevices of the rocks, thus rending them asunder and helping to pulverize them into soil.

(W. A. BEN.)

FROSTBITE, a form of mortification (*q.v.*), due to the action of cold in cutting off the blood-supply from the fingers, toes, nose, ears, etc. In comparatively trifling forms it occurs as "chaps" and "chilblains," but the term frostbite is usually applied only to more severe cases, where the part affected becomes in danger of gangrene. The degree of cold necessary to produce frostbite varies within wide limits and particularly with the associated conditions. A degree of cold that would be borne with impunity by a healthy person in dry air leads to frostbite when (as in the trenches during the World War) the feet are soaked through, movement is limited, and mental anxiety is great. If the individual be underfed in addition a relatively slight degree of cold leads to severe frostbite. An instant application of melting snow, or water, will restore the circulation; the application of heat would cause inflammation. But if the mortification has gone too far for the circulation to be restored, the part will be lost, and surgical treatment may be necessary.

FROSTBURG, a town of Allegany county, Md., U.S.A., in the north-western part of the State. It is on Federal highway 40, and is served by the Cumberland and Pennsylvania and the Western Maryland railways. The population was 6,017 in 1920; 1930 it was 5,588. The town lies amid beautiful scenery, about 2,000 ft. above sea-level, on a plateau between the Great Savage and the Dens mountains. It is the seat of a State normal school (opened 1904) and is the centre of the coal region of the State. The town itself is almost completely undermined. In 1926 Allegany county produced 2,275,374 tons of coal. Frostburg was settled in 1812 and incorporated in 1870. It was called Mount Pleasant until about 1830, when the present name was adopted in honour of one of the founders, Meshech Frost.

FROST-WEED (*Helianthemum canadense* or *Crocantimum canadense*), a North American plant of the rock-rose family (Cistaceae), native to dry rocky places and sandy soils from Maine to Ontario and Wisconsin southward to North Carolina and Missouri. It is a slender, sparsely branched, slightly woody perennial, with small, narrow, nearly stalkless leaves and showy yellow flowers, $\frac{3}{4}$ in. to $1\frac{1}{2}$ in. across, usually borne singly or rarely two together, the petals soon falling. These are followed later by small short clusters of cleistogamous flowers, without petals, borne in the axils of the leaves. The plant is remarkable in that late in autumn crystals of ice sometimes shoot from the fissured bark at the base of the stem, whence the popular name. The hoary frost-weed (*H. majus* or *C. majus*), a similar species but of more western and southern range, exhibits the same peculiarity.

FROTHINGHAM, OCTAVIUS BROOKS (1822-1895), American clergyman and author, was born in Boston (Mass.), Nov. 26, 1822. His graduation from Harvard college in 1843 and

from the Divinity school in 1846 was followed by pastorates at Unitarian churches in Salem, Jersey City, and New York city until ill-health compelled his resignation in 1879. In 1881 he returned to Boston, where he died on Nov. 27, 1895. To this later period of his life belongs his best literary work, although he remained a greater orator than he was a man of letters. Always on the unpopular side, he was not only an anti-slavery leader when abolition was not popular even in New England, and a radical and rationalist when it was impossible for him to stay conveniently in the Unitarian church, but he was the first president of the National Free Religious Association (1867) and an early and ardent disciple of Darwin and Spencer.

His works include *Stories from the Life of the Teacher* (1863), *A Child's Book of Religion* (1866), *Life of Theodore Parker* (1874), *The Cradle of the Christ* (1877), *The Spirit of New Faith* (1877), *Transcendentalism in New England* (1876), *George Ripley* (1882), *Memoir of William Henry Channing* (1886), *Boston Unitarianism, 1820-50* (1890) (really a biography of his father), and *Recollections and Impressions 1822-90* (1891).

FROUDE, JAMES ANTHONY (1818-1894), English historian, son of R. H. Froude, archdeacon of Totnes, was born at Dartington, Devon, on April 23, 1818. He was educated at Westminster and Oriel college, Oxford, then the centre of the ecclesiastical revival, and was elected a fellow of Exeter college (1842). Froude joined the High Church party and helped J. H. Newman, afterwards cardinal, in his *Lives of the English Saints*. He was ordained deacon in 1845. By that time his religious opinions had begun to change, he grew dissatisfied with the views of the High Church party, and came under the influence of Carlyle's teaching. Signs of this change first appeared publicly in his *Shadows of the Clouds* (1847), published under the pseudonym of "Zeta," and his complete desertion of his party was declared a year later in his *Nemesis of Faith*.

On the demand of the college he resigned his fellowship at Oxford. The first two volumes of his *History of England from the Fall of Wolsey to the Defeat of the Spanish Armada* appeared in 1856, and the work was completed in 1870. Froude held that the office of the historian was simply to record human actions and that history should be written as a drama. Accordingly he gives prominence to the personal element in history. His work is often marred by prejudice and incorrect statements. The keynote of his *History* is contained in his assertion that the Reformation was "the root and source of the expansive force which has spread the Anglo-Saxon race over the globe." Hence he overpraises Henry VIII. and others who forwarded the movement, and speaks too harshly of some of its opponents. A strong anti-clerical prejudice is manifest in his historical work generally, and is doubtless the result of the change in his views on church matters and his abandonment of the clerical profession. Carlyle's influence on him may be traced both in his admiration for strong rulers and strong government, which led him to write as though tyranny and brutality were excusable, and in his independent treatment of character. His rehabilitation of Henry VIII. was a useful corrective, but his representation of him as the minister of his people's will is founded on the false theory that the preambles of the acts of Henry's parliaments represented the opinions of the educated laymen of England. He was not a judge of evidence, and seems to have been unwilling to admit the force of any argument or the authority of any statement which militated against his case. He worked diligently at original manuscript authorities at Simancas, the Record Office and Hatfield House; but he used his materials carelessly, and evidently brought to his investigation of them a mind already made up as to their significance. He was constitutionally inaccurate, and seems to have been unable to represent the exact sense of a document which lay before him, or even to copy from it correctly.

Few more brilliant pieces of historical writing exist than Froude's description of the coronation procession of Anne Boleyn through the streets of London, few more full of picturesque power than that in which he relates how the spire of St. Paul's was struck by lightning; and to have once read is to remember for ever the touching and stately words in which he compares the monks of the London Charterhouse preparing for death to the Spartans at Thermopylae. Proofs of his power in the sustained narration of

stirring events are abundant; his treatment of the Pilgrimage of Grace, of the sea fight at St. Helena and the repulse of the French invasion, and of the murder of Rizzio, are among the most conspicuous examples of it. Nor is he less successful when recording pathetic events, for his stories of certain martyrdoms, and of the execution of Mary queen of Scots, are told with exquisite feeling and in language of well-restrained emotion. And his characters are alive. We may not always agree with his portraiture, but the men and women whom he saw exist for us instinct with the life with which he endows them and animated by the motives which he attributes to them. His successes must be set against his failures. At least he wrote a great history, one which can never be disregarded by future writers on his period, be their opinions what they may; which attracts and delights a multitude of readers, and is a splendid example of literary form and grace in historical composition.

On the death of his adversary Freeman in 1892, Froude was appointed to succeed him as regius professor of modern history at Oxford. His lectures on Erasmus and other 16th-century subjects were largely attended. He died on Oct. 20, 1894. His long life had been full of literary work. For 14 years he was editor of *Fraser's Magazine*. He was one of Carlyle's literary executors, and brought some sharp criticism upon himself by publishing Carlyle's *Reminiscences* and the *Memorials of Jane Welsh Carlyle*, for they exhibited the domestic life and character of his old friend in an unpleasant light. Carlyle had given the manuscripts to him, telling him that he might publish them if he thought it well to do so, and at the close of his life agreed to their publication. He also wrote *Thomas Carlyle: a History of the First Forty Years of His Life* (1882) and *Thomas Carlyle, a History of His Life in London* (1884); *Short Studies on Great Subjects* (1867-82); and an historical novel, *The Two Chiefs of Dunboy* (1889). He was twice married. His first wife, a daughter of Pascoe Grenfell and sister of Mrs. Charles Kingsley, died in 1860; his second, a daughter of John Warre, M.P. for Taunton, died in 1874.

See H. Paul. *Life of J. A. Froude* (1905).

FROZEN CREDIT, credit (generally bank loans) which has been extended but which the creditors find it impossible or highly inexpedient to collect at maturity or at any given time. Banks may make loans to corporations which are apparently in good financial condition and yet which, upon the maturity of the loan, are, temporarily at least, unable to liquidate. To enforce payment might result in financial embarrassment or bankruptcy of the borrowing firm, which with an extension of the loan might continue successfully. In such a case the bank will often renew or extend the loan, and this credit is said to be *frozen*, a term signifying the opposite of "liquid" as applied to credit, capital or assets.

FROZEN DISHES: see ICE CREAM.

FROZEN MEAT: see MEAT.

FRUCTOSE, occurs mixed with glucose (*q.v.*) in fruit juices, and is combined with glucose as sucrose (cane sugar). It has the same molecular formula as glucose, $C_6H_{12}O_6$, and is a ketose (ketone-alcohol) of the hexose class. It is also known as fruit-sugar or laevulose, the latter name arising from the fact that solutions of the sugar are laevorotatory, *i.e.*, rotate the plane of polarization of light to the left. It is sometimes prescribed for diabetics in place of sucrose. (See CARBOHYDRATES.)

FRUGONI, CARLO INNOCENZIO MARIA (1692-1768), Italian poet, was born at Genoa on Nov. 21, 1692. He took Monastic vows at an early age. From 1716 to 1724 he filled the chairs of rhetoric at Brescia, Rome, Genoa, Bologna and Modena successively. Through Cardinal Bentivoglio he was recommended to Antonio Farnese, duke of Parma, who appointed him his poet laureate; and he remained at the court of Parma until the death of Antonio, after which he returned to Genoa. Through the intercession of Bentivoglio, he obtained from the pope the remission of his monastic vows. After the peace of Aix-la-Chapelle he returned to the court of Parma, and devoted his later years to poetry. He died on Dec. 20, 1768. Frugoni was one of the best of the school of the Arcadian Academy, and his lyrics and pastorals had great facility and elegance.

1. Section and whole fruit of ash. 2. Strawberry. 3. Fruit of Rose. 4. Fig fruit. 5. Cherry. 6. Seed-vessel of Campion. 7. Poppy capsule. 8. Pea pod. 9 and 10. Meadow Saffron capsules and seeds. 11. Editions of his collected works appeared at Parma (10 vols., 1799) and at Lucca (15 vols., 1799); a selection at Brescia (4 vols., 1782). See Calcaterra, *Storia della poesia frugoniana* (1920); and A. Equini, *C. I. Frugoni alle corti dei Farnesi et dei Borboni di Parma* (2 vols., Milan, 1919-20).

FRUIT, in its popular sense is any product of the soil that can be enjoyed by man or animals; in the Bible the word is often extended to include the offspring of man and of animals, e.g., in such expressions as "the fruit of the womb," "fruit of thy cattle" (Deut. xxviii. 4). More often it is employed to denote a group of edible parts of plants, as contrasted with another group termed "vegetable." But the term is a loose one, including, e.g., the stalks of the rhubarb.

In its strict botanical sense the fruit is developed from the flower as a result of fertilization of the ovule. This phenomenon induces various changes: the anther and stigma wither, the petals drop off and the sepals may be shed or undergo modifications; the ovary enlarges to form the *pericarp* and the ovules develop into the seeds, containing the embryo-plant. The term fruit is strictly applied only to the mature pistil or ovary, but it often includes other parts of the flower. Normally no fruit is produced unless fertilization is effected; but in certain plants, mostly cultivated varieties, this is not the case (e.g., the seedless oranges and grapes, the banana and the bread-fruit).

Functions of Fruit.—The fruit protects the growing and aids in distributing the mature seeds. This latter function is very important and numerous devices secure a wide and effective dispersal. These may be classified according to the agents employed as animate and inanimate. To the second group belong also those methods by which the plant itself propels the seed forcibly from the fruit. Some plants employ a combination of the two. Thus in the gorse the seeds are shot out by the splitting and curling of the pod in which they are contained, and they must then be buried by ants in order to germinate. Violent dehiscence occurs in many plants (fig. 28). In the squirting cucumber the walls of the pericarp exert pressure on the pulpy contents in which the seeds are placed. In the balsam (*Impatiens*) also the seeds are actively expelled. Other inanimate agents are water and wind. Fruits or seeds are sometimes sufficiently buoyant to float for a long time in water. Thus the coconut may be carried hundreds of miles in the sea; the fruits and seeds of West Indian plants are sometimes thrown up by the Gulf Stream on the coasts of Europe and will often germinate; in the water lily and many other aquatic plants, the seeds float for a time before sinking to the bottom. In many cases the wind plays a part in distribution. In the poppy and many Caryophyllaceae (figs. 6, 7) there is a capsule opening by pores borne on a long stalk which sways in the wind, thus jerking out the seeds. In the pine, sycamore (fig. 22), ash (fig. 1) and many others, there is a wing-like development; in numerous Compositae the fruit is crowned by a plumose pappus (e.g., dandelion, thistle); in the clematis, the style becomes feathery, while the seeds of the willow and poplar bear tufts of silky hairs. The fruit of the bladder-senna (*Colutea*) is easily rolled by the wind, while in the Rose of Jericho (*Anastatica hierochuntina*), the whole plant dries up after developing its fruits and forms a mass, easily rolled over the dry ground by the wind.

Birds and mammals are also utilized as dispersal agents by plants. The mistletoe develops a sticky layer round the seeds which stick to the bill of the bird that eats the berries; these may be wiped off on the bark of trees, thus transporting the embryo to a new host. More commonly, the fruit develops hooks which become entangled in the fur or feathers. Such are the fruits of cleavers (*Galium aparine*), *Ranunculus arvensis* (fig. 21), etc. Another method is to provide the seed with a hard covering, while surrounding this with a succulent and often brightly coloured integument; thus the seed can pass through the alimentary tract of an animal without injury, e.g., plum, cherry (fig. 5); or providing the true fruit with stiff hairs, which cling to the beak of the bird which eats the fleshy receptacle, e.g., rose (fig. 3).

Classification and Structure.—Fruits may be divided into two groups. "A" consists of true fruits, developed from the ovary alone. Of these (1) consists of those in which the surrounding

pericarp, round the seed, is not fleshy or fibrous. These again may be subdivided, (i.) Indehiscent fruits, not opening to allow the escape of the seeds. Such are generally one-seeded. The *achene* has the pericarp closely applied to the seeds, though separable from it. Achenes are borne singly in the dock; aggregated together in the buttercup (fig. 21); on a fleshy receptacle, which may be convex as in the strawberry (fig. 2) or concave, as in the rose (fig. 3). Thus what is popularly called the fruit of these last three is really the swollen receptacle with the carpels. In *Clematis* the style, and many *Compositae* (in which the fruit is often called a *cypsela*) the modified calyx remains adherent to the fruit. A *caryopsis* differs from an achene in that the pericarp and seed become fused; wheat and grasses generally show this type of fruit. A *nut* possesses a hardened pericarp, often surrounded by bracts at the base, and containing, when mature, a single seed. Examples are the hazelnut and the acorn (fig. 27). Achenes, in which the pericarp is extended to form a winged appendage, as in the ash (fig. 1) and sycamore (fig. 22) are often called *samaras*. Those fruits which break into two or more one-seeded, indehiscent portions (*mericarps*) are termed *schizocarps*. Examples are found in the Geraniaceae, in which the mericarps separate from below upwards, in the Euphorbiaceae, etc. (ii) Dehiscent fruits, in which the pericarp splits to allow the escape of the seeds. They are generally many-seeded. When such a fruit dehiscs by the ventral or, occasionally (*Magnolia*) by the dorsal, suture, it is called a *follicle*. There are usually several aggregated together; e.g., columbine (figs. 28, 29). A *legume* or *pod* differs in dehiscing by both sutures. This is characteristic of leguminous plants, such as the pea (fig. 8). In *Arachis* the fruit does not dehisce, being produced under-ground. *Hedysarum* and others have a pod that separates transversely into single-seeded mericarps (fig. 18); such a structure is called a *lomentum* and must be looked upon as a modified legume which no longer dehiscs. In *Erythrina monosperma* there is only one seed. In the Cruciferae (wallflower, cabbage, shepherd's purse), the characteristic fruit is a *siliqua* (fig. 34), which is long and narrow, or short and broad, *silicula*. In both of these there are two carpels, dehiscing by two valves from below upwards, the valves separating from the placentas and leaving them united by a false septum. As in the legume, single-seeded and lomentaceous modifications are found. It is a development of the type of fruit known as a *capsule*, which is exhibited by the iris (fig. 12). Capsules which open by pores (*porose*) are seen in the poppy (fig. 7) and *Campanula*. A *pyxidium* is a capsule opening by a lid, as in the pimpernel (fig. 17). Another type of capsule is exhibited by the Geraniaceae (fig. 19). (2) Fruits in which the pericarp is differentiated into distinct layers, one of which is succulent or fibrous. To this group belong many of the edible fruits. In the *drupe*, as shown by the cherry (fig. 5), plum, etc., the endocarp is usually hard and the mesocarp pulpy and succulent, though in the almond it is tough and in the coconut fibrous. In the raspberry and bramble several small drupes are aggregated into an *etaerio*. The *berry* includes various types of fruit, all characterized by the fact that the seeds are immersed in pulp. To this group belong the barberry, gooseberry (fig. 30), currant and pomegranate.

"B."—Fruits which include parts other than the ovary. These are called *pseudocarps* or false fruits. The fleshy, indehiscent *pome* of the apple (fig. 31), hawthorn, etc., incorporates the receptacle, which becomes much swollen. The true fruit is the core. Superficially the pome resembles the "hip" of the rose. The fruits of the pineapple (*sorosis*) and fig (fig. 4) are compound pseudocarps, i.e., are formed from a number of flowers. In the pineapple, the fruit called a *sorus* is formed by the coalescence of a spike of flowers, as is also the case in the mulberry. In the fig, the whole inflorescence is a hollow structure bearing male and female flowers in the cavity; each female flower forms a single true fruit. (See ANGIOSPERMS; FLOWER; SEED.)

FRUIT-BAT: see FLYING FOX, CHIROPTERA.

FRUIT COOKERY. Though certain fruits, e.g., bread-fruit, dates, figs, form the staple food of various tropical peoples, fruits are used by nations in the temperate zones mainly as an

agreeable means of introducing liquid into the system: for their mixture of salts and vegetable acids, *e.g.*, tartaric, malic, citric; for their slight laxative properties; as an anti-scorbutic and as a valuable medium for supplying the body with vitamins. Fruits can be classified as small fruits, including currants, raspberries, blackberries, strawberries, etc.; apricots, plums, cherries, etc.; citrus fruits, *i.e.*, oranges, tangerines, lemons, grapefruit, etc.; orchard fruits, apples, pears, etc.; vine (grapes); and a few fruits which do not come into any of these categories, as for instance, pineapple, avocado, olive, etc. Fresh fruit is used as a first course and as dessert, and for fruitades.

Methods of Cooking.—There are innumerable ways of serving fruit, and owing to the great variety of fruits at the disposal of mankind it is possible to employ every known method of cookery in preparing fruit dishes (*see* PRESERVING AND BOTTLING; CONFECTIONERY; PASTRY).

Stewed Fruit.—A great number of fruits can be cooked by stewing either by a waterless method or with the addition of a little water and sugar. By the waterless method the fruit is placed in a stone jar (with or without sugar according to taste) in a pan of boiling water. In this way, all the juices of the fruit are conserved without loss of flavour. Where water is added this should be as little as possible with due consideration for the amount of water (generally about 80%) already contained in the fruit. If desired to keep the fruit whole it is wiser to boil the sugar and water before adding the fruit. All fruit should be stewed slowly. Over-heating causes the pectin in fruit to jelly. Dried fruits should be soaked before stewing in order to restore the water.

Baked Fruits.—Apples may be cored, filled with sugar and cooked in a baking dish. A compote of fruit is baked fruit to which is added a sugar syrup.

Fried Fruit.—A number of fruits may be dipped in batter and fried in deep fat and served as fritters. In this case, the fruit, if large, is cut into suitable portions, or if small, is left whole in a sugar syrup for a short time before frying. Certain fruits may be sliced and pan-fried as a vegetable.

Fruit Salads.—These may be sweet or savoury and are made by mixing different fruits together with certain flavourings, *e.g.*, liqueurs, essences, oil, vinegar, etc., to form a salad. When raw fruits are used they are usually soaked in a marinade of their own juices and the flavourings for some time before dishing.

Fruit Moulds.—When hot stewed fruit is thickened with a liaison of corn-flour, tapioca, sago, etc., or when mixed with jelly powders, gelatin, agar agar, etc., it can be turned out into a wet mould and allowed to cool and served as a blancmange. Dried fruits may be thickened with starch liaisons but it is best to use gelatin or jelly for setting soft small fruits, as this does not spoil the colour of the fruit.

Fruit Ices.—These differ from ice-creams in that they possess no cream or custard foundation and are made with a fruit syrup which may, in some cases, be thickened with gelatin to give a smooth appearance. (J. A. Sr.)

FRUIT FARMING. With the larger consumption of fruit and the higher prices paid for it, fruit farming is developing in all parts of the world, the principal fruits eaten being apples, oranges and bananas, though every kind of fruit is consumed in some quantity. As an instance of the increased consumption, the annual consumption of apples per head for the quinquennium ending 1904 in Great Britain was 14.4 lb., and rose to 22.8 lb. in 1924. Of oranges the consumption per head per annum for the quinquennium ending 1904 was 14.7 lb. and 18.1 lb. in 1924. This consumption of oranges is about the same as that of the United States, though the American consumption of apples per head of population is estimated to be double that of Great Britain.

The British consumption of bananas per head was estimated at 30 in 1924; though not a large figure, it represents a great increase since 1900. For other fruits it has been estimated as: pears 2 lb., plums 3 lb., cherries 1 lb., currants 1 lb., strawberries 2 lb., gooseberries 1.7 lb. Much of this fruit is produced in England, though a much larger quantity is imported, and in consequence the British market is of great importance to every fruit-

exporting country.

In 1924 the net imports of fruits into the United Kingdom was valued in the customs returns at £44,800,000. This is more than three times as much as the average annual value of imported fruit during the quinquennium ending 1913. Comparing the expenditure per head, for the quinquennium 1909-13, it was 6s. 6d. and £1 per head in 1924, much less money being spent in home produced fruits; while according to the report of the agricultural output of England and Wales for 1925, the estimated value of the fresh fruit sold off the farms over one acre in size was £9,420,000, or less than a quarter of the value of the fruits imported.

FRUIT PRODUCTION IN GREAT BRITAIN

The climate of England permits of outdoor culture of but a portion of the fruits eaten, these being known as the hardy fruits. The following table gives in detail the output of fruits from holdings over one acre in size in England and Wales for 1925, the year when the last census of production was made:—

	Gross production in cwt.	Estimated value
<i>Orchard Fruits</i>		
Apples	6,520,000	3,750,000
Pears	82,000	80,000
Cherries	349,000	1,130,000
Plums	801,000	1,180,000
Nuts and other kinds	170,000
<i>Small Fruits</i>		
Strawberries	705,000	1,410,000
Raspberries	145,000	450,000
Black currants	188,000	660,000
Red and white currants	66,000	100,000
Gooseberries	590,000	550,000

The apple crop is therefore by far the most valuable; next come plums, followed closely by strawberries and gooseberries.

The climate is a handicap to the production of fruit on a commercial scale in Scotland. Nevertheless, there is an important fruit industry at Blairgowrie, Perthshire, where the largest raspberry area in the United Kingdom exists. There is also a strawberry industry in the Clyde valley.

Special Fruit Areas.—Most of the fruit of England is the output of a comparatively few districts where growers have specialized on fruit production. Orchard fruits and small fruits are produced in most counties of England, but experience has shown that crops of a satisfactory size and quality are only secured in certain areas where the soil and climatic conditions are favourable, and where growers have a knowledge of the technique of fruit growing. In fact, there is a tendency against widening the areas over which fruit is produced in favour of securing a relatively more intense production in the few selected centres. (*See* subsequent section: *Fruit Plantations*.) No doubt, the oldest fruit area lies in the south-west of England, in Devon, Somerset, Gloucestershire and Hereford, where orchard fruit has been grown since Norman times. In these counties each farm has its orchard of apple trees, the numbers of which by the terms of the lease have to be kept constant. The orchard is laid down to grass, and often provides grazing for pigs, calves, ewes and lambs. Formerly grass orcharding was used for the production of cider fruits only, but in recent years both cider and market varieties of fruit have been cultivated. Some of the commercial fruit plantations of market varieties have also been laid down to grass, so that grass orcharding must now be regarded as one of the recognized systems of English fruit production. The method, though found suitable for apples, damsons, plums and cherries, cannot be used with success either for bush fruits or for the best dessert pears and plums.

ORCHARD FRUITS

Apples in Grass Orchards.—The grass certainly affects the growth of the trees, and where new fields are being planted the soil should be kept cultivated until the trees are from eight to ten years old before grass seeds are sown. Where planting is done directly in a grass orchard the turf soil surrounding the young

tree should be kept clear for three or four years, after which the trees may be left to take care of themselves. The trees, propagated as standard on vigorous stock, are planted in rows 40 ft. apart so as to allow plenty of room for development and for sheep to graze under the branches. Young trees need staking and to be protected from damage by cattle, sheep and rabbits.

With this method of growing fruit the cost of production is low, and the grass crop provides a certain return. Apples from grass orchards are usually well coloured, of firm flesh and keep well in storage. On the other hand, the crop generally is very uneven, with a high proportion of small and blemished specimens. Varieties of apples, such as Worcester Pearmain, Blenheim Orange, Bramley Seedling, Newton Wonder and Anne Elizabeth, are the best for growing in grass orchards. The apple trees in grass orchards are prone to biennial cropping, and the yield varies widely from year to year, averaging four to six tons to the acre.

Plums and Cherries in Grass Orchards.—The real dessert plums are seldom grown in grass orchards, but the method is very popular for the production of the damson, the Aylesbury prune and some of the common jam plums.

Cherry growing in grass orchards seems to have been practised from early times, not only in England, but throughout France, Switzerland, Italy and Western Europe.

It is estimated that in England there are approximately 741,000 cherry trees, mostly grown in grass orchards, of which no less than 456,000 are in Kent. This county has been the home of the cherry industry for more than two centuries and the Kentish farmers take pride in the management of the well-grazed orchards. Cherries prefer light, well drained land, such as the brick earths and the light loams overlying the chalk. Not more than 60 to 70 trees are planted to the acre, for when fully grown a tree is of great size, capable of yielding over a ton of cherries in a season. These cherry orchards are stocked heavily with sheep, sometimes 12 or 15 to the acre, so that the sheep could not secure a living from the grass alone and much additional food, such as cake, turnips and hay must be used. This close grazing and its consequent heavy natural manuring seems to be productive of the best fruit bearing trees and of the largest cherries. This Kentish method is accepted as the best method and copied elsewhere.

The varieties of cherries mostly grown in grass orchards are the sweet cherries, Early Rivers (black), Governor Wood (yellow), Knights Early (black), Black Tartarian, Elton (yellow), Waterloo (black) and Napoleon Bigarreau (yellow). When the last census was taken in 1925 the yield of cherries was estimated at 349,000 cwt., or an average yield per tree of nearly 53 lb.

Fruit Plantations.—Distinct from grass orcharding, there has been established in England within the past 60 years a definite fruit growing industry concentrated entirely on fruit growing and having little or nothing to do with other kinds of farming. The holdings, often owned or rented on special terms, are planted thickly with fruit and the soil is kept cultivated as in a garden. At times these fruit plantations contain wholly apple trees, with vigorous trees and dwarf growing bushes so ingeniously interplanted that the land may carry 200 or in extreme cases 400 trees and bushes to the acre. Notably in Worcestershire plantations of plums exist, and in a few other places plantations of pears may be found. The more generally favoured practice, however, is to cultivate what is termed a mixed plantation where apples, plums and even gooseberries, red currants and raspberry canes all find a place. These mixed plantations produce most of the market fruits of Great Britain; they are unique, for though copies of the English system may be seen in France, Belgium and the Netherlands, the system is not typical of the fruit plantations of any other country.

Mixed plantations suggested by the British Ministry of Agriculture are:—

1. *Mixed Standard Plantation.*—Bramley Seedling and Lord Derby apples, 40 ft. square, with bush Czar plums interplanted at 20 ft. apart. The intermediate land planted either with Stirling Castle or Lane Prince Albert apples at 10 ft. square or with soft fruits, gooseberries or red currants at 5 ft.

2. *Bush Apple Plantation.*—Worcester Pearmain (dwarfing

stock) and Allington Pippin (dwarfing stock) 18 ft. square, interplanted with soft fruits of 6 ft. square.

3. *Bush Plums.*—Victoria and Czar at 14 ft. square, interplanted with soft fruits at 7 ft. square.

4. *Bush Pears.*—Conference (quince), Durendeu (quince) at 12 ft. square, interplanted with soft fruits at 6 ft. square.

These mixed plantations are concentrated in special areas when soil conditions are favourable, such as the sandy loams of Kent, the brick earths of Middlesex, the alluvial deposits of the Isle of Ely, Lincolnshire and Norfolk, and the loams and old red sandstone of Worcestershire and Herefordshire.

The Kentish fruit area now extends eastwards from Bexley and Farnborough through Maidstone, Sittingbourne and Canterbury to Sandwich, running down southwards to Tunbridge Wells and to Rye in Sussex. In this region where the soils and aspect are favourable these mixed plantations are to be found, some growers having as much as 50 acres of fruit. London is the principal market, though large quantities are sent to the midland and northern markets.

Middlesex still produces large quantities of apples, pears and plums, but fruit growing has waned in favour of vegetable growing, which is now the more important industry. In the eastern counties there has been built up within the present generation a fruit industry which has become one of the largest in Great Britain. The plantations, though mainly planted on the alluvial deposits around the Wash, stretch outwards through the Isle of Ely into the counties of Cambridge, Huntingdon, Norfolk and northwards to Spalding in the Holland division of Lincolnshire.

The Worcestershire and Herefordshire areas are spoken of as the West Midland area. Starting on the small holdings in the Vale of Evesham, the fruit planting has progressed rapidly and now extends from Birmingham almost to Bristol and westwards into Hereford. The holdings, which range from small statutory cottage holdings, are densely planted with fruit trees and interplanted thickly with either bush fruits or vegetables. Practically all kinds of fruit are produced, but mainly plums. This area is favourably situated to supply the markets of South Wales and the industrial towns of the Midlands.

In the valley of the River Tamar in Cornwall and Devon there is a fruit area of small size but important for early fruits. From here come the early strawberries, gooseberries, currants, plums and raspberries, that ripen a week or ten days before the other districts.

Pear Production.—The prevailing climate of the United Kingdom is scarcely warm or dry enough for pear growing, yet in sheltered spots much can be done. Trees are propagated as standard and half standard on the pear stock and as bushes on the quince stock. The most productive varieties under English conditions are the Hesse, Chalk and Lammis, but these are of indifferent quality. Varieties such as Fertility, Conference, Durendeu, Marguerite Marillat, Clapps Favourite, Dr. Jules Guyot are some of the more suitable for English markets and are now being planted. The home production in 1925 from 1,976,460 trees amounted to 83,000 cwt., which is approximately 12% of the demand.

Plums.—The great plum area lies in the West Midlands, where there is an intense production, mainly of the Yellow Pershore Egg in Worcestershire and of the Blaisden Red in Gloucestershire. In other areas the chief varieties are Czar (an early dark culinary plum), the Victoria (a large red plum), and Monarch (a late round purple). The English season extends from August till the end of September.

Before the English crop is ready importations have commenced from Spain, France and Belgium and of these the gages are the best known. These delicious fruits arrive during and throughout June, July and August.

SMALL FRUITS

Black Currants.—Black currants are not suited for growing under the shade of top fruits and are not found often in the mixed plantations. They grow best in open field culture, in soil of light texture, farmed highly. The bushes are planted in rows 6 to 8 ft.

BY COURTESY OF THE CORNELL UNIVERSITY AGRICULTURAL EXPERIMENT STATION

APPLE TREE CULTURE IN THE UNITED STATES

1. Apple tree, unpruned. The tangled mass of small branches causes stunted fruit and shuts off sunlight from the ripening fruit
2. Apple tree, same as fig. 1, properly pruned, giving ample access to sunlight throughout tree, and space between the branches which bear fruit
3. A young apple tree growing according to the sod mulch system: soil is not cultivated but is sown to grass, clover, alfalfa or other light crop and mowed several times during the season. Covering the ground it serves as a mulch and, as it works down into the soil, forms humus. Grasses are used for mulch in the East, alfalfa in the West
4. A heavily pruned mature tree, typical of those found in old orchards, which may have grown untended for many years. Pruning restores the tree
5. Colonies of bees brought into the orchard to help the setting (fertilization) of the fruit by carrying pollen from one variety to another
6. A well pruned young apple tree. The wide angle formed by the trunk and each of the main branches is to be noted. The wire protector at the base of the tree prevents destruction of bark by rabbits and other gnawing animals
7. Vigorous growth of young wood in old trees due to severe pruning
8. Apple orchard in bloom: the weather at blossom time is important in determining the set of fruit (see fig. 5) Several dry days, with temperature about 65°, are required
9. Typical fruit farming scene in the Great Lakes region, western New York. Because of the moderating influence of a large body of water, the climate is favourable for most deciduous fruits, including peaches and grapes
10. Orchards on hillsides are particularly satisfactory in many sections because of favourable air drainage. The level floor of a valley is usually undesirable for fruit plantations because of the accumulations of cold air which causes freezing injuries

apart. Black currant growing has become a special industry on the sandy soils of East Norfolk. Kent, Worcestershire and Herefordshire are also important centres of production. Varieties such as Biskoop Giant (the earliest), Seabrooks Black, and Goliath (mid-season) and Baldwin (late) are the main sorts grown. Septembers Black and Davidsons Eight are promising new introductions.

The black currant bushes have suffered much in the past from diseases such as Big Bud and Reversion, but in recent years scientific workers have shown that these may be controlled with spring spraying of lime-sulphur. Since these sprayings have been made crops have improved and acreages have extended. The average yield in 1908 fell to the low figure of 9 cwt. per acre, since when it has risen steadily until by 1925 it had reached 16 cwt. per acre. In 1927 the Ministry of Agriculture commenced a scheme whereby young bushes were inspected during the growing season and certificates issued in respect of well-grown bushes true to variety and free from reversion. A register of growers having these certificates was issued to facilitate growers in securing healthy bushes, for that seems to be of paramount importance. The planting of bushes propagated from reverted parents has been shown to be disastrous, for the planter has little or no chance of securing a crop. The total production in England and Wales rose from 51,000 cwt. in 1908 to 188,000 cwt. in 1925; but even that quantity is insufficient, so that about one-third has to be imported.

The Strawberry.—The strawberry crop is essentially a crop for open field culture, and especially for production on suitable soils. About 90% of the consumption is produced at home, the mild, temperate and humid climate of Great Britain being favourable to strawberry production and berries of Royal Sovereign, the Duke and Joseph Paxton are of a size and quality not reached in other lands. In 1925 strawberries in England and Wales covered 29,300 ac., having risen from 21,672 ac. in 1913.

The Hampshire area, centred at Botley, Fareham and Swanwick, is perhaps the most famous, for here there are over 3,000 ac. planted in close concentration. The holdings vary from one to five acres, though a few growers have large farms. The soil is of a sandy character of easy cultivation, but rather poor and requiring liberal fertilization with stable dung, bone meal and dried blood to yield good crops. The early maturing Royal Sovereign predominates, and few are left for jam purposes. The berries are picked by gangs of pickers into chip baskets, holding at first 1 lb. and 2 lb. and later in the season 3 lb. and 4 lb. respectively. From the various stations within this area approximately 2½ million chip baskets are sent to markets all over England and Wales and as far north as Dundee and Aberdeen.

In Kent the area is now less concentrated, but it has an important production; the Kent soil is heavier and more retentive of moisture and larger yields per acre are obtained. On the fertile soils in the Wisbech area, between King's Lynn, March and Spalding, the average to strawberries is nearly four times that of the Hampshire area. The crop here is later and the growers, missing to some extent the consumers' early market, concentrate on big yields, a large proportion of which goes for making jam. In addition to the Royal Sovereign, the heavy cropping Sir Joseph Paxton, Madame Kooi, and the Laxton are grown. Yields are larger than in Hampshire and growers have been known to pick over two tons to the acre.

In all areas the strawberry plants have suffered from pests and diseases, such as eelworm, red plant and patch. At the request of growers the Ministry of Agriculture caused research investigations to be instituted at the horticultural research station at Long Aston, and in addition a strawberry experimental station has been established at Botley by the Hampshire county council. The ministry also initiated a scheme of certificates similar to that for black currant growers.

Storage, Grading, Packing and Marketing.—Soft fruits, such as strawberries, currants, gooseberries, raspberries, cherries and plums, are in the main marketed directly they are picked without grading, for there seems a general belief that such fruits will not stand further handling and cannot therefore be graded. Where grading is attempted for strawberries it is usually done by

the picker. Some have graded both cherries and plums with success. In these cases the corps are taken to the packing sheds and graded by hand into three grades, the best cherries being packed in one-pound cartons covered with celapane paper and marketed in crates holding eight cartons. The best grade plums have been packed in chip baskets of four pounds and marketed in crates holding four baskets.

French growers specially grade their plums for the English market, and pack into small neat wooden boxes, sometimes separating each plum with white paper. South African plums for the English market are well packed so that each plum rests in its own nest of wood wool in flat boxes, being sold by the dozen and not by the pound.

Such well graded produce is doing much to create an impression in favour of grading, all the hardy fruits unless graded and packed in a recognized market package fetching low prices. Quicker work is made by using machinery to group certain fruits according to size, after they have been sorted into different grades by hand and the cull fruits removed. Some fruit growers have established their own grading rooms, but a beginning, too, has been made in establishing public fruit packing stations on lines comparable, though smaller, to those found in the fruit districts of the United States. The first public company was incorporated in 1924 as British Fruit Packing Co., with a packing house at East Peckham, Kent. This company undertook to provide boxes and paper, to grade, pack and sell at a fixed charge all fruit delivered to the station. The grower was relieved of the labour of grading and packing and of the task of selling; he shared the goodwill attaching to the company's label and had the fruit dealt with by skilled people. In 1925 the company handled 60,000 bushels of apples. In 1926 the business was transferred to East Farleigh (Kent) and a branch opened at Faversham (Kent).

The fruit growers of Cottenham (Cambridge) combined and opened a packing station in 1925; similarly equipped with grading and packing machinery, mostly imported from the United States. The business was conducted on co-operative lines and in consequence the society has enjoyed a loan from the Ministry of Agriculture for the purchase of the machinery. During the year 1925 over 10,000 bushels were handled. The failure of the apple crop in Cambridge in 1926 and 1927 prevented the station from reopening. Nevertheless, these and other British packing stations are too few in number to handle the apple and pear crops, to say nothing of the other fruits.

CANADA

The Canadian fruit areas of importance are three: (a) Nova Scotia, (b) Ontario and (c) British Columbia. The Nova Scotia area is the oldest; the British Columbia area the youngest; that of Ontario by far the most important.

Fruit Growing in Nova Scotia.—The fruit growing industry, mainly apples, of Nova Scotia is concentrated in the narrow Annapolis valley which runs almost down to the Bay of Fundy. The soil is rich, light and of an alluvial nature; the rainfall is heavy and the district well drained by four rivers. The climate is cold, with snow in winter; the summers are moderately hot with bright sunshine.

There is great similarity in the plan of the orchards, half-standards being planted widely in rows fully 40 ft. apart. Some orchards are 80 to 100 years old, though the majority would be from 20 to 30 years and a few are quite young. Grass orchards are not favoured, and all but the backward growers keep the land well cultivated with disc harrows from spring until July 1, when seed of clover, vetches, rape, millet or buckwheat is sown to produce a green crop for ploughing in to provide soil humus.

The district is by no means free of pests, and in old neglected trees scab, and scabby blotch, the codling moth, brown tail moth and aphids can be found. It is said that most growers spray three or four times and the best five or six—using lime-sulphur, Bordeaux mixture, arsenate of lime and nicotine.

The fruit after picking is taken into the packing stations, where it is graded into Grade 1, Grade 2, Domestic and Grade 3, after which it is packed into wooden barrels each holding 120 lb. The

larger growers of from 70-100 ac. have their own packing houses, but the majority adopt a co-operative method of packing and selling and for that purpose have formed a number of societies or companies each of which owns one or more packing houses. Throughout the Annapolis valley there must be over 100 of these packing houses.

Forty of the fruit packing companies have carried co-operation a stage further by combining to form a central trading organization registered as the United Fruit companies of Nova Scotia. This company acts as a selling agency for all its subsidiary companies and has sales which exceed 400,000 barrels of apples annually. The total production of apples is estimated at 1,400,000 barrels, of which at least two-thirds is annually exported to Great Britain. The chief varieties grown are the Baldwin, Blenheim, Gravenstein (early), Golden Russet, Kings and Ribston. Cherries, strawberries, pears are also grown in smaller quantities.

Fruit Growing in Ontario.—The province of Ontario produces 60% of the apples, 69% of the plums, 84% of the pears, 92% of the peaches, and 98% of the grapes of the Dominion of Canada. The apples are produced over an area stretching from Lake Ontario in the east to Lake Huron in the west, and from Lake Erie in the south to Georgian bay in the north. The other fruit crops and some apples are concentrated into a narrow strip of land between Hamilton and Niagara and lying between the Western hills and Lake Ontario. This Niagara area is regarded as the garden of Canada.

The soil is silty, though varying considerably in texture, so that patches of very light, medium and heavy soils occur frequently and each is cropped in a special way. Orchards of peach trees abound on the light soils; pears, plums and apples on the medium, whilst grapes and currants are found on the heavy. Fields of strawberries and raspberries are common. The Niagara district lying well south has a climate coming under the moderating influence of the Great Lakes, so that the day and night temperatures are more even and spring frosts are very rare. All these factors combined are said to give high flavour and piquancy to Ontario grown fruit and to render safe the production of good annual crops.

The apple trees in the orchards follow the English system; but in culture, cover cropping, manuring with artificials, and spraying to control pests the methods are akin to those practised in Nova Scotia. The grading of the fruit is done in the orchards mostly by hand, for few have yet adopted the packing house system so commonly seen elsewhere. The fruit districts are in close proximity to populous districts and much is sold for local consumption, leaving but little for export.

Fruit Production in British Columbia.—The bulk of the fruit crop of British Columbia is grown in the Oakanagan valley. The valley is situated in the Rockies over 1,000 ft. above sea-level and has a large lake of deep, cold, blue water running down the centre for 80 to 90 miles. Towering immediately above the lake in the east are the rugged mountains of the Gold Range, and on the west those of the Coast Range. In past ages the mountain slopes have been subjected to glacial action, and the soil brought down the mountain sides has been deposited as bench on the slopes immediately above the lake. It is on these benches, both flat and hilly, that the fruit, primarily apples, with a few pears, plums, cherries and prunes, is grown. Normally the benches look like heaps of dry dust, and produce nothing but bunch grass, but when artificially irrigated large crops of fruit of the finest appearance can be produced. Every bit of land capable of irrigation has been planted to fruit, so that the fruit area is very compact and very similar from the top end of the lake to the bottom. The district is very cold in winter and hot, dry and sunny during the summer. Little summer rain falls, so that the trees would stand little chance if the melting snow water had not been harnessed in its downward course and led to irrigate the orchard soils.

The land under the trees is cover cropped to alfalfa (mostly), vetches or sweet clover, for the practice of clean-cultivation has not been successful. The fruit on the trees are much thinned after the June drop and trees are sprayed five or six times to prevent insect pests from doing damage. Under these conditions

it is not surprising that high quality clean fruit is produced.

In each centre, Vernon, Kelowna, Penticton, etc., local growers have combined to form fruit companies for the co-operative storing, grading and packing of the fruit ready for marketing. In British Columbia the standard box of 40 lb. is used for apples. None of the packing houses—nor any of the members—are permitted to sell fruits on the markets, the selling being left to a central agency, the Associated Growers of British Columbia, Ltd., with headquarters at Vernon. The annual sales of this central agency exceed 3,000,000 boxes of fruit (of which over 2,500,000 are apples) and over 12,000,000 lb. of vegetables. The chief varieties of apples grown are McIntosh Red and Jonathan, Wealthy, Kings, Delicious and some Cox's Orange Pippin.

AUSTRALIA AND NEW ZEALAND

Enjoying a wide range of soil and climate, it is not surprising that districts can be found in Australia where nearly every kind of fruit may flourish. Large scale production is, however, restricted to fruits that can be exported under refrigeration, for the main market is Great Britain. In the census for 1926 the main fruits grown and produced were as follows:—

Australian Fruit Production, 1926

	Area	Production
Bananas	9,754 ac.	40,795,700 dozens
Oranges	33,000 „	63,363 tons
Peaches	21,000 „	45,570 „
Apples	81,000 „	173,334 „
Vines for raisins	48,000 „	145,015 „
Pears	17,000 „	31,057 „

Apples are the most important crop not only in production but for export. Tasmania is the oldest fruit growing centre and still has the largest industry. Next in order of importance are Victoria, Western Australia and South Australia. The total value of the Australian fruit crop in 1925 amounted to £6,283,000 and with the grape harvest included it reached a total of £10,000,000.

Growers have copied the orcharding systems of both Great Britain and the United States for apple and pear growing; apricot and peach culture closely resemble that of California. New South Wales, Victoria, and South Australia have taken the lead in irrigation of orchards, utilizing the waters of the Murrumbidgee and the Murray rivers with schemes under Government direction.

Of apples, the principal varieties grown are Sturmer Pippin, Cleopatra, Scarlet Pearmain, Cox's Orange Pippin, Ribston Pippin, Dunn's Seedling and the American Jonathans and Rome Beauty; of pears, Doyenne du Comice, Josephine, Bon Morceau, Beurre Bosc and Keiffer, etc. The Australian growers, and especially those of Tasmania, have introduced most varieties grown in England and the best of the American kinds, with the inevitable result that too many kinds are grown to market to the best advantage.

To a large extent the grading and packing is modelled on the American system and improvements in the market package are made annually. There now exists a plan for linking up the fruit areas with district packing houses and cold stores working as co-operative concerns. Stage by stage these are coming into operation; but it will be some years before complete standardization is effected. At present the Western Australian apples are packed in bushel cases made of red eucalyptus wood, Tasmania uses white gum wood, while New Zealand uses deal.

In New Zealand the fruit-growing lands are situated in the provinces of Auckland, Hawkes Bay, Nelson, Canterbury and Otago. The orchards are surrounded with shelter belts of rapid growing Australian wattles, usually three rows, for it is held that one of the first essentials in successful fruit production in New Zealand is adequate shelter to protect the trees when in blossom. The fruits from New Zealand are juicy and well flavoured, much as those grown in England, but the skins are more polished and coloured by the bright sunshine.

The fruit industry of Australia and New Zealand acquires added importance in virtue of its season of harvest synchronizing with the lean fruit months of countries in the Northern Hemi-

sphere. Great Britain, for instance, is able to draw supplies of apples and pears from the Northern Hemisphere from September till April, and from Australia and New Zealand from May till August.

SOUTH AFRICA (1928)

The potential capacity of South Africa for fruit production is fast becoming recognized. Large numbers of trees have been planted, but only a few have reached the production stage. The statistics show the trees of bearing and non-bearing ages:—

	<i>Trees</i>
Peaches (bearing)	5,427,170
(non-bearing)	1,437,750
Plums (bearing)	1,171,120
(non-bearing)	640,960
Pears (bearing)	642,480
(non-bearing)	513,850
Apples (bearing)	1,814,880
(non-bearing)	1,161,570
Oranges (bearing)	1,623,100
(non-bearing)	1,936,180

These figures clearly show that in a few years' time South Africa will rank amongst the great fruit producing countries, whilst its production will resemble that of California, which enjoys a summer climate not very dissimilar. Irrigation is practised, particularly for the citrus groves.

Apples of a sort have been grown for generations in all parts of South Africa, especially on the high plateaux of the Transvaal, Free State and Natal, and recently, when the commercial possibility of production was realized, many commercial orchards were established mainly in the same regions, for apples seem to do better on the high veldt than in the hot plains. The rainfall is mainly in the summer; for the winter is dry, with frost at night. Sunshine at all times is very bright. Some apples are grown in the eastern portion of Cape Province near the sea, where these conditions are reversed.

The peaches, pears, plums and apricots are grown in special areas, of which the district at the back of Cape Town is well known, though some are produced in the Orange Free State and the Transvaal. The pear probably does best. It is the longest in coming into bearing, but has a commercial life twice as long as the peach tree and yields large crops. William Bon Chretien, Beurre Bosc, Beurre Hardy and Louise Bonne are favourite kinds. Plums and peach trees commence to give a commercial return in about four years, in seven or eight they are in full cropping and have a life of about 20 years.

Oranges are now grown throughout the South African Union and also in Southern Rhodesia, but as yet the trees are young and only yield light crops. In 1907 only 3,000 boxes were exported to the United Kingdom, in 1925 the number had reached 1,000,000 boxes. It is estimated that within the next 15 years South Africa and Southern Rhodesia will be able to send to the United Kingdom 10,000,000 cases a year. The chief varieties grown are the Washington Navel and Late Valentia, though the Jaffa and the Mediterranean Sweet are being planted. The Late Valentia has proved very suitable for South Africa. The trees grow well and the fruit packs and carries satisfactorily; it arrives in the United Kingdom during September, October and November. The Washington Navel is earlier and reaches the British markets in June, July and August. Orange growing in South Africa is done by the white population helped by native labour. All exported oranges must conform in grade, quality and packing to the Government regulations which define the grades. The future prospects for fruit production in South Africa seem particularly bright.

MISCELLANEOUS PRODUCTION

Oranges.—In pride of place the orange comes after the apple. It requires a warm climate, such as is found in Spain, California, the West Indies, Palestine and in some parts of Australia and South Africa.

Oranges ripen at different times in the various countries of production, and so reach the markets at different seasons of the year. Oranges from the West Indies, Palestine and Spain are on sale

during the winter months from November to April, those from California in January to July. The South African and Australian crops arrive in Britain from June to November. Oranges from all these places are sent for sale to England; but the Californian crop is marketed mainly in the United States, though a small quantity is exported to Europe. The Spanish oranges differ a good deal, those of the Mediterranean seaboard being the sweeter, whilst the Seviles, a speciality of the south, are bitter and largely used for making marmalades. These Seviles are sold during January.

No general organization exists for grading and packing, nor has the Spanish Government passed any laws to compel grading. A few large growers do their own grading and packing, but in general the fruit is taken over by merchants who grade and pack in accordance with their own standards.

The total orange area in Palestine is over 8,000 ac., with extensive new annual planting being made on the coastal strip near Jaffa. Both Jewish and Arab labour is employed. Camels are used to take the cases of oranges to Jaffa, whence they take 12 to 20 days by ship to reach England. The large oval Jaffa oranges enjoy a high reputation.

Orange growing in California is on a large and elaborately organized scale. Washington Navel (maturing from November to May) and Valentia (from May to November) are the two main varieties. Many Tangerines and Mediterranean Sweet have been planted in recent years. In order to protect the maturing fruits against frost, oil pots are used to heat the orchards.

The Californian orange growers are great believers in bud selection. In propagating citrus trees nurserymen now use buds from parent trees with known and satisfactory performance records. These are grafted on the sour orange, which has proved to be the best stock for California.

Grape Fruit.—Grape Fruit is a comparatively new fruit to Europe. It was not till 1920 that the import figures of grape fruit were given as a separate item in the British trade statistics. Imports into England rose from 13,424 cwt. in 1920 to 77,880 cwt. in 1924. The Florida fruits, mainly of the Duncan, Walters, and Hale varieties, are marketed almost throughout the year, the South African from June to September, and the West Indian from December to April.

Government standards of grading and packing are in force in South Africa for all exported fruits. In the West Indies, especially in Jamaica, the grape fruit is found wild in many places.

Bananas.—In the Western hemisphere this important tropical fruit is cultivated in the Central American States, Colombia, Brazil and in the West Indies. It is grown in the Canaries and Madeira, and has been introduced to West and East Africa, where it grows in a semi-wild state on both sides of the Equator. Eastwards, the banana is found in Burma, Assam, Indo-China and China, and southwards in Queensland. It grows in many islands of the Pacific, and there is an extensive production in the Philippine islands. In most of these places the banana is an important local food.

Great Britain draws its supplies from two main areas: the British West Indies with Central America and Colombia together supply about 75% of the British imports, the other 25% comes from the Canary islands and Madeira:—

Great Britain's Importation of Bananas

Main supplying countries	Year 1904	Year 1924
Canaries (and Madeira)	1,767,000	2,649,064
Central America and Colombia	361,000	6,875,501
British West Indies	535,000	1,795,533
Total (from all sources)	2,664,000	11,307,940

The banana is easy to grow provided there is sufficient heat and an abundance of water. Suckers planted soon take root and grow into plants which yield fruit in about 18 months, but the plant bears only a single bunch in its life cycle. The Gros Michael is the principal kind grown in Central America and Jamaica. Individual bunches of these vary between 50–80 lb. in weight. This banana is large, has a thick skin, and may be

marketed in towns far from the centre of production. Unfortunately it is liable to the Panama disease (*Fusarium cubense*), which in the past has caused so much loss, especially in the West Indies.

The Canary banana has bunches weighing from 25 to 65 lb., and carrying from 125 to 200 separate fruits. The individual fruits are thin skinned, small and of high class. Owing to the delicacy of the skin of the fruit and the structure of the bunch special precautions in handling, packing and carriage have to be made. The supplies sent to Great Britain from the Canary islands are wrapped in cotton wool and packed in crates to prevent damage and decay.

EXTERMINATING PESTS

Spraying Mixtures.—No matter where grown, all kinds of fruit are attacked by pests. In mild, humid atmospheres tree pests are usually of a fungoid nature; in the dry, warm regions insects and bacteria are rife. In temperate zones all three are present. All parts of the fruit trees suffer, including the foliage, the blossom, and the fruits; where the last named are affected their value is considerably reduced. Apples, for instance, holed with the codlin moth, a pest very prevalent in box apple districts of America, or spotted with scab, as is common in Great Britain and the eastern district of America and Canada, are practically valueless and would be culled out in grading. Similarly, cherries with worms of the cherry fly, and gooseberries covered with mildew are of little value.

The fruit grower who would produce high grades of fruit has to carry on a regular campaign to keep pests under control. For deciduous fruits like apples, pears, plums, cherries, gooseberries and currants, etc., a series of sprays on the trees is regularly practised in all districts. One spray, called the winter spray, is applied when the trees and bushes are dormant, and other sprays in the spring and early summer when the foliage is developing or out. Formerly sprays of lime, lime and salt, lime and sulphur and caustic soda were used as winter sprays, but whilst all these sprays would cleanse the trees and bushes of lichens and mosses, would kill any adult insects that were hiding, they either had no effect on the insect eggs or killed a few only, for which reason they have been supplanted by sprays of a coal tar distillate type. These tar distillate sprays, mixed with water for top fruits in the ratio of $7\frac{1}{2}$ of spray fluid to $92\frac{1}{2}$ water and applied to the trees when dormant, kill the lichens and mosses, adult insects, and the eggs of most of the insects which attack fruit. The same fluid in the ratio of 5 of spray to 95 water may also be used for bush fruits. This discovery has placed a most efficient spray at the service of fruit growers and large quantities are now used as winter sprays. The proprietary washes known on the English markets as Carbokrimp, Mortegg, Ialine, Aboline, and Sterolite are of this class.

The first of the summer sprays is applied to the apple trees when the blossom buds are just developing and a second is made immediately after the petals have fallen, and repeated, if necessary, in two to three weeks' time. Pears and other top fruits are the better for being treated similarly. The spray used is Bordeaux mixture—4 lb. copper sulphate, 4 lb. quicklime, and 50 gal. of water into which 2 lb. of lead arsenate has been added. The Bordeaux-arsenate mixture sticks to the foliage and protects it against fungus diseases like scab and leaf eating caterpillars and all biting insects. Instead of the Bordeaux mixture many growers prefer to use a lime-sulphur spray, which is safer for tender varieties, such as Cox's Orange Pippin, James Grieve and Rival. Lime sulphur, one gal. to 29 gal. of water, is largely used for spraying gooseberry bushes to prevent mildew and for black currant bushes (one part lime-sulphur to 12 parts of water), to control the bud mite.

Spraying must be thoroughly and intelligently done, and that largely is a matter of understanding the technique and having suitable machinery. The sprayers may vary in size from a small knapsack costing £3, or a barrel on wheels with a hand pump costing £20, or a large portable machine with pump (motor) costing over £100. Pumps which release the spray from the nozzle

at a pressure of 200 lb. are the more efficient. These repeated sprayings have become a necessity and no growers could now succeed without them in producing high grade clean fruits. (See also under APPLE GROWING, etc.). (H. V. T.)

UNITED STATES

With the wide range of climatic and soil conditions in the United States, it is possible to grow to perfection in one part of the country or another most of the temperate zone fruits and many others of semi-tropical origin. It is not surprising, therefore, that fruit growing occupies an important place in the agriculture of the country. The total farm value of fruit and nuts in 1919 was placed at \$730,000,000. The production of some of the principal fruits is given in the following table:

Total Production of Fruit in United States in 1919 and 1922-6
(In thousands of bushels, boxes, tons or quarts)

	1919	1922	1923	1924	1925	1926
Apples (bu.)	142,086	202,702	202,842	171,725	172,389	246,460
Peaches "	53,178	55,852	45,382	53,848	46,562	68,425
Pears "	15,006	20,705	17,345	18,866	20,720	25,644
Plums "	19,084
Apricots (tons)	175	145	210	142	140	..
Oranges (box)	16,390	31,341	36,341	29,300	33,723	34,312
Grapefruits (box)	5,795	7,674	8,453	8,842	8,100	7,916
Lemons (box)	3,983	3,492	6,840	5,125	7,136	7,200
Grapes (tons)	1,258	1,778	2,064	2,349
Strawberries (qts.)	176,932	284,716	211,396	256,411
Raspberries (qts.)	61,334
Black and dew (qts.)	39,945
Cranberries (qts.)	35,260
Currants (qts.)	7,615
Other berries (qts.)	3,904

The combined production of all fruit has increased greatly since the beginning of the century. Keen competition has led to a gradual decline of fruit farming in the less favourable regions and a concentration in sections where natural conditions and good transport facilitate production and marketing. Farm orchards in the marginal regions are becoming less important also because little or no attempt is made to control pests there, so that the fruit is usually of low quality.

Apples are the most extensively cultivated of all fruits. They are grown commercially in all except a few of the warmest and most southern States and in the two or three northern States of the Great Plains region. Outstanding apple sections are found in New York and in parts of Ohio and Michigan adjoining the Great Lakes; Washington, and several other portions of the north-west States; the Shenandoah-Cumberland region including parts of southern Pennsylvania, western Maryland, West Virginia and Virginia; the New England States; the Ozark regions of Arkansas and Missouri; southern Ohio, Illinois, Colorado and California. Pears are grown only in the cooler climates with important centres in California, New York, Washington, Oregon and Michigan. Quinces are grown in a very limited way in the same regions. Important commercial peach areas are found in Georgia, California, Texas, the Ozarks, the Carolinas and Tennessee, the Middle Atlantic States and those parts of New York, Michigan, Ohio and Pennsylvania that have the advantage of the moderating influence of the Great Lakes. Plums are most largely grown in California, Washington and Oregon, although several native species are widely distributed, yet not extensively grown, throughout the eastern States and in the upper and lower Mississippi valley. Commercial sweet cherry production is confined to the Pacific coast while sour cherries are grown most extensively east of the Rocky mountains, especially in New York, Michigan and Wisconsin. The commercial production of apricots is carried on only in California. The important citrus regions are limited to southern and central California and southern Florida.

The American *Labrusca* grapes are largely grown along the

shore of Lake Erie in Western New York, Pennsylvania, Ohio, and the eastern shore of Lake Michigan. Other important sections are found in the Hudson valley and in the Ozark region. Muscadine grapes have recently been planted largely in the southern Atlantic and the Gulf coast states, especially in North Carolina. Numerous attempts have been made to grow European grapes in the eastern part of the United States but the cultivation of this species is now confined to California, where it is the most important fruit. Large commercial areas of strawberries are found in Florida, Alabama, the Carolinas, Tennessee, Arkansas, Missouri, Eastern Maryland, Delaware, south-western Michigan and New York. Raspberries are extensively grown in Washington and throughout the north-eastern part of the United States with specially concentrated areas in the fruit regions around the Great Lakes and in the Hudson valley. Blackberries are grown farther south along the Ohio river in the Ozark region and in Texas. Dewberries are also grown in the Pacific States. Currants and gooseberries are found mostly in the Hudson river valley and in Western New York near Lake Ontario, but they are among the least important fruits. Cranberries are confined to limited areas in Massachusetts, New Jersey, Wisconsin and Long Island, N.Y. Among the cultivated fruits that have been planted on a commercial scale in recent years might be mentioned the persimmon and blueberries which are found in the temperate regions and the olive, dates, avocado, mango and loquat which are grown chiefly in California, Arizona and Florida.

The fruit industry in the United States traces back to the first settlers of America. Old world species have become well established in the new country. Most of the apples and peaches grown in the United States are American varieties of European species. Foreign grapes, plums, pears, cherries, apricots are as extensively grown as are varieties developed in America. A number of the native fruits are among the important cultivated sorts notably the *Labrusca* and several other species of grape, several species of plums, raspberries, blackberries, dewberries, blueberries and cranberries. The strawberries are mostly hybrids of American and foreign sorts. There are many other promising native fruits which are being grown locally and which are also being used extensively by experiment stations throughout the country in breeding work. These State and Federal experiment stations have produced thousands of seedlings of fruits of known parentage the aim being to develop varieties that have fewer faults from the standpoint of the grower than the existing sorts. The ideal variety combines the desirable features of high quality, productivity, resistance to extreme cold in winter, to late spring frosts, and to diseases and insects.

Varieties.—The variety list for most fruits is very extensive, though the tendency is to limit the number of varieties grown. Over 900 sorts of apple have been described, among the varieties found in the newer plantings being the McIntosh, Delicious, Northern Spy, Rhode Island Greening, Cortland and Jonathan, all being of very fine quality. The Baldwin, York Imperial, Rome Beauty and Yellow Newton are still standard sorts used extensively for cooking. Ben Davis, Roxbury Russet, Spitzenburg, Tompkins King were formerly of high rank but are no longer planted on account of low quality or susceptibility to disease. Bartlett, Bosc, Seckel and Kieffer are the important commercial pears. The Elberta peach is the most important variety in all sections both north and south; the Hale, Belle of Georgia, Carmen, Greensboro and Champion are also prominent sorts; Muir is widely grown for drying on the Pacific coast, and Cling and Phillips are among those used for canning. The chief apricots are the Royal and the Blenheim. Montmorency and Early Richmond are the standard sour cherries, and Napoleon, Bing and Lambert the principal sweet sorts. Among the European plums the Italian prune, Tragedy and Pond, Imperial Epineuse, Jefferson and Reine Claude, Bradshaw and Shropshire Damson are extensively grown; the Burbank, Climax and Satsuma are the important Japanese sorts. Only two varieties of orange are widely grown in California—Washington Navel and Valencia; Parson Brown and Homosassa come from Florida, and Satsuma oranges from the Gulf States. The Duncan and the Marsh are

the important grapefruit varieties; and the Eureka and Lisbon are the lemons grown in the United States. Among the grapes the Concord, Worden, Niagara, Winchell are the outstanding American sorts; the Raisin Muscat, Muscat of Alexandria, Mission, Malaga, Sultanina are the important representatives of the old world varieties. The important strawberries are Missionary, Klondike, Premier, William Belt, Sample, Senator Dunlap, Glen Mary, Marshall and Chesapeake although numerous other sorts are grown locally. In the bush fruits list the Cuthbert, Latham, June, Herbert are important red raspberries; Gregg and Plum Farmer are standard black raspberries; Eldorado, Snyder and Mersereau the outstanding blackberries. The loganberry and the Lucretia are the most important of the dewberry type. The Industry is the only European gooseberry that does fairly well, but it is not grown as widely as the Chautauqua and Poorman varieties of American origin. The Cherry and the Fay are the important currants.

Orchard Methods.—Frost constitutes the greatest uncertainty in fruit growing. No fruit and no fruit section is entirely safe from unseasonable cold weather, and in occasional years even the most reliable and hardy varieties in established fruit sections suffer during the winter or have the bloom killed or seriously curtailed by late frosts in spring. Winter injury to the plant and the fruit buds is a more important problem in the northern sections, although there are also serious losses from unfavourable weather at blooming time. Only the hardier varieties are chosen and cultural operations are done in such a way as to insure the best maturity of fruit and wood. The proximity of large bodies of water is a most important feature of the oldest established fruit sections in Western New York, in the Hudson Valley, and in south-western Michigan. The influence of the Atlantic on the New England States and of the Pacific in the north-west also has its beneficial effects on the fruit growing industry in those parts; frequent extremes of temperature are avoided during the winter, and in spring the buds remain dormant for a week or ten days later than in less favoured regions of the same latitude. The inland sections, notably those in the Shenandoah-Cumberland region, the Ozarks and the Mississippi valley are specially hazardous so far as the injury from spring frosts is concerned. In favourable climates the site of a fruit farm is generally chosen with reference to its freedom from frost pockets. Orchard heating has not proved economical for deciduous orchards except in the north-west, but this method of avoiding injury from frosts is extensively practised among the citrus growers in California and Florida. By the use of 30 to 50 small oil or coal fires per acre it is possible to raise the temperature 4° to 5° F and thus prevent damage from cold. The overhead cost of heating may run as high as \$50 to \$75 per acre but heated citrus orchards may show a profit over a ten year period, of from 30% to 50% over unheated orchards.

While the climate determines whether or not it is possible to grow fruit in any locality, the soil is probably the most important factor in determining the yields and profits. For most tree fruits the fertility of the surface soil is less important than is a good depth and proper drainage of the sub-soil. Most fruit growers have learned to avoid obvious defects such as shallow or impervious soil; but it is, unfortunately, difficult to predict the drainage conditions in years of unusual rainfall during late spring and late autumn, so in every fruit section one finds many orchards established on ill-suited land. Even in a given orchard trees in one row may yield two to four times as much fruit as borne by the same variety a few hundred feet removed.

The standard planting distances for mature apple trees is 40 x 40 feet. Practically all other tree fruits are set 20 x 20 feet apart. Small fruits are planted in rows far enough apart to permit cultivation by horse- or tractor-drawn implements. It is important to reduce the amount of man labour required, the land being a relatively cheap item in most cases. In apple orchards, fillers or semi-permanent trees are sometimes allowed to occupy the intervening spaces for the first 15 to 25 years after planting. In many cases intercrops such as corn, tomatoes, strawberries and the like are grown for the first 2 to 4 years. In setting out a

modern fruit plantation particular attention is given to cross-pollination, since many kinds of fruits will set more abundantly if they have the stimulus of pollen from another variety of the same species. Some cherry, plum and apple trees may bloom heavily but set few if any fruits without cross-pollination. The weather at blooming time may interfere with the flight of bees, or the temperature may be too low for the proper development of the young fruits, so that severe losses are not infrequently encountered even though cross-pollination has been provided.

Orchard soil management is concerned chiefly with the conservation of soil moisture and the supply of nitrogen to the plants. Early ploughing in spring and the frequent stirring of the soil during the summer is the standard procedure for most fruits. The tendency is to plough earlier in the spring and not so late in the autumn, for nitrates and moisture are thus provided at a minimum expense at a time when the tree is making most rapid growth. Cover crops of rye, oats, legumes or even volunteer crops of weeds are allowed to occupy the land during late summer and autumn. By absorbing excess moisture and plant food from the soil and thus reducing the supply to the tree the cover crop helps to mature the fruit and allows the tissues to develop hardness against cold. When ploughed under in late autumn or early spring the cover crop tends to replenish the humus supply of the soil. Grass interferes with the growth and productivity of the trees; but it is possible to overcome much of this injury by applying readily available nitrogenous fertilizers. Many fruit growers are now turning to a method of sod culture with nitrates. Nitrogen is necessary for vigorous shoot growth; it causes the flowers to set fruit and to develop to the proper size. Peaches require most nitrogen and are the first to suffer when the element is deficient. Cherries, plums, pears and apples follow in the order given. While other elements than nitrogen, especially phosphorus and potash, are applied to fruits, they seldom prove profitable in the cultivated orchard except on very poor soils. Phosphorus seems to be especially needed by strawberries. Cultivation in most cases not only liberates adequate supplies of nitrates and other food elements for fruit plants by destroying the grass and weed growth but also tends to conserve the soil moisture by providing a dust mulch. An adequate supply of soil moisture is an important factor with all small fruits, and with tree fruits in the less humid sections of the country. Irrigation is a common practice with fruits throughout the north-west and in many parts of California, but is not used in the eastern part of the United States except for special plantings of strawberries and raspberries.

Pruning practices vary greatly for the different fruits and for a given fruit in different sections. The present tendency is to prune young trees less severely, although it is generally recommended that some attention be given to shaping of the main framework. Experiments have definitely shown that the heavy cutting formerly believed to be necessary to train the tree may delay bearing from two to five years. As the trees grow older, the most common practice is to remove the crowding branches and any weak, shaded or diseased wood. After a time it becomes necessary to cut back the high branches in order to confine the bearing surface within a reasonable distance of the ground and within the allotted space. Extra heavy cutting is sometimes practised to rejuvenate tall and neglected trees. Among the tree fruits, peaches and apricots receive the most frequent and the most severe cutting, to force an abundance of new shoot growth and increase the size of the fruits. While the sour cherry commonly receives the least pruning many growers find that the heavy cutting given to keep the tree small, also stimulates a desirable wood growth and provides somewhat hardier buds. Mature apples may be pruned every few years by cutting out much wood, or they may receive a more detailed pruning annually. Although it is recognized that very severe cutting may in some cases reduce the total yield, most growers seem to find that the quality of the fruit is greatly improved and orchard practice is facilitated enough to justify the costs of the operation. The pruning of grapes and bush fruits is more nearly standardized than the practice for tree fruits, heavy cutting and thinning out

of old wood each year being the rule. The refinements of pruning frequently practised in Europe are not followed in the United States, chiefly because economic conditions do not permit of much hand labour and also because there seems to be little need; its problems, as well as other cultural operations, have, however, been the subject of much study by the agricultural experiment stations in recent years. Such matters as the regularity of bearing, flower bud formation, fruit setting, growth and quality of fruit, and winter injury have been shown to be associated with the physiological disturbances caused by the removal of leaves and twigs.

Pests and Diseases.—The control of orchard pests is attempted in all fruit growing localities; effective spray schedules have been worked out for most of the pests and special spray services under the supervision of experts are maintained by progressive groups of growers. Schedules generally give the spray or dust mixtures to be used with particulars of pests to be combated at various times throughout the season; insecticides and the fungicides are applied in liquid or dust form and power sprayers are chiefly used. In some modern orchards the mixtures are piped from a central mixing and power plant to various sections of the orchard where the spray hose may be attached to convenient outlets. Lime sulphur and Bordeaux mixture and corresponding sulphur and copper-lime dusts are the standard fungicides, while lead arsenate, nicotine sulphate and oil emulsions are used as insecticides. Timeliness and thoroughness of application are important.

Among the more important diseases which can be successfully controlled by spraying are apple-scab, bitter-rot, blotch and apple cedar rust; peach-scab, leaf-curl and brown-rot; black-rot on grapes; citrus scab and melanose. The various fruits are also subject to injury by sucking insects such as scales, aphids, red mite, and pear psylla as well as by a large number of biting insects among which the most important are the codling moth and the green fruit worms, plum curculio, canker worms, tent caterpillars and grape phylloxera. Fumigation with hydrocyanin gas is used for citrus scale, and peach tree borers are now controlled by the use of a volatile paradichloro-benzene which is placed about the base of the tree. A few pests such as blight, yellows and mosaics, cannot as yet be satisfactorily controlled by spray, and many troublesome insects such as fruit flies, Japanese beetles and others are being introduced in spite of rigorous quarantine, new sprays being required to hold these in check. Rodents—especially mice, rabbits and gophers—do considerable damage to the young fruit plantations and many growers find it necessary to carry on systematic control measures involving their wholesale destruction.

Transport and Marketing.—More and more attention is given to the proper harvesting and handling of fruit since much of the marketing quality depends upon the proper time of harvesting and handling. While most fruits improve in quality if they can become ripe or nearly so while on the tree, it is often impractical to allow the ripening process to proceed far where the product must be shipped hundreds or even thousands of miles to market. In most cases the fruit is harvested in a hard ripe stage so that it reaches the market in firm condition with as much quality as possible. If picked too green the fruit tends to wilt, fails to attain a satisfactory quality and breaks down prematurely; but there is a temptation, nevertheless, to harvest early since prices for the first products are high. Pressure testers have come into use for determining the proper time for picking pears, for these give a definite standard of maturity and overcome many difficulties previously experienced. Much damage formerly resulted from the careless handling of citrus fruit due to the small abrasions on the skin, and subsequent attacks by blue mould and other rot-causing organisms; this is now largely avoided by providing the pickers with canvas gloves and blunt picking shears; the same problem confronts the deciduous fruit industry, and much loss is incurred by bruising and moulds. Rapid advances have been made in the proper grading and standardization of fruit and the most important fruit States have laws regulating the standard grade requirements for the different fruits. The

BY COURTESY OF (1) THE NATIONAL ORCHARD HEATER CO., (2) THE CATERPILLAR TRACTOR CO., (3, 5) THE CALIFORNIA STATE DEPARTMENT OF AGRICULTURE, (4, 6) THE CALIFORNIA FRUIT GROWERS EXCHANGE

MODERN METHODS USED IN CITRUS FRUIT FARMING

1. Protection against frost in California citrus grove: oil heaters placed at regular intervals throughout groves diffuse heat when frost threatens. Many fruit crops are saved in this way
2. Soil cultivation in citrus grove with tractor. Top soil is loosened with disc harrow to prevent it from drying out too fast, thereby saving moisture for development of trees and fruit. A tractor driven carefully will move among the trees without causing damage
3. Apricot and pear trees in full bloom on a California ranch. Pear orchard in foreground; apricot trees in background with profuse bloom
4. Typical fruit picking scene in a California valley. Expert pickers carry bags slung from shoulders and use short ladders to reach the fruit. Each piece of fruit is carefully picked by hand, placed in the bag and transferred to containers on the ground. Wagons passing between rows of trees collect containers for delivery to packing house
5. Making raisins of muscat grapes. The grapes are placed on tables or drying floors in open fields, where a maximum of sunlight and air gives good drying conditions. In some seasons the grapes must be dried in a drying house, seen in this illustration in the left background
6. Interior view of packing house in the California citrus fruit district. Oranges are delivered by conveyor to four hoppers (right background), from which they pass along the sorting tables. Girls wearing soft gloves to prevent scratching skin of oranges (which would cause premature decay) wrap each piece of fruit in tissue paper and pack carefully in wooden crates. Roller conveyors remove the crates

Federal government maintains a shipping point inspection, at numerous centres to certify the condition and grade of fruit at the time it is loaded, and federal inspection at the receiving end is available to the grower. More and more of the fruit is being graded, packed and shipped co-operatively at a central fruit packing house. Trained help is employed, and special machinery is used for sizing, packing and loading. In the citrus industry the fruit has for many years been washed before it is packed, and this is now necessary to remove arsenical spray residue on apples, especially those grown in the north-west where the codling moth has to be combated and where the rain does not wash off the spray. Fruits are packed in many different kinds of container but in practically all cases the buyer retains the package. The tendency is toward standardization and the use of smaller packages as for example the bushel box or basket in place of the barrel. The fancy grades of fruit are wrapped in oil-treated tissue to prevent scald. Shredded oil paper placed throughout the package also serves the same purpose. A recent development is the marking of individual fruits to distinguish the brand. Most of the fruit moves under refrigeration, and special fast freight service is available from the Pacific and other important fruit sections. The rapid advances in the cultivation of fruit and the increased production of competing products has emphasized the need for more careful and economical methods of marketing and distribution. Numerous agencies, including the railroad, receiver, broker, truckers and retailers, are involved in the disposition of the crop and the grower may often receive only a small fraction of the price that the ultimate consumer pays.

Large quantities of fruit, especially apples, are kept in cold storage warehouses to supply the market throughout the winter and late spring. Other fruits such as peaches, pears, plums and strawberries are held for periods of several days to a month or more. Only certain varieties are suitable for prolonged keeping and these must go into storage in proper condition. Storage scald and internal breakdown are common storage difficulties. These can be prevented by the use of oiled paper wrappers and by allowing the fruit to mature properly before storing.

Canning and Export.—The bulk of the fruit is consumed in the fresh state, but in recent years the canning industry has made great strides. The combined pack of the more important fruits in 1919 was over 20,000,000 cases, and the value of the canned fruits of 1925 was estimated at nearly \$101,911,000. Peaches contributed over one-third to the 1919 total, about as much as the next three important fruits—apricots, apples and pears—combined. In the last few years the freezing of fresh fruit with or without sugar has come into extensive practice. The fruit is held indefinitely in the original container at a low temperature, to be used subsequently by large consumers such as bakers and ice cream manufacturers. Cherries, strawberries and raspberries are successfully preserved thus and the result is as good as or better than fresh fruit and more suitable than canned fruits for trade purposes. Fruit juices are manufactured widely, especially grape, cider and orange juice. It is interesting to note that the early settlers grew fruits almost exclusively for the purpose of manufacturing drinks, but the juice industry is now a by-product except in the case of grapes.

The fruit drying industry is very extensive. In 1919 about 575,000,000 lb. of evaporated fruit were produced. Raisins accounted for approximately one-half of this amount and prunes for a little less than one-fourth. Apricots, apples and peaches made up practically all of the remainder. Large quantities of the fresh fruit and of the by-products are exported to Great Britain and Germany and other European countries. Approximately 5,000,000 boxes and 1,500,000 bbl. of apples, about 420,000,000 lb. of dried fruits and over 225,000,000 lb. of canned fruits are exported each year.

BIBLIOGRAPHY.—Among the many modern works of a scientific nature on fruits in America may be mentioned Chandler's *Fruit Growing* and Gardner, Bradford and Hooker's *Fundamentals of Fruit Production*. The various fruit monographs published by the New York agricultural experiment station at Geneva, N.Y. are the standard references for a description and history of the varieties of deciduous fruits. A recent comprehensive survey of the industry in the United

States is found in the 1925 *Yearbook* of the U.S. department of agriculture. The Federal and State experiment stations throughout the country have contributed largely to the advancement of the fruit industry and their numerous bulletins on insects, diseases and cultural problems are of great value. (A. J. He.)

FRUMENTIUS (c. 300–c. 360), the founder of the Abyssinian church, traditionally identified in Abyssinian literature with Abba Salama or Father of Peace (see ETHIOPIA), was a native of Phoenicia. According to Rufinus (x. 9), who gives Aedesius as his authority, a certain Tyrian, Meropius, accompanied by his kinsmen Frumentius and Aedesius, set out on an expedition to "India," but fell into the hands of Ethiopians on the shore of the Red Sea and was put to death. The two young men were taken to the king at Axum, where they obtained, in time, great influence. With the help of Christian merchants who visited the country Frumentius gave Christianity a firm footing. In 326 he was consecrated bishop of Axum by Athanasius of Alexandria, who in his *Epistola ad Constantinum* mentions the consecration, and gives details of Frumentius's work.

FRUNDSBERG, GEORG VON (1473–1528), German soldier, was born at Mindelheim on Sept. 29, 1473. He fought for the German king Maximilian I. against the Swiss in 1499, and in the same year was among the imperial troops sent to assist Ludovico Sforza, duke of Milan, against the French. Still serving Maximilian, he took part in 1504 in the war over the succession to the duchy of Bavaria-Landshut, and afterwards fought in the Netherlands. Frundsberg assisted Maximilian to organize the *Landsknechte* (q.v.), and subsequently at the head of bands of these formidable troops he was of great service to the Empire and the Habsburgs. In 1509, 1513 and 1514 he gained fresh laurels by his enterprises against the Venetians and the French. When the struggle between France and the Empire was renewed he took part in the invasion of Picardy, and then proceeding to Italy brought the greater part of Lombardy under the influence of Charles V. through his victory at Bicocca in April 1522. He was partly responsible for the great victory over the French at Pavia in February 1525, and, returning to Germany, assisted in suppressing the Peasants' Revolt, using on this occasion, however, diplomacy as well as force. He died at Mindelheim on Aug. 20, 1528. Frundsberg was a capable and chivalrous soldier, and a devoted servant of the Habsburgs. With his grandson the family became extinct.

See Adam Reissner, *Historia Herrn Georgs und Herrn Kaspars von Frundsberg* (Frankfort, 1568). A German translation of this work was published at Frankfurt in 1572. F. W. Barthold, *Georg von Frundsberg* (Hamburg, 1833); J. Heilmann, *Kriegsgeschichte von Bayern, Franken, Pfalz und Schwaben* (Munich, 1868).

FRUNZE, MIKHAIL VASSILIEVICH (1885–1925), Russian soldier, was the son of a peasant who had settled in Turkistān and become a surgeon. While at school he came in contact with socialists and on entering the Polytechnic Institute at St. Petersburg (Leningrad) he joined the Bolshevik section of the social democratic organization. In 1905 he worked in the industrial district of Ivanovo-Voznesensk and helped to organize the big textile strike of that year. He was frequently arrested and in 1907 was sentenced to four years penal servitude, and to a subsequent six years on the grounds that he had offered armed resistance to the police.

At the end of 1914 his penal servitude was exchanged for banishment to Siberia, where he was arrested for revolutionary activities in the following year, but soon afterwards escaped from prison and the March revolution of 1917 found him in Minsk at the head of an illegal organization in the army. He became president of a Front Committee, and later president of a Soviet in the provinces, and at the time of the November revolution came to Moscow with a detachment of 2,000 men, with which he took part in the fighting in that city. After the revolt in Jaroslav he became military commissar of that district, and in Dec. 1918, commander of an army on the Eastern Front. He later became commander in chief of four armies and directed the operations against Admiral Kolchak. When the Eastern Front was divided,

Frunze became commander on the Turkistān section of it, where he surrounded and destroyed Kolchak's southern army. He afterwards took part in minor operations in Central Asia, returning to Europe in Sept. 1920 when he took command of the troops that eventually drove Gen. Wrangel out of the Crimea. He then commanded the military forces in the Ukraine. In 1924 he became vice-president of the Revolutionary Military Council, and, in the absence of Trotsky, the actual head of the Red Army. He became president of this council and People's Commissar for Military and Naval Affairs in Jan. 1925, but died before the end of the year.

FRUNZE, the chief town of the Kirghiz A.S.S.R., situated on the Chu river in lat. 42° 45' N. long. 74° 45' E., formerly ПИШПЕК. Its chief industries are brewing and the manufacture of tobacco (*makhorka*). A branch line from the Orenburg-Tashkent railway, passing through Chimkent and Aulie-ata, reaches the town. In 1928 a line to the densely peopled Tokmak region, north west of Lake Issyk-kul, was commenced, and lines which will link Frunze and Semipalatinsk are under construction. This will open up the corn growing region round Lake Balkhash, and, it is hoped, will enable the Central Asiatic republics to depend on imported, instead of homegrown, grain and thus to increase the area under cotton.

FRUSTUM, a term in geometry for the part of a solid figure, such as a cone or pyramid, cut off by a plane parallel to the base, or lying between two parallel planes; and hence in architecture a name given to the drum of a column.

FRUYTIERS, PHILIP (fl. 1627-1666), Flemish painter and engraver, entered the Antwerp guild of painters in 1631. He is described in the register of that institution as "illuminator, painter and engraver." He worked exclusively in water colours, "yet was so remarkable in this branch of his art for arrangement, drawing, and especially for force and clearness of colour, as to excite the admiration of Rubens, whom he portrayed with all his family." Unhappily no undoubted production of his hand has been preserved. All that we can point to with certainty is a series of etched plates, chiefly portraits. Some beautiful miniatures on vellum may possibly be attributed to Fruytiers.

FRY, the name of a well-known English Quaker family. About the middle of the 18th century JOSEPH FRY (1728-1787), a doctor, settled in Bristol, where he acquired a large practice, but eventually abandoned medicine for commerce. He became interested in various manufacturing enterprises, and was the founder of the Bristol firm of J. S. Fry and Sons, chocolate manufacturers. He purchased the chocolate-making patent of William Churchman and on it laid the foundations of the business. After his death the Bristol chocolate factory was carried on with increasing success by his widow and by his son, JOSEPH STORRS FRY (1767-1835). In 1795 a new and larger factory was built in Union street, Bristol, and in 1798 a Watt's steam-engine was purchased and the cocoa beans ground by steam. On the death of Joseph Storrs Fry his three sons, Joseph (1795-1879), Francis, and Richard (1807-1878) became partners in the firm, the control being mainly in the hands of FRANCIS FRY (1803-1886). Francis Fry took a principal part in the introduction of railways to the west of England, and in 1852 drew up a scheme for a general English railway parcel service. He was an ardent bibliographer, and made a large collection of early English bibles. In 1896 the business was converted into a private limited company, Joseph Storrs Fry being chairman and all the directors members of the Fry family.

FRY, SIR EDWARD (1827-1918), English judge, second son of Joseph Fry (1795-1879), was born at Bristol on Nov. 4, 1827, and educated at University college, London. He was called to the bar at Lincoln's Inn in 1854 and was made a Q.C. in 1869, practising in the rolls court and becoming recognized as a leading equity lawyer. In 1877 he was raised to the bench and knighted. As chancery judge he will be remembered for his careful interpretations and elucidations of the Judicature Acts, then first coming into operation. In 1883 he was made a lord justice of appeal, but resigned in 1892; his knowledge of equity and talents for arbitration were utilized by the British Government from

time to time in various special directions, particularly as chairman of many commissions. He retired from the bench in 1892 after 15 years of service. J. E. G. de Montmorency (*Dict. Nat. Biog.*) writes: "Probably, when the history of English law for the period falls into perspective, it will be found that Fry did more than any other lawyer, with perhaps the exception of Lord Cairns, to secure perfect continuity in the adaptation, under purified conditions of civil procedure, of the rules of law to modern social conditions."

His retirement was only a prelude to a period of hard work as an arbitrator in many domestic questions and as an international lawyer. In Nov. 1900 he was made a judge on The Hague tribunal, and sat in the first case called before the court, the "pious foundations" case between the United States and Mexico. He was British assessor on the North Sea Inquiry Commission (Dogger Bank incident) in 1904; first British plenipotentiary and doyen of the conference at the second Hague Conference of 1907; and an arbitrator in the Casablanca incident between France and Germany (1908). Fry was G.C.B. (1907) and F.R.S. (1883). He died at Failand on Oct. 18, 1918.

See Agnes Fry, *Memoir of Sir Edward Fry* (1921), which includes an autobiography and a bibliography of his numerous works.

FRY, ELIZABETH (1780-1845), English philanthropist, and, after Howard, the chief promoter of prison reform in Europe, was born in Norwich on May 21, 1780. Her father, John Gurney, afterwards of Earlham Hall, a wealthy merchant and banker, represented an old family which for some generations had belonged to the Society of Friends. While still a girl she showed the benevolence of disposition, clearness and independence of judgment, and strength of purpose, for which she was afterwards so distinguished. In Aug. 1800 she became the wife of Joseph Fry, a London merchant.

Amid increasing family cares she was unwearied in her attention to the poor and the neglected of her neighbourhood; and in 1811 she was acknowledged by the Society of Friends as a "minister." She had made several visits to Newgate prison as early as February 1813, but the great public work of her life dates effectively from the formation of the Association for the improvement of the female prisoners in Newgate in April 1817. Its aim was the much-needed establishment of some of what are now regarded as the first principles of prison discipline, such as entire separation of the sexes, classification of criminals, female supervision for the women, and adequate provision for their religious and secular instruction, as also for their useful employment. The ameliorations effected by this association, largely by the personal exertions of Mrs. Fry, led to a rapid extension of similar methods to other places. In 1818 she, with her brother, visited the prisons of Scotland and the north of England. The publication (1819) of the notes of this tour, and the cordial recognition of the value of her work by the House of Commons committee on the prisons of the metropolis, led to an extensive correspondence with persons interested in prison reform in Italy, Denmark and Russia. Through a visit to Ireland, which she made in 1827, she was led to direct her attention to other houses of detention besides prisons; and her observations resulted in many important improvements in the British hospital system, and in the treatment of the insane.

In 1838 she visited France, where she conferred with many of the leading prison officials, and personally visited most of the houses of detention in Paris, Rouen, Caen and other places. In 1839 she obtained an official permit to visit all the prisons in that country; and her tour, which extended from Boulogne and Abbeville to Toulouse and Marseilles, resulted in a report which was presented to the minister of the interior and the prefect of police. Before returning to England she had included Geneva, Zürich, Stuttgart and Frankfort-on-Main in her inspection. The summer of 1840 found her travelling through Belgium, Holland and Prussia on the same mission; and in 1841 she also visited Copenhagen. In 1842, through failing health, Mrs. Fry was compelled to forgo further travels, but she had the satisfaction of hearing from almost every quarter of Europe that the authorities were giving increased practical effect to her suggestions. She died on Oct. 12,

1845. She was survived by a numerous family, the youngest of whom was born in 1822.

Two interesting volumes of *Memoirs, with Extracts from her Journals and Letters*, edited by two of her daughters, were published in 1847. See also G. King Lewis, *Elizabeth Fry* (1910).

FRY, ROGER ELLIOT (1866—), British painter and art critic, son of Sir Edward Fry, was born in London, and educated at Clifton and King's College, Cambridge. He studied painting under Francis Bate and then in Paris, and exhibited at the Carfax Gallery, London, in 1903. His work, notably in his landscapes, is marked by deep feeling for form and a scholarly sense of design and technical means. An active member and exhibitor of the London Group, he gave an exhibition of his own paintings in 1920. As a critic, with his wide knowledge and acute sensibility, Fry became a recognized authority in England and abroad. He published a study of *Bellini* (1899) and edited Reynolds' *Discourses* (1905), but is best known by his championship through much opposition and prejudice, of Cézanne and the post-impressionists. His *Cézanne* (1927) is an authoritative study of the master. Among other publications are *Vision and Design* (1920); *Architectural Heresies of a Painter* (1921), a book of travel impressions; *A Sampler of Castile* (1923), and *Transformations* (1926). He was also joint editor of *The Burlington Magazine*.

FRYATT, CHARLES (1872–1916), British seaman, was born at Parkeston, Essex, on Dec. 2, 1872. He entered the service of the Great Eastern Railway Co., and in 1904 became chief officer in their service of vessels plying between Harwich and Rotterdam. In 1913 he was promoted captain. At the end of July 1916, it was announced that his ship, "Brussels" had been captured and the captain himself arrested and tried by court martial, on a charge of having attempted, on March 28, 1916, to ram a German submarine. The German authorities stated that Captain Fryatt had confessed that he had acted under orders from the British Admiralty; but the trial was hurried and secret, no intervention on the part of neutrals being allowed. The captain was condemned to death and shot at Bruges on July 27, 1916. The body was, on July 7, 1919, brought from Belgium to England and was buried at Dovercourt, near Harwich.

FRYDLANT, an old town in northern Bohemia. It has local administrative functions supplemented by small but thriving textile and engineering factories, paper-mills and pottery works. The old castle situated on a small hill commanding the town epitomises its stormy history. Pop. 6,172. It must be distinguished from Frydlant in Moravia, a small town of 3,215 inhabitants.

FRYXELL, ANDERS (1795–1881), Swedish historian, was born at Hesselskog, Dalsland, Sweden, on Feb. 7, 1795. He was educated at Uppsala, took holy orders in 1820, was made a doctor of philosophy in 1821, and in 1823 began to publish the great work of his life, the *Stories from Swedish History*. Fifty-six years later, he published the 46th and crowning volume of his vast enterprise. In 1833 he received the title of professor, and in 1835 he became incumbent of Sunne, where he resided for the remainder of his life. On March 21, 1881, he died at Stockholm. See his posthumously published (1884) *History of My History*.

FUAD I. (1868—), king of Egypt, was born at the palace of Gizeh on March 26, 1868, the youngest son of the khedive Ismail Pasha. After his father's débâcle Prince Ahmed Fuad, as he then was, went to Italy where his youth was spent. He returned to Egypt in the 'nineties and was appointed aide-de-camp to the khedive Abbas Hilmi. He found outlet for his energies by presiding over charitable and educational institutions and was largely responsible for the foundation of the Egyptian university, of which he became president. In 1917 his elder brother, the sultan Hussein Kiamil died, and as the latter's son, Prince Kemal ed Din, renounced the rights of succession, Prince Fuad became sultan. After the termination of the British protectorate on Feb. 28, 1922, he was proclaimed king of Egypt (March 16). He had married on May 25, 1919, the Princess Nazli, daughter of Abdel Rehim Sabri Pasha, a former governor of Cairo, and his heir, Prince Faruk, was born on Feb. 11, 1920.

After the serious Anglo-Egyptian crisis of 1927 King Fuad,

accompanied by Sarwat Pasha, the Egyptian prime minister, visited England, where he had a great reception. He left London for Paris on July 26, and paid a state visit to Rome (Aug. 2–6) before returning to Egypt on Nov. 14. At the opening of parliament he outlined his negotiations in London with reference to Egypt and the Sudan. He also referred to the proposed extension of jurisdiction of the Mixed Courts, and the reform of the Capitulations. In June, 1928 were published unsavoury revelations concerning Nahas Pasha, the nationalist premier, and certain of his colleagues. Taking advantage of the discredit thus brought on the Government, the king forced Nahas Pasha from office on July 20, dismissed parliament and announced that he would take the reins of power himself, and Mahomed Mahmud Pasha the liberal leader accepted the premiership at his hands (see EGYPT: *History*).

FUAD PASHA (1815–1869), Turkish statesman, was the son of the poet Kechéji-zadé Izzet Molla. He was educated at the medical school and was at first an army surgeon. He became secretary of the embassy in London; was employed on special missions in the principalities and at St. Petersburg (1848), and was sent to Egypt as special commissioner (1851). He was five times foreign minister. During the Crimean War he commanded the troops on the Greek frontier and distinguished himself by his bravery. He was Turkish delegate at the Paris conference of 1856; was charged with a mission to Syria in 1860; grand vizier in 1860 and 1861, and also minister of war. He died at Nice in 1869. Fuad was renowned for his boldness and promptness of decision, as well as for his ready wit and his many *bons mots*. Generally regarded as the partisan of a pro-English policy, he served his country well by his able management of foreign affairs, and not least by his efficacious settlement of affairs in Syria after the massacres of 1860.

FUCHOW: see FOOCHOW.

FUCHS, LEONHARD (1501–1566), German physician and botanist, was born at Wemdingen, Bavaria, on Jan. 17, 1501, and studied at Ingolstadt, receiving his M.D. in 1524. Having adopted Protestantism, he wandered from place to place, in 1529 successfully treating the "English sweating sickness," which had spread to the Continent. In 1535 he became professor of medicine at Tübingen, where he remained till his death, on May 10, 1566. His most valuable work is the herbal, *De historia stirpium* (Basle, 1542). The genus fuchsia is named after him. His collected works were published at Frankfurt in 1566.

FUCHSIA, a genus of plants of the family Onagraceae, characterized by entire, usually opposite leaves, pendant flowers, a funnel-shaped, brightly coloured, quadripartite, deciduous calyx, four petals, alternating with the calycine segments, eight, rarely ten, exerted stamens, a long filiform style, an inferior ovary, and fruit, a fleshy ovoid many-seeded berry. All the members of the genus, except a few New Zealand species, are natives of Central and South America—occurring in the interior of forests or in damp and shady mountainous situations. The various species differ not a little in size as well as in other characters; some, as *F. verrucosa*, being dwarf shrubs; others, as *F. arborescens* and *F. apetala*, attaining a height of 12 to 16ft., and having stems several inches in diameter.

F. coccinea was the first species cultivated in England, where it was long confined to the greenhouse. The numerous hybrid forms now existing are the result chiefly of the intercrossing of long-flowered with globose-flowered plants. In some varieties the blossoms are variegated, and in others they are double. There appears to be little limit to the number of forms to be obtained by careful cultivation and selection.

Ripe seed is sown either in autumn or about February or March in light, rich, well-drained mould, and is thinly covered with sandy soil and watered. A temperature of 70° to 75° Fahr. has been found suitable for raising. The seedlings are pricked off into shallow pots or pans, and when 3in. in height are transferred to 3in. pots, and are then treated the same as plants from cuttings. Fuchsias may be grafted readily, preferably by the splice or whip method, the apex of a young shoot being employed as a scion; but the easiest and most usual method is by cuttings.

Among the more hardy or half-hardy plants for inside borders are varieties of the Chilean species, *F. macrostemma* (or *F. magellanica*), a shrub 6 to 12 ft. high with a scarlet calyx. For inside culture may be mentioned *F. boliviana* (Bolivia), 2 to 4 ft. high, with rich crimson flowers with a trumpet-shaped tube; *F. corymbiflora* (Peru), 4 to 6 ft. high, with scarlet flowers nearly 2 in. long in long terminal clusters; *F. fulgens* (Mexico), 4 to 6 ft., with drooping apical clusters of scarlet flowers; *F. microphylla* (Central America), with small leaves and small scarlet funnel-shaped flowers, the petals deep red; *F. procumbens* (New Zealand), a pretty little creeper, the small flowers of which are succeeded by oval magenta-crimson berries which remain on for months, and *F. splendens* (Mexico), 6 ft. high, with very showy scarlet and green flowers. These wild species, however, cannot compare in beauty or freedom of blossom with the numerous varieties raised by gardeners. The nectar of fuchsia flowers contains nearly 78% of cane sugar, the remainder being grape sugar. The berries of some fuchsias are subacid or sweet and edible. From certain species a dye is obtainable. The so-called "native fuchsias" of southern and eastern Australia are plants of the genus *Correa*, family Rutaceae.

COURTESY OF ROYAL HORTICULTURAL SOCIETY AND BAILLON, "HISTOIRE DES PLANTES" FUCHSIA (F. COCCINEA), FLOWERING BRANCH AND A SINGLE DETACHED FLOWER. THIS HANDSOME PLANT, A NATIVE OF TROPICAL SOUTH AMERICA, WAS THE FIRST FUCHSIA GROWN IN ENGLAND

FUCHSINE, also termed magenta or roseine, the first dye-stuff of the triphenylmethane or carbonium series. (See DYES, SYNTHETIC.)

FUCINO, LAGO DI, a lake bed of the Abruzzi, Italy (Lat. *Lacus Fucinus*), in the province of Aquila, 2 m. E. of the town of Avezzano. The lake was 37 m. in circumference and 65 ft. deep. From the lack of an outlet, the level of the lake was subject to great variations. As early as A.D. 52 the emperor Claudius, realizing a project of Julius Caesar, constructed a tunnel 3½ m. long, with 40 shafts at intervals, by which the surplus waters found an outlet to the Liris. No less than 30,000 workmen were employed for eleven years in driving this tunnel. In the following reign the tunnel was allowed to fall into disrepair, but was repaired by Trajan. It is still preserved but is no longer in use. Various attempts to reopen it from 1240 onwards were unsuccessful. By 1852 the lake had gradually risen until it was 30 ft. above its original level. In 1854-75 Prince Alessandro Torlonia, the great Roman banker, drained the lake at the cost of some £1,700,000, becoming proprietor of the site in return. The reclaimed area is 12½ m. long, 7 m. broad, and is cultivated by families from the Torlonia estates. The outlet by which it was drained is 4 m. long and 24 sq.yd. in section.

See A. Brisse and L. de Rotrou, *Le Dessèchement du lac Fucin, exécuté par S. E. le Prince A. Torlonia* (Rome, 1876); E. Agostinoni, *Il Fucino* (Bergamo, Arti Grafiche, 1908) well illustrated.

FUEL: A GENERAL SURVEY. Fuel is a term applied to materials used to produce heat by combustion in air. Man alone among living creatures has discovered ways of creating heat and power by the use of fuel. He has thereby improved his means of procuring food, has adapted himself to live and flourish on almost the entire area of the globe and has secured an immeasurably increased standard of comfort. Modern civilization could no longer exist if fuel supplies failed or became exhausted. Generally speaking, the bulk of natural fuels such as coal, wood, peat, oil and natural gas, are made up of compounds of carbon, hydrogen and oxygen in association with small proportions of nitrogen and sulphur, in addition to moisture and mineral ash; but

in special circumstances such elements as phosphorus, and the more readily oxidizable metals such as magnesium and aluminium may be utilized as fuel.

When the constituent elements of a fuel burn, or unite with oxygen, heat is evolved; and a fuel is completely burned only when the whole of its combustible components are oxidized to the highest possible degree. In the process a definite quantity of heat is produced which can be calculated approximately from the chemical composition of a fuel. Thus one pound of carbon in complete combustion to carbon dioxide (CO₂), produces 14,650 B.Th.U.; but only 4,410 B.Th.U. are produced in burning to the lower oxide, carbon monoxide, (CO). If however, this is subsequently burned to CO₂ the balance of 10,240 B.Th.U. is liberated. Hydrogen burns to water vapour, 53,000 B.Th.U. being produced per lb. of hydrogen burned. The value of a fuel depends primarily upon its potential heat producing capacity per unit mass or "calorific value"; but the calorific intensity, or the temperature to which this amount of heat can raise the products of combustion without excess air, is also of importance. The impurities in a fuel affect both its calorific value and calorific intensity.

I. SOLID FUELS

Solid fuels may be divided into two main groups as being "natural" or "manufactured." In the former category are coal, wood, peat and other vegetable matter; and in the latter, products such as coke and charcoal, obtained by destructive distillation, viz., by heating the raw material in the absence of air, by which process gas and tar are also yielded. Such processes form the basis of the manufacture of both metallurgical coke and gas, two very important industries.

COAL

Of all known fuels, coal (*q.v.*) is by far the most important. In spite of developments in the use of oil and water power it still provides three-quarters of the world's total energy supplies. Further, the reserves of coal, which according to recent estimates may be expected to last some 1,000 years at the present rate of consumption, are far above those of any other combustible. Even in America, the most important petroleum consuming country in the world, coal accounts for some 70% of the energy produced, natural oil and natural gas for 25% and water power for only 5%.

Coal is a stratified mineral which has been formed by the action of decay, heat and pressure upon accumulations of vegetable, and woody, or cellulosic, matter laid down in bygone ages. It varies widely in composition and properties. While the proportions of the elements present in any particular variety of coal and its behaviour under various forms of treatment are known, the fundamental causes of the differences between the different types have not yet been placed upon a really rational basis. A knowledge of the true constitution of coal, which is being sought by many research workers, could not fail to be of the greatest assistance to those responsible for the proper utilization of a vast but irreplaceable store of fuel.

Classification.—Many classifications of coal have been suggested, but none is entirely satisfactory. Thus, classification may be by geological age, coking properties, commercial application, chemical composition, etc. There is, in fact, no sharp distinction between any one coal and its nearest relation, but rather an innumerable family with characteristics changing gradually from one extreme to the other. The following main divisions are however, commonly made: (1) peat, (2) lignites and brown coals, (3) cannel, (4) bituminous coals and (5) anthracite.

	Carbon (C)	Hydrogen (H)	Oxygen (O)	Nitrogen (N)	Sulphur (S)	Ash
Cellulose (forms the bulk of plant structure)	44.4	6.2	49.4
Wood	48.5	6.0	43.5	0.5	..	1.5
Peat	58.0	6.3	30.8	0.9	trace	4.0
Lignite	67.0	5.1	19.5	1.1	1.0	6.3
Coal	77.0	5.0	7.0	1.5	1.5	8.0
Anthracite	90.0	2.5	2.5	0.5	0.5	4.0

The chemical composition of solid fuels (moisture free) is given by Butterfield on p. 890; it will be seen that the transition from cellulose to anthracite is marked by an elimination of oxygen, and a corresponding increase of carbon.

Regnault and Gruner were among the first to formulate methods for the classification of coal, which they grouped according to its flaming characteristics and the nature of the coke residue. S. W. Parr of the University of Illinois has proposed a classification based upon the heat value of the true coal substance "Unit Coal," free from ash or sulphur, which is given by the formula

$$\text{Total B.Th.U.} - 5000 S - 1 - (1.08A + 0.55 S) \quad \text{where } S \text{ and } A \text{ are the percentages of sulphur and ash respectively.}$$

One of the best methods of classification is that of Seyler, in which coals are divided according to their hydrogen content into five groups which are further subdivided according to the carbon content. This classification has been used by the British Geological Survey in publications on the coals of South Wales.

For carbonization purposes one of the most important properties of bituminous coals is their ability to form coherent coke and the extent to which they swell or shrink during this process. This behaviour forms the basis of a useful subclassification of such coals. Illingworth and others have classed coals according to the temperatures at which certain constituents decompose.

Tests on Carbonaceous Materials.—Accurate tests are available for such characteristics of coal as its calorific value or ultimate chemical composition, and independent determinations of these should agree closely. Tests of an empirical nature, such as "proximate" analysis and special tests such as determinations of agglutinating or caking value are less specific but may be equally important. Since in such cases variation of method might produce widely divergent results, the same convention must be adopted by different workers.

In 1920 the British Government Fuel Research Board, which is responsible for the Physical and Chemical Survey of the National Coal Resources, appointed a committee to examine methods of analysis, including (1) proximate and (2) ultimate analysis, (3) determination of caking index and (4) measurement of calorific value. The following methods of analysis have been adopted:

(1) *Proximate Analysis.* This consists of the determination of moisture, ash, volatile matter and fixed carbon in a sample of coal ground to pass a standard sieve of 60 meshes to the inch and air dried.

(a) *Moisture.*—This is given by the loss in weight of one to two grammes of coal, when heated for one hour at a temperature of 105–110° C. Coals specially liable to oxidation should be heated in a current of dry nitrogen.

(b) *Ash.*—1 to 2gm. of the coal in a platinum or silica dish is heated gradually in air to about 800° C. When combustion is complete the residue is cooled and weighed.

(c) *Volatile Matter.*—1gm. of the coal is heated for 7 minutes at a temperature of about 925° C in a platinum crucible of special shape closed by a well fitting lid. The loss of weight is taken conventionally to represent the volatile matter.

Fixed Carbon.—This value is obtained by subtracting the sum of the percentages of ash, volatile matter and moisture from 100.

(2) *Ultimate Analysis.* This consists of the determination of the proportions of the various constituent elements of the coal. The carbon and hydrogen are determined by the combustion of 0.2 of a gram of coal in a current of oxygen. The products of combustion are passed over copper oxide at a temperature of 800° C and then over granular lead chromate at a temperature of 600° C to absorb sulphur compounds. The carbon dioxide and water produced are weighed separately and from these weights are calculated the percentages of carbon and hydrogen in the coal. Nitrogen is determined by digesting one gram of coal with sulphuric acid according to the method of Kjeldahl. The nitrogen is thereby changed into ammonia which after distillation is titrated with standard solutions. The sulphur is determined by conversion into sulphate by heating the coal gently with a fusion mixture of lime and magnesia ("Eschka's method").

(3) *Caking Index.* This is used as a rough measure of the power which a coal possesses of being converted by heat in the absence of air into a coherent mass of coke. It is obtained by heating a

mixture of coal and sand in various proportions in a covered crucible, the caking index being the maximum proportion of sand to coal which allows of the residue being strong enough to bear a 500gm. weight with the production of not more than 5% of loose powder.

Calorific Value.—The heat evolved by the complete combustion of a fuel may be determined in various ways, but the most accurate method is by means of the bomb calorimeter. 1gm. of finely powdered coal is pressed into the form of a cylindrical pellet, accurately weighed, and inserted in a strong metal bomb with an airtight cover. This is filled with oxygen to a pressure of about 25 atmospheres and immersed in a calorimeter vessel containing water. The pellet is ignited by passing a momentary current of electricity through a thin wire within the bomb and the heat evolved by the combustion of the coal is measured by the rise in temperature produced, proper cooling corrections being applied. The accuracy obtainable is of the order of two or three units in the fourth significant figure. The calorific value of dry coal varies from 10,000 to 15,000 B.Th.U. per lb. according to the type. Approximate values in the same units for other dry fuels may be taken as: wood, 8,000; peat 10,000; lignite, 12,000; bituminous coal, 14,000; and anthracite, 15,000.

In practice the heat obtainable from a fuel is always less than in theory, since losses due to imperfect combustion and to heat carried away in the flue gases, in clinkers and in ashes, can never be entirely avoided. Further, in fuels containing hydrogen the calorific value measured in the calorimeter and used generally for scientific purposes (the "gross" calorific value) is higher than that obtainable under working conditions (the "net" calorific value) by an amount equal to the latent heat of vaporization of the water formed. Examples of the magnitude of the differences are:—

	Calorific Value (B.Th.U. per pound)	
	Gross	Net
Methane (CH ₄)	23,830	21,450
Acetylene (C ₂ H ₂)	21,460	20,700
Hydrogen (H ₂)	61,750	57,790
Carbon Monoxide (CO)	4,390	4,390

For coal containing 5% of hydrogen the difference between the gross and net calorific values is about 3%.

Constitution of Coal.—Scientific workers to-day are realizing the important bearing of the nature of the actual coal substance upon fuel problems. Since coal is derived from vegetable matter, it is to be expected that among its major constituents will be degradation products of cellulose and lignin together with small proportions of resinous bodies and compounds containing nitrogen and sulphur. There has been controversy as to the exact mechanism of this gradual transformation of vegetable matter into coal, and the question will probably be settled definitely only after a systematic study of deposits of coal in which all stages of maturing from peat to anthracite are represented.

The more important methods of research which have been employed in investigating the constitution of coal may be briefly enumerated as (a) extraction by solvents; (b) action of reagents, e.g., controlled oxidation, hydrogenation, chlorination, methylation, etc.; (c) carefully regulated destructive distillation; (d) microscopic examination of thin sections or etched surfaces; and (e) examination by X-rays. These methods have all contributed useful information.

One of the most recent investigations has been to determine the effect of hydrogen under high pressure upon the coal substance, by which it has been found possible to confer caking properties on coals which are normally non-caking. Even anthracite has yielded to this treatment, while the substance of certain types of coal has been converted into a mineral oil. By the extraction of coal with benzene under high pressure, F. Fischer in Germany and W. A. Bone in England have been able to separate the constituents in which the caking properties of a coal appear to reside. Similar results were obtained by S. W. Parr in America by the use of phenol and xylene as solvents. Bone obtained a considerable yield of mellitic and other benzene carboxylic acids in the

oxidation products of the residue from the benzene extraction, and concluded that a considerable proportion of the coal substance possesses a six carbon ring structure, each carbon of the ring being connected to other carbon atoms.

According to R. V. Wheeler bituminous coal consists essentially of insoluble ulmins in which organized plant tissues are dispersed. By mild oxidation, *e.g.*, with hydrogen peroxide or with air at 100–150° C the ulmins are rendered soluble in alkali and may thus be separated from the organized plant remains. Fossil plant cuticles and other tissues have been recognized in this residue. The ulmins when oxidized by dilute nitric acid yield oxalic, succinic, picric and pyromellitic acids, indicating that the ulmin molecules consist of benzenoid groupings linked together by such structures as pyrol and furan or their derivatives. The results of the destructive distillation of coal have proved difficult of interpretation from the point of view of the constitution of the coal substance, owing to overlapping of the various decomposition processes taking place. Examination of the oils produced by hydrogenation of coal seems to confirm the views of Bone and of Wheeler on the six carbon ring structure of the coal substance. By microscopic study of thin sections Dr. Marie Stopes has identified four main ingredients in British banded bituminous coal which she has designated vitrain, clarain, durain and fusain. Thiessen on the other hand considers that American coals contain three main ingredients which he terms mother of coal, attritus and anthraxylon. C. A. Seyler has applied the methods of metallography to the microscopical examination of coal surfaces and has been able thereby to identify directly many forms of plant tissue in the coal.

Wood.—The use of wood as a fuel is of great antiquity and, although in industrial countries it has been almost entirely superseded by coal, large quantities are still employed locally. It cannot be economically transported large distances by rail, and its use is as a rule contingent upon its being at hand more or less in a waste form; for example, in portions of woodlands unsuitable for timber. Large quantities of waste wood are produced in process of conversion, some of which is used either for the production of power or for domestic purposes or is distilled for making charcoal, acetate of lime and wood alcohol.

The structural basis of wood is cellulose, of which the simplest form may be taken as $C_6H_{10}O_5$. The composition of wood tissue has been expressed by Schultze and Schappe as "an aggregate of cellulose and a lignone complex" namely $5 C_6H_{10}O_5$, $C_{18}H_{18}O_8$, or, in percentage composition, C=49.66, H=5.74, O=44.60. The water content of green wood ranges from 50% to over 200% of the weight of dry fibre; in other words wood may contain as much as two parts of water to 1 part of fibre, according to species, the position in the tree and age. On air-drying this is reduced to some 15% to 20%, or still further by artificial drying; dried wood, however, may under certain conditions re-absorb moisture.

Both the inflammability and the calorific value of wood are greater in the soft resinous varieties such as pine, fir and spruce, than in hard woods like oak or elm, the calorific value after air drying varying from 6,500 to 9,000 B.Th.U. per lb. The temperatures attained, however, are comparatively low owing to the high moisture and hydrogen content. On this account raw wood is unsuitable for metallurgical operations, but before the days of coke manufacture large quantities of wood charcoal were used in the iron industry.

Peat.—Vast accumulations of peat occur in Europe, North America and northern Asia but the industry has been developed only in regions deficient in coal. In Ireland some 7,000,000 tons are consumed annually; Russia, Sweden, Germany and Denmark also produce and use considerable quantities, and it is used locally in England and Scotland. Peat bogs are formed chiefly in temperate humid climates by the accumulation and partial decomposition of vegetable remains under conditions of deficient drainage, the immersion excluding air and preventing complete decay.

Winning of Peat.—The chief use to which peat has hitherto been put is as a domestic fuel, usually hand cut; and though pro-

cess has been made in recent years in the excavation and spreading of peat by mechanical methods, there is as yet no general adoption of such methods. In many bogs roots and tree trunks are found, but if, as is believed, such obstructions occur only near the edges they would not necessarily preclude the successful application of mechanical winning. Peat is cut by spade in the form of blocks which are spread out on the bog to dry, and, when dry, weigh $\frac{1}{2}$ to 2 lb. each. In machine winning a dredger or excavator digs the peat from the drained bog and delivers it to a macerator which extrudes the peat pulp through a rectangular orifice; this is then cut into blocks which are spread upon the surface of the bog; after a week or two these are collected into small piles, or "footings," and after further drying are built in open order into small clamps. Maceration tends to a more uniform shrinkage, and a denser and tougher fuel; it also accelerates drying under unfavourable weather conditions. Hydraulic excavating can also be used and is specially applicable to bogs containing roots and tree trunks, the peat being washed down by a jet of water under a pressure of about 150 lb. per sq. in. and the pulp run to a sump. Here after slight maceration it is pumped to a draining ground in a layer about 9 in. thick, which, after partial drying, can be cut up. Complete drying is effected in the usual manner.

Peat varies from a light spongy material mainly composed of sphagnum moss in the upper layers to a dense brown more humified substance at the bottom of thick bogs. In its natural state it contains from 90% to 95% of water but by draining this may be reduced to 88% or 91%. The "water ratio" (the ratio of water to dry peat substance) of peat containing 95% water is 19:1, that of peat containing 90% water 9:1: the latter will thus contain twice as much solid matter although its water content has only been reduced by 5%. The moisture may be reduced by (a) air-drying; (b) evaporation by heat with partial heat recovery; (c) mechanical pressure; or (d) electrical osmosis. Many methods involving combinations of two or more of these have been tried, but as yet air-drying is used in all schemes working on a commercial basis. By air-drying the water may be brought down to about 25%, the calorific value then being about 7,000 B.Th.U. Peat thoroughly dried by heat takes up about 16% of water on exposure to air; it is thus useless to dry it artificially below this limit. The density of air-dried cut peat is about 0.5, that of macerated machine-cut peat 0.85 to 1.0. For industrial purposes $1\frac{1}{2}$ tons of air-dried peat is about equivalent to a ton of coal, but owing to its lower density nearly $3\frac{1}{2}$ times the storage space is required.

The ash in peat varies considerably, say from 1% to 8%, usually increasing with depth. The nitrogen likewise increases with the depth from 1% to 2%. The proximate analysis of a good Irish peat, air-dried, may be taken as: moisture, 20.2; organic volatile matter, 49.5; fixed carbon, 26.8; and ash, 3.4. Peat burns readily with a smoky flame and a characteristic odour. The ash is powdery and light except in certain varieties high in ash through the inclusion of sand, etc. Peat is largely used for domestic purposes and forms a fuel suitable for boiler firing either in the briquetted or pulverized form; it has also been used in gas producers, and the coke from carbonized peat forms a suitable fuel for small producers such as are sometimes used for motor transport purposes.

Lignite.—It has been estimated that about 50% of the world's total coal reserves are lignitic, but being inferior in some ways to bituminous coal these reserves have not been exploited to anything like the same extent. During recent years, however, the growing urgency of the fuel problem has led to extensive developments, especially in Germany, where the production of lignite in 1927 reached the enormous figure of 150,000,000 tons, nearly equalling the output of bituminous coal. Schemes for its utilization, particularly by resort to briquetting, are also receiving attention in Australia, Canada, America, New Zealand and other countries.

Lignite is intermediate in its properties between peat and bituminous coal, containing when dry some 60 to 75% of carbon

and a variable proportion of ash. Raw lignite conforms to two types, brown or amorphous and black or pitch-like; it is characterized by a high water content which may amount to as much as 60% in the brown varieties. On weathering a proportion of this moisture is given up, and a disintegration or crumbling of the material occurs which reduces its value as a fuel. Lignite tends also to disintegrate during combustion; hence the losses through the grate are relatively high. It does not store well, it is uneconomic to transport long distances and it is liable to spontaneous combustion. Against these drawbacks, many of the beds lie close to the surface and are of great thickness, sometimes over 100 ft.; they are, therefore, easily worked, and the cost of production is low.

The U.S. Geological Survey restricts the term lignite to brown coals of woody or amorphous structure, classifying the bituminous or black lignites as sub-bituminous coal. The latter, however, retain some of the more characteristic features of lignites; in particular, a high moisture content—usually averaging from 10 to 25%—and a tendency to disintegration on air-drying which differentiates them from true bituminous coals.

Bituminous Coals.—A large variety of coals is included under the term bituminous but all are broadly characterized by their high volatile content (which causes them to burn with a long smoky yellowish flame), and their resistance to weathering. The carbon content varies from 75 to 90%, moisture usually being below 10%. The non-caking varieties are used largely for furnace work, the caking varieties for gas and metallurgical coke manufacture. For steam raising the non-caking type is used and also a class of feebly-caking coals intermediate between bituminous coals and anthracite and designated anthracite coals. The well-known Welsh steam coals belong to this class.

Cannel.—Cannel coal is composed largely of certain resinous or waxy plant materials and is characterized by the high yields of oil and gas which it gives on distillation. For gas manufacture, however, the high ash content of many seams is a disadvantage, while natural petroleum has largely destroyed its value for oil production. Recently it has been suggested that cannel might be profitably treated for the extraction of oils, the solid residue being gasified in ammonia recovery producers.

Anthracite.—Anthracites are characterized by their low percentage of volatile matter, less than 8%. Their high calorific value and the comparative absence of smoke on combustion make them the most valuable type of coal for steam raising and power purposes generally. Many seams are inclined to be friable and in certain parts (S. Wales) this has given rise to briquetting industries for the utilization of the fine coal, or duff, as lump fuel.

Coke.—When a raw carbonaceous fuel is “distilled” or “carbonized” by heating it in the absence of air, gas and tar vapours are evolved and a residue known as coke remains. The characteristics of a coke vary with the type of coal treated, the temperature and time of carbonization, and the peculiarities of the plant in which the operation is carried out. Coke may, however, be broadly divided into two classes, namely metallurgical coke and gas coke. The former is the main product of the carbonization of coal at about 1,000° C in the so-called coke ovens, the tar and gas obtained usually being considered as by-products. It is used for the reduction of iron ore and for various other metallurgical processes, its essential property being strength to withstand the heavy loads placed upon it in the blast furnace. The desired properties in coke are frequently obtained by blending coals having properties complementary one to the other. At about 1,000° C gas coke is also the most important by-product of carbonization of coke in vertical or horizontal retorts for gas manufacture. Its chief use is as a furnace fuel and in the production of water- and producer-gas. Coals rich in volatiles are used for gas manufacture but the best metallurgical coke is produced from coals containing not more than 20 or 30% of volatiles. In either case a caking power sufficient to produce a strong well knitted coke is required. Non-caking coals such as lignite produce a pulverulent coke of little value.

Recently the possibility of producing economically a third type

of coke by carbonization at about 600° C has attracted considerable attention. This “low temperature coke” retains some 8% or 9% of volatiles compared with only 1% or 2% in gas or metallurgical coke, and so can be ignited almost as easily as coal and burns freely in open grates, producing a pleasing glowing fire. It thus forms an excellent smokeless substitute for household coal; but it is lighter and more friable than ordinary cokes. The gas yield is less from low temperature carbonization than from high but the tar yield is increased.

From one ton of coal the yields of coke are approximately as follows:—

Metallurgical by-product coke	13–14 cwt.
Gas coke	13.5–14.0 cwt.
Low temperature coke	14–15 cwt.

Since the heating of the ovens is usually effected by producer gas made from a proportion of the small coke, the amount of coke available for sale will be less than these figures.

The following analyses are typical of cokes produced by the three methods under conditions of proper quenching. If the coke has been badly quenched or stored in the open the moisture content will be much greater.

Proximate Analysis	Metallurgical coke	Gas coke		Low Temperature coke
		Horizontal	Vertical	
Moisture	0.7	0.9	0.6	2.0
Volatile matter	2.6	2.9	3.5	7.5
Fixed carbon	88.2	86.5	86.4	80.0
Ash	8.5	9.7	9.5	10.5
Ultimate Analysis (dry coke)				
C	88.0	85.8	85.4	78.7
H	0.5	0.6	0.8	2.5
N	1.0	1.2	1.2	1.5
S	0.9	1.9	1.8	1.0
O	0.9	0.6	1.0	5.6
Ash	8.7	9.9	9.8	10.7

Structure of Coke.—Recent work has shown that the physical characteristics of coke have an important bearing upon its suitability for different uses. The cell structure of coke appears to be due to the formation of bubbles during the fusion of certain portions of the coal substance and their subsequent perforation. Its exact nature depends largely upon the conditions of heating, the type of coal dealt with, and the fineness to which it is ground prior to carbonization. Thus the dense coke made from finely divided coal of suitable coking properties consists of minute cells of uniform structure; but dense cokes can be produced even from strongly swelling coals by blending or by pressure during carbonization, usually effected by preventing expansion by walls, etc.

In addition to the chemical tests already described which are applicable to any solid fuel, certain special tests have been devised for the investigation of other properties of coke. Those most usually relied upon are determinations of specific gravity (apparent and true), and porosity. Strength is measured by the “shatter test,” in which 50 lb. of 2 in. screened coke are dropped four times from a height of 6 ft. on to an iron plate and the proportion broken determined. A limit of 1% has been adopted as the maximum allowable sulphur content in blast furnace coke. Reactivity to carbon dioxide is also of importance, and is receiving much attention by research workers.

Charcoal.—Charcoal is the solid residue of the destructive distillation of wood. Formerly it was manufactured for smelting purposes by the charring process in which large heaps of wood, covered with earth and turf and provided with flues, were set on fire and allowed to smoulder until the volatile matter was completely driven off, no by-products being recovered. In many countries of Europe and Asia charcoal is still prepared in earth kilns. It is only where concentrated supplies of waste wood are available that it is prepared in retorts. In such cases the charcoal becomes practically a by-product of the wood alcohol and acetic acid industry.

Charcoal is a brittle and porous material retaining the original shape of the wood while its microstructure preserves the vegetable cell structure. By far the greater portion of the world's supply of charcoal is used for heating and cooking. Other uses are for

the manufacture of gunpowder, absorbent and decolourizing agents, heat insulating materials and for hop drying, case-hardening steel, etc. As a fuel it is frequently used in gas producers. Good charcoal is deep black in colour and breaks with a bright fracture. It rings when struck and burns without smoke. In the dry state the apparent specific gravity varies from about .11 for a soft wood to .20 for a hard wood. The true specific gravity of charcoal substance varies between 1 and 2. The carbon content increases with the temperature at which it is prepared, being about 65% for 250° C, 96% for 1,500° C; the loss of weight involved at the high temperatures however, is very serious, the percentage yield falling from about 50% at 250° C to 15% or less at 1,500° C. Charcoal is comparatively low in ash and varies from 12,000 to 14,000 B.Th.U. in calorific value. The charcoals prepared at low temperatures are exceedingly inflammable, imperfectly charred pieces often being used in Europe for kindling purposes.

Briquettes.—Fuels prepared from fines and dust by moulding under pressure either with or without a binding material are called briquettes. Pitch and coal tar are the binders most commonly used, the amount required depending upon the hardness of the coal and the proportion of dirt and moisture, but usually lying between 6.5 and 10%. One of the most important factors in the prosperity of a briquette works is the cost of pitch which, during recent years, has been very high. Hence other materials such as clay, tar, crude oil, peat, silicate of soda, molasses, sulphite liquor, etc., have been tried. Binders have also been prepared by the fermentation of waste straw, farmyard manure or seaweed, the latter having the advantage of being smokeless but being difficult to make waterproof. In Europe large quantities of briquettes are made from lignite by pressure alone.

Briquetting forms a means of utilizing quantities of small coal, which, though of good quality, is unsaleable, or of coals which are deficient in caking power and are therefore unsuitable for coke-making or for burning in the fine state. Special processes are required for absolutely non-coking materials, such as anthracite duff, since these disintegrate on the fire through the melting out and burning of the pitch. Germany occupies the premier place in the briquetting industry, using mainly brown coal; but briquetting is also carried on in France, Austria, the United States and Wales. Coal briquettes are used on railways and steamers, and for industrial purposes; but lignite briquettes which do not stand transport well are chiefly used as household fuel in the neighbourhood of their manufacture.

Briquettes are usually of rectangular shape varying in weight up to about 28lb., but smaller egg-shaped or ovoid briquettes are produced in roll presses for domestic purposes. They should be uniform in composition and weight, of high calorific value, strong, waterproof and able to bear transport or storage without disintegration. The density should be about 1.3, the same as that of the lump coal. The ash content where pitch or a similar binder is used is less than that of the original coal, which should be small; but when inorganic binders such as clay or lime are adopted the non-combustible constituents of the binder are added to the ash of the coal. The average ash content of a commercial briquette of good quality is about 7%. The calorific value is affected by the binder, but in pitch briquettes the calorific value is slightly greater than that of the raw coal.

Briquetting under pressure either at ordinary temperatures or at temperatures high enough to cause incipient fusion of some of the constituents, is sometimes adopted as a preliminary process in the carbonization of blends of finely ground coal. It not only aids the production of a homogeneous fuel, but simplifies the retorting process.

Utilization of Solid Fuels.—The Physical and Chemical Survey of the National Coal Resources (Great Britain) is engaged on a close examination of the properties of the whole range of British coal seams. Samples consisting of carefully cut pillars of coal representing the entire thickness of the seam are taken from suitable points and are examined inch by inch, since every seam presents in its stratifications material of widely differing properties. Large scale work, sometimes on as much as 500 tons, is also carried out to find the purpose for which a seam is most suitable.

Similar investigations are in train in other countries.

Substantial economies in the use of coal might be effected by an improved distribution of the various available grades and to this end a wider adoption of the method of buying to specification would be advantageous. It is not easy to lay down suitable specifications for widely differing purposes; but in Great Britain gas is now sold on a thermal basis and great interest is being taken in the feasibility of selling coal by some analogous method which would take account not only of calorific value, but also of other properties.

Since the World War the world's annual production has remained more or less stationary at 1,200 million tons, a figure roughly the same as the maximum reached in the period immediately preceding the war. By far the greater proportion of this coal is of the bituminous type, anthracite and lignite each accounting for approximately 10% of the total. The production of lignite is, however, increasing very rapidly.

Data are not available to show accurately the proportions of coal which are used for different purposes but the following percentage figures give an estimate of distribution, and at the same time show how prevalent is the burning of coal in its raw state:—Railways, 20%; Domestic Consumers, 15%; Metallurgical Coke, 15%; Electricity Production, 5%; Gas Manufacture, 5%; and Industrial and other Uses, 40%.

The Combustion of Fuel.—The combustion of a solid carbonaceous substance is an exceedingly complex process, taking place in several stages and involving the interaction of gases, water vapour and solid carbon. The theoretical amount of air necessary to burn a fuel completely to carbon dioxide and water-vapour can be calculated from a knowledge of its ultimate analysis by the use of the equations, (1) $C + O_2 = 2CO_2$, and (2) $2H_2 + O_2 = 2H_2O$. From (1) it follows that 12lb. of carbon will require 32lb. of oxygen and from (2) that 1lb. of hydrogen will require 8lb. of oxygen, for complete combustion; thus to burn the carbon and hydrogen in a pound of coal of composition $C=73.1\%$, $H=5.5\%$, $O=8.7\%$ will take respectively $\frac{0.731 \times 32}{12}$ (=1.95) pounds, and 0.055×8 (=0.44) pounds of oxygen, a total of 2.39 pounds of oxygen, or 10.3 pounds of air.

In a similar manner the percentage of carbon dioxide in the flue gases corresponding to the theoretical proportion of air can be calculated. The equations, however, tell us nothing regarding the manner in which gases are given off from the raw material and interact among themselves and with oxygen and water vapour before the final products of complete combustion are formed. A complex mixture is involved containing simple gases such as hydrogen and carbon monoxide, in addition to molecules of greater complexity which are less directly acted upon by oxygen than the simpler ones. The combustion of the heavier hydrocarbons presents great difficulty since the action of heat causes them to form still denser aggregates. Even the combustion of such a comparatively simple gas as methane (CH_4) has been shown by Bone to proceed in stages involving the entry of successive atoms of oxygen. Methyl alcohol is first formed, but this is subsequently oxidized to an unstable compound which breaks up into formaldehyde and steam. Under certain conditions of slow combustion further stages are involved before complete oxidation is effected, but under high temperature conditions the formaldehyde is decomposed into carbon monoxide and hydrogen, which then burn directly to carbon dioxide and steam.

Combustion of Carbon in the Lower Layers of a Furnace.—It is not definitely known whether solid carbon burns directly to carbon dioxide or whether it proceeds first to carbon monoxide and so to CO_2 . Three possible reactions are involved:

The older theory which is still widely quoted is that the carbon is first burnt to CO_2 , which is subsequently reduced to carbon monoxide by contact with heated coke.

By circulating air or oxygen at temperatures from 100° C to

900° C over purified wood charcoal Rhead and Wheeler were led to the conclusion that CO_2 and CO are formed simultaneously from an unstable "physicochemical complex" C_xO_y , which is the first product of the action of oxygen on carbon. Langmuir's experiments appear to show that the first gaseous product of the interaction between carbon and oxygen is carbon dioxide, as he was unable to detect the presence of carbon monoxide. On passing upwards the two oxides in the presence of carbon react one upon the other in accordance with the reversible reaction $\text{C} + \text{CO}_2 \rightleftharpoons 2\text{CO}$, the final products being formed in definite relative proportions which depend upon the conditions, such as temperature and concentration of the various gases present, and also upon whether sufficient time has elapsed for equilibrium to be established. In the reaction quoted above, equilibrium is established at 850° C, when the percentages of CO_2 and CO are 6.23 and 93.77 respectively; at 1,200° C when they are 0.06 and 99.94. Under furnace conditions the gas leaving the incandescent bed will thus be almost entirely composed of carbon monoxide. With coal firing this carbon monoxide is consumed together with the gases of distillation by the secondary air, but even a coke fire, although smokeless, may give off carbon monoxide if the supply of secondary air should be deficient or badly distributed.

The Combustion of Raw Carbonaceous Fuels.—When a raw carbonaceous material is burned it must first be heated up to the point of decomposition. The gases evolved at this stage vary in composition, but consist chiefly of hydrocarbons, hydrogen, carbon monoxide, water and tarry vapours, mixed with a certain amount of solid carbon in a finely divided state. As the combustion proceeds the fuel is freed from volatile matter and converted into coke.

Distillation takes place in the upper layers of an ordinary fire, and in order to burn the gas and smoke "secondary air" must be supplied at some point above the fire bed. The solid coke burns in the lower portions of the fire, "primary air" for this purpose passing through the bed from under the grate. Thus combustion both of solid carbon and of volatile matter is involved. Special devices are sometimes used to force the volatile products through the incandescent coke; for example, by down draught in which the flue gases are drawn away below the grate, or by downward combustion in which the raw fuel is introduced at the bottom of the fire. In practice air in excess of that theoretically necessary for complete combustion is always required. In good boiler practice 50% of excess air is about the minimum amount necessary to ensure absence of smoke and fairly complete combustion. Too much air is undesirable, since by cooling down the gases it may retard combustion and aggravate the production of black smoke, and will increase heat losses. The best furnace conditions are obtainable with mechanical methods of continuous firing in which the air supply is under more exact control than can be obtained when the firing door has to be opened at frequent intervals for hand charging.

The Blast Furnace.—Coal and coke are used in large quantities, not only for the production of heat but also for chemical purposes such as the smelting of iron ores, where carbon effects the removal of oxygen, so producing metallic iron. The process is an ancient one, but until the middle of the eighteenth century the fuel used was charcoal. By far the greater proportion of smelting furnaces have, however, now adopted coke, although a small amount of raw coal such as Scottish splint is used. The blast furnace in which pig iron is produced consists of a hollow shaft, 80 to 100 ft. in height, with an internal diameter increasing from 10 or 15 ft. at the top and bottom to some 20 to 25 ft. in the centre. At the bottom of the shaft is a hearth upon which the superincumbent column of coke and iron ore rests. The exact lines of a blast furnace are of importance and vary with the types of ore. Air under a pressure of 5 to 6 lb. per square inch and at a temperature of about 725° C can be blown in through tuyères in the lower portion of the furnace.

The ores used may be either oxides or carbonates of iron. The reactions occurring are complex; in the lower portion of the furnace near the tuyères the fuel is burnt by the blast to carbon monoxide, which effects the reduction of the ore in the upper

portion of the shaft, where spongy iron impregnated with carbon and carbon monoxide is produced by a series of reactions of which the following is the resultant: $\text{Fe}_2\text{O}_3 + 3\text{CO} = 2\text{Fe} + 3\text{CO}_2$. This spongy iron is melted as it passes through the lower layers and can be drawn off from time to time through tapping holes. Limestone is added to the charge in order to assist in fluxing.

Blast furnace practice has been greatly influenced by the work of Sir Lowthian Bell, who in 1872 applied the laws of mass action to the reactions in the blast furnace, and came to the conclusion that the practical limit for the ratio of CO to CO_2 in the gases leaving the furnace could not be reduced below 2.0. In modern blast furnaces a ratio of 1.7 has been reached, but in average practice a ratio of 3.0 is more common. Bell's argument, however, remains valid, although imperfections in scientific measurement affected the accuracy of his calculation. It will thus be seen that fuel economy in iron and steel practice depends essentially upon finding uses for the combustible gases (100 B.Th.U.) which are necessarily rejected in large quantities from the shaft. In modern furnaces these may be used either for heating the blast, or for power and heat requirements in the subsequent treatment of the pig iron. Concentration of coke ovens, blast furnaces and steel making in the same works enables the fuel consumption per ton of finished steel to be reduced to a minimum, from 30 to 33 cwt. or less of coal per ton of finished steel.

Pulverized Fuel.—During recent years attention has been drawn to the possibilities of burning fuel in pulverized form. When powdered fuel is blown into a furnace as a cloud the surfaces exposed to air are enormously increased; combustion is therefore both efficient and rapid. Pulverized fuel thus offers considerable advantages and its use is being developed, especially in America, while large installations are at work in Europe. Attention is also being paid to the possibility of its adoption by steamships and the voyages of U.S.S. "Mercer" across the Atlantic in 1927-28 led to the converting of other Shipping Board freighters to the use of slack coal.

Fuel for Domestic Purposes.—The fuel used for warming buildings, producing hot water and cooking is a very considerable item, probably amounting in the aggregate to 15% of the total British consumption. The manner of its use varies widely according to climate and custom. Thus in Great Britain, where extremes of temperature are rare but rapid changes common, and where ample supplies of cheap bituminous coal have been available, the open fire persists; but to cope with the severe winters of parts of America and Europe, central heating or closed stoves, generally consuming anthracite, coke or briquettes, are necessary. In England the substitution of coke for raw coal is extending, and attention is being paid to the possibility of manufacturing a carbonized fuel more easily ignited than gas or metallurgical coke.

II. LIQUID FUELS

The use of fuel in liquid form is undoubtedly of very ancient origin, vegetable and animal oils being burned for the production of light and, to a limited extent, of heat. The modern oil industry, however, originated about the middle of the 19th century in the distillation of Scottish shales, which was carried out on a considerable scale during the subsequent 50 years, the most important products for fuel purposes being kerosenes and paraffin wax. When, however, natural petroleum was discovered, its phenomenal development gradually affected more and more the shale oil industry and the enormous quantities of natural oil now produced completely overshadow that obtained by distillation.

Petroleum.—Natural petroleum forms the basis of practically all industrial liquid fuels. The development of the internal combustion engine has increased enormously the consumption of the lighter types of oils; the heavier fractions being utilized as fuel oils. Petroleum supplies also illuminating oil and the mineral lubricating oil which is required in such large quantities for mechanical equipment.

Crude petroleum is a mixture of hydrocarbons and small proportions of oxygen, nitrogen and sulphur derivatives of hydrocarbons. It can be divided into two main classes known respectively as paraffin base crudes and asphalt base crudes, according

to whether the residue after distillation consists mainly of paraffin wax or is of an asphaltic nature. In a third type, known as mixed base crudes, paraffins and asphalts co-exist.

The carbon in a crude petroleum varies under analysis from about 81 to 87%, hydrogen from 10 to 14%, oxygen and nitrogen from 1 to 7%. Sulphur is an undesirable constituent; it is usually present only in small quantities but special methods of refining are necessary where it occurs in larger proportions.

Petroleum, which is usually associated with water and natural gas, is found in voids in porous sedimentary rock where the geological formation is such as to allow the oil to collect from over a wide area. Impervious rock usually overlays the petroleum-containing strata which is commonly concave downwards (anticline), the dome formed collecting natural gas at the top, under which is oil floating upon water. Occasionally the oil occurs in strata which are concave upwards, collecting in a pool from which it is prevented from escaping downwards by underlying impervious strata. In the former case the oil is obtained by drilling the non-porous strata, when the natural gas and oil are forced to the surface by the pressure exerted by the underlying water. Under these conditions the well is termed a "gusher," but sooner or later it usually becomes necessary to pump out the oil.

It has been estimated that not more than 20% or 30% of the oil present in a natural well reaches the pipe line. The porous rock retains a considerable proportion and further waste occurs through infiltration of water and the escape of natural gas, in addition to losses due to improper storage and fires. Possibly some such means as mining may be developed for the recovery of a further percentage, but this has not yet become feasible economically.

Petroleum Resources.—In 1928 the U.S.A. produced about 70% of the world's total annual supply of one million barrels of petroleum; but important oilfields are being worked also in Russia, Dutch East Indies, Persia, India, Galicia, Mesopotamia and Burma. Various attempts have been made to predict the world's oil resources but such computations have usually proved too conservative. Haslam, however, has recently estimated that the United States and Mexico control some 20% and Great Britain 70% of the total recoverable supplies. Many petroleum producing districts have passed the peak of their productivity, but supplies have been maintained by the opening up of further fields. It is, however, certain that if oil requirements continue to increase at the present rate, a period will ultimately be reached when other sources, such as shale deposits, which exist in vast quantities, will have to be tapped. For this to become commercially possible the shortage of natural petroleum will have to reach a point sufficiently acute to be marked by considerable advance in prices.

Preparation of Fuel Oils.—Crude petroleum is usually subjected to fractional distillation, the more volatile constituents being used as motor spirit, which is also obtained from natural gas. Other fractions are kerosene, gas oil, fuel oil and lubricating oil, a heavy viscous residue being left in the still. The great demand for motor spirit has had the effect of increasing the amount of light fractions "topped" from the crude, which may reach 20% or more of the total. An additional quantity is obtained by cracking some of the heavier fractions, e.g., gas oil; the light product is a gasoline with anti-knock qualities. Standard specifications for motor and aviation spirit have been laid down by the British Engineering Standards Association. Crude petroleum which has lost its volatile constituents by evaporation during storage is sometimes used in the natural state as fuel oil; distillate and residual fuel oils are also used.

The gross calorific value of fuel oil averages about 19,000 B.Th.U. per lb., but an oil of high specific gravity and comparatively low calorific value may contain more heat units per gallon than one of low specific gravity and high calorific value.

The flash point of an oil is the temperature at which under defined conditions a momentary flash is produced when a flame is brought near the surface. A minimum flash point is laid down in navy and other specifications. The temperature at which sufficient vapour to support continuous combustion is given off by an oil is known as the fire point; it is usually about 20° F

higher than the flash point.

The viscosity of oil, which changes rapidly with temperature, is determined by its resistance to flow as measured by the amount passing through a standard orifice in a prescribed time. The formation of solid paraffins, etc., may also cause difficulty in pumping oil through pipes at low temperatures. Asphalt base crudes as a rule must be preheated to reduce their viscosity to a degree which allows of ready atomization in the burner.

The chief drawback in the use of fuel oil is the presence of foreign matter; for it has been shown that sulphur and asphalt play little part in the difficulties that have been experienced. Consequently all fuel oil should be strained, filtered or centrifuged.

Artificial Liquid Fuels.—To countries not possessing oil fields the problem of developing means of obtaining fuel oils from available materials, if only for emergency use, is of great importance. Several such processes are feasible, and attempts are being made to bring them to a commercial stage.

From Carbonization Processes.—The tars formed by the destructive distillation of coal, lignite or shale at low temperatures yield under suitable treatment a range of fuel oils. European oil shales yield over 20 gallons of oil per ton, while in the United States there are large shale deposits capable of yielding over 40 gallons per ton. About 15–22 gallons of crude tar per ton of bituminous coal can be obtained. After dehydration and removal of suspended matter this is suitable for use in Diesel engines, but its flash point is below the Admiralty specification, while after removal of the light spirit the residue is above the specified viscosity. By fractionation and refining, however, fuel and lubricating oils can be obtained in addition to a quantity of motor spirit. The tar from high temperature distillation also contains petroleum constituents, but in relatively small quantities. It is frequently used as a fuel, the lighter fractions forming the source of an excellent fuel (benzole) for internal combustion engines.

Synthetic Fuels from Carbon Monoxide.—In the first of these, described initially by the Badische-Anilin und Sodafabrik and developed by Fischer in Germany and Patart and Audibert in France, carbon monoxide and hydrogen are produced by the action of steam upon red-hot incandescent carbonaceous matter according to the water-gas reaction, $C + H_2O \rightleftharpoons CO + H_2$, and the recombination of the gaseous molecules is subsequently effected by the action of heat in the presence of a catalyst. By suitable adjustment of pressure and temperature, together with a suitable choice of catalyst, products varying from oxygen-containing compounds such as methyl and ethyl alcohol to liquid and solid hydrocarbons of the paraffin series may be obtained. Patart has developed a method in which water gas made from coal or coke is used for producing alcohols by heating it to about 400° C at 300 atmospheres in catalyst tubes, while in the Fischer process synthetic liquid and solid hydrocarbons of the petroleum series are produced at atmospheric pressure.

It is not easy at the present stage of progress to estimate the extent to which the high thermal losses associated with these processes will affect the commercial position of the production of motor spirit from coal, which can only be decided from the results of working a full-scale plant.

Hydrogenation of Coal.—Another process for the manufacture of oils and motor spirit from coal is that of hydrogenation investigated by Bergius. Hydrogen is added to coal by the action of heat and high pressure in such a proportion as to bring the carbon-hydrogen ratio to about that of natural oil, the molecules being caused to split up and combine with this hydrogen for the production of an artificial oil material. The coal after mixing with a small quantity of alkaline iron oxide (luxmasse) and suitable oil or tar (usually obtained from previous runs) is forced into a reaction bomb to which hydrogen at 180–200 atmospheres is pumped, the temperature being raised to some 400° C. Approximately 50% of the coal is converted into oil, which on distillation yields 20 to 25% of pitch. Of the remaining 50% of the coal 20% is converted into gas, 8% into water, 0.5% into ammonia, while 11.5% remains as insoluble organic matter, the ash being 10%.

An intermediate scale Bergius plant has been installed at the

British Fuel Research Station and a large scale unit is being erected in Germany. A modification of the Bergius process is being worked commercially for the production of motor spirit by the Interessen Gemeinschaft at Leuna in Germany.

Utilization of Liquid Fuels.—Liquid fuels derived from petroleum may be utilized either by combustion in furnaces or to produce energy directly in the cylinders of internal combustion engines. Either light or heavy oils are applicable to the internal combustion engine; the former can be ignited by a flame or spark while with heavier oils vaporization and ignition are effected by the high temperature developed on the compression stroke.

In furnaces oil must be changed prior to combustion from the liquid to the gaseous state. In general a mixture of heavy and light gaseous hydrocarbons is formed, and for smokeless combustion these must be brought into contact with a sufficient supply of air at a high temperature to ensure the complex series of changes involved in the successive picking up of molecules of oxygen overtaking the tendency of the heavier molecules to split up into solid carbon and hydrogen under the action of heat.

Oil Burners.—Preliminary vaporization is sometimes effected by the application of heat to light oils, but in general fuel oils are pre-heated only sufficiently to ensure free flow in the pipe line and burners. The main function of the burner is then to break up or atomize the oil, which enters the furnace in the form of fine mist or spray and is volatilized almost immediately. There are three main types of atomizing burners; firstly the spray type in which a current of steam or air is used to break up the oil into a fine spray, secondly rotary burners where atomizing is effected by a disk or cylinder rotating at high speed, and thirdly mechanical spray burners where the oil is forced by high pressure through fine slots or orifices.

Each type has its advantages and disadvantages and the choice of burner must depend on local conditions. Thus, atomizers are cheap and simple in design and operation, but it is not practicable to use them with small flames and close regulation is difficult, and since they can only be used with dry steam there is a chimney loss in sensible heat of steam. Air atomization is used only when compressed air is already available; short intense flames are readily obtained and closer adjustment is possible than with steam. Rotary burners are often low in efficiency, but they are easy to operate and are very useful for low pressure installations where pressure for other types is not available. Mechanical spray burners require neither high pressure air nor steam, and are efficient at high capacities. Short intense flames can be obtained and less energy is necessary than is required in either air or steam atomization. The disadvantages include high first cost of installation, lack of flexibility and tendency to clogging of fine orifices.

Advantages of Oil Fuel.—The price of oil on a thermal basis is usually relatively high, but it has many advantages over solid fuels. For the same calorific value it is considerably lighter than coal and is only half the volume. The saving in weight and storage space made possible and the ease of bunkering are of particular significance for steamships, especially since the labour entailed in stoking and trimming coals is reduced and the handling of ash eliminated. Further, the quality of oil is more uniform than that of coal, it is not liable to spontaneous combustion and it is clean and safe. Efficiencies up to 80%, and high flame temperatures, are easily obtainable with oil fuel. It is interesting to note that in 1927 36% of the tonnage recorded in Lloyd's Register was equipped to burn oil though it does not follow that all these vessels were actually using oil.

Fuels for Light Internal Combustion Engines.—In light internal combustion engines such as are used in aircraft and motor vehicles the fuel used is termed *petrol* in England, *gasoline* in America and *essence* in France. It usually consists of the lighter hydrocarbons obtained from crude oil by distillation, of specific gravity about .725 and net calorific value 18,600 B.Th.U. per lb.

Liquid fuel is vaporized more or less completely in its passage by the suction of the engine through fine orifices (carburettor jets) and subsequently through the induction pipes and manifolds. On reaching the cylinders it consists of a mixture of liquid mist,

hydrocarbon vapours and air. The efficiency of combustion depends largely upon the completeness with which the fuel is vaporized; if fuels of the kerosene type, which are less volatile than motor spirit, are used, they must be previously converted into vapour by the application of heat in a specially designed vaporizer.

The theoretical efficiency obtained in the engine varies with the compression ratio, the highest practicable value of which depends upon the design of the engine and certain characteristics of the fuel used, in particular the latter's tendency to produce detonation or "knocking." Benzol and alcohol can stand much higher compression ratios than other fuels before this phenomenon occurs. Detonation can be inhibited by the introduction into the spirit of small quantities of tetra ethyl lead; but since this material possesses toxic properties caution is necessary in its use.

Fuels for Heavy Oil Engines.—The Diesel engine, unlike the gas or petrol engine, draws in air during the suction stroke without admixture of liquid fuel or gas. Oil is injected mechanically in the form of spray during the earlier portion of the working stroke, and burns at the high temperature brought about by the compression. A third type of engine, often termed semi-Diesel, is intermediate between the gas and Diesel engine, the oil being injected into a combustion space incorporating surfaces maintained at a much higher temperature than the remainder of the engine cylinder. Ignition is effected partly by exposure to these surfaces and partly by the temperature induced by moderate compression of the air drawn in during the suction stroke. The fuels used are intermediate in gravity and volatility between fuel oil and Diesel engine oil. The fuel for semi-Diesel and Diesel engines may be either gas oil or the residuum left in the still after distillation. Tar oils are sometimes used but owing to the difficulty of ignition special precautions have to be taken.

The British Admiralty specify for Diesel engine purposes either shale oil, petroleum, or a distillate or residual product of petroleum, with a flash point not lower than 175° F. The sulphur content is limited to 3% and a maximum acidity is also specified. The viscosity must not exceed 2,000 for an outflow of 50 cubic centimetres at a temperature of 32° F as determined in the Admiralty-type Redwood viscometer for testing oil fuel.

III. GASEOUS FUELS

It has already been pointed out that before final combustion all fuel is converted to the gaseous state. In this section, however, fuels which when supplied to consuming appliances are already in the gaseous form will be considered separately. These may be grouped as natural gas, coal gas obtained by destructive distillation of carbonaceous material at high or low temperatures and gas obtained either by partial combustion or by the action of steam on red hot carbonaceous materials. The latter comprise water gas, producer gas and blast furnace gas or other gas obtained as a by-product from industrial or chemical processes.

Natural Gas.—Natural gas usually occurs in conjunction with petroleum or coal, being stored in porous rocks with an impervious covering, from which it is obtained by drilling. In the United States very large quantities have been recovered and used for industrial and domestic purposes, as much as 800,000 million cu.ft. per ann. from 1917 to 1922, and in 1926 1,300,000 million cu.ft.; but its utilization in isolated oil-fields is a serious problem. Natural gas consists chiefly of methane (CH₄) and other light hydrocarbons, its calorific value varying from 700 B.Th.U. per cu.ft. to 1,500 B.Th.U. or more. It frequently contains hydrocarbons liquid at ordinary temperatures and pressures which can be recovered by washing or other treatment, several million tons of such spirit ("casing-head" gasoline) being obtained annually.

Coal Gas.—Coal gas is obtained by the distillation of coal and was formerly made almost solely for illuminating purposes; but the introduction of the incandescent mantle and the development of gas cooking and heating, have made calorific value a far more important criterion than illuminating power. This change has had a profound effect on the process of manufacture. During the 19th century gas practice tended towards constantly rising temperatures in horizontal retorts. Until about the middle of the century oval or D shape retorts of metal were used, but these

were replaced later by retorts of fireclay or other refractory material, about 16in. wide \times 24in. broad \times 20ft. long, installed in benches one over the other and heated by flues in which is burned producer gas. Such retorts are still largely used, but the vertical retort—which was introduced about the beginning of this century—now carbonizes half of the gas-works coal in Great Britain. Vertical retorts are 20 to 25ft. high with a rectangular section of 33 to 43in. by 10 to 14in.; they may be either intermittently or continuously operated, and in them the coal travels by gravity.

The quantity and yield of gas vary with the parent coal, the temperature and time of carbonization, the type of retort, etc. A typical town gas has the following percentage volume composition:—carbon dioxide 2.2, oxygen 0.5, unsaturated hydrocarbons 2.0, carbon monoxide 14.0, hydrogen 52.0, methane, etc., 23.0, nitrogen 6.3; calorific value 500 B.Th.U. per cubic foot.

During recent years the practice of passing steam through the charge in vertical retorts during carbonization has gained ground, since an increased yield can be obtained thereby through the water gas action (*see below*). The calorific value of the resultant gas is reduced, but owing to the large volumes produced the aggregate thermal yield is considerably increased. For example: in a test of Yorkshire coal in vertical retorts without steaming, the British Fuel Research Board obtained 13,100 cu.ft. of 544 calorific value gas or 71.3 therms (1 therm=100,000 B.Th.U.). In a parallel test with the same coal, steaming to the extent of 20% by weight of the coal charged increased the yield to 22,580 cu.ft. of 460 calorific value gas or 103.8 therms. Experiments have shown that if a small quantity of oil be introduced into the retort by suitable means, in addition to the steam, both high yields and high calorific value may be obtained. Thus a series of tests using 4.75gal. of gas oil per ton of coal and 5% of steam gave 15,450 cu.ft. of 558 calorific value gas or 86.2 therms. An increased measure of elasticity is therefore conferred on the vertical retort. Variations of these methods for increasing the thermal yield or the elasticity of working of vertical retorts are under investigation in the industry.

The purification of coal gas is of great importance especially for domestic purposes. The purification system includes condensers and scrubbers for cooling the gas and extracting such valuable by-products as tar, benzol, naphthalene and ammonia; but small quantities of impurities as cyanogen and sulphur compounds remain. Sulphuretted hydrogen is removed by passing the gas through layers of hydrated ferric oxide, the spent material being "revivified" by oxidation in the atmosphere, and after repeated use sold for sulphuric acid manufacture. The removal of carbon disulphide is more difficult but processes are now available whereby it may be converted to sulphuretted hydrogen and removed as above.

In Great Britain gas is now usually sold by the therm (100,000 B.Th.U.) and gas undertakings are given freedom regarding the calorific value of the gas which they supply. This must be declared and cannot be altered without due notice, the Company being responsible for making the necessary adjustment to consumers' fittings. In Great Britain declared values vary from 640 to 280 B.Th.U., such extremes however being exceptional. Taking 26 of the most important undertakings, the declared value of gas supplied varied between 450 and 560 B.Th.U., and of these 11 declared a value of 500 B.Th.U.

Water Gas.—Large quantities of water gas are used industrially and are also distributed both in Europe and America for town purposes. This gas is usually enriched by gas from cracked oil and is then termed carburetted water gas.

When steam is passed over highly heated carbonaceous matter a strong reaction occurs. The oxygen in the steam combines with the carbon, the final products of the reaction being formed in definite relative proportions depending upon temperature and concentration of the different gases present and also upon whether there is sufficient time for chemical equilibrium to be established. Two primary reactions occur, viz., (1) $\text{H}_2\text{O} + \text{C} \rightleftharpoons \text{H}_2 + \text{CO}$, and (2) $2\text{H}_2\text{O} + \text{C} \rightleftharpoons 2\text{H}_2 + \text{CO}_2$. In addition to these there are many others of which perhaps the most important are, (3) $\text{C} + \text{CO}_2 \rightleftharpoons 2\text{CO}$, and (4) $\text{H}_2\text{O} + \text{CO} \rightleftharpoons \text{H}_2 + \text{CO}_2$.

It can be shown experimentally that above 1000° C reactions (1) and (3) predominate, while reactions (2) and (4) predominate at temperatures below about 700° C: The percentage of carbon monoxide is high and that of carbon dioxide low at high temperatures (about 1000° C) whilst the reverse is the case below 700° C. It is desirable then, in order to get the richest possible water gas, that the temperature of the fuel bed should not fall below 1000° C.

The reactions (1) (2) and (3) are strongly endothermic in character, that is to say they are accompanied by the absorption of heat and if no heat be applied during the reaction the temperature of the fuel bed will fall. Water gas producers are therefore generally worked upon an intermittent system; that is to say, the gas-making period during which the temperature of the fuel bed falls considerably is followed by a period of heat recuperation, in which the steam is replaced by a blast of air, the oxygen of which combines with the carbon with evolution of heat so that the temperature of the fuel bed is again raised to that necessary to produce gas of the required CO content.

Water gas made from coke under commercial conditions usually has a calorific value of about 300 B.Th.U. per cu.ft., the percentage volume composition being approximately:—carbon dioxide 3.5, carbon monoxide 44.0, hydrogen 48.0, methane, etc. 0.5, nitrogen 4.0; calorific value 308 B.Th.U. per cubic foot. While water gas is sometimes used as a diluent for richer gases such as coal gas, it is usually delivered as carburetted water gas "enriched" with oil gas obtained by cracking petroleum oil in "carburettors" incorporated in the plant and heated by waste heat during the blow period. The composition varies but the following may be taken as typical:—carbon dioxide 3.0, unsaturated hydrocarbons 8.5, benzene 1.5, carbon monoxide 28.0, hydrogen 37.0, methane, etc. 20.0, nitrogen 2.0; calorific value 500 B.Th.U. per cubic foot. The calorific intensity of water gas is higher than that of coal gas owing to the heat capacity of the products of combustion being low. It can for this reason be made to burn with a short flame and is especially valuable for processes such as steel welding, where intense local heat is necessary. It has also been used, especially in Sweden, for small steel melting and re-heating furnaces.

Producer Gas.—For many industrial purposes a cheaply made gas which need not necessarily possess a high calorific value is of importance. Low calorific value gas is produced by the incomplete combustion of the carbon of the raw material, so that the products of combustion are rich in carbon monoxide. Such a gas would contain a proportion of CO_2 , and the whole of the nitrogen from the air used to supply the necessary oxygen. Gas of this type is often referred to as Siemens gas. As we have already shown, the combustion of carbon to carbon monoxide is an exothermic reaction in which large quantities of heat are given off. The bulk of this heat may be utilized if the hot producer gas be immediately consumed in the furnace, but if required for storing, this sensible heat must necessarily be lost. The temperature of producers working in this manner will tend to be high and artificial cooling may be necessary.

Alternatively a power gas though not water gas, may be produced by combining the above processes with the water gas process; thus if a mixture of air and steam properly proportioned is admitted to a producer, both water gas and partial combustion gas are made simultaneously and continuously, the heat evolved during the exothermic reaction of $\text{C} + \text{O} = \text{CO}_2$ being utilized to maintain the temperature of the fuel bed which is being continually cooled by the endothermicity of the water gas reaction. The composition of producer gas varies widely but the following may be taken as a typical gas suitable for a steel melting furnace where a high proportion of CO is considered desirable: carbon dioxide 2.5, carbon monoxide 30.0, hydrogen 12.0, methane, etc. 3.0, nitrogen 52.5; calorific value 164 B.Th.U. per cubic foot. For power gas associated with maximum ammonia recovery a large proportion of steam must be used. In such a case the composition would be approximately: carbon dioxide 16.0, carbon monoxide 12.0, hydrogen 24.0, methane, etc. 3.0, nitrogen 45.0; calorific value 145 B.Th.U. per cubic foot.

Producer gas forms a good fuel for gas engines. It may be made in positively blown producers or, for comparatively small powers, in those of the suction type where the vacuum induced in the suction stroke of the engine draws the necessary air and vapour through the producer. It is essential, however, that the gas be cooled down before delivery to the engine, and that it should be thoroughly cleaned from both dust and tarry vapours.

By-product Gas.—The iron and steel industry presents two important cases of large quantities of valuable gas being obtained as a by-product of major operations. These comprise (a) blast furnace gas and (b) coke oven gas.

Blast Furnace Gas.—In blast furnace operations a low grade gas is necessarily evolved. A typical percentage composition for such a gas would be: CO_2 , 10; CO , 30; H_2 , 1; N_2 , 59, with a net calorific value of 100 B.Th.U. per cubic foot. From each cwt. of coke consumed in the furnace some 165,000 cu.ft. (at 15°C and 760mm.) of this gas would be obtained at a temperature of about 250°C . In modern steel works it is utilized for many purposes, including the pre-heating of the blast in Cowper stoves, steam raising, gas engines, steel furnaces and soaking pits, etc.

Coke Oven Gas.—The rich gas given off in by-product coking is similar in composition to retort gas made for town purposes but it is usual to extract the benzene. Its composition is approximately: carbon dioxide 3.0, unsaturated hydrocarbons 4.0, carbon monoxide 6.0, hydrogen 49.0, methane, etc. 34.0, nitrogen 4.0; calorific value 580 B.Th.U. per cubic foot. Where coke ovens are associated with steel works it is frequently possible to use some of the surplus gas upon the works, but when, as often happens, they are situated at a colliery, or are totally independent, difficulties arise in its disposal and it may be burnt to waste. The question of its utilization in greater measure for town purposes over long distances is the subject of experiment and of enquiry at the present time, and there is no doubt that if certain difficulties associated with constancy of supply etc. can be overcome it will find such an outlet in increasing quantities. In both Europe and America long distance pipe-lines are frequent, the gas being transported economically under pressures up to about 45 lb. per sq. in. Recently schemes have been considered for carrying gas long distances at pressures up to 450 lb. per square inch.

Combustion of Gases.—The advantages of gaseous fuels are (a) ease of distribution, (b) high thermal efficiency of utilization, (c) no smoke or ash, (d) ease of control giving either oxidizing or reducing flames and flames of varying temperatures.

The general question of combustion has already been dealt with, but certain special considerations are applicable to the case of gaseous combustion. In the burning of gases both rapidity of combustion and length of flame can be controlled by suitable adjustment of the gas rate and the primary and secondary air supplies.

Gas Burners. Gas burners vary widely but most types can be divided into two main classes according to whether or not air is mixed with the gas prior to its reaching the point of combustion. A relatively long flame, which may be suitable for certain types of furnace work, is produced by burning gas without primary air. On the other hand burners of the well-known Bunsen type can, if desired, be adjusted to give a rapid rate of combustion with relatively short flames, such as are necessary where the combustion space is limited or maximum flame temperatures are required.

Submerged Combustion. Lately, with a view to obtaining increased efficiencies in water or steam heating, attempts have been made to develop a type of burner in which gas can be consumed under water. For such submerged combustion it is obviously essential that sufficient primary air for complete combustion should be intimately mixed with the gas.

Surface Combustion.—Sir Humphry Davy in the earlier part of the nineteenth century discovered that a warmed platinum wire when introduced into a non-explosive mixture of air and coal gas became incandescent and continued to glow until practically the whole of the oxygen was consumed. Further experiments, particularly by Dulong and Thomson and Döbereiner, showed that many other substances possessed the same power. Before commencing work on this subject in 1902 W. A. Bone proved (1)

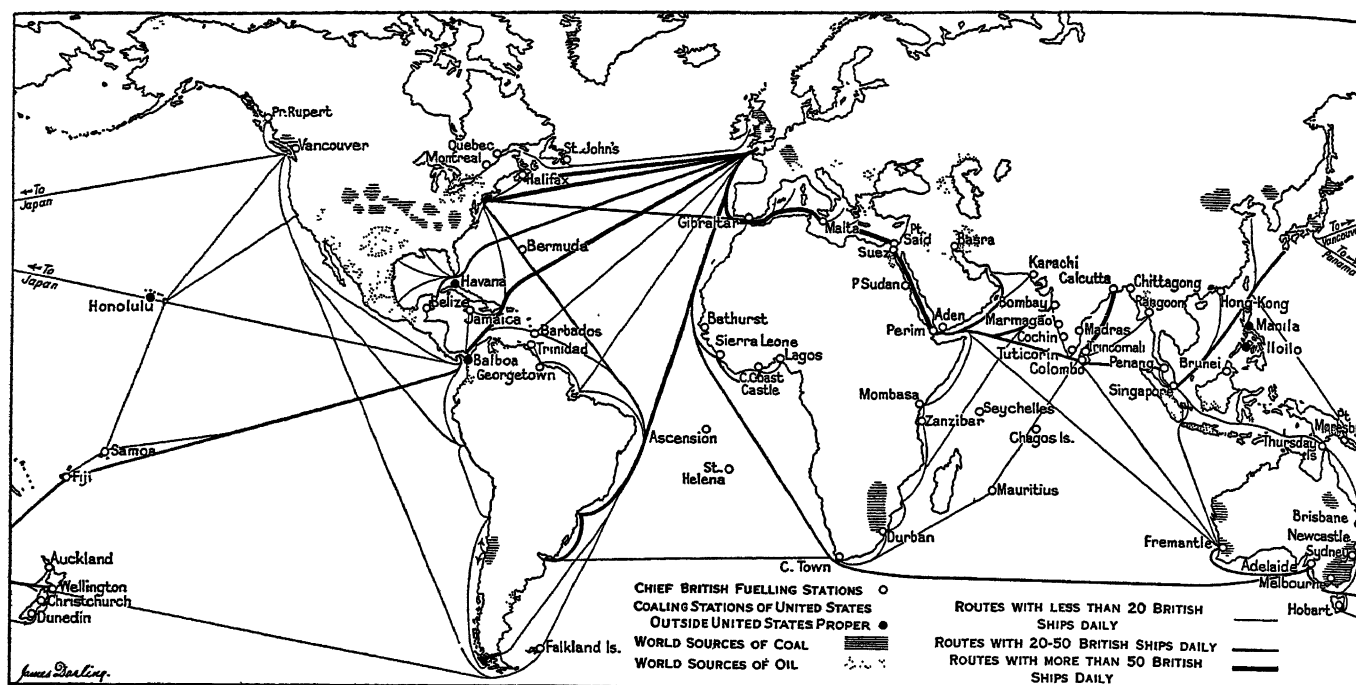

“that the power of accelerating gaseous combustion is possessed by all surfaces at temperatures below the ignition point in varying degrees, dependent upon their chemical characters and physical texture” and (2) “that such an accelerated surface combustion is dependent upon an absorption of the combustible gas, and probably also of the oxygen by the surface, whereby it becomes ‘activated’ (probably ionized) by association with the surface” and (3) “that the surface itself becomes electrically charged during the process.” Bone also pointed out that “there are experimental grounds for the belief that not only does the accelerating influence of the surfaces rapidly increase with the temperature, but also that the differences between the catalysing powers of various surfaces, which at low temperatures are often considerable, diminish with ascending temperatures until at bright incandescence they practically disappear.” This accelerated combustion has been applied by Bone to various industrial heating appliances as a means of increasing the efficiency of heating operations. In these a mixture of air and gas in correct proportions is caused to burn without flame in contact with incandescent surfaces. The advantages are (1) accelerated combustion, (2) concentration of combustion where required, (3) minimum excess air, (4) high temperature, (5) rapid heat transfer by radiation.

Surface combustion has been applied to gas furnaces, gas cookers and heaters, etc., gas and air being forced by slight pressure through a porous diaphragm of refractory material, the mixture burning on the exit surface and maintaining it at incandescence without flame. Other applications include boiler heating where the gas is burnt in boiler tubes filled with granular fireclay.

For further particulars reference should be made to the following articles. Under COAL AND COAL MINING will be found a general survey of the world's coal resources and of the methods of coal mining; cognate articles will be found under ANTHRACITE, LIGNITE, PEAT, COKE and PULVERIZED FUEL. Mineral oil is treated under PETROLEUM, SHALE OIL, GASOLINE and PARAFFIN OIL. See also GAS MANUFACTURE, NATURAL GAS and PRODUCER GAS. (C. H. L.)

FUELLING STATIONS are repositories or warehouses located at convenient ports for supplying coal and oil to commercial and naval vessels. In the latter half of the 19th century as steam vessels replaced the old sailing ships in ocean transport, the trade of the world began to settle down upon definitely fixed routes and, with the opening of the Suez and afterwards of the Panama canals, the great sea lanes encompassing the globe were completed. Along these lanes fuelling stations have grown up at ports where merchant ships have found it convenient to take fuel for replenishing their bunkers. In the early days of steam, the endurance of the ships was low, frequent bunkering was necessary, and coaling stations came into being at every few hundred miles along the trade routes. The increased size of ships, improvements in the steam engine, the use of oil fuel, and lastly the introduction of the internal combustion engine, have now added greatly to the time that ships can keep to sea without refuelling. Consequently some of the older coaling stations are decreasing in importance, whilst others, under the influence of oil are growing rapidly. At few but the terminal ports on the great trade routes, is either coal or oil native, and the “bunkering” trade, which carries oil or coal from its sources to the fuelling stations, forms no small part of the commerce of the world.

Naval Fuelling Stations.—With the growth of the commercial fuelling stations, strategic positions were chosen for supplying the needs of the navies charged with the duty of protecting and keeping open the trade routes. Until 1878 the question of coaling stations for the British Fleet was not seriously considered, but in that year the threat of war with Russia drew attention to the exposure of the expanding British commerce to the depredations of hostile cruisers. Public alarm led to the appointment of a royal commission to enquire into the protection of British commerce at sea. Unfortunately, the cardinal fact that the basis of protection of seaborne commerce must be a mobile navy was ignored and the necessary standard of naval strength was excluded from the terms of reference of the commission. It was not recognised at the time that it is the movement of commerce at sea in war time, and not its security in port, that is vital to the British Empire. The com-

MAP OF THE WORLD SHOWING BRITISH FUELLING STATIONS ON THE MAIN OCEAN ROUTES, TOGETHER WITH THE PRINCIPAL WORLD SOURCES OF COAL AND OIL, ONLY THE LARGEST STATIONS HAVING FACILITIES FOR FUELLING BOTH COAL AND OIL STEAMERS

mission in its report in 1881, recommended the erection of fortifications at certain ports; this resulted in a great scheme of passive defence of the coaling stations which has since been proved to be entirely incorrect in principle. Heavy guns were mounted in forts at Cape Town, Singapore, Hongkong, Bermuda and elsewhere, but most of the works were obsolete before they were completed. The commission, however, recognised that none of these forts could exist without the support of a naval force, and they went beyond their terms of reference to issue a grave warning as to the then state of the navy, which eventually bore fruit in the Naval Defence Act of 1889.

From this time forward it was recognised that the determining factor in the defensive policy of the Empire was the protection of its trade and that the defence of the fuelling stations, be they commercial or purely naval, must depend primarily upon the navy. They require only sufficient local defences to deal with predatory raids of cruisers; such raids could only be made by a few cruisers and, unless supported by troops (a contingency impossible in the face of a strong naval force), could have no permanent effect. Coal stored on shore cannot be damaged by gunfire from a ship and men must be landed to damage or appropriate it. Oil fuel, however, unless stored in underground tanks, is vulnerable both from gunfire and from aerial attack. Therefore fuelling stations, in common with all commercial ports, now require defence from aerial attack if they are situated within the radius of hostile aircraft or are liable to a raiding attack from cruisers carrying aircraft.

The World War demonstrated that the fleet which establishes and maintains the command of the sea has no difficulty in keeping itself supplied with fuel. Even at the height of the intensive German submarine campaign, the British navy was never hampered by shortage of fuel. The fleets did not seek the established fuelling stations to replenish, but improvised bases in sheltered waters within each sphere of operations, to which fuel was sent in oilers and colliers.

Modern navies now depend almost entirely upon oil fuel and the fuelling stations are in the course of reorganisation according to the needs of each individual nation. For the British Navy, besides the large stocks of oil fuel maintained in the Home Dockyards, oil depots have been established at the old coaling stations at Gibraltar, Malta, Port Said, Suez, Aden, Ceylon, Rangoon, Singapore, Hongkong, Jamaica, Sierra Leone, the Cape of Good Hope, Falkland Islands, Halifax, Vancouver and in the

Australian and New Zealand ports. The vital supplies of fuel are thus assured to the Navy, although only a small portion of the world's supply of oil is produced within the British Empire.

The United States has coaling stations at Havana, Balboa, Honolulu, Manila and Iloilo.

Commercial Fuelling Ports.—The necessity for a well placed chain of fuelling ports to the commerce of the world is well shown upon the map. The thickness of the lines of the main trade routes indicates the average number of British ships on each route on each day throughout the year and gives an approximate indication of the volume and flow of world trade; except of course in the case of the great coastwise trade of the United States through the Panama Canal and in other more local areas such as the Mediterranean and Northern Europe. It is seen that the British trade routes are marked out by fuelling stations and that those in territory under Imperial control are well placed for maintaining the flow of seaborne traffic in the event of foreign ports being closed to British ships in war time. The United States has a large number of fuelling stations around her coasts and also in the West Indies, Panama, Hawaii and the Philippines, where her overseas interests lie. France and Portugal maintain stations in their colonial possessions overseas, but Japan, Italy, Spain and the smaller countries confine their stations to their own territories. Central America has many fuelling stations, chiefly used for the export of oil fuel and there are numerous stations around the South American Coast capable of supplying both oil and coal.

The principal sources of the world's fuel supplies are shown upon the map. The chief coal fields are in the temperate zones, mainly in the northern hemisphere; petroleum comes from two main belts, each situated between latitudes 40° N and 10° S, one in central America and the other in the Middle East, between Persia and the Dutch Indies. Great Britain is the greatest coal exporting country in the world and exports about 30% of the coal mined, about one third of which goes to make up the "bunker trade" for keeping the coaling stations on the trade routes replenished. In addition to the bunker coal sent to the Continental ports, British coal is sent to the West Indies and as far south as Buenos Aires. It supplies the Mediterranean ports and the coaling stations on the eastern trade routes as far east as Singapore and Hongkong.

The United States is the largest producer of coal in the world but uses about 95% of the coal mined for home consumption: Of the 5% exported in the coastwise trade to the Atlantic and

Pacific ports and the Panama canal area, a small proportion only is represented by the bunker trade. The Canadian coal fields of Nova Scotia and Vancouver each have a coastwise export trade upon their respective coasts and the Chilean coal fields support a small export trade in the south Pacific. Natal coal finds its way to the Red Sea, where it comes into competition with cargoes from the British coalfields: it is sent to India and Ceylon and, as far east as the Dutch Indies and Singapore; Colombo and Sabang are important bunkering ports where British and Natal coals are obtainable. Coal from the Japanese and Chinese coal fields is exported as far west as Singapore. The Australian coalfields, the most important of which is situated at Newcastle (New South Wales), supply a coastwise trade to the Australian and New Zealand ports and Australian coal can be obtained as far north as Singapore. It is a notable fact that Singapore, one of the four greatest seaports in the world, is the terminal point of four streams of the coal export trade for bunkers, two of the coalfields being over 6,000 miles away. Yet Singapore is situated in close proximity to the oilfields of Burma, Borneo and the Dutch Indies.

Oil Fuel.—Turning to the world's sources of oil, the United States, Mexican and northern South American fields produce the greatest quantity, their output in 1927 representing no less than 84.3% of the world supply. Next in order come the Rumanian, Polish and South Russian Group with 8.2%, whilst the Persian, Burma, Dutch East Indies and Egyptian fields account for 6.5%. The remaining 1% comes from other countries; this includes a considerable amount from the Argentine and a small supply from Japan.

In 1927 the world produced and used three times as much oil as in 1913 and a glance at the map shows that the general flow of the oil carrying trade is, with the world supplies as they are at present, in the reverse direction to that of coal. Special ships are necessary for carrying oil and the world tonnage of oil "tankers" rose from 1,500,000 in 1913 to over 6,000,000 in 1927, more than one third of which is under the British flag. Oil is being used in ever increasing quantities for marine propulsion. Apart from the burning of oil fuel under steam boilers in warships and large liners, the internal combustion engine is demanding an increasing quantity of its special fuel. In 1927 5.2% of the world merchant ship tonnage was driven by oil motor engines, more than a quarter of these being British ships: in the same year more than one half of the merchant ships under construction in the world were to be motor driven. Oil is evidently the future fuel upon the sea on account of its economy, flexibility and ease in handling and the increased endurance at sea which it affords. Provision is already being made for it, for in 1927 there were over 350 fuel oil bunkering stations in being, more than one quarter of which (excluding the great naval stations) were in British territory.

Coal will continue to be used at sea especially for short voyage traffic in countries where no oil is found and where it is therefore expensive e.g., the British Continental, coastwise and Mediterranean trades. But science has discovered a process of distilling oil from coal and with the development of this invention upon a commercial basis, Great Britain will be able to use her inexhaustible coal supplies more economically and so become an oil as well as a coal producing country. Such a development would be of inestimable economic value to Great Britain. She stands in her unalterable position at the centre of the world trade routes: her great trade has been built up on cheap and abundant coal: now that the oil era has dawned she requires but a similar supply of the new fuel to increase her trade and maintain the prosperity built on her mines.

Whatever fresh sources of oil are opened or new methods of using coal are invented the fuelling stations are likely to remain unchanged, except for the type of fuel they stock. Their position has been established by years of trade upon routes which are fixed. Merchant ships will always re-bunker on their particular routes where fuel is to be obtained most cheaply and upon those routes must be maintained adequate supplies of fuel for the navy whose duty it is to keep the high roads of the sea safe and secure to all traders, both in peace and in war. (S. T. H. W.)

FUEL RESEARCH BOARD. This board was appointed in Great Britain in 1917 as one of the research boards of the newly formed Department of Scientific and Industrial Research, "to investigate the nature, preparation and utilization of fuel of all kinds, both in the laboratory, and, when necessary, on an industrial scale." Sir George Beilby, F.R.S., was the first chairman of the board and director of fuel research. He retired in 1923 when Sir Richard Threlfall, G.B.E., F.R.S., was appointed chairman, and Dr. C. H. Lander, C.B.E., M.Inst.C.E., director of fuel research.

Two main lines of enquiry have been pursued: (1) a survey and classification of the coal seams in the various mining districts, and (2) an investigation of the practical problems which must be solved if any large proportion of the raw coal at present burned in its natural state is to be replaced by the various forms of fuel obtainable from coal by carbonization and "gasification" processes.

Coal is not a definite homogeneous substance, and its composition and properties vary greatly in the different seams, and even throughout a single seam, but comparatively little is known as to the precise variations that occur. The object of the physical and chemical survey of the national coal resources is to determine the variations that occur, the purposes for which each seam is best fitted and the best means of preparing each coal for the market. Local laboratories are established for this purpose in the various coalfields, and advisory committees, on which the coal owners and mine managers are represented, have been appointed in the various areas.

The second main line of investigation is being carried out at the fuel research station at East Greenwich, London, where full size retorts, boilers, coal cleaning plant, etc., are installed, as well as the necessary laboratories. The general idea of the station is that the operation of treating coal should be carried out in plant of a size used in commercial practice, but with equipment and methods of control to allow of an accuracy of measurement closely approaching that of laboratory work. The plant includes settings of vertical and horizontal gas retorts, each with a nominal capacity of ten tons of coal a day. The amount of coal carbonized in 1927 amounted to 4,500 tons, producing over 68 million cubic feet of gas. Low temperature carbonization has been intensively studied and a type of retort for this purpose developed. Some 1,600 tons of coal were treated by this method in 1927. A complete coal washery has been installed containing examples of six different types of washers, as well as screening plant. Boilers, water-gas plant, producer plant, and briquetting plant, are provided. The production of oil from coal by the Bergius method of hydrogenation is being studied in a plant with a capacity of one ton of coal a day. The object of these experiments is two-fold: (1) to ascertain the suitability of the various coals for the different treatments, and (2) to improve the efficiency of the treatments. The inception of the station is due to the imagination and foresight of the late Sir George Beilby, and it provides unique facilities for the work required. The cost of the work carried out under the director of fuel research is met from the funds voted by parliament, and amounts to between £80,000 and £90,000 per annum. Detailed annual reports are published in England by H. M. Stationery Office. (C. H. L.)

FUENTEVEJUNA, a town of Spain, province of Cordova, on the Fuente del Arco-Belmez-Cordova railway. Pop. (1920) 15,547. Fuenteovejuna is built on a hill, in a district well watered by tributaries of the Guadiato and Zújar, which, besides producing much oil, wheat, wine and honey, also contains important coal, lead and mica mines. Sheep and goats are reared and pigs are kept in oak forests near by. Leather, preserved meat and flour are manufactured in the town. The parish church occupies the site of an ancient palace of the knights of Calatrava (c. 1163-1486), which was earlier a Moorish castle.

FUENTERRABÍA (formerly sometimes *Fontarabia*; Lat. *Fons Rapius*), a town in northern Spain, province of Guipúzcoa; on the San Sebastian-Bayonne railway; near the Bay of Biscay and on the French frontier. Pop. (1920) 5,570. Fuenterrabía, on the slope of a hill on the left bank of the river Bidassoa, near the point where its estuary begins, became popular towards the close of the 19th century as a summer resort for visitors from

the interior of Spain. Hotels and villas were then built on the lower ground beside the estuary. This large modern suburb stands out in strong contrast to the picturesque old town, with its heavy, ruined ramparts, its steep, narrow streets and gabled houses with overhanging upper stories, its castle and its fine Gothic church. The town has a tiny harbour for fishing vessels and makes cider, fishing tackle and pickles fish.

Fuenterrabía formerly possessed considerable strategic importance, and it has frequently been taken and retaken in wars between France and Spain. The rout of Charlemagne in 778, associated by Milton (*Paradise Lost*, i. 587) with Fontarabía, is generally understood to have taken place not here but at Roncesvalles (*q.v.*), nearly 40 m. E.S.E. Unsuccessful attempts to seize Fuenterrabía were made by the French troops in 1476 and again in 1513. In 1521 they captured it but it was retaken in 1524. The prince of Condé sustained a severe repulse under its walls in 1638, and the town then received from Philip IV. the rank of city, a privilege which involved some measure of autonomy. In 1719 Fuenterrabía surrendered to the duke of Berwick and his French troops and in 1794 it again fell into the hands of the French, who so dismantled it that it has never since been reckoned by the Spaniards among their fortified places. It was by the ford opposite Fuenterrabía that the duke of Wellington, on Oct. 8, 1813, successfully forced a passage into France in the face of an opposing army commanded by Marshal Soult. Severe fighting also took place here during the Carlist War in 1837.

FUERO, a Spanish term, derived from the Latin *forum* (*q.v.*). The Castilian use of the word in the sense of a right, privilege or charter is perhaps to be traced to the Roman *conventus iuridici* (assize towns), also known as *iurisdictiones* or *fora*, in Pliny's time already numerous in the Iberian peninsula. In each of these provincial *fora* the Roman magistrate paid all possible deference to the established law of the district; and every free subject could demand that he should be judged in accordance with the customs and usages of his proper forum. It is highly probable that the old administrative arrangements of the provinces, and especially of the towns, remained practically undisturbed at the period of the Gothic occupation of Spain.¹ The Theodosian Code and the Breviary of Alaric alike seem to imply a continuance of the municipal system established by the Romans; the later Lex Visigothorum does not appear to have contemplated any marked interference with the former *fora*. During the Arab occupation the Christians were, sometimes at least, judged according to their own laws in separate tribunals presided over by Christian judges;² and the mere fact of the preservation of the name *alcalde* (*q.v.*), an official whose functions corresponded so closely to those of the *iudex* or *defensor civitatis*, suggests that the old municipal *fora*, if much impaired, were not even then in all cases wholly destroyed. When the word *forum* (or *forus*, Ducange) begins to appear in documents of the 10th century in the sense of a liberty or privilege, it is generally implied that the thing so named is nothing new. The earliest extant written fuero is probably that granted to the province and town of León by Alfonso V. in 1020. It emanated from the king in a general council of the kingdom of León and Castile, and consists of two parts, the "fuero general" applying to the kingdom at large and the "fuero municipal," a mere municipal charter. The "fuero general" does not profess to supersede the *consuetudines antiquorum iurum* or Chindaswint's codification of these in the Lex Visigothorum; the "fuero municipal" is for the most part but a resuscitation of usages formerly established. Almost contemporaneous with it was that granted to Nájera by Sancho el Mayor of Navarre (*ob.* 1035), and confirmed, in 1076, by Alfonso VI.³ In the fuero of Cardeña,

granted by Ferdinand I. in 1039, reference is made to a previous forum Burgense (Burgos), which, however, has not been preserved, if, indeed, it ever had been reduced to writing at all. The fuero of Sepúlveda (1076) points back to a remote antiquity. Among the later fueros of the 11th century, the most important are those of Jaca (1064) and of Logroño (1095). The former, unusually large in its concessions, rapidly extended to many places in the neighbourhood, while the latter, given also to Miranda by Alfonso VI., was extended in 1181 by Sancho el Sabio of Navarre to Vitoria, thus constituting one of the earliest written *fora* of the "Provincias Vascongadas." In the 12th and 13th centuries the number of such documents increased rapidly; that of Toledo, granted to the Mozarabic population in 1101, but greatly enlarged and extended by Alfonso VII. (1118) and later sovereigns, was the basis for many other Castilian fueros. Latterly the word fuero came to be used in Castile in a wider sense, as a general code of laws; thus about the time of Saint Ferdinand the old Lex Visigothorum was translated into the vernacular and called the Fuero Juzgo; and among the compilations of Alfonso the Learned were an *Espejo de Fueros* and the *Fuero de las leyes*, or *Fuero Real*. The famous code known as the *Ordenamiento Real de Alcalá*, or *Fuero Viejo de Castilla*, dates from a later period. As the power of the Spanish crown was gradually concentrated and consolidated the local fueros slowly yielded before the force of imperialism; and only those of Navarre and the Basque provinces (*see* BASQUES) managed to survive. At the death of Ferdinand VII. in 1833, these rights were set aside by Castaños. The result was a civil war, which terminated in a renewed acknowledgment of the fueros by Isabel II. (1839). The provisional government of 1868 also promised to respect them, and similar pledges were given by the governments which succeeded. In consequence, however, of the Carlist rising of 1873-76, the Basque fueros were finally extinguished in 1876. The history of the *Foraes* of the Portuguese towns, and of the *Fors du Béarn*, is analogous to that of the fueros of Castile.

FUERO JUZGO, the Spanish term for the translation of the Lex Visigothorum made by order of St. Ferdinand in 1241 (*see* FUERO; GERMANIC LAWS) after his capture of the city of Córdoba from the Moors. He directed this translation to be called the *Fuero de Córdoba*, but the rather barbarous name of Fuero Juzgo prevailed. This version was corrected under Ferdinand's son, Alfonso the Wise; but it varied in many particulars from the original Latin. It was received not only in the free parts of Spain (supplemented by their local *fueros*) but in the Mohammedan parts, where it was applied to the Christian populations. It has never been repealed, though little is now in force.

FUERTES, LOUIS AGASSIZ (1874-1927), American artist and naturalist, was born at Ithaca, N.Y., on Feb. 7, 1874, youngest son of Prof. Estevan Antonio Fuertes of Porto Rico and Mary Stone Perry Fuertes of New York. He was educated at Cornell university and received art training from Abbott H. Thayer. As a painter of birds he was pre-eminent in America during a period of 30 years from 1897 to 1927. Enthusiastic and industrious, he produced abundantly, mainly as an illustrator of popular and technical ornithological books. He painted also a limited number of large pieces, some of which are owned by the New York Zoological Society. His most extensive work was a series of large plates illustrating "The Birds of New York," published by the State and covering practically every species of eastern North America. A similar work for the State of Massachusetts was incomplete at his death. His work is characterized by a fidelity to nature involving not only objective but subjective accuracy. His genius lay in the power to reproduce subtle, fleeting and intangible qualities of birds which reflected their individuality to a remarkable degree. This was quite as much the result of a highly sympathetic and very extensive knowledge of birds in their

³"Mando et concedo et confirmo ut ista civitas cum sua plebe et cum omnibus suis pertinentiis sub tali lege et sub tali foro maneat per saecula cuncta. Amen. Isti sunt fueros quae habuerunt in Naxera in diebus Sanctii regis et Gartiani regis." (I order and permit and confirm that this town with its people and all that pertains to them shall remain under such law and such forum for all time. Amen. These are the fueros which they held in Naxera in the days of King Sancho and King Garcia.)

haunts as it was of technical skill. His travels covered a wide field in North America, Mexico, West Indies, South America, Europe and Africa. His field experience, therefore, was of the widest.

FUERTEVENTURA, an island in the Spanish archipelago of the Canary islands (*q.v.*). Pop. (1920) 11,703; area 665 sq.m. Fuerteventura lies between Lanzarote and Grand Canary. It has a length of 52 m., and an average width of 12 m. Lava streams and other signs of volcanic action abound, but there has been no igneous activity since the Spaniards took possession. The highest peak reaches 2,500 ft. In external appearance, climate and productions, Fuerteventura greatly resembles Lanzarote. Oliva (pop. 1920, 2,377) is the largest town. Cabras (1,016) on the eastern coast is the chief port.

FUGGER, the name of a famous German family of merchants and bankers. The founder of the family was Johann Fugger, a weaver at Graben, near Augsburg, but its real greatness was established by his grandsons, Andreas and Jakob, who greatly extended the business in Augsburg, which they inherited from their father. Andreas, called the "rich Fugger," had several sons, among them being Jakob, who was granted the right to bear arms in 1452, and who founded the family of Fugger vom Reh, which died out in 1583. Jakob Fugger died in 1469, and three of his seven sons, Ulrich (1441-1510), Georg (1453-1506) and Jakob (1459-1525), men of great resource and industry, inherited the family business and added enormously to the family wealth. In 1473 Ulrich obtained from the emperor Frederick III. the right to bear arms for himself and his brothers, and about the same time he began to act as the banker of the Habsburgs, a connection destined to bring fame and fortune to his house. Under the lead of Jakob the Fuggers were interested in silver mines in Tirol and copper mines in Hungary, while their trade in spices, wool and silk extended to almost all parts of Europe. Their wealth enabled them to make large loans to the German king, Maximilian I., who pledged to them the county of Kirchberg, the lordship of Weissenhorn and other lands, and bestowed various privileges upon them. Jakob built the castle of Fuggerau in Tirol, and erected the Fuggerei at Augsburg, a collection of 106 dwellings, which were let at low rents to poor people and which still exist. Jakob Fugger and his two nephews died without direct heirs, and the family was continued by Georg's sons, Raimund (1489-1535) and Anton (1493-1560), under whom the Fuggers attained the summit of their wealth and influence.

Jakob Fugger's florins had contributed largely to the election of Charles V. to the imperial throne in 1519, and his nephews and heirs maintained close and friendly relations with the great emperor. In addition to lending him large sums of money, they farmed his valuable quicksilver mines at Almaden, his silver mines at Guadalcanal, the great estates of the military orders which had passed into his hands, and other parts of his revenue as king of Spain; receiving in return several tokens of the emperor's favour. In 1530 Raimund and Anton were granted the imperial dignity of counts of Kirchberg and Weissenhorn, and obtained full possession of these mortgaged properties; in 1534 they were given the right of coining money; and in 1541 received rights of jurisdiction over their lands. Continuing their mercantile career, the Fuggers brought the new world within the sphere of their operations, and also carried on an extensive and lucrative business in farming indulgences. Both brothers found time to acquire landed property, and were munificent patrons of literature and art. Before this time the total wealth of the family had been estimated at 63,000,000 florins. The Fuggers were devotedly attached to the Roman Catholic Church. Jakob had been made a count palatine (*Pfalzgraf*) and several members of the family had entered the church; one, Raimund's son, Sigmund, becoming bishop of Regensburg.

In addition to the bishop, three of Raimund Fugger's sons attained some degree of celebrity. Johann Jakob (1516-1575), was the author of *Wahrhaftige Beschreibung des österreichischen und habsburgischen Namens*, which was largely used by S. von Bircken in his *Spiegel der Ehren des Erzhauses Österreich* (Nuremberg, 1668), and of a *Geheim Ernbuch des Fuggerischen Geschlechtes*. He was also a patron of art, and a distinguished

counsellor of Duke Albert IV. of Bavaria. Another of Raimund's sons was Ulrich (1526-1584), who became a Protestant and took refuge in the Rhenish Palatinate; greatly interested in the Greek classics, he occupied himself in collecting valuable manuscripts, which he bequeathed to the university of Heidelberg. Raimund's other son was Georg (d. 1579), who inherited the countships of Kirchberg and Weissenhorn, and founded a branch of the family which still exists, its present head being Georg, Count Fugger of Kirchberg and Weissenhorn (b. 1850).

Anton Fugger left three sons, Marcus (1529-1597), Johann (d. 1598) and Jakob (d. 1598), all of whom left male issue. Marcus was the author of a book on horse-breeding, *Wie und wo man ein Gestüt von guten edeln Kriegssassen aufrichten soll* (1578), and of a German translation of the *Historia ecclesiastica* of Nicephorus Callistus.

Johann Fugger had three sons, Christoph (d. 1615) and Marcus (d. 1614), who founded the families of Fugger-Glött and Fugger-Kirchheim respectively, and Jakob, bishop of Constance from 1604 until his death in 1626. The family of Kirchheim died out in 1672. That of Glött was divided into several branches by the sons of Otto Heinrich and of his brother Johann Ernst (d. 1628). These lines, however, have gradually become extinct except the eldest line, represented in 1909 by Karl Ernst, Count Fugger of Glött (b. 1859). Anton Fugger's third son Jakob, the founder of the family of Wellenburg, had two sons who left issue, but in 1777 the possessions of this branch of the family were again united by Anselm Joseph (d. 1793), Count Fugger of Babenhausen. In 1803 Anselm's son, Anselm Maria (d. 1821), was made a prince of the Holy Roman Empire, the title of Prince Fugger of Babenhausen being borne by his direct descendant Georg (b. 1889). On the fall of the empire in 1806 the lands of the Fuggers, which were held directly of the empire, were mediatised under Bavaria and Württemberg. The heads of the three existing branches of the Fuggers are all hereditary members of the Bavarian Upper House.

Augsburg has many interesting mementoes of the Fuggers, including the family burial-chapel in the church of St. Anna; the Fugger chapel in the church of St. Ulrich and St. Afra; the Fuggerhaus, still in the possession of one branch of the family; and a statue of Johann Jakob Fugger.

In 1593 a collection of portraits of the Fuggers, engraved by Dominique Custos of Antwerp, was issued at Augsburg. Editions with 127 portraits appeared in 1618 and 1620, the former accompanied by a genealogy in Latin, the latter by one in German. Another edition of this *Pinacotheca Fuggerorum*, published at Vienna in 1754, includes 139 portraits. See *Chronik der Familie Fugger vom Jahre 1599*, edited by C. Meyer (Munich, 1902); A. Geiger, *Jakob Fugger, 1459-1525* (Regensburg, 1895); A. Schulte, *Die Fugger in Rom, 1496-1523* (Leipzig, 1904); R. Ehrenberg, *Das Zeitalter der Fugger* (Jena, 1896); K. Ehrenberg, *Capital and Finance in the Age of the Renaissance: A Study of the Fuggers and their Connexions* (Eng. trans. by H. Lucas, 1928).

FUGITIVE SLAVE LAWS, a term applied in the United States to the statutes passed by Congress in 1793 and 1850 to provide for the return of negro slaves who escaped from one State into another or into a public territory.

The first specific legislation on the subject was enacted on Feb. 1, 1793; by its provisions any Federal district or circuit judge or any State magistrate was authorized to decide finally and without a jury trial the status of an alleged fugitive. The measure soon met with strong opposition in the northern States, and Personal Liberty laws were passed to hamper officials in the execution of the law; Indiana in 1824 and Connecticut in 1828 providing jury trial for fugitives who appealed from an original decision against them. In 1840 New York and Vermont extended the right of trial by jury to fugitives and provided them with attorneys. As early as the first decade of the 19th century individual dissatisfaction with the law of 1793 had taken the form of systematic assistance rendered to negroes escaping from the South to Canada or New England—the so-called "Underground Railroad" (*q.v.*). The decision of the Supreme Court of the United States in 1842 that State authorities could not be forced to act in fugitive slave cases, but that national

authorities must carry out the national law, was followed by legislation in Massachusetts (1843), Vermont (1843), Pennsylvania (1847) and Rhode Island (1848), forbidding State officials to help enforce the law and refusing the use of State gaols for fugitive slaves.

The demand from the South for more effective Federal legislation was voiced in the second Fugitive Slave Law, enacted on Sept. 18, 1850, as a part of the Compromise measures of that year. Special commissioners were to have concurrent jurisdiction with the U. S. courts in enforcing the law; fugitives could not testify in their own behalf; no trial by jury was provided; penalties were imposed upon marshals who refused to enforce the law or from whom a fugitive should escape, and upon individuals who aided negroes to escape; the marshal might raise a *posse comitatus*; a fee of \$10 was paid to the commissioner when his decision favoured the claimant and only \$5 when it favoured the fugitive; and both the fact of the escape and the identity of the fugitive were to be determined on purely *ex parte* testimony. The severity of this measure led to gross abuses and defeated its purpose; the number of abolitionists increased, the operations of the Underground Railroad became more efficient, and new Personal Liberty laws were enacted in Vermont (1850), Connecticut (1854), Rhode Island (1854), Massachusetts (1855), Michigan (1855), Maine (1855 and 1857), Kansas (1858) and Wisconsin (1858). These Personal Liberty laws forbade justices and judges to take cognizance of claims, extended the *habeas corpus* act and the privilege of jury trial to fugitives, and punished false testimony severely. These State laws were one of the grievances officially referred to by South Carolina (in Dec. 1860) as justifying her secession from the Union. Attempts to carry into effect the law of 1850 aroused much bitterness. The arrests of Sims and of Shadrach in Boston in 1851; of "Jerry" M'Henry, in Syracuse, N.Y., in the same year; of Anthony Burns in 1854, in Boston; and of the two Garner families in 1856, in Cincinnati, with other cases arising under the Fugitive Slave Law of 1850, probably had as much to do with bringing on the Civil War as did the controversy over slavery in the Territories.

For some time after the beginning of the Civil War the Fugitive Slave Law was considered still to hold in the case of fugitives from masters in the border states who were loyal to the Union government, and it was not until June 28, 1864 that the Act of 1850 was repealed.

See J. F. Rhodes, *History of the United States from the Compromise of 1850*, vols. i. and ii. (1893); and M. G. M'Dougall, *Fugitive Slaves, 1619-1865* (Boston, 1891).

FUGUE, in music, the mutual "pursuit" of voices or parts. It was, up to the end of the 16th century, if not later, the name applied to two art-forms. (A) *Fuga ligata* was the exact reproduction by one or more voices of the statement of a leading part. The reproducing voice (*comes*) was seldom if ever written out,

for all differences between it and the *dux* were rigidly systematic; e.g., it was an exact inversion, or exactly twice as slow, or to be sung backwards, etc., etc. Hence, a rule or *canon* was given, often in enigmatic form, by which the *comes* was deduced from the *dux*; and so the term *canon* became the name for the form itself and is still retained. (B) A composition in which the canonic style was cultivated without canonic restriction was, in the 16th century, called *fuga ricercata* or simply *ricercare*, a term which is still used by Bach as a title for the fugues in *Das musikalische Opfer*.

Fugue is a texture the rules of which do not suffice to determine the shape of the composition as a whole. Schemes such as that laid down in Cherubini's treatise, that legislate for the shape, are pedagogic fictions; and such classical tradition as they represent is too exclusively Italian to include Bach. Yet, strange to say, the Italian tradition in fugue style is represented by hardly any strict works at all. Under the general heading of CONTRAPUNTAL FORMS many facts concerning fugues are discussed; and only a few technical terms remain to be defined here.

(i.) If during the first entries or "exposition" of the fugue, the counterpoint with which the opening voice accompanies the answer is faithfully reproduced as the accompaniment to subsequent entries of the subject, it is called a *countersubject*. Obviously the first countersubject may continue with a second when the subject enters in the third part and so on. The term is also applied to new subjects appearing later in the fugue in combination (immediate or destined) with the original subject. Cherubini, holding the arbitrary dogma that a fugue cannot have more than one subject, applies the term to the less prominent of the subjects of what are commonly called double fugues, i.e., fugues which begin with two parts and two subjects simultaneously, and so also with *triple* and *quadruple* fugues. It is remarkable that Bach (with only three known exceptions) never writes this kind of double fugue, but always introduces his new subjects later.

(ii.) *Episodes* are passages separating the entries of the subject. There is no reason for distinguishing episodes that occur during the exposition from later episodes. Episodes are usually developed from the material of the subject and countersubjects; they are, when independent, conspicuously so.

(iii.) *Stretto* is the overlapping of subject and answer. A *stretto maestrale* is one in which the subject survives the overlapping. The makers of musical terminology have no answer to the question of what a non-magistral stretto may be.

(iv.) The distinction between *real* and *tonal* fugue is a matter of detail concerning the answer. A fugal exposition is not intended to emphasise a key-contrast between tonic and dominant. Accordingly the answer is (especially in its first notes and in points that tend to shift the key) not so much a transposition

I. Stretto-Fugue in 4 parts.

Δ = Subject. C.S. = Counter subject. U = Diminution. V = Inversion. * = Variation.

BACH. *Das Wohltemperirte Klavier*. II 9.

The musical score is presented in two systems. The first system shows the beginning of the fugue with four staves. The subject (Δ) is introduced in the first staff, followed by the counter-subject (C.S.) in the second staff. The third and fourth staves show further entries of the subject and counter-subject. The second system is labeled "End of exposition" and "Stretto I". It shows the subject and counter-subject overlapping, with the subject (Δ) and counter-subject (C.S.) clearly marked. The score is in G major (one sharp) and 4/4 time.

Canonic Episode suggested by C.S(a)

Stretto II: chromatic, with two new counter subjects

New C.S 1

Stretto III on a variation of the subject

Stretto IV by diminution. (Note new position in scale, with first two entries)

Stretto V combining normal subject with Diminution freely inverted and direct.

Stretto VI, reviving C.S as a result of ♯

** These two notes would have been an 8ve higher if 10ths could be stretched on Bach's instruments.

The image shows a musical score for a piece titled 'Führich—Fu-Kien'. It consists of two systems of music, each with a treble and bass staff. The first system includes annotations: 'b' above the treble staff, 'C.S 2' above the bass staff, and 'C.S 1 exchanging with C.S 2' between the staves. A Roman numeral 'III' is also present. The second system is labeled 'Non-polyphonic Coda' and ends with a double bar line. The music is written in a key with two flats (B-flat and E-flat) and a common time signature.

of the subject to the key of the dominant as an adaptation of it from the tonic part to the dominant part of the scale or vice versa; in short, the answer is as far as possible *on* the dominant, not *in* the dominant. This is effected by a kind of melodic foreshortening on principles of great aesthetic interest but difficult to reduce to rules of thumb. The rules as often as not produce answers that are exact transpositions of the subject; and so the only kind of "real" fugue (*i.e.*, fugue with an exact answer) that could rightly be contrasted with the tonal fugue would be that in which the answer ought to be tonal but is not.

The term "answer" is usually reserved for those entries of the subject that are placed in what may be called the "complementary" position of the scale, whether they are tonal or not. Thus the order of entries in the exposition of the first fugue of *Das Wohltemperirte Klavier* is subject, answer, answer, subject, a departure from the usual rule, according to which subject and answer are regularly alternated in the exposition.

The nature of fugue and of polyphony as building harmony in "horizontal" melodic threads instead of in "vertical" chordal lumps is all summarized by Milton, during no classical period of polyphony, but in the chaotic time half-way between the death of Frescobaldi and the birth of Bach.

His volant touch,
Instinct through all proportions, low and high,
Fled and pursued transverse the resonant fugue.
Paradise Lost, book XI.
(D. F. T.)

FÜHRICH, JOSEPH VON (1800–1876), Austrian painter, was born at Kratzau in Bohemia on Feb. 9, 1800. He was celebrated as a composer of scriptural episodes, and his sacred subjects were transferred in numberless repetitions to the roadside churches of the Austrian State. Führich has been fairly described as a "Nazarene," a romantic religious artist whose pencil gave shape to countless incidents of the gospel and scriptural legends. He composed with great skill, especially in outline. His mastery of distribution, form, movement and expression was considerable. He had, however, no feeling for colour; and when he produced monumental pictures he was not nearly so successful as when designing subjects for woodcuts. Führich's illustrations to Tieck's *Genofova*, the Lord's Prayer, the Triumph of Christ, the Road to Bethlehem, the Succession of Christ according to Thomas à Kempis, the Prodigal Son, and the verses of the Psalter, became well known. In 1834 he was made custos and in 1840 professor of composition in the academy of Vienna. After this he completed the monumental pictures of the Church of St. Nepomuk. In 1872 he was pensioned and made a knight of the order of Franz Joseph. He died on March 13, 1876.

See Mor. Dreger, *Jos. Führich* (1912); H. V. Wörndle, *Jos. v. Führichs Werke* (1914); also his autobiography published in 1875 and a memoir by his son, Lucas (1886).

FUJI or **FUJIYAMA**, a celebrated quiescent volcano of Japan, standing 70 m. W.S.W. of Tokyo. It rises to a height of 12,395 ft. and its southern slopes reach the shore of Suruga Bay. It is a cone of beautifully simple form, the more striking to view because it stands isolated; but its summit is not conical, being broken by a crater some 2,000 ft. in diameter. (*See JAPAN.*)

FU-KIEN, one of the three maritime provinces of south China situated between Chekiang on the north and Kwangtung on the south. Its western boundary follows the crest of the high ranges which form the water-parting between the Kan section of the Yang-tze basin and streams flowing eastwards to the China sea. These ranges effectively separate it from its western neighbour Kiangsi and form the boundary zone between Mandarin, spoken in that province, and the Fu-kien dialects, of which there are about seven main varieties. Topographically isolated on the landward side and with a distinct group of languages, Fu-kien has marked individuality. The province is mountainous and, apart from its border ranges, is crossed by several ridges with the S.W.-N.E. axis characteristic of the eastern portion of the south China highlands. A longitudinal system of drainage parallel to these ridges has been tapped by coastal streams of which the most important is the Min, which drains two-thirds of the province. These streams are navigable for large vessels only for comparatively short distances inland but small junks penetrate far upstream and they are invaluable for floating down timber. The climate is sub-tropical, although the winters are cool on the hills, and the rainfall high and well distributed seasonally, with, however, a marked maximum during the summer monsoon. (Foochow, *c.* 60 in. per year.) This implies a rich vegetation and favourable conditions for crop production in the valleys, where two crops of rice are harvested, the first in June and the second in September. The forests are still of great importance and, as a source of timber, Fu-kien is only rivalled by Manchuria and Hunan in all China. The most important woods are fir, pine and rosewood, mostly floated in the form of big rafts down to Foochow, a great timber emporium. The camphor of Fu-kien, however, formerly very important, has been altogether eclipsed by that of Formosa, and the European market for tea, exported from Foochow, is now comparatively insignificant. Yet Fu-kien remains a great tea-growing province with a large home market. A special feature is its production of flower-scented teas, for the manufacture of which there are nearly 50 factories in Foochow. Of recent years this has called into existence a large flower-growing industry. There is also a large manufacture of paper from bamboo pulp. In addition to its agricultural and timber resources, Fu-kien has considerable and varied mineral wealth, including coal, iron, copper, gold, silver, graphite and good clay for porcelain. Mines are scattered widely over the province. Foochow, on the navigable lower Min and the outlet for the northern and central

interior, is the capital of the province and the largest city. Amoy, where another system of valleys finds its contact with the sea, is the great regional centre for the south. There are several smaller intermediate ports and in the extreme north Funing is open to foreign trade.

The great majority of the population of Fu-kien, estimated at 20,000,000, lives in the coastal zone, where the density is very high. There is close contact with the Chinese communities of Malaya and other districts of the Far Eastern Tropics to which the Fu-kienese emigrate in considerable numbers.

The situation of Fu-kien immediately opposite Formosa, Japan's chief base for trade and influence in the maritime provinces of south China, gives the province strategic importance. In the concessions of 1915 Japan obtained from the Chinese Government an undertaking not to give permission to foreign nations to construct on the coast of Fu-kien dockyards, coaling stations for military use, naval bases, etc., nor itself to borrow foreign capital for the purpose of setting up such establishments.

FUKUI, a town of Japan in the province of Echizen, near the west coast, 20 m. N. by E. of Wakasa Bay. It lies in a volcanic district much exposed to earthquakes. Fukui is now in a flourishing condition, with several local industries, especially the manufacture of paper, and an increasing population exceeding 50,000.

FUKUOKA, a town on the north-west coast of the island of Kyushu, Japan, in the province of Chikuzen, 90 m. N.N.E. of Nagasaki by rail. Pop. c. 80,000. With Hakata, on the opposite side of a small coast stream, it forms a large centre of population, with an increasing export trade and several local industries, e.g., silk-weaving. There are several other places of this name in Japan, the most important being Fukuoka in the province of Mutsu, North Japan, a railway station on the main line from Tokyo to Aomori Ura Bay. Pop. c. 7,000.

FULANI, a long-headed white race of pastoralists of disputed origin with considerable intermixture of other blood, calling themselves *Fulbe* (sing. *Pullo*), distributed from the upper Nile to Senegal. They have regular features and narrow nose, wavy hair, light complexion; are long-limbed, highly strung. They live independently, or near cultivators whose cattle they herd, and in certain districts constitute the ruling class, as in the theocratic States of Fouta Jalon, French Guinea. They conquered the Hausa States of Nigeria about 1804; and maintained precarious power up to the establishment of the British Protectorates (1904). Some have taken up cultivation. They are usually Muslims and observe the Koranic code; a small proportion are Animists (Senegal, French Sudan and on the Niger).

See Arcin, *La Guinée Française* (1907); Delafosse, *Haut Sénégal Niger* (1912); Meek, *The Northern Tribes of Nigeria* (1925).

FULBERT (c. 960–1028), bishop of Chartres, was probably of French origin. He was educated at the school of Rheims under Gerbert, afterwards Pope Sylvester II., and in 990 opened a school at Chartres which soon became famous throughout Europe. His pupils, among whom was Berengarius of Tours, affectionately termed him "Socrates." While interested in the propagation of secular learning, Fulbert emphasized the distinction between human knowledge and divine revelation. As bishop of Chartres from 1006, he advocated ecclesiastical reforms and in 1020 rebuilt the burnt cathedral.

His discourses, hymns and interesting letters are in Migne, *Patrol. Lat.* vol. 141. See C. Pfister, *De Fulberti Carnotensis episcopi vita et operibus* (Nancy, 1886).

FULCHER OF CHARTRES (1059–c. 1130), French chronicler, was a priest who was present at the council of Clermont in 1095, and accompanied Robert II., duke of Normandy, on the first crusade in 1096. He became chaplain to Baldwin, king of Jerusalem. His *Historia Hierosolymitana* or *Gesta Francorum Jerusalem expugnantium*, one of the most trustworthy sources for the history of the first crusade, covers the period between the council of Clermont and 1127, and the author only details events which he himself had witnessed. It was used by William of Tyre. Fulcher died after 1127, probably at Jerusalem. He has been confused with Foucher of Mongevillier (d. 1171), abbot of St.-Père-en-Vallée at Chartres, and also with another

person of the same name who distinguished himself at the siege of Antioch in 1098.

The *Historia*, in an incomplete form, was first published by J. Bongars in the *Gesta Dei per Francos* (Hanover, 1611). The last edition is by H. Hagenmeyer (Heidelberg, 1913). There is a French translation in t. xxiv. of Guizot's *Collection des mémoires relatifs à l'histoire de France* (1823–35).

See H. von Sybel, *Geschichte des ersten Kreuzzuges* (Leipzig, 1881); and A. Molinier, *Les Sources de l'histoire de France* (1902).

FULDA, a town and episcopal see of Germany, in the Prussian province of Hesse-Nassau, between the Rhön and the Vogel-Gebirge, 60 m. N.E. from Frankfort-on-Main by rail. Pop. (1925) 29,958.

Fulda owes its existence to its abbey, and became a town in 1208. In the middle ages there were many struggles between the abbots and the townsfolk. It came finally into the possession of Prussia in 1866. From 1734 to 1804 Fulda was the seat of a university, and latterly many assemblies of German bishops have been held in the town.

The great Benedictine abbey of Fulda was founded in 744 at the instigation of St. Boniface by his pupil Sturm, who was the first abbot, and became a missionary centre. It was liberally endowed with land and soon became one of the most wealthy establishments of its kind. About 968 the pope declared its abbot the primate of Germany and Gaul, and later he became a prince of the Empire. The school at Fulda was the centre of theological learning in the early middle ages. Among its teachers were Alcuin, Hrabanus Maurus, who was abbot from 822 to 842, and Walafrid Strabo. Early in the 10th century the monastery was reformed by monks from Scotland, but had declined considerably before the Reformation. In 1752 the abbot was raised to the rank of a bishop, and Fulda ranked as a prince-bishopric. This was secularized in 1802. In 1816 the greater part of the principality was ceded by Prussia to Hesse-Cassel, a smaller portion being united with Bavaria. Sharing the fate of Hesse-Cassel, this larger portion was annexed by Prussia in 1866. In 1829 a new bishopric was founded at Fulda.

The present cathedral was built early in the 18th century on the model of St. Peter's at Rome, but it has an ancient crypt, restored in 1892. Opposite the cathedral is the former monastery of St. Michael, now the episcopal palace. The Michaelskirche, attached to it, is a small round church built, in imitation of the Holy Sepulchre, in 822 and restored in 1853. The library, the palace, the former Benedictine nunnery (founded 1625, and now used as a seminary), and the Minorite friary (1238) now used as a warehouse, may be noted. Industries include weaving and dyeing, the manufacture of linen, felt and tapestry. There are also railway works in the town, and trade is in cattle.

FULGENTIUS, SAINT (468–533), bishop of Ruspe, in the province of Byzacene, in north Africa, was born at Telepte. He was well educated and became fiscal procurator, but later took up the monastic life. About the year 500, persecution drove him to Syracuse and Rome. On his return he was made abbot of a small community on an island, and in 508, against his will, was elected bishop of Ruspe. Two years later he was banished, with other African bishops, whom he represented at a disputation before King Thrasimund in 515. On the death of the king in 523, Fulgentius was able to return to Ruspe, where he remained until 532, when he retired to a monastery on the island of Circe, and practised a strict asceticism. He died on Jan. 1, 533. Of his works, which were written against Arianism and Pelagianism, and are penetrated by the thought of St. Augustine, the chief are *Ad Trasimundum regem Vandalorum libri tres*, *De Fide*, *Ad Monimum*, *De Veritate predestinationis et gratiae Dei*, *De remissione peccatorum* and *Contra Arianos*.

The best edition is in Migne, *Patrol. Lat.*, vol. lxx. See also A. Mally, *Das Leben des heiligen Fulgentius* (1885), and O. Bardenhewer, *Patrologie* (Freiburg, 1901).

FULGENTIUS, FABIUS PLACIADIS, Latin grammarian, a native of Africa, flourished in the first half of the 6th (or the last part of the 5th) century A.D. He is to be distinguished from Fulgentius, bishop of Ruspe (468–533), to whom he was probably related, and also from the bishop's pupil and biographer,

Fulgentius Ferrandus. Four extant works are attributed to him. (1) *Mythologiarum libri iii.*, dedicated to a certain Catus, a presbyter of Carthage, containing 75 myths explained in the mystical and allegorical manner of the Stoics and Neoplatonists. As a Christian, Fulgentius sometimes quotes the Bible by the side of the philosophers; (2) *Expositio Vergilianae continentiae* (*continentia* = contents), a sort of appendix to (1), explains the twelve books of the *Aeneid* as a picture of human life. The three words *arma* (= *virtus*), *vir* (= *sapientia*), *primus* (= *princeps*) in the first line represent respectively *substantia corporalis*, *sensualis*, *ormans*. Book i. symbolizes the birth and early childhood of man (the shipwreck of Aeneas denotes the peril of birth), book vi. the plunge into the depths of wisdom. (3) *Expositio sermonum antiquorum*, explanations of 63 rare and obsolete words, supported by quotations (sometimes from authors and works that never existed). It is much inferior to the similar work of Nonius. (4) *Liber absque litteris de aetatibus mundi et hominis*. The ms. heading of this work gives the author's name as Fabius Claudius Gordianus Fulgentius (Claudius is the name of the father, and Gordianus that of the grandfather of the bishop, to whom some attribute the work). The title *Absque litteris* indicates that one letter of the alphabet is omitted in each book (A in bk. i., B in bk. ii.). Only 14 books are preserved. The matter is chiefly taken from sacred history. In addition to these, Fulgentius speaks of early poems in imitation of Anacreon, and of a medical work (*Physiologus*). Fulgentius is a representative of the so-called late African style, taking for his models Apuleius, Tertullian and Martianus Capella.

See the edition of the four works by R. Helm (1898, Teubner series); also M. Zink, *Der Mytholog Fulgentius* (1867); E. Jungmann, "De Fulgentii aetate et scriptis," in *Acta Societatis Philologiae Lipsiensis*, i. (1871); A. Ebert, *Allgemeine Geschichte der Litt. des Mittelalters*, i.; article "Fulgentius" by C. F. Böhr in Ersch and Gruber's *Allgemeine Encyclopädie*; Teuffel-Schwabe, *History of Roman Literature* (Eng. trans.); H. Liebeschütz, *Fulgentius Metaphorals* (1926) on his influence on mediaeval mythology; O. Friebe, *Fulgentius, der Mythograph und Bischof* (Paderborn, 1911), attempts to identify the two on stylistic grounds.

FULGINIAE, an ancient town of Umbria, Italy, on the later line of the Via Flaminia, 15 m. S. of Nuceria. It lay $1\frac{1}{2}$ m. S. of the modern Foligno. It was of comparatively late origin as it had no city walls, but, in imperial times it became important as a junction on the new line of the Via Flaminia. Three miles to the N. was the independent community of Forum Flaminii, the site of which is marked by the church of S. Giovanni Profiamma, at or near which the newer line of the Via Flaminia rejoined the older. It was no doubt founded by the builder of the road, C. Flaminius, consul in 220 B.C. (See FOLIGNO and FLAMINIA, VIA.)

FULGURITE, in petrology the name given to rocks which have been fused on the surface by lightning, and to the characteristic holes in rocks formed by the same agency (from Lat. *fulgur*, lightning). When lightning strikes the naked surfaces of rocks, the sudden rise of temperature may produce a certain amount of fusion, especially when the rocks are dry and the electricity is not readily conducted away. Instances of this have been observed on Ararat and on several mountains in the Alps, Pyrenees, etc. A thin glassy crust, resembling a coat of varnish, is formed; its thickness is usually not more than one-eighth of an inch, and it may be colourless, white, yellow, brown or black.

Another type of fulgurite is commonest in dry sands and takes the shape of vertical tubes which may be nearly half an inch in diameter. Generally they are elliptical in cross section, or flattened by the pressure exerted by the surrounding sand on the fulgurite at a time when it was still very hot and plastic. These tubes are often vertical and may run downwards for several feet through the sand, branching and lessening as they descend. Tubular perforations in hard rocks have been noted also, but these are short and probably follow original cracks. The central cavity of the tube and the bubbles in its walls point to the expansion of the gases (air, water, etc.) in the sand by sudden and extreme heating. Very fine threads of glass project from the surface of the tube as if fused droplets had been projected outwards with considerable force. (J. S. F.)

FULHAM, a western metropolitan borough of London, England, bounded north-west by Hammersmith, north-east by Kensington, east by Chelsea, and south-east, south and south-west by a wide loop of the river Thames. Pop. (1931) 150,940. In the north Fulham includes the residential district known as West Kensington, and farther south that of Walham Green. It lies almost entirely on a low gravel terrace north of the Thames. The lowest part, the riverside district adjoining Chelsea, is liable to flood, and suffered in the floods of Jan. 1928. Chelsea basin is in this part; and there are many wharves along the river front, which is longer than that of any other London borough. The borough has no outstanding industries, but many men are employed on the railways, and there are also motor works, breweries and wallpaper, tobacco, biscuit and pickle factories. The manor house or palace of the bishops of London stands in grounds, beautifully planted and surrounded by a moat, believed to be a Danish work, near the river west of Putney bridge. Its oldest portion is the picturesque western quadrangle, built by Bishop Fitzjames (1506-22). The public recreation grounds include the embankment and gardens between the river and the palace grounds, and there are also two well-known enclosures used for sports within the borough. Of these Hurlingham park is the headquarters of the Hurlingham Polo club and a fashionable resort; and Queen's club, West Kensington, has tennis and other courts for the use of members, and was also the scene of important football matches, and of the athletic meetings between Oxford and Cambridge Universities, and those between the English and American universities held in England. In Seagrave road is the Western fever hospital. The parliamentary boroughs of Fulham east and west each return one member. Area, 1,703.5 ac.

Fulham, or in its earliest form *Fullanham*, is uncertainly stated to signify "the place" either "of fowls" or "of dirt." The manor is said to have been given to Bishop Erkenwald about the year 691 for himself and his successors in the see of London, and Holinshed relates that the bishop of London was lodging in his manor place in 1141 when Geoffrey de Mandeville, riding out from the Tower of London, took him prisoner. There is no record of the first erection of a parish church, but the first known rector was appointed in 1242.

FULK (d. 900), archbishop of Reims, and partisan of Charles the Simple in his struggle with Odo, count of Paris, was elected to the see as archbishop in 883 upon the death of Hincmar. In 887 he was engaged in a struggle with the Normans who invaded his territories. Upon the deposition of Charles the Fat he sided with Charles the Simple in his contest for the West Frankish dominions against Count Odo of Paris, and crowned him king in his own metropolitan church at Reims after most of the nobles had gone over to Odo (893). Upon the death of Odo he succeeded in having Charles recognized as king by a majority of the West Frankish nobility. In 892 he obtained special privileges for his province from Pope Formosus. From 898 until his death he held the office of chancellor, which for some time afterwards was regularly filled by the archbishop of Reims. In his efforts to keep the wealthy abbeys and benefices of the church out of the hands of the nobles, he incurred the hatred of Baldwin, count of Flanders, who secured his assassination on June 17, 900, a crime which the weak Carolingian monarch left unpunished.

Fulk left some letters, which are collected in Migne, *Patrologia Latina*, vol. cxxxi. 11-14.

FULK, king of Jerusalem (b. 1092), was the son of Fulk IV., count of Anjou, and his wife Bertrada (who ultimately deserted her husband and became the mistress of Philip I. of France). He became count of Anjou in 1109, and showed himself a doughty opponent to Henry I. of England, against whom he continually supported Louis VI. of France, until in 1127 Henry won him over by betrothing his daughter Matilda to Fulk's son Geoffrey Plantagenet. Already in 1120 Fulk had visited the Holy Land, and become a close friend of the Templars. On his return he assigned to the order of the Templars an annual subsidy, while he also maintained two knights in the Holy Land for a year. In 1128 he was preparing to return to the East, when he received an embassy

from Baldwin II., king of Jerusalem, who had no male heir to succeed him, offering his daughter Melisinda in marriage, with the right of eventual succession to the kingdom. Fulk accepted the offer; and in 1129 he came and was married to Melisinda, receiving the towns of Acre and Tyre as her dower. In 1131 he became king of Jerusalem. His reign is not marked by any considerable events: the kingdom which had reached its zenith under Baldwin II., and did not begin to decline till the capture of Edessa in the reign of Baldwin III., was quietly prosperous under his rule. In the beginning of his reign he had to act as regent of Antioch, and to provide a husband, Raymund of Poitou, for the infant heiress Constance. But the great problem with which he had to deal was the progress of the atabeg Zengi of Mosul. In 1137 he was beaten near Barin, and escaping into the fort was surrounded and forced to capitulate. A little later, however, he greatly improved his position by strengthening his alliance with the vizier of Damascus, who also had to fear the progress of Zengi (1140); and in this way he was able to capture the fort of Banias, to the north of Lake Tiberias. Fulk also strengthened the kingdom on the south; while his butler, Paganus, planted the fortress of Krak to the south of the Dead Sea, and helped to give the kingdom an access towards the Red Sea, he himself constructed Blanche Garde and other forts on the S.W. to overawe the garrison of Ascalon, which was still held by the Mohammedans, and to clear the road towards Egypt. Twice in Fulk's reign the eastern emperor, John Comnenus, appeared in northern Syria (1137 and 1142); but his coming did not affect the king, who was able to decline politely a visit which the emperor proposed to make to Jerusalem. In 1143 he died, leaving two sons, who both became kings, as Baldwin III. and Amalric I.

Fulk continued the tradition of good statesmanship and sound churchmanship which Baldwin I. and Baldwin II. had begun. Unfortunately he neglected to envisage the needs of the northern principalities, and to head a combined resistance to the rising power of Zengi of Mosul.

His reign in Jerusalem is narrated by R. Röhrich (*Geschichte des Königreichs Jerusalem*, Innsbruck, 1898), and has been made the subject of a monograph by G. Dodu (*De Fulconis Hierosolymitani regno*, Paris, 1894).

(E. B.)

FULK NERRA (c. 970–1040), count of Anjou, eldest son of Count Geoffrey I., "Grisegonelle" (Grey Tunic) and Adela of Vermandois, was born about 970 and succeeded his father in the countship of Anjou on July 21, 987. He was successful in repelling the attacks of the count of Rennes and laying the foundations of the conquest of Touraine (see ANJOU). In this connection he built a great number of strong castles, which has led in modern times to his being called "the great builder." He also founded several religious houses, among them the abbey of Beaulieu, near Loches (c. 1007), of Saint-Nicholas at Angers (1020) and of Ronceray at Angers (1028), and, in order to expiate his crimes of violence, made three pilgrimages to the Holy Land (in 1002–1003, c. 1008 and in 1039). On his return from the third of these journeys he died at Metz in Lorraine on June 21, 1040. By his first marriage, with Elizabeth, daughter of Bouchard le Vénéable, count of Vendôme, he had a daughter, Adela, who married Boon of Nevers and transmitted to her children the countship of Vendôme. Elizabeth having died in 1000, Fulk married Hildegarde of Lorraine, by whom he had a son, Geoffrey Martel (q.v.), and a daughter Ermengarde, who married Geoffrey, count of Gâtinais, and was the mother of Geoffrey "le Barbu" (the Bearded) and of Fulk "le Réchin" (see ANJOU).

See Louis Halphen, *Le Comté d'Anjou au XI^e siècle* (1906). The biography of Fulk Nerra by Alexandre de Salies, *Histoire de Foulques Nerra* (Angers, 1874) is confused and uncritical. A very summary biography is given by Célestin Port, *Dictionnaire historique, géographique et biographique de Maine-et-Loire* (3 vols., Paris-Angers, 1874–78), vol. ii. pp. 189–192, and there is also a sketch in Kate Norgate, *England under the Angevin Kings* (2 vols., 1887), vol. i. ch. iii.

(L. HA.)

FULLER, GEORGE (1822–1884), American figure- and portrait-painter, was born at Deerfield (Mass.), in 1822. At the age of 20 he entered the studio of the sculptor H. K. Brown, at Albany (N.Y.), where he drew from the cast and modelled heads.

Having attained some proficiency he went about the country painting portraits, settling at length in Boston, where he studied the works of the earlier Americans, Stuart, Copley and Allston. After three years in that city, and 12 years in New York, where in 1857 he was elected a member of the National Academy of Design, he went to Europe for a brief visit and for study. During all this time his work had received little recognition and practically no financial encouragement, and on his return he settled on the family farm at Deerfield, where he continued to work in his own way with no thought of the outside world. In 1876, however, he was forced by pressing needs to dispose of his work, and he sent some pictures to a dealer in Boston, where he met with immediate success, financial and artistic, and for the remaining eight years of his life he never lacked patrons. He died in Boston on March 21, 1884. Among his noteworthy canvases are: "The Turkey Pasture," "Romany Girl," "And she was a Witch," "Nydia," "Winifred Dysart" and "The Quadroon."

FULLER, JOHN FREDERICK CHARLES (1878–), British soldier, was born on Sept. 1, 1878, entered the army in 1898, and served in the South African War. In the World War, after holding a variety of staff appointments, he became chief general staff officer of the Tank Corps in April 1917. He had a responsible share in the project for the great tank surprise at Cambrai in Nov. 1917, and in the tank successes later, until in July 1918, he was brought back to the War Office to organize the vast tank expansion then contemplated for 1919, had the war continued. Colonel Fuller was for a time criticized as a tank extremist, an impractical visionary. Abroad, however, his views were acclaimed, by the French general staff, who translated and circulated them throughout their army, as "an exact vision of the future." Gradually, however, his teaching permeated the army. He became in 1922 chief instructor at the Staff College, and in 1926, was appointed military assistant to the new chief of the Imperial General Staff.

The result of his researches into the science of war is incorporated in his *Foundations of a Science of War* (1926), and among numerous other books, his *Tanks in the Great War* (1920), *The Reformation of War* (1923), *Sir John Moore's System of Training* (1925) and *Imperial Defence 1588–1914* (1926) attracted wide attention (see STRATEGY).

FULLER, MARGARET, MARCHIONESS OSSOLI, (1810–1850), American writer, was born at Cambridge (Mass.), May 23, 1810. Unquestionably one of the most brilliant and scholarly of American women, Miss Fuller has been bitterly condemned and extravagantly praised. Of remarkable natural endowments, she was put through such a rigorous training by her father as to make her a "youthful prodigy" and by night "a victim of spectral illusions, nightmare and somnambulism." Soon, however, the great amount of study exacted of her ceased to be a burden, and reading became a habit and a passion. After her father's death in 1835 she went to Boston to teach languages in Alcott's school and in private classes, and in 1837 she was chosen principal teacher in the Green Street school, Providence (Rhode Island), where she remained till 1839. From this year until 1844 she stayed at different places in the immediate neighbourhood of Boston. In 1839 she published a translation of Eckermann's *Conversations with Goethe*, which was followed in 1842 by a translation of the correspondence between Karoline von Günderode and Bettina von Arnim. Aided by R. W. Emerson and George Ripley, she in 1840 started the *Dial*, a poetical and philosophical magazine representing the opinions and aims of the New England Transcendentalists. This journal she continued to edit for two years, and while in Boston she also conducted with remarkable success conversation classes for ladies on philosophical and social subjects, designed "to systematize thought" and to show women how to make the best use of their means "for building up the life of thought upon the life of action." These classes were an important step in the modern movement on behalf of women's rights; still more important was Miss Fuller's *Woman in the Nineteenth Century* (1844), an elaboration of an earlier essay in the *Dial* in which she pleaded with courageous frankness and historical fairness for greater equality between the sexes, particularly recognition of woman's

intellectual needs and capacities. Her *Summer on the Lakes in 1843* (1844) Horace Greeley characterized as "one of the clearest and most graphic delineations ever given of the Great Lakes, of the Prairies, and of the receding barbarism, and the rapidly advancing, but rude, repulsive semi-civilization which were contending with most unequal forces for the possession of those rich lands." In general, however, her writing was inferior to her conversation, which, through its wit, profundity of thought, and breadth and richness of culture, early won her an admiring audience not only from the young collegians, her contemporaries, but from the most distinguished thinkers of her day.

In Dec. 1844 she removed to New York to write literary criticism for the *Tribune*, and in 1846 she published a selection from her articles under the title *Papers on Literature and Art*. The same year she paid a visit to Europe, passing some time in England and France and finally taking up her residence in Italy. There she was married to the Marquis Giovanni Angelo Ossoli, a follower of Mazzini. During 1848-49 she was in Rome, and when the city was besieged she took charge of one of the two hospitals while her husband fought on the walls. In May 1850, along with her husband and infant son, she embarked at Leghorn for America; but when they had all but reached their destination, the vessel was wrecked on Fire Island beach, June 16, and the Ossolis perished. The Marchioness Ossoli's manuscript on the struggle for Italian freedom, with which she had deepest sympathy and which she had unrivalled opportunity to observe, was lost at the same time.

It is regrettable that her somewhat sad life should have been cut off so suddenly; perhaps it is unfortunate, too, in spite of her contributions to the cause of women's freedom, that she should have lived so far in advance of her time. Eccentricities that branded her in the 19th century would pass unnoticed in the 20th. She suffered as much from the adoration of her admirers as from the sneers of her enemies. She was called the high priestess of Transcendentalism, and yet her clear vision unerringly detected the flaws in the Brook Farm scheme. Her incisive intellect, her relentless truthfulness, her impulsive warm-heartedness, all doomed her to disappointments and to misinterpretations contradicted by her journals and letters. Nevertheless, by her high standards and by her familiarity with European literature, she remains an important figure in the history of American culture.

After Margaret Fuller's death her brother, Arthur E. Fuller, republished her works—her *Woman in the Nineteenth Century* and kindred papers in 1855, with an introduction by Horace Greeley; her *Summer on the Lakes* and her European letters, together with an account of her death and with numerous tributes to her, as *At Home and Abroad* (1856); her collected critical essays and "A Rhythmical Translation of Goethe's Tasso" as *Art, Literature and the Drama* (1859). He added *Life Without and Life Within* (1859), a collection of essays, poems, etc. The best biographies are *Memoirs of Margaret Fuller Ossoli*, by R. W. Emerson, W. H. Channing and J. F. Clarke (1852; several times reprinted) and *Margaret Fuller Ossoli* (1884), by T.W. Higginson, which contains a bibliography and which is based largely on unedited material. See also *Margaret Fuller (Marchesa Ossoli)* by Julia Ward Howe (1883), her edition of the *Love Letters of Margaret Fuller, 1845-1846* (1903) and F. A. Braun's *Margaret Fuller and Goethe* (1910). *Margaret Fuller* (1920), by Katharine Anthony, is a rather unconvincing "psychological" biography.

FULLER, MELVILLE WESTON (1833-1910), American jurist, chief justice of the Supreme Court of the U.S., was born at Augusta, Me., on Feb. 11, 1833. After he had graduated at Bowdoin College in 1853 he spent a year at the Harvard Law School, and in 1855 began the practice of law at Augusta. In 1856 he removed to Chicago, Ill., where he continued to practise until 1888. He was a member of the Illinois Constitutional Convention in 1862 and of the State house of representatives from 1863 to 1865. In 1888, by President Cleveland's appointment, he succeeded Morrison R. Waite as chief justice of the Supreme Court of the United States. In 1899 he was appointed by President McKinley a member of the arbitration commission at Paris to settle the Venezuela-British Guiana boundary dispute.

FULLER, THOMAS (1608-1661), English divine and historian, eldest son of Thomas Fuller, rector of Aldwinckle St. Peter's, Northamptonshire, was christened on June 19, 1608. At

13 he was sent to Queen's college, Cambridge, graduating M.A. in 1628. In that year he removed to Sidney Sussex college, and in 1630 was presented by Corpus Christi college to the curacy of St. Benet's, Cambridge. In June of the same year his uncle, John Davenant, bishop of Salisbury, gave him a prebend in Salisbury, where his father, who died in the following year, held a canonry. The rectory of Broadwindsor, Dorsetshire, then in the diocese of Bristol, was his next preferment (1634).

At Broadwindsor he compiled *The Historie of the Holy Warre* (1639), a history of the crusades, and *The Holy State and the Profane State* (1642). This popular work describes the holy state as existing in the family and in public life, gives rules of conduct, model "characters" for the various professions and profane biographies. He was in 1640 elected proctor for Bristol in the convocation of Canterbury, which assembled with the Short Parliament. His first published volume of sermons appeared in 1640 under the title of *Joseph's party-coloured Coat*, which contains many of his conceits. He was not formally dispossessed of his living and prebend on the triumph of the Presbyterian party, but he relinquished both preferments, to become lecturer at the chapel of St. Mary Savoy. Some of the best discourses of the witty preacher were delivered at the Savoy to audiences which extended into the chapel-yard. In one he set forth the hindrances to peace, and urged the signing of petitions in the cause of peace to the king at Oxford, and to the parliament. Fuller was one of a party entrusted to carry the Westminster petition to the king at Oxford. The deputation was turned back (Jan. 4, 1643) at Uxbridge, and the members of the party spent a brief period in gaol. But the petition reached the king by other means, and was published with his reply. In Aug. 1643 Fuller joined the king at Oxford.

The spirit of Fuller's preaching, always characterized by calmness and moderation, gave offence to the high royalists, who charged him with lukewarmness in their cause. To silence unjust censures he became chaplain to the regiment of Sir Ralph Hopton. For the first five years of the war, he had "little list or leisure to write, fearing to be made a history, and shifting daily for my safety. All that time I could not live to study, who did only study to live." After the defeat of Hopton at Cheriton Down, Fuller retreated to Basing House. He took an active part in its defence. In his marches with his regiment round about Oxford and in the west, he collected details from churches, old buildings, and the conversation of ancient gossips, for his *Church-History and Worthies of England*. He compiled in 1645, a small volume of prayers and meditations—the *Good Thoughts in Bad Times*—printed at Exeter, where he remained until the surrender of the city to the parliament in the summer of 1647. Under the Articles of Surrender Fuller made his composition with the Government at London.

In 1647 Fuller began to preach at St. Clement's, Eastcheap, and elsewhere in the capacity of lecturer. At Chelsea he covertly preached a sermon on the death of Charles I., but he did not break with his Roundhead patrons. James Hay, 2nd earl of Carlisle, made him his chaplain, and presented him in 1648 or 1649 to the curacy of Waltham Abbey.

His possession of the living was in jeopardy on the appointment of Cromwell's "Tryers"; but Fuller evaded their inquisitorial questions by his ready wit. He was not disturbed at Waltham in 1655, when the Protector's edict prohibited the adherents of the late king from preaching. Lionel, 3rd earl of Middlesex, who lived at Copt Hall, near Waltham, gave him what remained of the books of the lord treasurer his father; and through the good offices of the marchioness of Hertford, part of his own pillaged library was restored to him. Fuller, thus provided with books, wrote his descriptive geography of the Holy Land, called *A Pisgah-Sight of Palestine* (1650), and his *Church-History of Britain* (1655), from the birth of Jesus Christ until the year 1648. With the *Church-History* was printed *The History of the University of Cambridge since the Conquest and The History of Waltham Abbey*. These works were furthered by his connection with Sion college, London, where he had a chamber, as well for the convenience of the press as of his city lectureships. His last

and best patron was George Berkeley, 1st Earl Berkeley (1628-98), of Cranford house, Middlesex, whose chaplain he was, and who gave him Cranford rectory (1658). His later works are: *An Alarum to the Counties of England and Wales* (1660); *Mixed Contemplations in Better Times* (1660); and *A Panegyrick to His Majesty on his Happy Return* (1660). He resumed his lectures at the Savoy, where Samuel Pepys heard him preach, and became chaplain in extraordinary to Charles II. In the summer of 1661 he visited the west in connection with the business of his prebend, which had been restored to him. On Sunday, Aug. 12, while preaching at the Savoy, he was seized with typhus fever, and died at his new lodgings in Covent Garden on Aug. 16. He was buried in Cranford church. Fuller was twice married; his second wife, Mary Roper, being a sister of Viscount Baltinglass.

Fuller's writings were the product of a highly original mind. He had a fertile imagination and a happy faculty of illustration. Antithetic and axiomatic sentences abound in his pages, embodying literally the wisdom of the many in the wit of one. He was "quaint," and something more. "Wit," said Coleridge, in a well-known eulogy, "was the stuff and substance of Fuller's intellect. It was the element, the earthen base, the material which he worked in; and this very circumstance has defrauded him of his due praise for the practical wisdom of the thoughts, for the beauty and variety of the truths, into which he shaped the stuff. Fuller was incomparably the most sensible, the least prejudiced, great man of an age that boasted a galaxy of great men" (*Literary Remains*, vol. ii. [1836], pp. 389-390). This opinion was formed after reading *The Church History* and the *Worthies of England*. Charles Lamb had a profound admiration for Fuller and made selections from his works.

There is an account of the life and writings of Fuller by William Oldys in the *Biographia Britannica*, vol. iii. (1750), based on Fuller's own works and the anonymous *Life of . . . Dr. Thomas Fuller* (1661; reprinted in a volume of selections by A. L. J. Gosset, 1893). The completest account of him is *The Life of Thomas Fuller, with Notices of his Books, his Kinsmen and his Friends* (1874), by J. E. Bailey, who gives a detailed bibliography (pp. 713-762) of his works. *The Worthies of England* was reprinted by John Nichols (1811) and by P. A. Nuttall (1840). His *Collected Sermons* were edited by J. E. Bailey and W. E. A. Axon in 1891. Fuller's quaint wit lends itself to selection, and there are several modern volumes of extracts from his works.

FULLER'S EARTH, so named from its use by fullers as an absorbent of the grease and oil of cloth, a clay-like substance, which from its variability is somewhat difficult to define. (Ger. *Walkererde*; Fr. *terre à foulon*, *argile smectique*.) In colour it is most often greenish, olive-green or greenish-grey; on weathering it changes to a brown tint or it may bleach. As a rule it falls to pieces when placed in water and is not markedly plastic; when dry it adheres strongly to the tongue; since, however, these properties are possessed by many clays that do not exhibit detergent qualities, the only test of value lies in the capacity to absorb grease or clarify oil. Fuller's earth has a specific gravity of 1.7-2.4, and a shining streak; it is usually unctuous to the touch. Microscopically, it consists of minute irregular-shaped particles of a mineral that appears to be the result of a chloritic or talcose alteration of a felspar. The small size of most of the grains (less than .07 mm.) makes their determination almost impossible. Chemical analysis shows that the peculiar properties of this earth are due to its physical rather than its chemical nature.

The following analyses of the weathered and unweathered condition of the earth from Nutfield, Surrey, represent the composition of one of the best known varieties:

Blue Earth (dried at 100° C.)			
Insoluble residue	69.96	Insoluble residue	
Fe ₂ O ₃	2.48	SiO ₂	62.81
Al ₂ O ₃	3.46	Al ₂ O ₃	3.46
CaO	5.87	Fe ₂ O ₃	1.30
MgO	1.41	CaO	1.53
P ₂ O ₅	0.27	MgO	0.86
SO ₃	0.05		69.96
NaCl	0.05		
K ₂ O	0.74		
H ₂ O (combined)	15.57		
	99.86		

Yellow Earth (dried at 100° C.)

Insoluble residue	76.13	Insoluble residue	
Fe ₂ O ₃	2.41	SiO ₂	59.37
Al ₂ O ₃	1.77	Al ₂ O ₃	10.05
CaO	4.31	Fe ₂ O ₃	3.86
MgO	1.05	CaO	1.86
P ₂ O ₅	0.14	MgO	1.04
SO ₃	0.07		76.18
NaCl	0.14		
K ₂ O	0.84		
H ₂ O (combined)	13.19		
	100.05		

(Analysis by P. G. Sanford *Geol. Mag.*, 1889, 6, pp. 456-526.)

Of other published analyses, not a few show a lower silica content (44%, 50%), along with a higher proportion of alumina (11%, 23%).

Fuller's earth may occur on any geological horizon, at Nutfield in Surrey, England, it is in the Cretaceous formations; at Midford near Bath it is of Jurassic age; at Bala, North Wales, it occurs in Ordovician strata; in Saxony it appears to be the decomposition product of a diabasic rock. In America it is found in California in rocks ranging from Cretaceous to Pleistocene age; in South Dakota, Custer county and elsewhere a yellow, gritty earth of Jurassic age is worked; in Florida and Georgia occurs a brittle, whitish earth of Oligocene age. Other deposits are worked in Arkansas, Texas, Colorado, Massachusetts and South Carolina.

Fuller's earth is either mined or dug in the open according to local circumstances. It is then dried in the sun or by artificial heat and transported in small lumps in sacks. In other cases it is ground to a fine powder after being dried; or it is first roughly ground and made into a slurry with water, which is allowed to carry off the finer from the coarser particles and deposit them in a creamy state in suitable tanks. After consolidation this fine material is dried artificially on drying floors, broken into lumps, and packed for transport. The use of fuller's earth for cleansing wool and cloth has greatly decreased, but the demand for the material is as great or greater than it ever was. It is now used very largely in the filtration of mineral oils, and also for decolorizing certain vegetable oils. It is employed in the formation of certain soaps, cleansing preparations, pigments for wall-papers, and the finest grade is utilised in toilet requisites.

The name "Fuller's Earth" is applied to a subdivision of the Jurassic rocks of south-west England (*see JURASSIC SYSTEM*).

(J. A. H.)

FULLERTON, LADY GEORGIANA CHARLOTTE (1812-1885), English novelist and philanthropist, youngest daughter of the 1st Earl Granville, was born at Tixall Hall, Staffordshire. In 1833 she married Alexander George Fullerton, then an Irish officer in the Guards. In 1844 she published her first novel, *Ellen Middleton*. In 1846 she entered the Roman Catholic Church. In 1856 she became one of the third order of St. Francis, and thenceforward devoted herself to charitable work. She died at Bournemouth on Jan. 19, 1885. Among her other novels were *Grantley Manor* (1847), *Lady Bird* (1852) and *Too Strange not to be True* (1864).

See Mrs. A. Craven, Lady G. Fullerton, sa vie et ses oeuvres (1888); C. M. Yonge, *Lady Georgiana Fullerton* (1897).

FULLERTON, a city of Orange county, Calif., U.S.A., 30m. S.E. of Los Angeles; served by the Pacific Electric, the Santa Fe, the Southern Pacific and the Union Pacific railways. The population was 4,415 in 1920, and was 10,860 in 1930 by the Federal census. Walnuts and fruits are grown, and large quantities of crude oil are shipped. There are producing wells within the city limits. The city was incorporated in 1904.

FULMAR, the name of several species of petrels, *Fulmarus glacialis*, one of the largest petrels (*Procellariidae*) of the Northern Hemisphere, is about the size of the common gull (*Larus canus*) and not unlike it in coloration, except that its primaries are grey instead of black. The bird ranges over the North Atlantic. In the Pacific it is represented by *F. glupischa*. In the British Isles, the fulmar breeds in St. Kilda and Skye, but has rapidly extended its breeding area in recent years. Its range towards the Pole seems to be bounded only by open water. By

British seamen it is called the "molly mawk" (corrupted from *Mallemuck*). It only visits land to deposit its single white egg, which is laid on a rocky ledge, in a shallow nest lined with a little dried grass. Many of its breeding-places are valuable property to those who live near them and take the eggs and young. The oil from the young has been found to possess the same qualities as cod-liver oil. However, it has a strong scent, which is retained by an egg or skin of the bird for years. The bird, when seized, ejects this oil from its mouth. In courtship, the male and female simultaneously display the mauve lining of the mouth. The giant fulmar (*Macronectes gigantea*) of the southern Pacific sometimes reaches Oregon. It has a wing-spread of seven feet.

FULMINIC ACID, a volatile explosive liquid, $C:NOH$, having an odour of prussic acid, has not been obtained in a state of purity. It is set free from sodium or potassium fulminate by dilute sulphuric acid followed by extraction with ether. The chemical constitution of fulminic acid and its salts has long been a matter of controversy among chemists, although the general consensus of opinion favours the view epitomized by the foregoing chemical formula which represents the acid as carbyloxime (carbonyloxime) or the oxime (*q.v.*) of carbon monoxide. Accordingly fulminic acid belongs to the small group of organic substances regarded as containing bivalent carbon. The best known fulminates are those of mercury and silver. The preparation of the former is described under MERCURY, FULMINATE OF; the latter is produced similarly by adding ethyl alcohol to a nitric acid solution of silver nitrate. The liquid is gently heated until frothing occurs and when the vigorous reaction has subsided, silver fulminate, $C:NOAg$, separates in opaque white needles which are sparingly soluble in water. This salt is an extremely dangerous compound since it detonates even more violently than the mercury compound. Cadmium, cuprous and thallous fulminates have been prepared (L. Wöhler and Martin, 1917); they are all violently explosive.

The production of fulminate from ethyl alcohol, acetaldehyde and similar two-carbon compounds supported the older view that fulminic acid and its salts also contained two carbon atoms in the molecule ($C_2H_2O_2N_2$), but this hypothesis was disproved completely by J. U. Nef (1894) who prepared fulminates from organic compounds containing only one carbon atom. For example, he obtained mercuric fulminate by the interaction of mercuric chloride and sodium nitromethane, $CH_3:NO.ONa$. Another neat synthesis of metallic fulminates from a one-carbon compound was discovered by H. Wieland (1907): on warming methylnitrolic acid, $NO_2CH:NOH$, with excess of silver nitrate in dilute nitric acid silver fulminate separates in considerable yield. The synthesis of benzaldoxime from benzene and mercuric fulminate in presence of hydrated aluminium chloride (R. Scholl, 1899) is corroborative evidence in favour of the carbyloxime structure of fulminic acid. Further confirmation is afforded by the physico-chemical evidence adduced by L. Wöhler (1905) who, by the freezing-point method, found that in decinormal aqueous solution, sodium fulminate had an apparent molecular weight of 34.9; this corresponds with the molecular weight of undissociated $C:NONa$, divided by the dissociation factor (1.85) generally observed for sodium salts of monobasic acids. This result excludes the dimeric formula, $C_2N_2O_2Na_2$. *Fulminuric Acid*, $C_2H_2O_2N_2$, colourless prisms soluble in water and deflagrating at $145^\circ C$, is obtained through its ammonium salt by boiling mercuric fulminate with an aqueous solution of ammonium chloride. *Metafulminic Acid*, containing water ($2H_2O$) and melting at $85-86^\circ C$, and at $102^\circ C$ when anhydrous, is formed by the spontaneous polymerization of fulminic acid.

See "Fulminic and Fulminuric Acids," Thorpe's *Dictionary of Applied Chemistry*, vol. iii., p. 280 (1922).

FULTON, ROBERT (1765-1815), American engineer, was born in 1765 in Little Britain (now Fulton, Lancaster county), Pa. At an early age he was bound apprentice to a jeweller in Philadelphia, but subsequently adopted portrait and landscape painting as his profession. In 1787 with the object of studying with his countryman, Benjamin West, he went to England, and there became acquainted with the duke of Bridgewater, Earl

Stanhope and James Watt. Partly by their influence he was led to devote his attention to engineering. He obtained an English patent in 1794 for superseding canal locks by inclined planes, and in 1796 he published a *Treatise on the Improvement of Canal Navigation*. He then took up his residence in Paris, where he projected the first panorama ever exhibited in that city, and constructed a submarine boat, the "Nautilus." It was at Paris also in 1803 that he first succeeded in propelling a boat by steam-power. Returning to America he continued his experiments with submarine explosives, but failed to convince either the English, French or United States Governments of the adequacy of his methods. With steam navigation he had more success. In association with Robert R. Livingston (*q.v.*) he constructed the "Clermont," which, engined by Boulton and Watt of Birmingham, began to ply on the Hudson between New York and Albany in 1807. By an act passed in 1808 the navigation monopoly was secured to them and their associates for a period depending on the number of steamers constructed, but limited to a maximum of 30 years. In 1814-15, on behalf of the United States Government, he constructed the "Fulton," a vessel of 38 tons with central paddle-wheels, which was the first steam warship. He died at New York on Feb. 24, 1815. Among Fulton's inventions were machines for spinning flax, for making ropes, and for sawing and polishing marble.

See C. D. Colden, *Life of Robert Fulton* (1817); Robert H. Thurston, *History of the Growth of the Steam-Engine* (1878); George H. Preble, *Chronological History of Steam Navigation* (Philadelphia, 1883); and Mrs. A. C. Sutcliffe, *Robert Fulton and the Clermont* (1909).

FULTON, a city of Missouri, U.S.A., 25m. N.E. of Jefferson City, on Federal highway 54 and the Chicago and Alton railroad; the county seat of Callaway county. The population was 5,595 in 1920; 1930, 6,105. Cattle, mules, grain and hay are raised in the region, and there are coal mines and mineral springs near the city. The principal manufactures are fire-brick and shoes. Fulton is the seat of Westminster college for men (Presbyterian), founded in 1849 as Fulton college; Synodical college (Presbyterian, 1871) and William Woods college (Christian, 1890), both for women; a State school for the deaf (1851); and the oldest State hospital for the insane in Missouri (1847). The town was laid out in 1825 and named Volney, but was re-named a little later in honour of Robert Fulton. It was incorporated in 1859.

FULTON, a city of Oswego county, New York, U.S.A., on the Oswego river and canal, 12m. from Lake Ontario. It is served by the Lackawanna, the New York Central, and the New York, Ontario and Western railways. The population was 13,043 in 1920; 1930 it was 12,462. Ample water-power is furnished by the river, and the manufactures are numerous and varied, including paper, aluminium goods, cutlery and chocolate candy, with an aggregate output in 1927 valued at \$21,357,454. On July 3, 1756, on an island 4m. N. of Fulton, an attacking force of 700 French and Indians under De Villiers was defeated by 300 British under Capt. John Bradstreet, who soon afterwards built a fort within the present limits of the city. Settlement by civilians began in 1793. The village was named after Robert Fulton. It was incorporated in 1835, and in 1902, combined with Oswego Falls, was chartered as a city.

FUMARIC AND MALEIC ACIDS, unsaturated organic acids $C_4H_4O_4$ showing stereoisomerism. Fumaric acid is found in fumitory (*Fumaria officinalis*), various fungi (*Agaricus piperatus*, etc.) and Iceland moss. It is obtained by heating malic acid alone to $150^\circ C$, or by heating it with hydrochloric acid or hydrobromic acid. It may also be obtained by boiling monobromosuccinic acid with water, and by heating maleic acid to $210^\circ C$. It crystallizes in small prisms or needles, and is practically insoluble in cold water. It sublimes to some extent at about $200^\circ C$, being partially converted into maleic anhydride and water, the reaction becoming practically quantitative if dehydrating agents be used. Potassium permanganate oxidizes it to racemic acid (see TARTARIC ACID).

Maleic acid is obtained by distilling malic or fumaric acids, or by heating fumaric acid with acetyl chloride to $100^\circ C$. It crystallizes in monoclinic prisms, which are easily soluble in water,

melt at 130° C. and boil at 160° C. decomposing into water and maleic anhydride. When heated with concentrated hydrobromic or hydriodic acid, it is converted into fumaric acid. Oxidation converts it into mesotartaric acid. Maleic anhydride is obtained by distilling fumaric acid with phosphoric oxide. It forms triclinic crystals which melt at 60° C. and boil at 196° C. On a manufacturing scale maleic anhydride is prepared by aerial oxidation of benzene vapour with a vanadium pentoxide catalyst. This preparation of the anhydride from benzene, a cyclic compound, affords additional confirmation of the *cis*-configuration assigned to maleic acid. Both acids yield acetylene by the electrolysis of aqueous solutions of their alkali salts, and on reduction both yield succinic acid, whilst by addition of hydrobromic acid they both yield monobromosuccinic acid. From these results it follows that the two acids are structurally identical, the isomerism being due to differences in the spatial arrangement of their constituent atoms (*see* STEREOCHEMISTRY), thus:

The foregoing formulae account for maleic acid readily yielding an anhydride, whereas fumaric acid does not, and for the behaviour of the acids towards bromine, fumaric acid yielding ordinary dibromosuccinic acid, and maleic acid the isomeric isodibromosuccinic acid.

FUMAROLE, a vent from which volcanic vapours issue, named indirectly from Lat. *fumariolum*, a smoke-hole. The vapours from fumaroles were studied first by R. W. Bunsen in Iceland, and afterwards by H. Sainte-Claire Deville and other chemists and geologists in France, who examined the vapours from Santorin, Etna, etc. The hottest vapours issue from dry fumaroles, at temperatures of at least 500° C. and consist chiefly of anhydrous chlorides, notably sodium chloride. The acid fumaroles yield vapours of lower temperature (300° to 400°) containing much water vapour, with hydrogen chloride and sulphur dioxide. The alkaline fumaroles are still cooler, though above 100°, and evolve ammonium chloride with other vapours. Cold fumaroles, below 100°, discharge principally aqueous vapour, with carbon dioxide, and perhaps hydrogen sulphide. The fumaroles of Mont Pelée in Martinique during the eruption of 1902 were examined by A. Lacroix, and the vapours analysed by H. Moissan, who found that they consisted chiefly of water vapour, with hydrogen chloride, sulphur, carbon dioxide, carbon monoxide, methane, hydrogen, nitrogen, oxygen and argon, issuing at a temperature of about 400°. (*See* VOLCANO.)

FUME PRECIPITATION, ELECTRICAL. The precipitation of smoke by electricity was described in 1824 by Hohl-feld, a teacher of mathematics in Leipzig, but only after it was independently rediscovered and critically studied by Sir Oliver Lodge about 1884 did it attract general attention and lead to attempts at industrial applications. At the time, however, these proved unsuccessful due to the lack of modern equipment. It was not until 1906, following experiments at the University of California, that the process was commercially successful.

The first installation was at the Selby Smelting Works, near San Francisco, where it was used for the removal of sulphuric acid mist from about 5,000cu.ft. of gases per minute. By 1910 a plant to remove dry dust and fume from 250,000cu.ft. of gas per min. was built at another smelter, and in 1912 the process was successfully extended to the removal of cement dust at nearly a red heat from 1,000,000cu.ft. of gas per min. at the Riverside Portland Cement Company, a mill of 2,500bbls. daily capacity, in the heart of the Californian orange groves, threatened with legal closure as a nuisance because of the dust emitted.

The method removed 98% of the dust, the daily catch being about 100 tons, and equivalent after 13 years to a fully loaded freight train 100 miles long. Although first applied purely to mitigate nuisances, the demand for the process to-day is primarily based on a greater profit to be derived from the gases cleaned or the material removed. At one time during the World War, the Riverside plant was making even more profit from potash incidentally recovered in its dust than from its cement.

Research Corporation.—Another circumstance aiding the development through friendly public interest was the creation in 1912, under the auspices of the Smithsonian Institution, of the Research Corp. in New York city, to hold and administer as an endowment for research most of the United States patent rights to the process. The corporation besides supervising construction and development of this particular process, also serves in

FROM SMITHSONIAN REPORT, 1913
THE ESSENTIAL EQUIPMENT CONSISTS OF ELECTRICAL CURRENT SUPPLY LINES, TRANSFORMER, AT BOTTOM RIGHT, ROTARY RECTIFIER, ABOVE, AND TREATER, AT LEFT

general as a clearing house for information and as an intermediary and trustee between inventors, the industries and the public.

The Process.—Technically the process consists in securing a uniform, copious but non-disruptive discharge of electricity from small electrode surfaces of one polarity into a stream of cloudy gas. The fine solid or liquid particles composing the dust, fume or smoke are immediately attracted to, and deposited on, large electrode surfaces of opposite polarity, the particles having become charged from the condensation on their surfaces of a portion of the electricity passing between the electrodes. The process is diagrammatically illustrated here. Alternating current from service lines is stepped up in a transformer to a high voltage and then converted to a direct, or rather a pulsating unidirectional, current by a commutator or "rectifier" driven by a synchronous motor. One side of the line is grounded and connected to a pipe or "treater" carrying the fume-laden gases. This pipe serves as the collecting electrode. The other side of the line terminates in a wire serving as the discharge electrode, which is hung axially within the pipe. Voltage is regulated to secure as strong a glow as corona discharge from the wire electrode as possible without passing over into a disruptive discharge, *i.e.*, a spark or arc. This adjustment is easier when the discharge electrode is the negative, though either polarity may be used.

The gas treaters now in general use consist either of a multiplicity of pipes similar to that in the figure, or of plates hung

vertically in a flue, the wires being stretched parallel between them. The materials of construction, including the collecting electrodes, vary from iron and lead to reinforced concrete and vitrified earthenware, depending on the composition and temperature of the gas stream to be treated.

Factors in Design.—Most plants are designed with electrodes of opposite sign 2 to 6 in. apart and operating at 30,000 to 80,000 volts. The size of installation is determined primarily by the volume of gas to be treated and the percentage of suspended matter to be removed; the amount, kind and size of particle of the latter being of minor importance. If P is the ratio of out-going to incoming suspended matter, t the average time in seconds that the gas remains between the electrodes, and K , a constant depending upon the apparatus, voltage, temperature and kind of raw gas, then $P = Kt^t$. In most commercial practice t averages about 2 seconds and K varies from 0.2 to 0.7, the gases travelling from 10 to 40 ft. through the electric field at linear rates of 3 to 15 ft. per second. Removal of 90% to 99% of the suspended matter is usually aimed at, and the energy required is 1 to 3 kw. hours per 10,000 cu. ft. of gas treated.

Industrial Uses.—The earliest applications of the process were to the smelting and sulphuric acid industries. Installations in such plants in 1926 still outnumbered those in all other industries, and amounted to several hundred scattered throughout the world. Equipments at cement mills were fewer in number but handled a large volume of gas and a large tonnage of precipitate. Other important applications are to the detarring of coke-oven gases, the cleaning of producer and iron blast-furnace gas, the cleaning of ventilating air in crushing, grinding and polishing mills (especially where cost of heating in winter makes recirculation of air important), the recovery of sludge acid fumes in petroleum refineries, the recovery of dust from brown-coal dryers, and the removal of ash from the stack gases of large power-plants burning powdered coal. On a laboratory scale the process has also been applied successfully to sanitary atmospheric analysis and to gas masks, including the removal of bacteria from air.

FUMIGATION, the process of producing smoke or fumes, as by burning sulphur, frankincense, tobacco, etc., whether as a ceremony of incantation, or for perfuming a room, or for purposes of disinfection or destruction of vermin. In medicine the term has been used of the exposure of the body, or a portion of it, to fumes such as those of nitre, sal ammoniac, mercury, etc.; fumigation by the injection of tobacco smoke into the great bowel, was a recognized procedure in the 18th century for the resuscitation of the apparently drowned. "Fumigated" or "fumed" oak is oak which has been darkened by exposure to ammonia vapour.

FUMITORY, in botany, the popular name for the British species of *Fumaria*, a genus of small, branched, often climbing

annual herbs with much-divided leaves and racemes of small flowers. It is included in the family Fumariaceae. The flowers are tubular with a spurred base, and in the British species are pink to purplish in colour. They are weeds of cultivation growing in fields and waste places. *F. capreolata* climbs by means of twisting petioles. In past times fumitury was in esteem for its reputed medicinal properties; and in England, boiled in water, milk or whey, it was used as a cosmetic. The root of the allied species (*Corydalis tuberosa*) is known as *radix aristolochia*, and has been used medicinally for various cutaneous and other disorders, in doses of 10 to 30 grains. Some 11 alkaloids have been isolated from it. The herbage of *Fumaria officinalis* and *F. racemosa* is used in China as an application for glandular swellings, carbuncles and abscesses, and was formerly valued in jaundice.

The climbing fumitury or Alleghany-vine (*Adlumia fungosa*), native to moist woods in the north-eastern United States, with delicate flowers and foliage, is cultivated as an ornamental vine.

FUNCHAL, the administrative centre of the Portuguese archipelago of the Madeiras; on the south coast of Madeira, in 32° 37' N. and 16° 54' W. Pop. (1920) 20,844. Its white-washed houses, in their gardens full of tropical plants, are built along the curving shore of Funchal bay, and on the lower slopes of an amphitheatre of mountains, which form a background 4,000 ft. high. Numerous country houses (*quintas*), with terraced gardens, vineyards and sugar-cane plantations occupy the surrounding heights. The chief buildings include the cathedral, Anglican and Presbyterian churches, hospitals, opera-house, museum and casino. In the steep and narrow streets, which are lighted by electricity, wheeled traffic is impossible; sledges drawn by oxen and other primitive conveyances are used instead (see MADEIRA). In winter the fine climate and scenery attract numerous invalids and other visitors; many foreigners engaged in the coal and wine trades also reside here permanently. The British community was first established here in the 18th century. Funchal is the headquarters of Madeiran industry and commerce (see MADEIRA). Funchal is connected by cable with Carcavellos (for Lisbon), Porthcurnow (for Falmouth, England) and St. Vincent in the Cape Verde islands (for Pernambuco, Brazil).

FUNCTION, in mathematics, a variable whose values are determined by those of one or more other variables. The word *variable* here denotes a symbol which stands for any one of a class of things called *values* of the variable. Although the terms thus defined apply to other entities as well as to numbers, the mathematical theory of functions is in the main concerned with variables whose values are numbers. If y and x are two such variables, and if to each value of x corresponds one value of y and only one, then y is said to be a *single-valued function* of x . The functional relation is expressed by the equation $y = f(x)$, in which the symbol f may be replaced by some other letter. Here x is said to be the *independent variable*, and y the *dependent variable*. If more than one value of y corresponds to a value of x , the variable y is a *many-valued function* of x .

The set of values assigned to a variable is called the *domain* of that variable, and a theory of functions must rest on precise notions about domains. One of its goals should be a classification of functions with respect to their properties in given domains. As with the natural sciences, however, a mere taxonomy based on the presence or absence of distinctive traits cannot be the sole objective. These traits, the processes connected with them, and their consequences are the matters of greatest interest. In the general subdivision of mathematics styled *analysis* (*q.v.*) the rôle of the theory of functions consists in a critical examination of the validity of analytical processes. It is concerned mainly with the idea of a limit, and with the consequences of that notion, upon which the infinitesimal calculus is based.

If the domains of both dependent and independent variables consist of real numbers only, the corresponding function is a *real function of a real variable* (or variables). If the independent variable has complex values (*i.e.*, numbers of the form $a + b\sqrt{-1}$ where a and b are real) we have a *function of a complex variable*. The theory of such functions is equivalent to that of pairs of

real functions of two real variables. Historically, however, much of the theory of functions of a complex variable has been otherwise developed, and its field has included topics analogous to those whose treatment for real variables is considered as lying in the province of the infinitesimal calculus, rather than in that of a general theory of functions.

I. FUNCTIONS OF REAL VARIABLES

1. **The Development of the Theory of Functions** goes back to Descartes' publication of his work on analytic geometry (1637). The abscissas x and ordinates y of a plane curve are variables; the curve pictures the dependence of the one on the other. The word function seems first to have been used in such a sense by Leibniz (1694), who thus denoted certain lengths such as abscissas, ordinates, tangents, normals, radii of curvature, associated with the position of a point on a curve. J. Bernoulli (1698) applied the term to mathematical expressions involving variables and constants. The notation $f(x)$ was used by L. Euler in 1734. His *Introductio in Analysin Infinitorum* (1748) may be regarded as the first treatise on the theory of functions, although its point of view would now be described as elementary and formal. As in the definition of Bernoulli, a function is identified with its analytic expression and according to the form of this expression it is classified as explicit or implicit, algebraic or transcendental.

The eighteenth century was a constructive period in mathematics, an epoch of discovery, when scientific accuracy played a subordinate rôle. The first part of the nineteenth century ushered in the present era of criticism. The *Théorie des fonctions analytiques* of J. L. Lagrange (1797) was a precursor of this change. Better foundations were here sought by basing the processes of the calculus on the properties of series of powers of the independent variable. Analytic expressions were still of central interest, but soon a new point of view was forced upon mathematicians by the discovery of J. B. J. Fourier (1807) that a single analytic expression, a trigonometric series, may represent, in different domains, what had been regarded as different functions. It was believed at first that an arbitrary function could be represented by a series of Fourier. When it appeared that there were necessary restrictions, the way was open to a treatment of functions based on their intrinsic properties. In connection with his proof of the convergence of Fourier series (1829) P. G. Lejeune-Dirichlet gave essentially the definition of a function that appears at the head of this article (*Werke*, vol. 1, p. 135).

Among the founders of the modern theory of functions, both real and complex, three are pre-eminent, A. L. Cauchy (1789–1857), G. F. B. Riemann (1826–66), and K. Weierstrass (1815–97). To the latter is especially due the *arithmetization* of the subject, whereby all definitions are based on equalities and inequalities concerning numbers, and geometrical notions are avoided. The theory of aggregates (*q.v.*), which furnishes a necessary foundation for ideas regarding domains, and which arose from the investigations of G. Cantor (1845–1918), has become one of the most important adjuncts of the theory of functions. Its development has been connected with recent generalizations of the notion of integration by H. Lebesgue (1902) and others.

2. **The Real Variable and its Domain.**—The domain of a real variable is a set of real numbers, which may be positive or negative integers, rational numbers (fractions) or irrationals. In accordance with a fundamental postulate, such sets may be put into one-to-one correspondence with points on a line-segment, hence the point thus associated with a number is often substituted for it in the terminology of the subject. Domains are then referred to as *point sets* (*q.v.*), and the domain of a single variable is said to be a *linear point set* or *aggregate*. Since in most cases the domain of a variable is an infinite set of numbers, a general theory of such aggregates and of their properties is fundamental. We shall not here attempt to describe that theory, for an account of which the reader is referred to the article on NUMBER.

The most important domains for a real variable x are *intervals* consisting of all real numbers between given numbers a and b , or, in geometric language, of all points on an x axis between the point $x=a$ and the point $x=b$. Such an interval is denoted

by the symbol $[a, b]$. It is *closed* if it includes the values $x=a$ and $x=b$, and is *open* if it does not include them. A *neighbourhood* of a point x' is an interval which includes that point. A domain has an *upper bound* if its numbers are all less than a fixed number N ; it has a *lower bound* if its numbers are all greater than a fixed number M ; when one of these bounds does not exist, the domain is said to be *unbounded* or *unlimited* in that sense. For functions of more than one variable (*see* § 8 below), the notion of *region* corresponds to that of interval for a single variable.

A point x' is a *limit point* of a domain if in every neighbourhood of that point there is a point of the domain other than x' ; the point x' may or may not itself belong to the domain. Every bounded set of points whose number is infinite has at least one limit point, but this is not true, for example, of the set of all positive integers, which has no upper bound. This set is, however, said to have the limit $+\infty$ (positive infinity) and similarly a set without a lower bound has the limit $-\infty$.

A function is defined when, in addition to specifying the domain of the independent variable x , we give a rule which will serve to compute the corresponding values of the dependent variable y . Such a rule may be, and commonly is, given by an analytic expression in x whose value for each x of the given domain is to be taken as the value of y ; or different expressions may serve for different parts of the domain of x . Such expressions *represent* the function for the corresponding values of x .

We shall now consider some of the basic notions of the theory of functions of a real variable. To supplement this necessarily brief introduction to the subject, the reader should consult the authorities cited at the end.

3. **Upper and Lower Bounds: Limits.**—For a given function $y=f(x)$ defined on a given domain of values of x , the values of y also form a domain. If these values have an upper or a lower bound the same is said to be true of the function. In particular, if a function defined for a given domain of x has an upper bound, it has a *least upper bound* which is either, (1) a value of y not exceeded by any other value of y , but not a limit point of the y domain, or (2) a limit point for the values of y which is not exceeded by any of those values, but which may or may not itself be a value of y . In case (2) the least upper bound is the *upper limit* of the function, *i.e.*, the least upper bound of the limit points of y . In these definitions, whose extension to lower bounds is obvious, we may restrict the domain of x to a part of the total domain of definition of the function. As an illustration of these terms it is to be noted that the function represented by the expression x^2 has for its least upper bound, which is also the upper limit, on the open interval $[0, 1]$ of the x axis the value $y=1$, but this value is not attained by the function on that interval, since the end-point $x=1$ is not included. The difference between the least upper bound and the greatest lower bound of a function in a domain is called the *oscillation* or *fluctuation* of the function for that domain.

In order to describe the variation of a function on a given domain, we style $f(x)$ *monotonic increasing* if for every sequence of increasing x values the corresponding values of $f(x)$ always increase; similarly a function is *monotonic decreasing* if its values decrease as x increases. The least upper and greatest lower bounds of such functions correspond to end values or limits of the x domain. *Oscillating functions* are non-monotonic; an important class, those of *limited variation*, is composed of functions representable as differences of monotonic functions.

The properties specified so far are related to the behaviour of a function throughout a domain. The most important notion connected with the neighbourhood of a point, $x=X$, is that of the *limit* of $f(x)$ as x approaches X . We suppose $f(x)$ a single-valued function on a domain for which X is a limit point, but of which X is not necessarily a member. By a δ -neighbourhood of X we designate all x 's of the domain, except X itself, that lie between $X-\delta$ and $X+\delta$. Let ϵ be the fluctuation of $f(x)$ on a δ -neighbourhood of X . If ϵ can be made arbitrarily small by making δ a sufficiently small positive number, $f(x)$ is said to approach a limit as x approaches X . It can be proved that there then exists a number L such that no matter what positive

number ϵ is preassigned the numerical value of $f(x) - L$ is less than ϵ for all values of x in a δ -neighbourhood of X . This number L is the limit of $f(x)$ as x approaches X , a relation whose symbolic expression is $\lim_{x \rightarrow X} f(x) = L$.

The definition of a limit is extended to unbounded domains, with the notation $\lim_{x \rightarrow +\infty} f(x) = L$, if for every positive number ϵ a number N exists such that the numerical value of $f(x) - L$ is less than ϵ for all values in the domain of x that are greater than N . There are similar definitions for a limit as x becomes negatively infinite, and for a function's becoming positively or negatively infinite. The *sum of an infinite series* furnishes an important application of these definitions. Consider, for example, the series $\frac{1}{2} + \frac{1}{4} + \dots + \frac{1}{2^n} + \dots$, of which the sum of n terms is $s_n = \frac{1}{2} + \frac{1}{4} + \dots + \frac{1}{2^n} = 1 - \frac{1}{2^n}$, a function of the real variable n on the domain of all positive integers, $n = 1, 2, 3, \dots$. The numerical difference of s_n and 1 is $\frac{1}{2^n}$, and this can be made less than any preassigned positive number ϵ for all values of n greater than any positive number N for which $\frac{1}{2^N}$ is less than ϵ . Thus $\lim_{n \rightarrow \infty} s_n = 1$, and this limit is, by definition, the *sum* or *value* of the series.

Various extensions of the notion of limit play a considerable rôle in the modern theory of functions. For example, although $f(x)$ may not have a limit as x approaches X when *all* values of the domain are considered, there may be partial domains for which a limit exists. In fact it can be proved that if X is a limit point of a domain, then there is always at least one set of values belonging to this domain on which $f(x)$ either approaches a limit or becomes infinite as x approaches X . Restricted domains of especial interest are those whose values are all greater than X , or all less than X . For a domain of the former sort, for example, we write $\lim_{x \rightarrow X+0} f(x) = L$, or $f(X+0) = L$. If $f(x)$ is bounded and monotonic on such a domain, $f(X+0)$ always exists.

4. Continuity.—It is to be noted that in the definition of a limit we have not assumed that L is the value of $f(x)$ for $x = X$, or even that $f(X)$ exists. A function defined on an interval $[a, b]$ including the point X is *continuous* at X if it has the limit $f(X)$ as x approaches X on the interval. An extension of this definition styles $f(x)$ *continuous on the right* at X if $f(X+0) = f(X)$; we similarly describe continuity on the left. A function is *continuous throughout an interval* $[a, b]$ if it is continuous at every point of the interval. If $[a, b]$ is closed, it is here implied that $f(a) = f(a+0)$, and $f(b) = f(b-0)$.

Sums, differences, products and quotients of functions continuous on an interval are also continuous there, with the exception that a quotient may not be continuous for values which make its denominator equal to zero. More generally, it may be stated that every function of a continuous function is continuous in the sense that if $f(x)$ is continuous at X , and if $F(y)$ is defined throughout a neighbourhood of $y = f(X)$ and is continuous at $f(X)$, then $F[f(x)]$ is continuous at X .

Since a continuous function [for example, $f(x) = x \sin 1/x$] may oscillate infinitely often in the neighbourhood of a point, it is obvious that a complete graphic representation of all such functions is not possible. On the other hand all functions are continuous whose graphs as drawn in a system of ordinary rectangular coordinates are unbroken curves of one piece over an x interval. If this interval $[a, b]$ is closed, a function thus graphically defined is evidently bounded on $[a, b]$ and can easily be shown to have maximum and minimum values there. Further, every length between those of $f(a)$ and $f(b)$ will fit as an ordinate of the curve $y = f(x)$ somewhere between $x = a$ and $x = b$. The corresponding properties are shared by all functions that are continuous on a closed interval. Another property of all functions continuous on a closed interval $[a, b]$ is that of *uniform continuity*, according to which it is always possible to subdivide $[a, b]$ into a finite number of parts such that in each the fluctuation of the function is less than a preassigned positive number. On this property rests the proof that every function continuous on a closed interval $[a, b]$ has a definite integral from a to b (see § 6 below).

A function continuous on $[a, b]$ is completely determined by its values at all rational points of $[a, b]$, or by its values at any other

set of points everywhere dense on $[a, b]$, i.e., a set whose points are to be found in every subinterval of $[a, b]$. Since the rational points of an interval are enumerable, that is, can be put into one-to-one correspondence with the set of all positive integers, it follows that a continuous function can be completely defined by an enumerable number of conditions.

5. Discontinuous Functions.—A function defined on a neighbourhood of X , but not necessarily at X itself, is *discontinuous* at X if any part of the definition of continuity is not satisfied. This will be the case, in particular, if the function is not defined at X . An *infinite discontinuity* occurs if the function becomes infinite as x approaches X , either on the whole interval, or on some set of points of which X is a limit point. If the function is bounded on a neighbourhood of X but is not continuous at X , it has a *finite discontinuity* at that point. One class, that of *removable discontinuities*, consists of those presented by functions which have a limit L as x approaches X on a neighbourhood of X , but either $f(x)$ is not defined at X or $f(X)$ is not equal to L . When $f(X)$ is suitably defined the function becomes continuous at X . Another variety of finite discontinuities is presented when $f(X+0)$ and $f(X-0)$ each exist, but these two limits are not equal. In other cases the function may oscillate so that its fluctuation in every neighbourhood of X is greater than a positive constant [this is, for example, true of $f(x) = \sin 1/x$ at the origin]. Here the greatest and least limits approached by $f(x)$ on all sets of points to the right of X and for which X is a limiting point, together with similar limits on the left [designated $\bar{f}(X+0)$, $\underline{f}(X+0)$, $\bar{f}(X-0)$, $\underline{f}(X-0)$, respectively], furnish a measure of the *oscillation* of $f(x)$ at X . Examples can be given of functions that are discontinuous at every point of an interval, and of others that are continuous at every irrational point and discontinuous at every rational point.

6. Derivatives and Integrals.—The differential calculus is based on the idea of the *derivative* of a function $f(x)$ at a point X , (see CALCULUS). The derivative is, by definition,

$\lim_{x \rightarrow X} \frac{f(x) - f(X)}{x - X} = f'(X)$, where

$$F(x) = \frac{f(x) - f(X)}{x - X}.$$

When X is considered as a variable, $f'(X)$ is said to be the derived function of $f(X)$, but the term derivative is also used with this meaning. It is the main business of the differential calculus to investigate formulas for the derivatives of various analytic expressions and to make application of these formulas. The theory of functions concerns itself with conditions for the existence of the derivative and with generalizations of its definition. A function continuous at a point does not necessarily have a derivative there; Weierstrass has given an example of a function continuous at every point of an interval but without a derivative at any point whatever. If, however, a function defined and single-valued throughout a neighbourhood of X has a derivative at X , then it is continuous at that point.

Various generalizations of the notion of a derivative have been found useful, particularly those in which the limit entering into the definition is taken over restricted domains for x . Thus the limit $F(X+0)$ is designated the *progressive derivative* of $f(x)$ at X , and $F(X-0)$ the *regressive derivative*; $\bar{F}(X+0)$, $\underline{F}(X+0)$, $\bar{F}(X-0)$, $\underline{F}(X-0)$ are upper and lower extreme derivatives on the right and left respectively. The derivative of the derivative is called the *second derivative*, and the process may be carried on to *derivatives of the n th order*. From the existence of the derivative of order $n-1$ it does not follow that there is a derivative of n th order, or, if the latter exists, that it is continuous.

The integral calculus had its source in problems such as that of determining the area under a curve, for which a solution is obtained by subdividing the region under consideration into parts that are approximately rectangular and taking the limit of the sum of the partial areas. This led to the definition of the integral of $f(x)$ from a to b by means of the formula

$$\int_a^b f(x) dx = \lim_{\Delta x \rightarrow 0} [f(x_1)\Delta x_1 + f(x_2)\Delta x_2 + \dots + f(x_n)\Delta x_n].$$

The notation implies that the interval $[a, b]$ has been divided

into n successive subintervals of lengths $\Delta x_1, \Delta x_2, \dots, \Delta x_n$, all less than Δx , and that x_1, x_2, \dots, x_n are points chosen arbitrarily in the respective subintervals corresponding to their subscripts. The integral thus defined is called the *definite integral*, to distinguish it from an *indefinite integral* or *primitive function* of $f(x)$, i.e., a function $\phi(x)$ whose derivative is $f(x)$. The two notions are brought together by the theorem that if $f(x)$ is integrable, that is, has a definite integral from a to b , and if x is between a and b , then an indefinite integral $\phi(x)$ can differ at most by a constant from the definite integral of $f(x)$ from a to x . Every function continuous on a closed interval $[a, b]$ is integrable from a to b .

The integral as thus defined is called the *Riemann integral* since its precise formulation was given in the famous memoir of Riemann on trigonometric series (1854). A necessary and sufficient condition that a function bounded on a closed interval $[a, b]$ be integrable from a to b can be given in terms of the notion of *content*. The content of a set of points in an interval $[a, b]$ may be defined as the integral from a to b of a function equal to 1 at each point of the set, and to 0 at all other points. The condition for integrability is that the points of discontinuity of $f(x)$ on $[a, b]$ form a set whose content is zero.

More general definitions of integration, especially that due to Lebesgue, have had a very considerable influence on recent progress in the theory of functions. These generalizations are largely based on extensions of the notion of content; one of their aims has been to frame definitions so that integrals shall be differentiable and derivatives integrable for broad classes of functions. Another line of investigation has concerned itself with *improper integrals*, those in which either the function becomes infinite between the limits of integration, or the latter are not both finite.

7. Types of Analytic Representation.—In elementary analysis it is customary to identify functions with analytic expressions. According to a familiar classification the elementary functions are *polynomials*, of form $a_0x^n + a_1x^{n-1} + \dots + a_n$; *rational functions*, quotients of polynomials; *power functions*, of form x^n ; *algebraic functions*, given by equations $f(x, y) = 0$ where $f(x, y)$ is a polynomial in both x and y ; *transcendental functions*, such as the *exponential function* a^x , the *logarithmic function* $\log x$, *trigonometric and inverse trigonometric functions* such as $\sin x$, $\sin^{-1}x$; and functions defined by a finite number of functional operations within this class.

Limits of sets of elementary functions furnish a more general class of analytical representations. These may take the form of infinite series or products, or definite integrals. Representations by infinite series are of especial importance. An infinite series of functions of x defined on $[a, b]$,

$$f_1(x) + f_2(x) + \dots + f_n(x) + \dots,$$

is said to converge for $x = X$, if the sum of n terms has, for $x = X$, a limit when n becomes infinite. This limit is the *value of the series* for $x = X$. A function is represented by a *convergent series* of functions on $[a, b]$ if the value of the function at each point of (a, b) is the value of the series at that point. Among the series most studied have been the *power-series*, of type

$$c_0 + c_1(x - x_0) + c_2(x - x_0)^2 + \dots,$$

and *trigonometric series*, whose n th terms are of type $a_n \cos nx + b_n \sin nx$. Infinite series that are not convergent may still, in a sense, represent a function. Hence such *divergent series* have also been the objects of much research.

8. Functions of More Than One Variable.—Many of the properties of functions of one variable can be readily generalized for functions of two or more variables. As the geometry of several dimensions is, however, far more complicated than that of one dimension, it is clear that new notions must be introduced. Modern investigations have not stopped with functions of finitely many variables, but have gone on into domains of infinitely many dimensions.

II. FUNCTIONS OF COMPLEX VARIABLES

1. Complex Numbers and Their Geometric Representation.—The operations of addition, subtraction, multiplication and

division with non-vanishing divisor, when applied to real numbers yield only real numbers, but this does not hold good in the case of root extraction. We must, for example, either regard $\sqrt{-1}$ as indicating an impossible operation, or else we must enlarge the number system so as to give a meaning to this symbol. The purpose last indicated is accomplished by the definitions of complex numbers (see COMPLEX NUMBERS) and the elementary operations associated with them. It is only when complex numbers are admitted that we can assert the fundamental theorem of algebra according to which every algebraic equation with real coefficients has a solution.

A complex number is indicated by the symbol $a + ib$, where a and b are real numbers, and i is the so-called *imaginary unit*, sometimes written $\sqrt{-1}$ since, by definition, $i^2 = -1$. Addition, subtraction, multiplication and division are defined by the following formulae, together with the assumption that the associative, commutative and distributive laws (see under those headings) hold for complex as well as for real numbers:

$$(a + ib) + (c + id) = (a + c) + i(b + d),$$

$$(a + ib) - (c + id) = (a - c) + i(b - d),$$

$$(a + ib)(c + id) = (ac - bd) + i(ad + bc),$$

$$\frac{a + ib}{c + id} = \frac{(a + ib)(c - id)}{(c + id)(c - id)} = \frac{ac + bd}{c^2 + d^2} + i \frac{bc - ad}{c^2 + d^2}, (c^2 + d^2) \neq 0$$

If b is zero, $a + ib$ is identified with the real number a , so that the system of complex numbers includes that of real numbers. If b is not zero, $a + ib$ is said to be *imaginary* and a is the *real part* of $a + ib$. The numbers $a + ib$ and $a - ib$ are then *conjugate imaginaries*; the sum and the product of two conjugate imaginaries are both real. Two complex numbers $a + ib$ and $c + id$ are equal when and only when $a = c$ and $b = d$.

As real numbers may be represented by points on a straight line, so a one-to-one correspondence exists between all complex numbers (x, y) and the points of the plane whose coordinates are (x, y) in a given rectangular system (see ANALYTIC GEOMETRY). It is therefore customary to use the words *point* and *number* interchangeably for $z = x + iy$. The operations of adding and subtracting two complex numbers corresponding to points P_1 and P_2 give the points P_3, P_4 corresponding to a vector addition and subtraction, respectively, of directed segments from the origin of co-ordinates to P_1 and P_2 . (See VECTOR ANALYSIS.) A geometric picture of multiplication and division is most simply obtained by using a polar coordinate system in which the radius vector $r = OP$ is always positive, and θ is the angle from the positive x axis OX to OP . From elementary trigonometry we have $z = x + iy = r(\cos \theta + i \sin \theta)$. The rule already adopted for multiplication gives, after a trigonometric reduction,

$$r_1(\cos \theta_1 + i \sin \theta_1)r_2(\cos \theta_2 + i \sin \theta_2) = r_1r_2[\cos(\theta_1 + \theta_2) + i \sin(\theta_1 + \theta_2)].$$

Hence to obtain the radius vector, or *modulus*, and the *angle* of the product of two complex numbers, we multiply their moduli and add their angles. Similarly, in division we divide moduli and subtract angles. These definitions may be extended to products and quotients involving several terms. In particular, if m is a positive integer we have $z^m = r^m(\cos m\theta + i \sin m\theta)$, and in accordance with the usual definitions the same formula holds if m is a negative integer, or any rational number. Here, however, it must be observed that if θ_1 is the angle of z that lies between 0 and 2π then for all integral values of n , positive or negative, $\theta_1 + 2n\pi$ is also an angle of z . If each of these possible values of θ is used in the formula for z^m where m is the reciprocal of an integer p , it will be seen that $z^{1/p}$ has p values.

From the geometric theorem that a straight line segment is shorter than any broken line joining its extremities we deduce the result that the modulus of a sum of complex numbers is not greater than the sum of the moduli of the terms, or, to use a customary notation,

$$|z_1 + z_2 + \dots + z_n| \leq |z_1| + |z_2| + \dots + |z_n|.$$

2. Complex Variables: Limits.—A complex variable is one whose values are complex numbers. If the values of a complex

variable w are determined by those of another complex variable z , the variable w is a function of z . If we write $w = u + iv$ and $z = x + iy$, it is clear from the definition just adopted that u and v are each functions of x and y if w is a function of z , and conversely. The theory of functions of a complex variable is, from this point of view, identical with that of pairs of real functions of two real variables.

Since the totality of complex numbers corresponds to that of all points of the plane, the domain of a complex variable is in general two-dimensional. A *region* is a domain consisting of all points of a single piece of the plane bounded by one or more closed curves; if its boundary consists of one closed curve of a single piece that does not cut itself, a region is said to be *simply connected*, otherwise it is *multiply connected*. As to the boundary curves, we shall hereafter suppose them to be such as to allow the integration of a continuous function over them (see § 5, below). A region is *open* if it does not include its boundary; it is *closed* if all points of the boundary are included. A *neighbourhood* of a point is an open region to which the point belongs.

A function $w = f(z) = u(x, y) + iv(x, y)$, defined so as to be single-valued at each point of a neighbourhood of $z = Z = X + iY$ except possibly at Z itself, is said to approach the limit $W = U + iV$ as z approaches Z , provided we have

$$\lim_{z \rightarrow Z, u=x, y=Y} u(x, y) = U, \quad \lim_{z \rightarrow Z, u=x, y=Y} v(x, y) = V.$$

An equivalent definition is the following: $\lim_{z \rightarrow Z} f(z) = W$ if for every positive number ϵ there exists a positive number δ such that $|f(z) - W| < \epsilon$ for all points z other than Z for which $|z - Z| < \delta$. The function $f(z)$ is continuous at Z if $\lim_{z \rightarrow Z} f(z) = f(Z)$; a necessary and sufficient condition is that both $u(x, y)$ and $v(x, y)$ be continuous at (X, Y) . A function is continuous throughout a region if it is continuous at each point of the region.

3. Analytic Functions.—The definition of the derivative of a function of a complex variable is formally the same as for a real function of a real variable:

$$f'(z) = \frac{d}{dz} f(z) = \lim_{\Delta z \rightarrow 0} \frac{f(z + \Delta z) - f(z)}{\Delta z} = \lim_{\Delta z \rightarrow 0} \frac{\Delta f}{\Delta z}.$$

If we write the difference quotient $\Delta f / \Delta z$ in the form

$$(\Delta u + i\Delta v) / (\Delta x + i\Delta y),$$

it is clear that in terms of the two real variables Δx and Δy we are requiring the existence of a *two-dimensional* limit. Even when u and v have partial derivatives (i.e., derivatives with respect to one variable taken as though the other variable were constant) $\partial u / \partial x$, $\partial u / \partial y$, $\partial v / \partial x$, $\partial v / \partial y$, the derivative of $f(z) = u + iv$ may not exist. For example, if $f(z) = x - iy$, we have

$$\frac{\Delta f}{\Delta z} = \frac{\Delta x - i\Delta y}{\Delta x + i\Delta y} = \frac{1 - i\Delta y / \Delta x}{1 + i\Delta y / \Delta x},$$

since $\Delta y / \Delta x$ has no limit that is independent of the way that Δy and Δx approach zero, the same is true of $\Delta f / \Delta z$. Functions of a complex variable that have derivatives thus form a restricted class, even among those that have derivatives with respect to x alone and with respect to y alone. A function single-valued in a region S is said to be analytic throughout that region if it has a derivative at each point of S ; it is analytic at a point Z if there is a neighbourhood of Z throughout which it is analytic. Synonymous terms are *monogenic*, *holomorphic*, *regular*. It has been proved (by Ed. Goursat, 1900) that if $f'(z)$ exists at each point of S , then $f'(z)$ is a continuous function of z throughout S . Necessary and sufficient conditions that $f'(z)$ exist are that the partial derivatives of u and v exist, are continuous and satisfy the *Cauchy-Riemann equations*,

$$\partial u / \partial x = \partial v / \partial y, \quad \partial u / \partial y = -\partial v / \partial x.$$

In § 5 below it is shown that if $f'(z)$ exists, then its derivative also exists at each point of S and similarly for the derived functions of higher order. Thus the second partial derivatives of u and v also exist. By differentiating the first Cauchy-Riemann equation with respect to x and the second with respect to y , then

adding, we see that u (and similarly v) satisfies *Laplace's equation*

$$\partial^2 u / \partial x^2 + \partial^2 u / \partial y^2 = 0.$$

Polynomials in z are analytic throughout the entire plane. Rational functions are analytic except at points where their denominators vanish. Exponential, logarithmic and trigonometric functions of z require definition. Thus we wish to define e^z so that it will be single-valued and analytic throughout the entire plane and will be identical with the real exponential function e^x when $z = x$; similarly for $\sin z$ and $\cos z$. It can be shown that the only functions satisfying these requirements are the following,

$$e^z = e^x(\cos y + i\sin y), \quad \sin z = (e^{iz} - e^{-iz}) / 2i, \quad \cos z = (e^{iz} + e^{-iz}) / 2;$$

they also satisfy the formal identities that hold for real exponential and trigonometric functions. The logarithm of z (to the natural base e) is the function $w = \log z$ which identically satisfies the equation $e^w = z$. If (r, θ) are polar coordinates of z , we have $\log z = \log r + i\theta$, where $\log r$ is the real logarithm of the positive real number r . The angle θ is, however, as we have seen, infinitely many-valued. Hence $\log z$ is infinitely many-valued; any two of its values differ by an integral multiple of $2\pi i$. The inverse trigonometric functions can be expressed in terms of logarithms. From these elementary functions one may pass to algebraic functions and the elliptic and abelian functions associated with them. (See ELLIPTIC FUNCTIONS, and the authorities cited at the end.)

4. Geometrical and Physical Applications.—As has already been indicated, there were reasons of a purely mathematical nature for the introduction of complex numbers and functions of complex variables. Without them certain inverse operations on real numbers would have no meaning and many of the theorems of analysis would have awkward restrictions. In the applications of the theory of analytic functions in geometry and physics, however, is to be found one of the chief reasons why this theory has dominated analysis for the last three-quarters of a century. The Cauchy-Riemann equations and Laplace's equation are of central importance in the theory of maps and in various problems of mathematical physics (see SPHERICAL HARMONICS and CONFORMAL REPRESENTATION). Pairs of solutions, u and v , of those equations combine to form analytic functions $u + iv$ of the complex variable $x + iy$. Thus theorems about analytic functions have interpretations in such fields as those of conformal mapping and of the conduction of heat and electricity.

A conformal map may, for example, be described mathematically as follows: A plane region S is said to be mapped upon another plane region Σ in a one-to-one manner if to each point of one region corresponds one and only one point of the other. If a rectangular co-ordinate system (u, v) is set up for Σ and a system (x, y) for S , it follows that u and v are functions of x and y ; if these functions are continuous, S is said to be mapped continuously on Σ . To a piece of curve of length Δs in S will correspond a piece of length $\Delta \sigma$ in Σ . If Δs approaches zero, while one end-point is kept fixed, the ratio of $\Delta \sigma$ to Δs may approach no limit, or it may approach different limits on different curves, or it may approach the same limit on every curve through the fixed point. In the last case this limit is the *scale* of the map at that point. If a continuous one-to-one map has a scale at every point it is said to be conformal, and it can be shown that if two curves intersect at a point of S the corresponding curves intersect at the same angle in Σ . It can then be proved that either the pair (u, v) , or the pair $(u, -v)$ satisfies the Cauchy-Riemann equations. Every analytic function $w = f(z)$ has, as we have seen, a real part u and a pure imaginary part iv such that u and v satisfy the Cauchy-Riemann equations. It therefore defines a conformal map of a suitably chosen z -region on a w -region. The correspondence of two geographic maps, such as a stereographic map and a Mercator's map of the same portion of the earth's surface, is completely described by an appropriate equation $w = f(z)$. By a theorem of Riemann's, any simply connected plane region whatever can be mapped on the interior of a circle of unit radius about the origin by a suitable analytic function. In particular, every region, finite or

infinite, bounded by a single circle or straight line is so mapped by a suitable *linear transformation* $w = (az+b)/(cz+d)$.

It would be impossible to discuss here the many physical applications of the theory of analytic functions; a brief reference to the steady flow of heat in a conducting plate must suffice. Suppose a thin homogeneous metal plate is insulated except at its edge. Each point of the edge is kept at a fixed temperature, but this may vary from point to point. After a time each point (x, y) of the plate reaches, and maintains thereafter, a temperature $u(x, y)$; the flow of heat is then said to be steady. It can be shown that u satisfies Laplace's equation. Curves along which u is constant are called *isotherms*, while *lines of flow* are the curves $v = \text{constant}$ that cut each isotherm perpendicularly. The fact that u and v must satisfy the Cauchy-Riemann equations again makes contact with the theory of analytic functions.

5. Integrals.—In order to obtain a definition of integration formally similar to that used for a real function of a real variable, we consider a curve segment C interior to a region S throughout which $f(z)$ is analytic. On C we take $n+1$ successive points $z_0, z_1, z_2, \dots, z_n$, of which the first, z_0 , and the last, $z_n = Z$ are fixed. If the sum

$$\Sigma_n = f(z_1)(z_1 - z_0) + f(z_2)(z_2 - z_1) + \dots + f(z_n)(z_n - z_{n-1})$$

has a limit L as we take successive subdivision schemes, such that the limit of the largest modulus $|z_k - z_{k-1}|$ is zero, and if L is the same for all such sequences of sums formed for the function $f(z)$ and for the curve C from z_0 to Z , then this limit is said to be the value of the definite integral of $f(z)$ on C from z_0 to Z , and is written $\int_C f(z) dz$. In terms of the real functions $u(x, y)$, $v(x, y)$, where $f(z) = u + iv$, this definition yields the identity

$$\int_C f(z) dz = \int_C u dx - v dy + i \int_C v dx + u dy,$$

where the integrals on the right are real curve or line integrals along C (see CALCULUS). If $f(z)$ is continuous on C , and if C is of finite length, or in particular if C is *regular* (composed of a finite number of pieces with continuously turning tangent), the integral exists.

If $f(z)$ is merely continuous throughout a region S , the value of the integral of $f(z)$ from z_0 to Z will depend, in general, on the curve of integration. But if $f(z)$ is *analytic* throughout a simply-connected region S , then the integral of $f(z)$ from z_0 to Z is the same on all regular curves in S that join z_0 and Z . This follows from *Cauchy's integral theorem* (1825; proved by E. Goursat, 1900, without assuming that $f'(z)$ is continuous), which states that if $f(z)$ is continuous in a closed region S , simply or multiply connected, and analytic throughout open S , then the integral of $f(z)$ around the whole boundary of S is zero, provided each boundary curve is so traversed as to leave the interior of S to the left. Hence if curves C_1 and C_2 within S extend from z_0 to Z and bound a simply connected portion S' of S , then the integral of $f(z)$ around the boundary of S' is zero; that is, the forward integral on C_1 plus the backward integral on C_2 vanishes, so that the forward integral on C_1 is equal to the forward integral on C_2 . The same result is true even when C_1 and C_2 intersect at points between z_0 and Z , provided S is simply connected. In this case,

then, $F(z) = \int_{z_0}^z f(z) dz$ has a well-defined meaning. It is easily

proved that $f(z)$ is the derivative of $F(z)$. If $f(z)$ is analytic throughout S except at a single interior point z_0 , then the integral of $f(z)$ around the boundary C is called the *residue* of $f(z)$ at z_0 . Here C can be replaced by a circle of small radius about z_0 . On these considerations Cauchy built his calculus of residues, one aim of which was to obtain evaluations of improper real integrals.

A most important consequence of Cauchy's integral theorem is the *integral formula*,

$$f(z) = \frac{1}{2\pi i} \int_C \frac{f(t) dt}{t-z},$$

which holds if $f(t)$ is single-valued and analytic on the open region S bounded by C , and continuous on closed S , while z is an interior point of S . Thus the function $f(z)$ is uniquely determined

at each point of S by its boundary values. Since the above integral can be differentiated with respect to z by differentiating the integrand, it follows that an analytic function has derivatives of all orders, the n th derivative being given by the formula

$$f^{(n)}(z) = \frac{n!}{2\pi i} \int_C \frac{f(t) dt}{(t-z)^{n+1}}.$$

Among the corollaries of the integral formula are the following: (1) $f(z)$ has no maximum in the interior of S ; (2) if S consists of the entire plane, then either $f(z)$ is not everywhere finite (in which case it is called an *integral function*), or else it is a constant; (3) every algebraic equation $f(z) = 0$, where $f(z)$ is a polynomial of degree greater than zero, has at least one solution (the so-called *fundamental theorem of algebra*).

6. Infinite Series.—We define the sum or value of an infinite series of complex numbers, $w_0 + w_1 + w_2 + \dots + w_n + \dots$, to be the limit of the sum of the first n terms as n becomes infinite. If this limit exists the series is *convergent*, otherwise it is *divergent*. A necessary and sufficient condition for convergence is that the series of real parts and the series of pure imaginary parts of the w 's both converge; a sufficient condition is the convergence of the series of absolute values of the w 's.

A series of functions $w_0(z) + w_1(z) + w_2(z) + \dots + w_n(z) + \dots$ may converge in some regions and diverge in others. Such a series is *uniformly convergent* throughout a region S if for every positive number ϵ there exists an integer m such that

$$|s_m(z) - s_n(z)| < \epsilon$$

for all values of n greater than m ; here $S_n(z)$ designates the sum of the first n terms of the series and the same m must apply for all points z of S . If each of the terms of a series is single-valued and analytic and the series is uniformly convergent in S , then the sum-function is analytic in S .

Among the most important series are the *power series* $c_0 + c_1(z-z_0) + c_2(z-z_0)^2 + \dots + c_m(z-z_0)^m + \dots$. Such a series may converge for all values of z , or for $z = z_0$ only; otherwise there is a *circle of convergence* with its centre at z_0 , throughout the interior of which the series converges and outside which it diverges. Such a series is uniformly convergent within every region interior to its circle of convergence, and hence represents an analytic function throughout the open region interior to the circle. Conversely, every function $f(z)$ analytic throughout the interior of a circle is there represented by a power series, called its *Taylor's series*. For the coefficients we have the formula $c_k = f^{(k)}(z_0)/k!$. Such a series may be differentiated and integrated term by term; the new series will represent the derivative and the integral of the sum of the original series throughout its circle of convergence. Since the values of the derivatives of $f(z)$ at z_0 determine its Taylor's series, it follows that these values completely characterize the function itself throughout the circle of convergence. A more general result may be stated as follows: If $f(z)$ is single-valued and analytic throughout S it is completely determined in that region by its value and those of all its derivatives at an interior point, or by its values at the points of an infinite set having a limiting point within S .

A series in which both positive and negative powers of $z-z_0$ occur is called a *Laurent's series*. Such a series has a *ring of convergence* composed of the region bounded by two concentric circles about z_0 . A function analytic and single-valued in such a ring is representable there by a Laurent's series. Infinite products of analytic functions have also been the subject of many investigations.

7. Singularities.—A *singular point* is one at which a function is not analytic; an *isolated singular point* is one throughout a neighbourhood of which, except at the point itself, the function is analytic. Isolated singularities of single-valued functions are divided into three classes. The first is composed of the *removable singularities* where a proper definition of $f(z_0)$ would make $f(z)$ analytic at the singular point z_0 . This is the only possible isolated singularity whenever $f(z)$ remains finite in a neighbourhood of z_0 . Singular points of the second class are called *poles*; here $f(z)$ becomes infinite on all paths of approach to such a point. The

third class, that of *essential singularities*, includes all other cases; here $f(z)$ becomes infinite on some sequences of points approaching z_0 , but not on all such sequences; there are, in fact, sequences on which any limit whatever is approached. This last statement can be replaced by the celebrated *theorem of Picard*, according to which the equation $f(z)=A$, has, for all values of A , with at most one exception, an infinite number of solutions in every neighbourhood of an isolated singular point which is essentially singular.

The definition and classification of analytic functions in terms of their singularities was the starting-point of the program of Riemann for the theory of functions of a complex variable. As an example, we may define a rational function (with suitable conventions regarding $z=\infty$) as one with no singularities throughout the plane, or at $z=\infty$, except poles.

8. **Analytic Continuation: Many-valued Functions.**—If $f(z)$ is analytic in S and $\phi(z)$ analytic in S' ; if, further, S and S' overlap and $f(z)=\phi(z)$ throughout this overlapping portion, then $\phi(z)$ is uniquely determined and is said to be an *analytic continuation of $f(z)$ into S'* . We may thus be able to continue a function analytically by a chain of overlapping regions; the totality of functional values defined when this process has been carried as far as it will go is called a *monogenic analytic function*. In particular such a monogenic function may be many-valued when a chain of regions used in its definition overlaps itself. We then think of the plane of z as replaced by a many-sheeted surface called a *Riemann surface*, and of the many-valued monogenic function as single-valued on its Riemann surface. This conception has been especially fruitful in the study of algebraic functions and their integrals.

9. **Functions of Two or More Complex Variables.**—Many of the formulae for functions of one complex variable are readily extended to functions of more than one such variable. In other directions new difficulties appear. Algebraic functions of several variables have received especial attention, but the general field of functions of more than one variable is comparatively undeveloped as yet.

BIBLIOGRAPHY.—Functions of Real Variables.—References to memoirs and to other treatises are to be found in the following German and French encyclopaedias of mathematics, which also contain excellent general accounts of the subject. *Encyklopädie der Mathematischen Wissenschaften*, Band ii. (Leipzig, 1899—); *Encyclopédie des sciences mathématiques pures et appliquées*, vol. ii. (Paris, Leipzig, 1909—). Perhaps the most comprehensive treatise is the remarkable work of E. W. Hobson, *The Theory of Functions of a Real Variable and the Theory of Fourier's Series* (3d ed., 1927). Other treatises of a general character and belonging to the later period are: J. Pierpont, *Lectures on the Theory of Functions of Real Variables* (1905–12); A. Pringsheim, *Vorlesungen über Zahlen- und Funktionenlehre* (Leipzig, 1916); C. Carathéodory, *Vorles. ü. reelle Funktionen* (1918); H. Hahn, *Theorie der reellen Funktionen* (1921). Treatises which go back to an earlier period, but which had much influence on the development of the subject are: U. Dini, *Fondamenti per la teoria delle funzioni di variabili reali* (Pisa, 1878), German version by Lüroth and Schepp (Leipzig, 1892); C. Jordan, *Cours d'analyse de l'école polytechnique* (3d ed., 1909–15); O. Stolz, *Gründzüge der Diff.-und Int.-Rechnung* (Leipzig, 1893–99).

For the Functions of Complex Variables see *Ency. der Math. Wiss.*, mentioned above. The report of A. Brill and M. Nöther, "Die Entwicklung der Theorie der allg. Funkt. in älterer und neuerer Zeit," *Jahresber. d. Deutsch. Math. Ver.*, 3 (1894), gives an excellent historical account. General treatises carrying the subject into the present century are: W. F. Osgood, *Lehrbuch der Funktionentheorie* (Leipzig, Band i., 4th ed., 1923, Band ii., 1927–28); L. Bieberbach, *Lehrb. d. Funktionentheorie* (Leipzig, 1923, 1927); A. Hurwitz and R. Courant, *Vorles. ü. allg. Funktionentheorie u. elliptische Funkt.* (2d ed., 1925); K. Hensel and G. Landsberg, *Theorie d. algebr. Funkt. einer Variablen*, etc. (Leipzig, 1902); H. Burkhardt, *Einführung in die Theorie d. analyt. Funkt. einer komplexen Veränderlichen* (3rd ed., Leipzig, 1908), translated into English by S. E. Rasor (1913); J. Pierpont, *Functions of a Complex Variable* (1914); A. R. Forsyth, *Theory of Functions of a Complex Variable* (3d ed., 1918), and *Lectures Introductory to the Theory of Functions of Two Complex Variables* (1914); E. Goursat *Cours d'analyse*, vol. ii. (4th ed., 1925), translated into English by E. R. Hedrick and O. Dunkel (1916); E. Picard, *Traité d'Analyse*, vol. ii. (3d ed., 1926).

The series of monographs on the Theory of Functions edited by E. Borel (Paris, 1898—) also contains many important contributions. (D. R. C.)

FUNDAMENTALISM AND MODERNISM. Fundamentalism is the name given to a religious movement which, appearing independently in different denominations in the United States immediately after the World War, steadily gathered momentum until in 1925 it became a subject of national, as distinct from denominational, interest through the trial and conviction of John T. Scopes, teacher of science in Rhea high school, Dayton, Tenn., on a charge of violating the Tennessee law prohibiting the teaching of evolution in the State public schools.

The trial began on July 10, 1925, and was concluded on July 21, 1925, by the conviction of the defendant and his sentence to pay a fine of \$100. The immediate issue was as to whether the defendant had or had not violated the provisions of the State law as to the subjects to be taught in public schools, but the wider issue was as to the extent to which the State, in its control of public education, may determine the nature of the religious instruction given to the students in its schools. The trial itself was the culmination of a movement which had been going on for some years. Alarmed by the steady growth of liberal tendencies, the conservatives of the different churches had banded themselves together to stay what seemed to them the rising tide of negation. The form of the movement differed in the different communions according to the particular issue which was in question at the time, but common to all the Fundamentalist groups was, first, the acceptance of a view of the supernatural which insists that God manifests His presence in nature and history through exceptional and extraordinary activities, transcending the laws of nature; and, secondly, the determination to use this conception of religion as a test to limit the freedom of teaching hitherto enjoyed by the ministers of the denomination. In all this there is nothing new. In every age conservatives and liberals have carried on their conflict over some form of this issue. What is new is the widespread character of the movement, the missionary enthusiasm which has been brought to it by its advocates and the consciousness on their part of interests transcending denominational lines and calling for a new alignment, with the Fundamentalists of all denominations on one side and the liberals on the other.

The Presbyterian Church.—In the Presbyterian Church the controversy centred about the case of Dr. Harry Emerson Fosdick, a Baptist clergyman who had been invited to act as stated supply for the First Presbyterian church in New York city. Dr. Fosdick, who was also a professor in Union theological seminary of that city and a man of moderate liberal tendencies, made it his condition of accepting the call that he should be allowed to retain his membership in the Baptist Church. A sermon preached in May, 1922, entitled "Shall the Fundamentalists Win?" was the occasion of an attack upon his theology by conservative Presbyterians, which led the General Assembly of 1923 to direct the Presbytery of New York to take such action as would require the preaching in the First Presbyterian church to conform with the Confession of Faith. The Presbytery, after full conference with Dr. Fosdick and the church, reported that such was now the case, whereupon the Assembly of 1924, without passing any judgment on Dr. Fosdick's theological views, expressed the opinion that if he were to remain longer in the pulpit of the church, he should accept the standards of doctrine required of other ministers. On this issue Dr. Fosdick withdrew, declaring that "Creedal subscription to ancient confessions of faith is a practice dangerous to the welfare of the church and to the integrity of the individual conscience."

In connection with this controversy the General Assembly in 1923 reasserted the so-called "Five Points," a declaration originally made in 1910, setting forth as essential doctrines of the Christian faith, the Virgin Birth, the physical Resurrection, the inerrancy of Scripture, the substitutionary Atonement and belief in the Miracles. In reliance upon this statement the judicial commission of the Assembly, in May 1925, declared that the Presbytery of New York had erred in licensing a student who refused to affirm the Virgin Birth. The liberals attacked this procedure as an unconstitutional limitation of the liberty of interpretation accorded to every minister by the terms of subscription, and to the presbyteries by the historic precedents of the church. (Cf. Auburn Affirmation of May 1924, signed by 1,283 members.)

In view of these differing interpretations, the General Assembly of 1925 appointed a commission of 15 "to study the present spiritual condition of the Church and the causes making for unrest." This commission, which was continued by the Assembly of 1926, has done much to reconcile the contending factions and to vindicate the right of liberals, as well as conservatives in the church. The chief opponent of this mediating policy is Prof. J. Gresham Machen, of Princeton theological seminary, who is himself under attack by the more moderate alumni of his own institution. At their request a committee of the General Assembly has been investigating Princeton theological seminary and has recommended certain changes in its government which will make possible more unified control.

The Baptist Church.—In the Baptist Church the controversy has taken the form of an effort on the part of the conservatives to secure the adoption by the annual conference of a creed which should be used as a test of ministerial fellowship. This attempt failed at repeated conferences, but the conservatives, defeated at this point, have sought to secure their ends by instructions given to their board of home missions as to the conditions to be observed in the administration of their funds. One large bequest was actually accepted by the board on conditions which seemed to some of its critics unduly to limit its freedom. A parallel effort to secure control over the teaching of the seminaries has thus far failed of success.

Not the least important feature in the Fundamentalist movement is its bearing upon foreign missions. In general the policy of the different missionary boards has been to put the responsibility for determining the doctrinal qualifications of candidates upon the home church; and in the work on the foreign field conservatives and liberals have co-operated successfully in various union enterprises. Fundamentalists have challenged this arrangement and attacked the theology of liberal missionaries. On the whole this attack has been unsuccessful, and the unity won on the field has thus far been maintained; but the battle is by no means over. A case in point is the action of the general convention of the Disciples at Oklahoma City, Okla., on Oct. 6, 1925, in reaffirming the principle of close communion which has been departed from by some of their missionaries in the interest of wider co-operation.

The Episcopal Church.—In the Episcopal Church the controversy has centred about the literal observance of the creeds. On Oct. 5, 1923, Bishop Lawrence of Massachusetts made an address (afterwards published in pamphlet form) entitled *Fifty Years*, in which he pleaded for a liberal interpretation of the creeds. On Nov. 14, 1923 at Dallas, Tex., the bishops of the Episcopal Church met this challenge by issuing a pastoral insisting upon literal acceptance of the creeds and questioning the good faith of those ministers who gave their historic statements a symbolic interpretation. This pastoral was attacked by the liberals of the church who were organized in a body known as the Modern Churchman's Union. Sermons were preached by leading liberals, like Dr. Leighton Parks, of St. Bartholomew's church of New York, and Dr. William Russell Bowie, of Grace church of the same city, and manifestoes were issued by theologians like the volume of essays entitled *Creeds and Loyalty* by seven members of the faculty of the Episcopal theological school of Cambridge, Mass. (1924). As a result of this agitation a trial for heresy begun against the Rev. Lee W. Heaton for denying the Virgin Birth was abandoned, and for the moment a truce was declared.

The Bible Institutes.—One of the main sources of popular conservative propaganda is the so-called Bible institutes, of which the most important are the Moody Bible institute in Chicago and the Bible institute of Los Angeles. These schools, interdenominational in character, recruiting their students from young people without college, and many of them without high school education, insist upon the inerrancy of the Scriptures, which they interpret commonly in the pre-millennarian sense. They are carrying on an extensive propaganda partly through periodicals of interdenominational character and partly through conventions (the so-called prophetic conferences), which bring together large numbers of people. While these institutes are not designed primarily as theo-

logical seminaries, many of their pupils are finding their way into the churches and are reinforcing the conservative elements which are already there.

It is against the background of these influences that one must interpret the Tennessee trial. Under the leadership of William Jennings Bryan, the conservatives had been carrying on an active campaign throughout the country, attacking the views of liberal Christians as fundamentally irreligious and unchristian and insisting not only upon rigid measures on the part of the individual churches, but also upon such a stiffening of the laws of the States as to prevent what they regard as the insidious propaganda of modernism in the schools. The storm-centre of the debate was the doctrine of evolution which, as interpreted by Mr. Bryan, involves a denial of the Biblical doctrine of creation and the surrender on the part of the teacher to an all-devouring materialism.

As a result of his agitation, legislation similar to that of Tennessee has been attempted in a number of different States, but the only State which has adopted such legislation is Mississippi. During 1927, the following States rejected anti-evolution legislation: West Virginia, Missouri, Oklahoma, New Hampshire, Arkansas, Delaware and Minnesota. Both in Mississippi and Tennessee the law is now practically a dead letter.

In the State of Texas, the State text-book commission is given authority to prohibit the use of any text-book which the commission deems objectionable, a power which was intended to be used and has been used, for the prevention of the teaching of evolution in the schools of the State. (W. A. Br.)

FUNDED DEBT, that portion of the indebtedness of a business concern or of a Government which is represented by bonds. Such indebtedness may be created originally by an issue of bonds for a particular purpose, or may have resulted from the *funding* of various floating debts, i.e., paying off the floating debts with the proceeds of a bond issue made for that purpose. When bonds representing a funded debt mature they are frequently "re-funded," i.e., replaced by another bond issue extending over a further period.

FUNDY, BAY OF, an inlet of the North Atlantic, separating New Brunswick from Nova Scotia. It was first explored by the Sieur de Monts (d. c. 1628) in 1604 and named by him La Baye Française. It is 145 m. long and 48 m. wide at the mouth, but narrows towards the head, where it divides into Chignecto bay to the north which subdivides into Shepody bay and Cumberland basin (the French Beaubassin), and Minas channel, leading into Minas basin. Off its western shore opens Passamaquoddy Bay, forming part of the boundary between New Brunswick and the State of Maine. The Bay of Fundy is remarkable for the great rise and fall of the tide, which at the head of the bay has been known to reach 62 feet. In Passamaquoddy bay the rise and fall is about 25 ft. Though the bay is deep, navigation is rendered dangerous by the violence and rapidity of the tide, and in summer by frequent fogs. At low tide, at such points as Moncton or Amherst, only an expanse of red mud is seen, and the tide rushes in a bore from 3 to 6 ft. in height. Large areas of fertile marshes are situated at the head of the bay, and the remains of a submerged forest show that the land has subsided at least 40 ft. in the latest geological period. The bay has numerous harbours, of which the chief are St. Andrews (on Passamaquoddy bay) and St. John in New Brunswick, and Digby and Annapolis (on an inlet known as Annapolis basin) in Nova Scotia.

FÜNEN (Danish *Fyen*), one of the larger Danish islands, second in size to Zealand, lying between that island and south Jutland. Area, 2,986 sq. kilometres. Its physical features are similar to those of eastern Jutland. See DENMARK.

FUNERAL RITES: see DEAD, DISPOSAL OF THE.

FUNG (FUNNIYEH, FUNJ, FUNGHA), a mixed negroid race, occupying parts of Sennar and the hilly country to the south between the White and Blue Niles. They traditionally come from west of the White Nile and are affiliated to the negro Shilluks. The Fung became the dominant race in Sennar in the 15th century,

assimilated the speech, religion and habits of the Arabs settled in that region and until the 19th century were one of the most powerful of African peoples in the eastern Sudan. Traces exist of the custom of king killing. The king once in his reign sowed and ploughed a plot of land. He wore a *takia*, a close fitting hat with two flaps stuffed to resemble wings. To-day the Fung are a bright, hospitable folk. Many of them are skilful surgeons and go far afield in their work. The fellahin, indeed, call surgeons "Senaari" (men of Sennar). See H. A. MacMichael, *History of the Arabs of the Sudan* (1922).

FUNGI, a large group of plants devoid of green colouring matter (chlorophyll) and reproduced by spores. They include many of the lowest forms of plant life. The thallus is unicellular or composed of branched tubes or filaments which have apical growth. The spore may consist of one or many cells. The absence of chlorophyll has a striking effect on the mode of life of fungi since in its absence they are unable to synthesise carbohydrates from the carbon dioxide of the air. They are dependent therefore on other plants or animals for their supplies of carbohydrates and sometimes of organic compounds of nitrogen. These supplies are obtained from living organisms by parasitic fungi, or more commonly from their dead remains by fungi which are termed saprophytes. Certain non-chlorophyllous organisms however are separated from the fungi and regarded as independent groups.

The fungi are a large group distributed over the whole world wherever other living organisms are found on which they may depend for their subsistence. The number of species is very large; probably 100,000 is a conservative estimate, but no figures,

FIG. 1.—A. MYCELIUM. B. SPORE. C. GERM TUBES

however carefully compiled, can be other than provisional. The bulk of the species known belong to the temperate zone. A wealth of forms no doubt exists in the tropics which have yet to be discovered. Geologically the fungi are an old group; the delicate nature of their tissues has militated against their preservation as fossils, but the hyphae of parasitic fungi are found in some of the earliest plant fossils known to us, the beautifully preserved remains of the Rhynie chert of Devonian age.

Organization.—If spores of common white mould (*Mucor*) are placed in a suitable food-solution they readily germinate; they absorb water and swell—the dark outer coat (exospore) ruptures and the thin colourless inner coat (endospore) protrudes

and lengthens to form a short tube, known as the germ tube (fig. 1 c). This tube grows at its tip and lengthens considerably; branches arise from it, elongate and branch in their turn and so give rise to an interconnected series of tubular structures known as hyphae. Each hypha is covered externally by a membrane and encloses a mass of protoplasm in which many nuclei are embedded. In older hyphae vacuoles appear and coalesce to form a large central vacuole. Through the walls of the hyphae food solutions are absorbed which provide for their further growth and extension. The whole system of hyphae thus represents the vegetative body of the fungus known as the mycelium (fig. 1 a). As the development of the mycelium proceeds the work of absorption becomes restricted to the younger hyphae which are growing forward into fresh areas of the substratum. The protoplasm of the older parts of the mycelium becomes stored with reserve food-materials and sooner or later from this part of the mycelium arises a new kind of hypha, devoted to the reproduction of the mould. These hyphae are stouter, limited in growth and with a different reaction to such stimuli as light, gravity, oxygen, etc. Thus they normally grow upwards into the air, towards the light, and terminate their growth by swelling at the tip to form a spherical head (the sporangium), the contents of which divide into many portions, each of which secretes a wall and becomes a spore (fig. 1 b). The production of sporangia continues while external circumstances remain favourable and while fresh supplies of food material are available to the developing mycelium. Given these conditions there is no reason why growth should ever cease. In the case of the fungi causing the well-known fairy rings, common in pastures, from a comparison of the rate of growth with the size of the ring, it has been estimated that the age of certain rings is not less than 3-400 years. Although the actively growing hyphae of *Mucor* are continuous tubes with numerous nuclei in their protoplasm and are hence described as caenocytic, the older hyphae show numerous cross walls which serve to cut off useless side-branches and to concentrate the food-reserves. In the majority of fungi all the hyphae are segmented (multicellular), the segments being multinucleate or more commonly with one or two nuclei.

The cell walls of certain groups of fungi (Saprolegniaceae and Peronosporaceae) give the same reactions as those of the higher plants and apparently consist of cellulose, but Gilson and Van Wisselingh have shown that in a very large number of forms the main constituent of the wall is chitin, a substance common in many animals, e.g. insects. In many cases the membranes undergo secondary changes and other substances may be added such as resins and colouring matters, the walls may become thickened by the deposition of new layers and often profoundly altered by lignification and suberization (*Fomes*, *Daedalea*). A striking change is carbonization, in which the walls become black and brittle.

(*Daldinia*, *Cucurbitaria*).—In the reproductive bodies of many of the higher fungi the walls of certain hyphae become mucilaginous, being hard and horny when dry but capable of absorbing water with great rapidity and consequent swelling. Striking thickening and differentiation may occur in the walls of spores which are commonly pitted, sculptured and ridged.

In the simpler types of mycelium the hyphae show little differentiation except in size. In many parasites in which the hyphae traverse the intercellular spaces of their hosts, lateral branches are produced which penetrate into the living cells and there carry on the absorption of food materials, these haustoria may have the form of simple or branched hyphae or swollen vesicles. In many mycelia the hyphae may become woven together into threads or cords. These may be white and tender as in the "spawn" of the common mushroom, or develop an outer hard and dark coloured layer and so assume a root-like appearance as in the rhizomorphs of the honey fungus, *Armillaria mellea*. In other cases the closely interwoven hyphae may form compact masses, varying in size from that of a pin's head (*Botrytis*) to that of a man's head and weighing 10 to 25 lb. (*Polyporus Myllitae*). These bodies known as sclerotia show also a differentiation into a hard, black outer layer and an inner white core—the whole body consisting of hyphae so closely interwoven and copiously branched and segmented as to resemble in section parenchymatous tissue of one of the higher

plants. From its mode of formation, however, this tissue is more properly described as plectenchyma or pseudo-parenchyma.

Both rhizomorphs and sclerotia serve for the collection and storage of reserve foods to be used in the formation of reproductive bodies, or in the resumption of vegetative activity. The former also serve to extend the fungus and in some parasites act as organs of attack (*Armillaria*).

In the higher fungi a similar interweaving and compacting of hyphae are involved in the formation of the fruit bodies or sporophores and in these structures a high degree of elaboration and of differentiation of the plectenchyma may occur (Polyporaceae, Phallaceae fig. 19).

Cell Contents.—In addition to the protoplasm and nuclei, the hyphae of fungi may contain, like other vegetable cells, substances of various kinds. Amongst the more easily identified are oil-drops—often coloured—crystals of calcium oxalate, proteid granules and crystalloids and resin. Starch apparently never occurs but glycogen is common and other carbohydrates such as the sugars almost certainly occur in the living cell. Other substances which can be readily extracted from fungal tissues include acids such as oxalic, citric and many other lichen acids, ethereal oils, resins and a number of powerful alkaloid poisons such as ergotin, muscarin, etc. Many of the coloured pigments are fixed in the cell-walls or deposited on their surface (*Chlorosplenium*) but in some cases are dissolved in the oil which occurs in drops in the protoplasm (*Pyronema*, *Monascus*).

The particular mode of nutrition of the fungi, viz., their dependence on other organisms for their food materials, is only rendered possible by their power of secreting a whole range of ferments capable of digesting the many complex substances which go to form the bodies of plants and animals. Amongst the enzymes extracted from fungi may be mentioned as examples, *diastase* which converts starches into sugar, *cytase* with a similar action on cellulose, *peptase* which converts proteins into peptones and amides, *lipase* which hydrolyses fat and oils, *invertase* which splits cane sugar into simple sugars such as grape sugar, and *zymase* which decomposes grape sugar into alcohol and carbon dioxide. These or similar enzymes are found as normal products of metabolism in plants generally where they play their part in the necessary digestion of reserve foods, etc. Whilst, however, in the higher plants their work is performed with few exceptions in the cells or the tissues in which they arise, in the fungi these ferments are excreted by the hyphae in order to bring about the necessary changes in the food-substance with which they come into contact. All fungi are apparently not capable of secreting every kind of ferment and so are unable to utilize all classes of food materials. Many are restricted in their choice, or rather show special facility in dealing with particular materials, e.g., horn, feathers, cellulose, fats. Some moulds on the other hand (*Penicillium*, *Aspergillus*) can utilize almost any organic food material and a large number of enzymes have in fact been extracted from these forms.

CYTOLOGY AND REPRODUCTION

Although the small nuclei of certain fungi were not recognized by early investigators, subsequent improvements in methods of research have demonstrated their presence in all the species in which they have been sought. In the lower fungi the hyphae are coenocytic, i.e., they contain numerous nuclei and these are of small size (0.003–3 m.m. in the Mucoraceae). In the higher fungi the segments may contain several nuclei (*Pyronema*, *Aspergillus*) but usually have only one or two. There is no reason to doubt that not only are they as essential to the cell of the fungus as to that of any other organism, but that they are fully comparable with those of the higher plants both in essential structure and in function. They normally divide mitotically (see CYTOLOGY) and in a number of cases, where the nuclei are of considerable size, the details of division have been minutely described (*Phyllactinia*, *Eumaria*). Typical spindles with centrosomes and asters are formed and the chromosomes are clearly differentiated. The number of chromosomes is usually small, e.g., eight in *Phyllactinia*.

As in the higher plants, in those fungi in which sexual repro-

duction occurs, the essential feature of fertilization is the union of two nuclei. These are, in the simplest cases, the nuclei of the sexual cells or gametes and the new cell which results is known as the zygote. This has a double number of chromosomes, and is therefore described as diploid in contradistinction to the haploid nuclei of the sexual cells and of any vegetative cells associated

FROM "PROCEEDINGS OF THE ROYAL SOCIETY," BY COURTESY OF THE COUNCIL AND K. M. CURTIS

FIG. 2.—LIFE HISTORY OF *SYNCHYTRIUM ENDOBIOITICUM*

Copulation of two planogametes, G. Young hyphospore, H. Hyphospore during maturation of zoospore primordium, I. Penetration of the zygote

with them. Fertilization thus marks the end of one definite phase in the life of the fungus (haploid phase) and the beginning of a new one (diploid phase) of which the zygote is the starting point. This in its turn must end with a process of reduction (meiosis) by which the haploid nuclei are again restored (see CYTOLOGY). Fertilization and meiosis are thus two cardinal points in the history of an organism; ending the haploid and diploid phases respectively. In some of the higher fungi, these alternating nuclear phases are associated and correlated with striking differences in the vegetative structure of the mycelia concerned. In these the zygote may give rise to many generations of diploid cells which eventually produce the mother-cells—usually of special form—in which meiosis will occur. These cells—gonotocysts—correspond to the spore-mother-cells of the higher plants and like them they produce a definite number (four or eight) of daughter-cells, the spores, which contain haploid nuclei.

Life History of a Simple Fungus.—Some of the essential facts referred to above may be illustrated by reference to the life history of one of the simplest of the lower fungi, *Synchytrium endobioticum*, a parasite on potato tubers where it causes the well-known and destructive wart disease. The parasite enters an epidermal cell of the potato as a small naked protoplast containing a single nucleus. It increases in size at the expense of the contents of the host cells and, when these are exhausted, its vegetative activity is brought to an end. It now surrounds itself with a wall of two layers, a thicker outer exospore and a thinner endospore and becomes a summer spore (fig. 2 c). The exospore then ruptures and allows the endospore (prosporus), still enclosing the protoplasts, to escape into the host cell. Here the nucleus

begins to divide and by successive divisions, a number of nuclei, usually 32, are formed. The whole contents now become divided into several (five to seven) portions each of which becomes surrounded by a separate wall. We have thus formed a group of cells in which as many as 300 nuclei may be formed by further division and the whole protoplasmic contents become cleft into as many small naked spores each containing a single nucleus. The cells containing these spores (the sporangia) burst and liberate their contents and each spore is seen to be provided with a motile organ in the form of a delicate protoplasmic thread or cilium. By the cilia the spores are able to propel themselves in the soil water and, from this animal-like movement, are known as zoospores. They settle down eventually on the surface of a young tuber, throw off their cilia and then penetrate the outer cell-wall of the host and so effect an entrance to the interior of the cell. Here they repeat the development described above. Thus the haploid generation of *Synchytrium* can reproduce itself and the cycle of zoospore-vegetative-cell-summer-spore-sporangia-zoospore can be many times repeated. The release of the zoospores from the ripe sporangia is dependent on the presence of free water. If their escape is delayed for a time they show a significant difference in behaviour. They swim towards other zoospores, they fuse together in pairs and the fusion cells, now provided with two cilia, after independent movement, settle down and infect the cells of the host (fig. 2 f, g). As many sporangia will liberate their contents simultaneously when wetted, it is probable that any two cells uniting together will be derived from different sporangia. The zoospores in this case behave as sexual cells or gametes; there is no morphological difference; a zoospore is a potential gamete and its behaviour is determined by physiological conditions. The young zygote contains two nuclei which fuse and form a diploid nucleus. In the host cell it enlarges and on the exhaustion of available food surrounds itself with a double wall. So far its development resembles that of a haploid plant, but it now shows a marked difference in behaviour, since it passes into a resting condition, which may persist until the next spring. It is therefore known as a resting spore (fig. 2 i). Eventually the nucleus divides and it is probable that there is a true meiotic or reduction division. After repeated divisions, zoospores are formed and set free by the splitting of the thick wall. Thus the haploid generation again begins its development. Here, then, we have the nuclear cycle completed, and the haploid and diploid phases are each associated with a distinct generation of the fungus which, though resembling one another in vegetative structure, differ in the final products of their development. The haploid generation is terminated by the production of gametes and their conjugation; the diploid generation is terminated by meiosis and the resulting production of haploid zoospores.

Fertilization.—The conjugation of two similar gametes (isogamy) is characteristic only of the simpler fungi. Throughout the whole group it is possible to trace tendencies, which have not only profoundly modified the type of sexual reproduction, but in so doing have directly contributed to the success of the fungi in their transition from an aquatic to a terrestrial mode of life. These tendencies have led to the suppression of the individualization of the gametes and the assumption of their functions by the gametangia—the structures in which gametes are formed.

In the simplest cases this has resulted in the sexual process consisting in the fusion of two entire individuals. These are usually of different size and we can distinguish a smaller male and a larger female (*Polyphagus*, fig. 3 d). The mature individuals thus form a single gametangium and the distinction of sex is marked by calling the male gametangium an antheridium and the female an oogonium.

In most fungi the whole plant is not involved in reproduction as in *Synchytrium* and *Polyphagus*, but only certain hyphae which bear the gametangia. Thus many gametangia are borne on each individual and here we can distinguish two possibilities. The individual may bear gametangia of both kinds (monoecious, hermaphrodite, bisexual) or there may be two kinds of plants each bearing one kind of gametangium only (dioecious, unisexual). Since in the fungi we have only to consider sex in relation to the

haploid generation, it is more convenient to distinguish these fungi by the terms first suggested by Blakeslee for the Mucoraceae—homothallic (monoecious) and heterothallic (dioecious). Thus *Polyphagus* is heterothallic.

In the Mucoraceae in which both types of thallus occur, the gametangia, which contain a large number of nuclei representing the potential gametes, show no morphological distinctions into antheridium and oogonium. When they fuse their contents are mingled and a large number of nuclei pair together; we thus have multiple fertilization which, however, only results in the production of one zygote, a coenozygote.

In the Oomycetes, homothallism is the rule (except *Dictyuchus*), and the gametangia are clearly differentiated into antheridia and oogonia. In *Monoblepharis* the antheridia give rise to a number of uniciliate male gametes which are set free in the water to find the oogonium. The latter's contents round off to form one large naked uninucleate mass termed the oosphere or egg (fig. 4 a). This is not strictly a gamete, since it represents the whole contents of the gametangium and at first contains many nuclei—potential gametes. In other members of this group (Saprolegniaceae, Peronosporaceae) the element of chance in fertilization is still further reduced. The antheridia are brought into contact with the oogonia and the male gametes—now undifferentiated and represented only by their nuclei—are brought directly into contact with the eggs (fig. 4 d, e). As in the Mucoraceae, these fungi are independent of water for fertilization. It is this independence of water both for fertilization and, as will be shown later, for the dissemination of spores, that has rendered possible the migration of fungi from a life in water to an existence on land and on land plants.

In the higher fungi a further modification can be traced which leads to the suppression of the function of the male organ and finally to its disappearance. This does not involve the absence of fertilization, but the fusion of nuclei derived from nearly related cells of the female organ (*Ascobolus*) or of nuclei within the common mother-cell (*Humaria*, *Lachnea*). This leads finally to the disappearance of the female sexual organs and a condition of pseudogamy in which the cells concerned are two vegetative cells sexually different but not differentiated in structure. This is the case, e.g., in many yeasts and in some of the higher Basidiomycetes. These fusions of vegetative cells may appear to be on all fours with the anastomoses which occur not uncommonly between ordinary vegetative hyphae, but that they differ in kind is clear from the fact that they have the essential character of a sexual fusion inasmuch as they form the starting point of new development. As in all types of fertilization they mark the beginning of the diploid generation. A reference to the conditions existing in *Synchytrium*, where every zoospore is a potential gamete, may help the realization, that in a haploid or gametophyte generation of one of the higher fungi, however numerous the cells or diverse in structure, every nucleus has the same organization, every cell has the potentialities of a sexual cell.

Asexual Reproduction.—The reproductive bodies of fungi are known as spores. The simplest type of reproduction is the separation of a cell or group of cells which is capable of independent growth and which thus serves to propagate the fungus. Although physiologically these behave as spores they are usually distinguished as oidia (*Monilia*) or, in sprouting fungi such as the yeasts, as buds or gemmae. From a morphological standpoint spores are marked off from the hyphae which produce them by their form, size, colour, mode and place of origin, etc. Spores formed within a special sac, the sporangium, are known as sporangiospores, or if motile as zoospores. If they are cut off terminally from a hypha they are conidia and the parent hypha is a conidiophore. Chlamydospores are thick-walled, usually resting spores formed like conidia or more usually as intercalated bodies on ordinary hyphae. The various kinds of spores of fungi also receive special names in the different groups, and these, although given without any reference to general principles, are useful and convenient owing to their descriptive character.

Sporophores and Fruit Bodies.—In the simplest cases, the spore-bearing structures or sporophores are hyphae which by their

form and behaviour are marked off from the rest of the mycelium. They are simple or branched in a definite manner, they grow up into the air or radiate into the surrounding water. They may be isolated but are frequently associated together. If they are united into bundles these are called coremia; if in flat layers, sporodochia. They are often borne on a plectenchymatous cushion known as a stroma, and are distributed over its whole surface. In other cases the plectenchyma forms a hollow body which bears the conidia on its inner walls. These structures are termed pycnidia and their conidia are usually distinguished as pycnospores.

The various spore forms referred to above—sporangiospores, conidia, etc., are sometimes described as "summer" spores. It is a somewhat misleading term, but it does indicate that these bodies serve the purpose of rapid propagation of the fungus under favourable conditions. They are produced for the most part on haploid mycelia and appear as soon as the necessary food-materials have been accumulated by the vegetative hyphae. In the higher fungi special types of fruit bodies occur which are distinguished by the fact that they consist wholly or in part of diploid hyphae and that they are concerned with the production of gonotocysts, those cells in which the reduction divisions are effected. The gonotocysts produce daughter cells—the spores—with haploid nuclei. Where the spores are produced within the mother-cell—endogenously—it is called an ascus and the daughter cells ascospores. Where they are borne externally—exogenously—they are termed basidiospores and the mother cell a basidium. Details of the structure and mode of formation of these fruit bodies will be given in later sections dealing with classification (see below, Ascomycetes and Basidiomycetes).

PHYSIOLOGY

The general physiology of the fungi does not differ essentially from that of other plants. Their requirements are the same as those of the living cells devoid of chlorophyll of the higher plants, wherever these may occur. Like them they require water, various inorganic salts and supplies of carbonaceous and nitrogenous foods in varying degrees of complexity. They respire, taking in free oxygen and liberating free carbon dioxide or excreting carbonic acid. Aerial hyphae transpire and often exude drops of water; waste products (e.g., calcium oxalate) are also excreted. They respond to external stimuli such as light, gravity, certain chemical substances, etc.

The one fact which dominates and restricts the mode of life and nutrition of the fungi is the absence of chlorophyll and their consequent dependence on outside supplies of organic carbon and in many cases of organic nitrogen. Fungi are therefore compelled to live on materials derived from other plants or from animals, and are either parasites on living organisms or saprophytes living on their dead remains. No hard and fast line can be drawn between these habits. There are many fungi normally living as parasites which can exist as saprophytes and vice versa. The large majority of fungi are saprophytes and they, with the bacteria, are the great agents of decay in nature. The vast amount of vegetable material which annually falls to the soil, the remains of herbs, the fallen leaves of deciduous trees, the fallen branches and trunks of forest giants, the excrement and the dead bodies of animals are all material for the sustenance of fungi. They are abundant in the upper layers of the soil in which these organic remains become incorporated by the action of many animals, e.g., worms, beetles, etc. In the household they are found on stale foods of every kind, on preserves, on damp clothing and leather, wall paper and plaster. Special means are therefore taken to protect foods from destruction by the common moulds.

Harmful Forms.—The preservation of food such as fruit, meat, etc., is effected by first sterilizing the material by heat, which destroys active mycelia and spores, and secondly by preventing the access of other air-borne spores. Thus bottled fruit is heated to a temperature of 160° F, which destroys the yeasts and other fungi on the surface of the fruit, and the bottles or tins are closed whilst the space above the liquid in the tin or bottle is filled with steam. The same method of procedure is adopted for the preservation of meat but the food is raised to a higher

temperature. The preservation of jams depends not only on the sterilization by heat during their preparation, but on the high percentage of sugar, incorporated with the fruit, which is unfavourable to the development of mycelia and of yeasts. Where moist air is allowed access, by imperfect covers or bad conditions of storage, to the surface of the jam, water may be absorbed by the sugar and the concentration sufficiently reduced to allow moulds to develop. The damage is therefore confined to the surface layers. Where the proportion of sugar is low, yeasts may enter and cause fermentation, indicated by bubbles of gas and a pronounced alcoholic flavour.

Great damage is often caused to floor-boards, wooden partitions and wall-panelling by wood-destroying fungi, notably by the dry rot fungus, *Merulius lacrymans*. This attacks both soft and hard woods, its mycelium destroying the cell walls, reducing the wood to a soft brownish mass which as it dries becomes characteristically fissured by right-angled cracks. When the surface of the wood is dry the mycelium is largely confined to the inner layers, but in a moist atmosphere the mycelium appears on the surface of the wood, forming continuous sheets of tissue and giving rise to numerous strands and cords which pass to neighbouring wooden structures. Under these circumstances the spread of the fungus and the consequent destruction of the wood is rapid and unchecked. The cords enormously extend the range of the fungus; they have been known to spread along the surface of brick walls, to penetrate the mortar between the bricks and so convey the destroyer from one room to another. There is little doubt that the fungus is in most cases introduced with the wood, but the extent of the resulting damage can be minimised by ensuring that wood used in construction is dry and well seasoned and thoroughly ventilated. As a preventive against the attack of this and other fungi, wood is often treated with tar, creosote and other fungicides. (See DRY ROT.) The consumption of wood in coal mines is enormously increased by the short life of the pit props, whose decay is promoted by the warm humid atmosphere so favourable to the rapid development of mycelia.

Symbiosis.—The living together in close association of two dissimilar organisms is described as symbiosis and the fungi afford some of the best known instances of this mode of life. Lichens form a classical example. In these dual organisms a fungus and an alga are associated together. Both components derive advantages from the association. The alga receives from the fungus water and inorganic substances and in some cases is protected from desiccation; it grows and increases by vegetative means. The fungus is, however, the dominant partner. It derives its organic food supplies from the alga and in many cases has been observed to send haustoria into the alga cells. It alone produces a fructification. (See LICHENS.) The parasitic fungi provide another group of examples in which, however, the relation between the symbionts is definitely antagonistic. (See PLANT PATHOLOGY.)

There exists, however, another association between fungi and the higher plants in the formations which are known as mycorrhizas. These are structures in which a fungus is found growing in intimate relation with the roots of one of the higher plants. They are widespread, occurring, e.g., in the common forest trees of the temperate zone (Cupuliferae, Coniferae), in the heather and other members of the Ericaceae, in many orchids and in a large number of other plants which live in soils rich in humus. On the forest trees the mycorrhizas can be distinguished by their frequently branched coralloid appearance, and the presence of a complete mantle of fungal hyphae covering the terminal portion of the root. In orchids and in members of the Ericaceae another type is found, in which the fungus is for the most part inside certain of the living cells of the root and sometimes of other members. These two different types of mycorrhiza have been distinguished as ectotrophic and endotrophic. These terms are convenient to distinguish extreme cases, but intermediate forms are not unusual. As to the fungi concerned, a large number of the higher fungi (Hymenomycetes, Gasteromycetes) have been stated to be concerned in the formation of the mycorrhizas of forest trees. They are not usually specific and not only may a number of different fungi form mycorrhizas on one and the same

species of tree, e.g., the beech, but these in many cases show quite distinct differences in form, colour, etc. In the case of many orchids, the fungi concerned are nearly related and have been referred to the genus *Rhizoctonia*.

The whole question of the significance of these structures and of the relations existing between the fungus and its host, has provided a wide field for speculation and in recent years has led to experimental investigations which have yielded important and suggestive results. On the whole, these investigations may be said to support the view that these structures are of benefit to the host plant. It does not follow that any obligate relation exists between the fungus and the host. In the case of forest trees seedlings can be grown successfully in the absence of the fungus, but there is strong evidence that the presence of the fungus may promote the absorption of nitrogenous substances from the humus of acid soils and this may well be a decisive factor in the success of trees established in such conditions. In the case of many orchids whose seeds are notoriously difficult to germinate, successful growth can be induced by sowing the seeds on a suitable medium containing the appropriate endophytic fungus. Even here, however, the same results can be obtained in the absence of the fungus by a careful adjustment of the composition of the medium. Interesting as these latter results may be, as indicating the possible rôle of the fungus in promoting germination, it can hardly be doubted that in nature the latter plays a decisive part. It is probable that in these plants, and in forest trees, the fungus in the root cortex may serve to assist in the absorption of organic compounds. The strong development of similar fungi in the tissues of those orchids, which are devoid of chlorophyll and must therefore depend for their whole supply of organic food on the humus in which they live, gives strong support to this conclusion. There is no evidence that the plant in these cases is able to undertake this absorption in the absence of the fungus. The presence of fungi, which probably have a similar significance to those of mycorrhizas, has been noted in other groups of plants. They are known to be of regular occurrence in many liverworts, the prothallia of *Lycopodium*, the rhizome of *Psilotum* and in a number of ferns (Ophioglossaceae, Marattiaceae).

Medicinal and Dietetic Uses.—Although, in common with many other plants, fungi have played their part in the preparation of various specifics, only one yields a drug of first importance, viz., the ergot, *Claviceps purpurea*. The active principles are the alkaloids, ergotamine and ergotoxine and extracts containing these are used for obstetric purposes. *Boletus laricis* yields a drug long used under the name of agaricus albus.

In addition to these forms, many other fungi contain poisonous substances such as alkaloids which render them extremely dangerous when used as foods (species of *Amanita*, *Stropharia*, *Russula*, *Boletus*, etc. See Plate). However, there are a number of fungi which are perfectly wholesome when properly prepared, and although in England the common mushroom (*Psalliota campestris*) alone is generally eaten, on the continent of Europe many other species are eagerly sought, e.g., *Lepiota procera*, *Morchella esculenta*, *Boletus edulis*, *Cantharellus cibarius*. In addition to these species the truffle (*Tuber*) is universally esteemed a great delicacy.

Economic Uses.—The common mushroom is extensively cultivated and finds a ready sale at all seasons. It is sometimes grown on beds of horse manure out of doors, but more usually in special houses or pits, or in caverns or tunnels such as disused quarries. These beds are infected with "spawn" which consists of cakes of manure permeated with the mycelium of the fungus, whose growth has been arrested by drying.

The fungi which are the most important from an economic standpoint are the yeasts. They owe their importance to their power of fermenting various sugars with the production of alcohol (see BREWING). Brewers' yeast is also used in bread-making, the "rising" of the bread being caused by the escape of the bubbles of carbon dioxide evolved by the fermenting yeast. Another fungus, *Mycoderma aceti*, can, in the presence of oxygen, change the alcohol of fermented liquors to acetic acid and so produce vinegars. Of minor importance may be mentioned the species

of *Penicillium* with which various cheeses (Stilton, Gorgonzola) are inoculated in order to produce the characteristic green-veining and improvement in flavour.

CLASSIFICATION

It has for long been recognised that the fungi proper fall into three main groups, the Phycomycetes, Ascomycetes and Basidiomycetes. The scheme of classification put forward by O. Brefeld and F. Von Tavel has been very generally accepted and has formed the basis of more recent arrangements of the groups. Brefeld's classification of the higher fungi was, however, based on the conception that their characteristic reproductive structures, the ascus and basidium, had been derived by modification from the asexual sporangium and conidiophore respectively, of certain Phycomycetes. With increasing knowledge of the widespread existence of a sexual process in the higher fungi, with the modern developments of cytology, and appreciation of the rôle of the nucleus in fertilization and its importance in genetics, Brefeld's view of the origin of the ascus and basidium can no longer be maintained. These structures are now recognised as the gonotocysts, the cells in which the reduction division is effected and cannot be homologised with the asexual reproduction organs of the haploid mycelium of the Phycomycetes. Although the view has been expressed that the fungi are polyphyletic, i.e., they have arisen from the algae as several distinct groups, each with an independent origin, there is considerable justification for the view that the main advance has been in one monophyletic series and that the higher fungi have originated from the Phycomycetes, though not in the manner postulated by Brefeld. This view will be further discussed in the detailed consideration of the groups.

Scheme of Classification.

CLASS I. PHYCOMYCETES. Thallus a naked protoplast or an unsegmented coenocytic mycelium, sexual reproduction usual.

Order I. *Archimycetes*. Mycelium poorly developed or absent zoospores common, sexual reproduction frequent.

Order II. *Oomycetes*. Mycelium well developed, asexual reproduction by zoospores or conidia, sexual reproduction by oogonia and antheridia, resulting in oospores.

Order III. *Zygomycetes*. Mycelium well developed, asexual reproduction by sporangiospores or conidia, sexual reproduction by conjugation of similar gametangia and production of zygospores.

CLASS II. ASCOMYCETES. Thallus a segmented mycelium, segments with one or many nuclei, asexual reproduction common, sexual reproduction of wide occurrence, often much reduced. Characteristic spore-bearing structure the ascus.

Subclass 1. *Protascineae*. Asci free on mycelium.

Orders, *Endomycetales*, *Exoascascales*.

Subclass 2. *Euascomycetes*. Asci collected on or within a fruit body. Orders, *Plectascales*, *Perisporiales*, *Hypocreales*, *Sphaeriales*, *Dothideales*, *Hysteriales*, *Phacidiales*, *Pezizales*, *Tuberales*, *Laboulbeniales*.

CLASS III. BASIDIOMYCETES. Thallus a segmented mycelium, segments with either one nucleus or with two, asexual reproduction not uncommon, sexual reproduction much reduced. Characteristic spore-bearing structure the basidium.

Subclass 1. *Protobasidiomycetes*, Basidia septate. Orders, *Uredinales*, *Auriculariales*, *Ustilaginales*, *Tremellales*.

Subclass 2. *Autobasidiomycetes*, Basidia aseptate. Orders, *Tulaneales*, *Dacryomycetales*, *Cantharellales*, *Polyporales*, *Agaricales*, *Plectobasidiales*, *Gasteromycetes*.

Phycomycetes.—I. The *Archimycetes*. These parasitic and mainly aquatic forms have been looked upon as degenerate *Oomycetes* and were formerly included in that group. Simplicity of structure, however, though it is often the result of degradation, is equally a mark of primitive organisation. The fact that in this group is found the simplest type of sexual reproduction known among the fungi is justification for regarding them as an assemblage of primitive organisms, whose relation to the other groups of *Phycomycetes* is somewhat obscure. The simplest representatives such as *Olpidium* and *Synchytrium* live in the cells of their hosts as naked protoplasts. They reproduce by uniciliate zoospores, which under certain conditions behave as gametes (see above *Synchytrium*). The zygote resulting from the conjugation of the gametes has a period of vegetative growth and encysts to form a resting spore. A similar mode of life and vegetative structure is exhibited by *Olpidiopsis* in which the zoospores are biciliate; here, however, there are no motile gametes, a larger female and a

smaller male individual fusing together. These are multinucleate and may be regarded as gametangia which have assumed the functions of gametes (fig. 3 a).

In *Rhizophidium* the parasite is enclosed in a membrane and lives outside its host, into which it sends a short peg-like haustorium, which in some related forms (*Rhizidiomyces*), develops delicate absorbing threads (fig. 3 b). At maturity the whole

body becomes a sporangium or acquires a thick wall and forms a resting spore. Sexual reproduction is unknown, but in the related *Zygorkhizidium* conjugation between two individuals creates a resting zygote (fig. 3 d). This mode of sexual reproduction in which the conjugation of two individual plants is concerned is found in other forms, e.g., *Sporophlyctis*, *Polyphagus*. In the latter, which is parasitic on *Euglena*, the fungus possesses a highly developed system of hyphal-like haustorial threads, enabling it to attack a number of alga cells simultaneously (fig. 3 c). In other members of the group these threads, though extremely delicate, may be regarded as fine hyphae. In *Physodema* and *Urophlyctis* they develop at intervals large swollen vesicles, the collecting cells, which not only serve as centres for fresh hyphal development, but give rise to large, thick-walled resting spores (fig. 3 e).

Olpidium Brassicae causes a disease of cabbage seedlings, the species of *Synchytrium* cause warts or tumour-like swellings on their hosts (e.g., potato, dog's mercury, dandelion) and similar lesions are caused by species of *Urophlyctis* on alfalfa, beet and other plants.

II. The Oomycetes. These fungi have a well developed mycelium of large coenocytic hyphae. The lower families (Monoblepharidaceae, Saprolegniaceae) are saprophytes, living in water on vegetable or animal remains, the Ancylistineae being reduced forms, parasitic on algae, eelworms, etc., the Peronosporaceae are saprophytes or highly specialised parasites on land plants.

The group exhibits in the structure both of its asexual and

sexual organs a series of modifications, which can be directly related to the gradual change of habit from an aquatic to a terrestrial existence.

The lower families are propagated by zoospores, uniciliate in *Monoblepharis*, biciliate in the Saprolegniaceae and Ancylistineae (fig. 4 b) borne in sporangia which, e.g., in *Saprolegnia*, are but slightly enlarged terminal portions of the hyphae which bear them. In *Pythium* and *Phytophthora* the sporangia are spherical or oval in form and in certain conditions (absence of free water) they can put out a germ tube and so give rise directly to a hypha. In other genera (*Peronospora*) this direct mode of germination is alone possible, zoospores are no longer produced, the zoosporangium has become a conidium—capable of germinating in moist air and so adapted for a parasitic life on land plants (fig. 4 b).

In their sexual reproduction the group exhibits very strikingly the tendency already mentioned to replace the union of gametes by the fusion of gametangia. In *Monoblepharis* the female organ, the oogonium, contains a single, non-motile, uninucleate egg. It is fertilized by a motile spermatozoid, which closely resembles in structure the zoospores. The zygote resulting surrounds itself with a thick membrane and forms a resting oospore (fig. 4 a). In *Saprolegnia* the young oogonium contains many nuclei, potential gametes, but of these only a few become each the nucleus of an egg, of which there are several in the mature oogonium. There

are no spermatozoids, and male gametes are not differentiated, the antheridium puts forth a fertilization tube which conveys the male nuclei to the eggs. Thus, even in members of a family exclusively aquatic, water is no longer the means by which the male gametes reach the eggs. Some members of this family have but one egg in the oogonium and this is the rule in the other families. In *Albugo Blitii* the egg has many nuclei and numerous male nuclei pass from the antheridium and fuse with them. We have thus

multiple fertilizations and the oospore which results may be regarded as a coenozygote since it contains many zygote nuclei, each the result of a separate fertilization. In most of the higher Oomycetes however the mature egg is uninucleate and only one male nucleus passes into it from the fertilization tube. Thus the final result of the assumption of the function of the gametes by the gametangia is a single fertilization, made, however, under such conditions as to eliminate accidents and ensure the production of the zygote.

Many of this family are dangerous parasites of cultivated plants and the cause of destructive diseases, e.g. "damping off" disease of seedlings (*Pythium*), potato disease (*Phytophthora*), vine mildew (*Plasmopara*).

III. The Zygomycetes. These fungi are largely saprophytic in habit and terrestrial. Their mycelium resembles in structure that of the Oomycetes. Zoospores are unknown, the characteristic reproductive organs of the leading family, the Mucoraceae, being sporangia which may contain (*Mucor*) thousands of spores (fig. 1 b). Certain genera, however, are reproduced by conidia, e.g., *Chaetocladium*, *Cunninghamella*, and there are a series of forms which show that in this family, as in the Oomycetes, a transformation of sporangia to conidia has taken place. In one series this has been brought about by the gradual reduction in the number of spores in the sporangium; so, e.g., *Thamnidium* has small sporangia with two to four or sometimes only one spore and *Chaetocladium* may be regarded as a genus in which the small sporangia each contain a single spore and hence behave as conidia (fig. 5 a, b, c).

In another series, *Blakeslea* produces sporangia of normal type and also spherical heads bearing a number of small sporangia with only 3 spores. These can be related to the spherical conidiophores of *Cunninghamella* and *Syncephalis*.

In their sexual reproduction the Mucoraceae exhibit the conjugation of coenocytic gametangia, the resulting structure, the zygospore, containing many zygote nuclei. The gametangia con-

cerned may arise on the same mycelium, on a common supporting hypha or zygomphore as in *Sporodinia*, *Zygorhynchus*, and such forms are described as homothallic. In the majority of the species so far investigated the gametangia arise on two separate mycelia, which are different in kind. There is little doubt that these two kinds of mycelium represent distinct sexes. A. F. Blakeslee, to whom the discovery of this condition—known as heterothallism—is due, pointed out that a difference of vigour, indicated, e.g., by a greater luxuriance of growth, was often to be observed between the two strains, which for this reason he distinguished as (+) and (−). He was able to show, moreover, by the production of so-called hybrid reactions that there is an essential sameness in all the (+) and in all the (−) strains, respectively, throughout the family, and that the (+) strains are probably to be regarded as female and the (−) as male.

The germination of the zygospore usually results in the production of a "germ" sporangium and in *Phycomyces nitens* it is in this structure that the zygote nuclei undergo the reduction division. The resulting spores are in the main of two kinds, producing (+) and (−) mycelia respectively; but there are also a few spores which give rise to feeble thalli—neutral mycelia—which are homothallic. It is of interest to note that H. Burgeff experimentally produced similar mycelia by the admixture of the contents of hyphae from (+) and (−) mycelia, and thus reached the conclusion that homothallic mycelia contain both (+) and (−) nuclei.

The Entomophthoraceae is a family of insect parasites of which one, *Empusa muscae*, attacks the common house-fly. They are reproduced asexually by conidia which are shot off from the conidiophores and form a halo around the dead flies.

The small family of the Endogonaceae with a single genus *Endogone* may be included here. The species form mostly under-

ground stromata in which the reproductive organs are embedded. In *Endogone lactiflua* two sexual branches of unequal size—male and female—grow up side by side. They are multinucleate at first and from each a terminal cell containing a single nucleus is cut off. These cells unite together and from the larger, the female, there now arises an outgrowth which rapidly enlarges, and into this pass the two sexual nuclei. This outgrowth is the zygote, which not only develops a thick wall but becomes surrounded and embedded by a number of vegetative hyphae (fig. 7 a, b, c).

Its germination is unknown. *Endogone* has been included in the Ascomycetes and is of considerable interest as indicating a possible relation between that class and the Zygomycetes.

Ascomycetes.—The mycelium is composed of hyphae regularly segmented into portions containing one or several nuclei. Asexual reproduction is common and this class provides a rich variety of conidial fructifications. Many species may show several different

FIG. 7.—A. FORMATION OF COPULATION OPENING IN *ENDOGONE LAC-TIFLUA*. B. NUCLEAR MIGRATION. C. FORMATION OF HYPHAL SHEATH AROUND ZYGOTE. D–F. DEVELOPMENT OF ASCI IN *EREMASCIUS FERTILIS*. G–I. DEVELOPMENT OF ASCI IN *ENDOMYCES*

types of reproduction on one and the same mycelium. There are many species in which the ascus fruit is rarely produced and there may consequently be many generations reproduced entirely by conidia. It is not, therefore, surprising to find a large assemblage of fungi (*Fungi imperfecti*) which are only known to reproduce asexually and many of which are believed to be incomplete forms of Ascomycetes.

The sexual reproduction of the lower ascomycetes (Protasiceae) may be compared with that of certain Phycomycetes such as *Endogone*. In *Eremascus fertilis* the sexual branches arise from two neighbouring cells of a hypha and grow up side by side. They each receive a nucleus from their parent cells and then fuse together. The two nuclei unite and the zygote enlarges and forms a spherical ascus. The fusion nucleus divides and eight ascospores are formed (fig. 7 d, e, f). The main point in which *Eremascus* differs from *Endogone* is that the direct product of fertilization is in the latter a zygospore and in the former an ascus. This then is one of the essential differences that mark off the lower Ascomycetes from the Zygomycetes. The higher forms are distinguished by a further advance, in that the zygote instead of forming an ascus gives rise instead to one or many hyphae which eventually form a number of asci (ascogenous hyphae). Thus we have intercalated between the gametangium and the ascus a new mycelial generation—the diploid generation.

The development of this diploid generation is accompanied in many forms with a delay in the fusion of the sexual nuclei, so that the ascogenous hyphae contain paired nuclei (dikaryons). It is in the ascus that nuclear fusion is finally accomplished, to be succeeded immediately by the meiotic phase and the formation of spores.

The ascogenous hyphae, however, do not form an independent self-supporting mycelium. They are dependent on the haploid

mycelium for their nutrition, and this is accomplished by the enclosure of the ascogenous hyphae in a simultaneous growth of vegetative hyphae from the parent mycelium. Thus we have formed the fruit body or ascophore, one of the characteristic structures of the higher ascomycetes, showing in the different families great variety in structure and organisation. Whilst in many families its development awaits the stimulus which originates in fertilization, in the higher forms it may reach an advanced stage of development before the sexual organs arise, buried in its tissues.

In *Eremascus* the two sexual organs are alike, but in the related *Endomyces* they are differentiated into a large female gametangium, the ascogonium and a smaller male, the antheridium (fig. 7, g, h, i). In the Euascomycetes this differentiation in sex is maintained and the ascogonium is usually characterised by the development of a receptive portion, the trichogyne. Both structures may be unsegmented, but in many families they may be divided by cross walls into several cells, the whole ascogonial branch (archicarp) thus consisting of a hypha of many cells, which is sometimes spirally coiled.

The antheridium shows no corresponding development, in fact it is possible to trace throughout the whole group the gradual dwindling in importance and final elimination of this organ.

With the cessation of the function of the antheridium and the establishment of some autogamic type of fertilization, the importance of the ascogonium itself begins to diminish. The functionless trichogyne disappears and finally the ascogonium itself is suppressed, and fertilization is effected between two undifferentiated cells of the haploid mycelium. These processes may be illustrated by reference to certain genera of the Pezizales.

In *Pyronema confluens* the large pear-shaped ascogonium bears

FIG. 8.—A, B. ASSOCIATION OF MALE AND FEMALE NUCLEI IN *PYRONEMA CONFLUENS*. C. FUSION OF ANTHERIDIUM AND SEPTATE TRICHOGYNE IN *LACHNEA STERCOREA*. D. ASCOGENOUS HYPHAE IN *HUMARIA GRANULATA*

at its upper end a tubular trichogyne, the tip of which fuses with the club-shaped antheridium. All these structures are multinucleate. The contents of the antheridium pass first into the trichogyne and then, by absorption of the intervening wall, into the ascogonium, where the male and female nuclei become associated (fig. 8 a, b). In *Lachnea stercorea*, though the antheridium is fused with the trichogyne, the latter is septate and no male nuclei pass from the antheridium into the trichogyne (fig. 8 c). In *Lachnea cretea* no antheridium is formed though the septate tri-

chogyne is still developed. In *Humaria granulata* the trichogyne has disappeared though the ascogonium has still the form of those described above and like them gives origin to the ascogenous hyphae (fig. 8 d). Finally in *Humaria rutilans* the ascogonium itself has disappeared and, with it, all trace of autogamous fertilization, which is replaced by the pseudogamous fusion of vegetative cells.

A parallel series can be traced in a related genus *Ascobolus* in which the ascogonium is many-celled. In *A. magnificus*, which is heterothallic, normal conjugation takes place between antheridium and trichogyne, in *A. furfuraceus* antheridia are absent. In one species *Ascobolus carbonarius* the antheridia are absent, but the long and often coiled trichogyne comes into contact with one of the oval, stalked conidia, borne on the mycelium, and fuses with it and thus, apparently, fertilization is effected.

This process finds an interesting parallel in one of the lichen fungi *Collema pulposum*. Here the archicarp, as in many lichen fungi, is a coiled thread terminating in a long slender trichogyne; the latter comes into contact with a conidium and fusion results. In other species of *Collema* the trichogynes, projecting above the surface of the thallus, get attached to their surface one or more uninucleate bodies, the so called spermatia, which are formed in flask-shaped bodies resembling pycnidia. As the name implies, these spermatia have been regarded as male sexual cells, but since they can be germinated in certain cases to form mycelia, it is possible that they are to be regarded as pycnospores their function as male cells being a secondary one.

It may perhaps be as well to point out, that these processes of modification and disappearance of the sexual organs, should not obscure the fact that the essential feature of fertilization is the fusion of two haploid nuclei, and it would appear that it is immaterial, whether these nuclei are derived from different sexual organs, antheridium and ascogonium, from the ascogonium alone, from an ascogonium and a vegetative cell, or from two vegetative cells. In every case the process which brings them together, whether fusion immediately results or not, marks the starting point of a new development, viz., the diploid generation, represented by the ascogenous hyphae. These hyphae eventually give rise to the asci and in the majority of the ascomycetes they are formed in a very characteristic way. As already stated the ultimate segments of these hyphae are binucleate and any one of them may grow out to a short branch, into which the two nuclei pass. This cell now curves over at the tip to form a hook, and the nuclei moving up to the summit divide there simultaneously. The spindles are so arranged that when the two cross walls are formed the summit of the crook contains two nuclei, whilst one is in the tip and another in the stalk (fig. 9).

In most cases the two nuclei at the summit fuse together and form the fusion nucleus of an ascus, which is formed by the further development of the parent cell. The point of the crook and the stalk lie close together and either of them may now become binucleate by the migration into it of the nucleus from the other. In this process the walls are perforated by the travelling nucleus. The binucleate cell so formed may now originate a new crook and so the process may be repeated several times.

The young ascus now enlarges, the nucleus also increasing in size, and finally the latter divides; this is followed by two further divisions and thus eight nuclei are formed, which become the centres in forming eight ascospores (fig. 10). The details of nuclear division in the ascus have been carefully studied in a number of forms, and there is no doubt that the first division in the ascus is the heterotype or reducing division (see CYTOLOGY). The two following divisions have, for the most part, the characters

of post meiotic divisions, but there is no general agreement as to their interpretation. In the account of the sexual process and development of the ascogenous hyphae already given, it has been assumed that the sexual nuclei are associated in pairs and pass as such (dikaryons) into the ascogenous hyphae; here the pairs may divide but later a pair of nuclei, by derivation male and female, fuse together in the ascus and so complete fertilization. In such a case the first division in the ascus is a reducing division and in the two succeeding divisions the haploid numbers of chromosomes will appear.

There are a number of forms however (*Sphaerotheca*, *Humaria*, *Lachnea*, *Ascobolus*) in which the nuclei in the ascogonium, however derived, have been described as fusing together. In this case, the nuclei in the ascogenous hyphae are diploid nuclei and the fusion in the ascus is a second fusion, and results in a nucleus with a fourfold number of chromosomes (tetraploid nucleus). Obviously a double process of reduction is necessary to restore the haploid nuclei of the sexual generation, and the second reduction is stated to take place during the second or third division. Further investigation is needed either to confirm or disprove the existence of double fusion and double reduction.

The weight of evidence on the whole favours the conclusion, that single fusion is the normal process in the Ascomycetes. In this respect they conform with the other large group of the higher fungi, the Basidiomycetes.

The mode of spore-formation in the ascus is peculiar. The eight nuclei formed in the third division show delicate radiations, extending from a centrosome, which meet around the nucleus and thus delimit a portion of the protoplasm on which a wall is secreted to form a young spore (fig. 10, h, i, j).

It has already been explained that, in the higher Ascomycetes, the developing ascogenous hyphae are enclosed by a development of the haploid mycelium, on which, in fact, they are parasitic. The whole structure which results is known as a fruit body or ascomphore. In the simpler orders (Plectascales and Perisporiales)

the enclosure is complete, the sterile hyphae compacting together on the outside to form a completely closed investment. Such a fruit body is called a perithecium. In other orders (Hypocreales, Sphaeriales, Dothidiales) a perithecium is formed, which is often flask-shaped, and provided with a neck with a definite opening for the discharge of the spores (fig. 12).

The remaining orders have a fruit-body known as an apothecium. Here the numerous asci are assembled, together with sterile hyphae or paraphyses, in a continuous layer known as the hymenium (fig. 13). This is freely exposed on the surface of the ripe fruit body which may be a flat disc or a cup (Pezizaceae) or a convex, often stalked, structure (Helvellaceae).

The spores of many ascomycetes are explosively discharged from the asci; a process which is facilitated by their mucilaginous contents and the pressure of the

surrounding asci and paraphyses.

The Endomycetales are a small family in which (*Endomyces*, *Eremascus*) the asci result directly from the conjugation of the gametangia and are thus borne directly on the mycelium (fig. 7). The important family of the yeasts, Saccharomycetaceae, is included in this order. These are fungi which, living normally in liquid media, have the form of oval or spherical cells which reproduce by budding. Some forms, when grown under certain con-

ditions, can develop true hyphae and thus show their derivation from fungi of normal structure. Many genera have a sexual process represented by the conjugation of ordinary cells. The result is the formation of an ascus in which ascospores are formed (*Schizosaccharomyces*, *Zygosaccharomyces*). In *Saccharomycodes Ludwigii* the ascospores are formed in the ordinary yeast-cells and conjugation takes place between the germinating spores. The ordinary yeast cells so produced are thus diploid cells. The beer yeast (*Saccharomyces cerevisiae*) is generally regarded as parthenogenetic. (See YEASTS.)

The Exoascaceae is a family of parasitic fungi which grow on the higher plants, often producing malformation of the leaves, fruits, etc. The mycelium may develop in the deeper tissues, but eventually makes its way to the surface and the asci are produced between the epidermal cells, or more frequently they arise from hyphae which lie between the epidermis and the cuticle. The cells of the mycelium are binucleate, and in the young ascus the two nuclei fuse and then undergo division, eight spores resulting in the usual manner. In some species (*Taphrina*) the original spores may bud in the ascus and give rise to hundreds of small conidia.

When spores are sown in suitable culture fluids they bud after the manner of yeast cells and produce conidia. In two species of *Taphrina* it has been shown that these secondary conidia can conjugate in pairs by means of a short tubular process. The nucleus from one cell passes into the other and the binucleate cell so formed now puts out a germ-tube. Moreover, when the eight spores from one ascus are carefully isolated and germinated apart, it is found that they fall into two groups, the conidia of one group will not conjugate together but do so readily with any member of the other group. They are thus, like many of the Mucorini, heterothallic, and the separation into the two sexes must take place during the divisions in the ascus.

The Plectascales include the common saprophytic moulds *Aspergillus* and *Penicillium* of which some species—*Aspergillus*

e.g., hop mildew, American gooseberry mildew. They produce conidia in chains and numerous perithecia which bear characteristic appendages. The Perisporiaceae with a similar habit have dark coloured mycelium and are known as sooty moulds.

The three orders Hypocreales, Sphaeriales, Dothideales include families which have frequently been grouped together under the names of Pyrenomycetes. They have perithecia which, when mature, have a well-defined mouth (fig. 12). In some genera the

fruit bodies are borne directly on the mycelium (*Sordaria*, *Chaetomium*) or isolated in the host tissues (*Venturia*) but more often they are borne on a stroma (*Nectria*, *Cucurbitaria*) or embedded in it (*Epichloe*, *Claviceps*, *Valsa*). The stroma may be flat or cushion-shaped, or immersed in the tissues of the host. In the more specialized forms the stroma may show a sterile basal stalk, the perithecia being limited to the upper part, where they may more efficiently distribute their spores (*Xylaria*). The Pyrenomycetes is by far the largest group of the Ascomycetes, a conservative estimate of the number of species being 10,000. Though the majority are saprophytes some well-known diseases of plants are caused by members of this group, e.g., canker in fruit trees (*Nectria*), ergot of cereals and other grasses (*Claviceps*), apple and pear scab (*Venturia*), most species of *Cordiceps* are parasites on insects.

FIG. 12.—PERITHECIUM OF *PODOSPORA FIMIDA* IN LONGITUDINAL SECTION

apple and pear scab (*Venturia*), most species of *Cordiceps* are parasites on insects.

The Pezizales include the forms with apothecia and they provide the largest and most elaborate fruit-bodies among the ascomycetes, e.g., *Morchella* which may be 10–12 inches in height.

In the Pezizaceae—the cup fungi—the apothecium is concave, saucer or cup-shaped, sometimes stalked. In the Geoglossaceae and Helvellaceae the ascophores are club-shaped or differentiated into a sterile stalk and fertile head, which may be folded or ridged in various ways to increase the area of the spore-bearing surface (fig. 13).

The Tuberales is a small group of fungi which include the well-known truffles (*Tuber* sp.). They live underground in the neighbourhood of trees and have been thought to be concerned in the formation of mycorrhizas. The hymenium lines internal chambers in the fruit-bodies.

The Laboulbeniales is an order of peculiar fungi, whose manifold structure has been made known by the investigations of Thaxter in America. They are minute plants from 1–10 m.m. in height which grow attached to the bodies of insects, especially beetles. They are dark brown in colour and consist of a basal receptacle which bears appendages, on which are the sexual organs. The female

organ is essentially an ascogonium with a trichogyne and is fertilized by male cells or spermatia. The fertilized ascogonic cell (ascogonium) gives rise to a number of asci which are enclosed in a perithecial wall that develops around the female organ. Some species are probably heterothallic (Amorphomycetes) but the male and female spores are associated together in the ascus, are shed and germinate together.

The Basidiomycetes.—The mycelium, like that of the Ascomycetes, is fully segmented, but in the haploid mycelium the segments are uninucleate. They differ from the Ascomycetes in the absence of sexual organs, whose functions are performed by

An ascospore

herbariorum, *Penicillium crustaceum* are the commonest and most ubiquitous of fungi. They reproduce themselves by a profuse production of conidia and also by closed (cleistocarpous) perithecia (fig. 11).

The Perisporiales are parasitic fungi living epiphytically, i.e., on the surface of their hosts, absorbing food materials by haustoria from the epidermal cells—or sending hyphae through the pores of the stomata into the interior of the host. The Erysiphaceae or mildews are the cause of disease in many cultivated plants,

pseudogamous vegetative fusions. The diploid mycelium which results is extensively developed, has a completely independent existence and in the higher forms, is, in fact, the only mycelium which can normally be distinguished.

Though sexual organs are absent the haploid mycelium is often sexually differentiated. Heterothallism occurs both in the Uredinales and Ustilaginales, and is widespread in the higher forms. In the latter, pseudogamous fusions presumably occur between

quently "germinate," that is they produce a short vegetative outgrowth resembling a germ tube (promycelium), which functions as the basidium and bears the basidiospores (sporidia). Thus in these forms the probasidium is concerned with the distribution and perennation of the fungus as well as with the production of the basidiospores (fig. 14 g).

The basidiospores may be thin-walled and adapted for immediate germination, and this is the case of the Protobasidiomycetes and in some of the lower families of the Autobasidiomycetes. These thin-walled spores when germinated in water or nutrient solutions may sprout like yeast cells and produce gemmae or secondary conidia. In the higher families they are thick-walled and are resting spores. In the majority of Basidiomycetes the spores are discharged from the sterigmata, but only for a short distance (0.1–0.2 m.m.). They are, for the most part, distributed by air currents.

Sub Class. Protobasidiomycetes. The Auriculariales is an order of mostly parasitic forms of which the simpler representatives, e.g., *Helicobasidium*, bear the basidia scattered on a loosely woven mycelium, but in the more typical forms, e.g., *Auricularia*, the hyphae, which have gelatinous walls, are compacted to form fruit bodies, often of considerable size. The basidia are borne on the upper surface of these fruit bodies and are the terminal portions of hyphae which do not reach the surface, become somewhat wider and divide transversely into four cells. From each of these arises a long sterigma which projects above the surface of the thallus and develops a spore at its tip (fig. 14 e). The spores can germinate at once and bud off small curved conidia. The fruit body is formed throughout of binucleate cells; the origin of this

hyphae of the mycelia of different kinds, though in only a few cases have these actually been observed. Asexual reproduction by conidia and oidia occurs in both types of mycelia.

In the lower families the basidia are borne directly on the diploid mycelium, but in the vast majority of the forms they are borne on fruit bodies or sporophores. These are not formed, as in most Ascomycetes, as the immediate result of a sexual process (see above) but arise from the diploid mycelium at a time and stage in its development which are determined by physiological factors, such as nutritive conditions, humidity, light, etc. The basidium, like the ascus, is the gonotocont. In it the reduction of the chromosomes is effected but the daughter cells (usually four) resulting are exogenous, i.e., borne on short stalks (sterigmata) outside the mother cell (fig. 14 d). Two kinds of basidium occur, those characteristic of the Autobasidiomycetes are, like the ascus, undivided (holobasidia). The Protobasidiomycetes have the basidia divided by septa into four cells (phragmobasidia) (fig. 14 e). The dividing walls may run transversely, e.g., *Auricularia*, or longitudinally as in *Tremella* (fig. 14 f). The fertilization which takes place in the young basidium is followed immediately by the reducing divisions and the development of spores, but in the Uredinales and Ustilaginales, after the nuclear fusion, a resting stage, often very prolonged, may intervene. This may be accompanied by a thickening of the wall of the mother-cell, which may even become set free from the mycelium as a spore (teleutospore, chlamydospore). These "probasidia" as they may be called, can no longer behave as basidia and produce the spores; they conse-

condition is unknown. The Jew's ear (*Auricularia auricula-Judae*) is a well-known representative of this order.

The Uredinales is a large order of parasitic fungi, known as the rusts, which are responsible for the diseases of many of the higher plants—ferns, conifers and flowering plants. Both kinds of mycelium, haploid and diploid are parasitic and may be found on the same host (autoecious) or on different hosts (heteroecious), sometimes belonging to widely different families. They are intercellular, highly specialised parasites, producing haustoria which penetrate the living cells of the host, and often stimulate the tis-

sues to increased growth and the formation of galls. They are often short-lived—attacking the leaves of the host and falling with them, but when they extend to the stems of perennial plants they are also perennial. No less than five kinds of spore may be produced in the life of one species, viz., aecidiospores, spermatia, uredospores, teleutospores and basidiospores (fig. 15). The aecidiospores and spermatia are borne on the haploid mycelium and appear early in the year. The first named are borne in fructifications known as aecidia, which are cup-shaped receptacles surrounded and enclosed by an investment (peridium, pseudoperidium), and containing rows of spores, which arise from a layer of cells at the base of the aecidium. The spores are binucleate and it has been shown that in the development of the aecidium, the basal cells are formed from uninucleate cells which, either become binucleate by the migration of a nucleus from a neighbouring cell, or, by uniting in pairs, give rise to a fusion cell with two nuclei (fig. 16). In either case we have a reduced sexual process by which the diploid generation is initiated, the first products of which are the aecidiospores. The spermatia are thin-walled cells of small size containing little protoplasm and a relatively large nucleus. They are borne in flask-shaped receptacles, the spermogonia. As the name indicates, they have been regarded as aberrant male sexual cells. This implies the previous existence of female sexual organs provided with some apparatus for the reception of spermatia. It has been shown that in certain forms, e.g., *Phragmidium violaceum*, the fertile cells when young cut off a terminal sterile cell (fig. 16) which may well represent the remains of a trichogyne, which in ancestral forms projected above the surface of the host. These hypothetical ancestors would thus have a simple female sexual organ comparable with the archicarp of many Ascomycetes. The fact that all attempts to bring about infection of the host are by means of the spermatia lends strong support to the view that they are aberrant male cells. On the other hand there is evidence that in some species the haploid mycelia are heterothallic and that the conjugation of cells from two different mycelia are involved in the sexual act which precedes the formation of an aecidium. It is not without significance that spermogonia in these cases occur on all mycelia both (+) and (−). The spermatia are exuded from the spermogonia in drops of sweet fluid, which is sought by flies and other insects. Where drops of this liquid with the spermatia are transferred from the spermogonia on one mycelium to those on another sterile mycelium, the formation of aecidia is stated to follow immediately. Cytological details are unknown, but these observations, if confirmed and extended, may modify the conception now entertained of the morphological nature of the spermatia both in this and other groups in which they occur.

and so are the young teleutospores, but in the latter the two nuclei fuse before their development is completed. The teleutospores are thus the probasidia. They germinate in due course and give rise to the promycelium—the basidium proper, on which after its division into four cells the four basidiospores, known as sporidia—are produced. These are uninucleate and can at once infect the proper host and develop the haploid mycelium. This

FIG. 17.—(A) GERMINATING RESTING-CONIDIA OF *TILLETIA CARIES*, (B) GERMINATION OF SMUT PORES (*USTILAGO SCABIOSAE*), (C, D) COPULATION OF SPROUT CELLS (*USTILAGO VIOLACEA*), (E, F) GERMINATING AND COPULATING PROMYCELIA (*CINTRACTIA MONTAGNEI*), (G) YOUNG BINUCLEATE SPORE FUNDAMENTS, (H) MATURE UNINUCLEATE SPORES (*USTILAGO HOLOSTEI*)

is the life history of one of the most complicated forms, the so-called eu-forms of which the black rust of wheat (*Puccinia graminis*) is an example. In this species the host of the haploid mycelium is the common barberry (fig. 15). In other species one or more of the spore types may be absent. The -opsis forms have no uredospores (*Gymnosporangium* sp.). In the brachy-forms the aecidia are absent but the spermogonia are accompanied by sori of uredospores, which in some cases arise as the result of a reduced fertilization, like that already described as taking place at the base of the aecidium. These primary uredospores thus appear to be homologous with aecidiospores. Other species have neither aecidia (or primary uredospores) nor spermogonia and are known as hemi-forms; there are micro-forms in which teleutospores alone occur. In the latter the binucleate condition is established at an early stage—probably by the migration of a nucleus from one cell to another of the haploid mycelium. The most reasonable interpretation of these forms with a shortened life history is that they have been derived from the more complete forms. The teleutospore is the spore form almost invariably present and the classification of the family is based largely on its structural peculiarities.

The Ustilaginales were regarded by Brefeld as showing a half-way stage in the evolution of the Basidiomycetes from the lower fungi and he placed them in a separate group, the Hemibasidiomycetes. The cytology of the group, however, leaves little doubt that they are true Basidiomycetes and form a parallel group to the Uredinales.

They are parasites on grain and fodder plants causing the well-known diseases smut and bunt. The mycelium, which is usually binucleate, often develops slowly at first and then grows

The aecidiospores germinate readily on the surface of the appropriate host and the germ tubes enter the tissues by way of the stomata. They give rise to a binucleate mycelium and on this in due course appear the uredospores. These are so-called "summer" spores, i.e., conidia of the diploid mycelium, and can infect fresh hosts and so spread the disease. Later in the year and on the same mycelium teleutospores are formed. These are typically thick-walled and resting spores. The uredospores are binucleate

rapidly at a particular stage of development of the host and produces its spores, e.g., the smut of wheat (*Ustilago tritici*) attacks the wheat in the flower. The grains already infected are sown, the plant develops without external sign of disease and not until the ears are formed does the fungus develop in the flowers, and gives rise to a black powdery mass of spores. These chlamydospores are formed from binucleate hyphae which divide into short cells which separate, round themselves off and form the thick-walled chlamydospores. The two nuclei fuse in the spore which is, like the teleutospore of the host, uninucleate (fig. 17).

On germination the spores give rise to a promycelium. In the Ustilaginaceae the nucleus undergoes two successive divisions as in the Uredinales, and the promycelium (basidium) is divided by transverse walls into four cells. These may not form sporidia but may conjugate in pairs by clamp connections or short conjugating tubes (*Ustilago nuda*) (fig. 17), or they bud off small sporidia, which sprout like yeast cells and eventually conjugate in pairs (fig. 17). The binucleate cells, however formed, can sprout secondary cells or give rise to hyphae, either of which can infect a new host. In one species, *Ustilago Zeae*, the mycelium in the host is uninucleate and conjugation takes place at the appropriate time between cells of the hyphae, which then round off and form spores.

In the Tilletiaceae, the promycelium remains undivided, eight or more daughter nuclei are formed by division and a whorl of long curved sporidia arise at the tip of the promycelium. These fuse together in pairs, and from the fusion cell secondary sporidia may arise (fig. 17 a).

The Tremellales are a small family of saprophytic fungi with gelatinous fruit-bodies. Their mycelium is binucleate and gives rise to nearly spherical basidia. In these the fusion nucleus undergoes the usual divisions and the cell becomes divided by four vertical walls into four daughters from each of which a long sterigma grows up to the surface of the fruit body and develops a spore (fig. 14 f).

The general characters of the sub-class Autobasidiomycetes have already been outlined. Their basidia are undivided and they

broad cap or pileus. More advanced forms show the central stalk and cap-like pileus characteristic of the common mushroom and its relations the toad-stools. A further modification of the hymenium-bearing surface is the development of spines and wrinkles, folds, thin plates (gills) and of pits and tubes; all of which have the effect of increasing manifold the surface of the

FIG. 18.—AMANITA MUSCARIA

A. The young plant. B. Mature plant. C. Longitudinal section of mature plant: p. the pileus, g. the gills, a. the annulus, or remnant or velum parziale, v. remains of volva, or velum universale, s. the stalk

are typically collected together in a continuous layer, the hymenium, in which are associated with them sterile hyphae or paraphyses. In the lower families the hymenium is borne on the surface of the fruit body. This may be a flat crust of indeterminate form and extent or, in species growing on vertical trunks of trees, may be bracket-shaped. In this case the hymenium is on the lower surface. A whole series of forms show that the bracket may narrow at its point of attachment and form a stalk and the fruit body is then differentiated into the stalk or stipe and the

hymenium, without correspondingly increasing the size of the sporophore (fig. 18).

In the higher families the fruit-body when young is a rounded spherical structure and the hymenial layers are differentiated from the inner tissues. In the Agaricales the fruit-body ruptures before the basidia are matured and so exposes the hymenium, but in the Gasteromycetes the opening of the fruit-body is delayed until the spores have been formed. In this last-named group the fungus fruit-body is often elaborately constructed and may be formed of fibrous tissue, gelatinous tissue, plectenchyma, etc. At maturity a rapid expansion of pseudo-parenchymatous tissue forming the so-called receptaculum may rupture the outer covering and expose the mass of spores, embedded in the mucilaginous remains of the fertile tissue, clinging to its surface (*Ithyphallus impudicus*, *Clathrus cancellatus*, fig. 19).

For further discussion of the symbiotic relations of Fungi with Algae see the article LICHENS; for the symbiotic relations of Fungi with the higher plants, especially orchids, heaths and forest trees, see the article MYCORRHIZA. FUNK, FRANZ XAVER VON (1840-1907), German Catholic theologian, was born on Oct. 12, 1840, at Abtsgmünd, and was educated at Tübingen, Rothenburg and Paris. In 1870 he became professor of theology and archaeology at Tübingen, where he died on Feb. 24, 1907.

Funk's most important publications concern the history of the early Church and include: *Opera patrum apostolicorum* (2 vols., 1878; 2nd ed., 1901); *Die Echtheit der Ignatianischen Briefe* (1883); *Lehrbuch der kirchengeschichte* (1886; 4th ed., 1902); *Die Apostolischen Konstitutionen* (1891); *Kirchengeschichtliche Abhandlungen und Untersuchungen* (3 vols., 1897-1907); and *Didascalia et Constitutiones*

Apostolorum (2 vols., 1905).

FUNKIA, in botany, a genus of handsome, hardy, herbaceous plants of the family Liliaceae. There are five species, natives of China and Japan. They are tuberous, with broadly ovate or heart-shaped leaves and racemes of white or pale lilac, drooping, funnel-shaped flowers. They are useful for the borders of a shrubbery, lawn or rock-work, or may be grown in pots for the greenhouse. The plants are propagated by dividing the crowns in autumn or when growth begins in spring.

FUNNEL, a vessel shaped like a cone having a small tube at the apex through which powder, liquid, etc., is passed into another vessel with a small opening. The term is used in metal-casting of the hole through which the metal is poured into a mould, and in anatomy and zoology of an *infundibulum* or funnel-shaped organ, and generally of any shaft or passage to convey light, air or smoke, e.g., the chimney of an engine or a steamboat, or the flue of an ordinary chimney. It is also used of a shaft or channel in rocks, and in the decoying of wild-fowl is applied to the cone-shaped passage leading from a pond and covered with a "funnel-net," into which the birds are decoyed.

FUNSTON, FREDERICK (1865-1917), American soldier, was born at New Carlisle, O., on Nov. 9, 1865. When at an early age, his parents moved westward, settling in Kansas in 1881. After some three years' study at the University of Kansas, he worked as a railway conductor and as a newspaper reporter in Kansas City. In 1891 he was appointed botanist for the department of agriculture in the Death valley expedition, and two years later he was commissioned to report on the flora of Alaska, where he made extensive explorations, including a journey down the Yukon alone in an open boat. In 1896 he joined the Cuban insurgent army in which he became a lieutenant-colonel. On the outbreak of the Spanish-American War in 1898, he returned to the United States, was appointed colonel of the 20th Kansas Volunteers and sent to the Philippine Islands. For his conduct at the battle of Calumpit in 1899, during the Filipino insurrection, he received the Congressional medal of honour and was promoted to brigadier-general of volunteers. For his capture of Aguinaldo (q.v.), the leader of the revolt, he was made brigadier-general in the regular army. As commander of the U.S. troops stationed at San Francisco at the time of the earthquake and fire in 1906, he displayed notable promptness and energy in establishing order and organizing relief. Afterwards he saw further service in the Philippine and Hawaiian islands, and in Jan. 1914 he was appointed commander of the 2nd Division of the army. In April 1914, when the naval forces turned the captured city of Vera Cruz, Mexico, over to the army, Gen. Funston became military governor of the city, an office which he discharged humanely and efficiently. He was rewarded with the commission of major-general, and in 1916 was placed in general command of the forces along the Mexican border. In that year he directed the movements of the troops in Mexico in pursuit of Francisco Villa. His death occurred at San Antonio, Tex., on Feb. 13, 1917. He was the author of *Memories of Two Wars* (1911).

FUR, the covering of the skin in certain animals lying alongside another covering called the overhair, or guard-hair. The fur is barbed lengthwise, and is soft, silky, downy and inclined to curl. On the living animal the overhair keeps the fur filaments apart, prevents their tendency to mat or felt, and protects them from injury, thus securing to the animal an immunity from cold and storm.

The use of fur as apparel probably dates from the early stages of human history. Primitive man's chief needs in the colder regions of the earth were food and warmth, and it is reasonable to suppose that the use of animal fur for warmth was not long separated from that of animal flesh for food. To the barbarian in his northern forests fur was a necessity, and as such had its value; but it is important to note that in almost every civilization of which history is cognisant fur has also had its value from early times as an ornament or decoration. The Chinese are said to have esteemed it highly 3,500 years ago; the Greek legend of Jason and the Golden Fleece may well have had its origin in some more than usually perilous and fortunate fur trading voyage to the

FUR AND HAIR UNDER THE MICROSCOPE, SHOWING OUTSIDE VIEW AND LONGITUDINAL SECTION

The magnification is shown by the figure preceded by an x. The average diameter of the hairs in μ is shown under the name of the animal. ($\mu = 1/1000$ mm.)

Euxine; and the use of furs was one of the luxuries Rome adopted from Greece. In the narrowing of this distinction between fur as a necessity and fur as the luxury of the few, desirable on account of its rareness and beauty, may be found the clue to the subsequent development of the fur trade.

In the civilization of mediaeval Europe fur was emphatically a luxury. As such its use was forbidden by the church to monks and to all but the highest ecclesiastics, while among the laity it was carefully regulated by frequent and severe sumptuary laws. None but those of royal blood were allowed to wear certain furs, and in general a man's social importance could have been gauged by the amount and nature of the fur he wore. Fur, be it observed, was mainly connected with male attire at that time; in certain instances, indeed, it became almost a badge of office, as witness the judge's ermine. The only form in which fur seems to have been permitted to all who could afford it in the Middle Ages was as headgear, and in the English language the words "beaver" and "hat" seem to have been used almost interchangeably from the time of Chaucer. The chief sources of European fur supply in the Middle Ages were northern and central Europe, and the Hanseatic League, with its chain of associated towns dotted round the Baltic, was a great power in the trade.

The modern age may be said to have begun for the fur trade with the discovery of America. That event opened up vast fur resources to European enterprise, and this seems to have been an aspect of the new continent which appealed to the early explorers most strongly. In patents of discovery and charters to early settlements "trade in furs" is frequently mentioned, and much of the interior exploration of North America was the direct consequence of this trade. The French settlers in Canada were especially ardent fur traders; the more adventurous among them had penetrated to the Mississippi, and probably to Lake Winnipeg, long before the English had crossed the Alleghenies. The Hudson's Bay Company entered the field in the latter half of the 17th century and in the 250 years of its existence has spread its trading posts and interests from Vancouver to Prince Edward Island, and northward to the Arctic Ocean. The fur trade of the 18th and early 19th centuries, when an Indian trapper would barter his winter's catch for a blanket and a bottle of cheap spirits, was a highly profitable business; John Jacob Astor, among others, founded his fortune upon it. The supply of furs appeared inexhaustible and the demand steadily grew; for the industrial revolution in Britain and western Europe, creating vast new wealth, created also new desires, and furs, from being a luxury, became by the middle of the 19th century a fashion. This tendency towards the popularization of fur grew gradually stronger, and the progressive redistribution of wealth which has been the consequence of 20th century social and economic legislation, coupled with the production of more and cheaper furs, has made fur obtainable and desired by nearly every class in Great Britain. In America the two chief incentives to the development of the demand for fur garments have been the steam radiator and the motor-car. The former did away with heavy underclothing and the latter made warm, windproof outer garments necessary. The fashionable luxury of one generation has, in fact, become the popular mode of the next; and the time is not far distant when it will become, like other fashionable luxuries of the past, the common necessity of all.

THE MODERN FUR TRADE

Sources of Supply.—It is a mistake to suppose that furs are the product only of cold climates. The fur trade draws its supplies from all over the world, and finds use for those of the tropics as well as for those of the Arctic. But it remains a fact that the more valuable pelts are mostly obtained from those regions where the winter temperature is sufficiently low to ensure the growth of thick and luxuriant fur. Canada and North America generally, northern Europe and Siberia are therefore the most important sources of fur supply, and their production in this kind includes almost all the so-called "fine furs," and the majority of those classed as staple articles.

The principal furs obtained from North America are beaver, musquash, skunk, American opossum, mink, marten, fisher, er-

mine, silver fox, blue fox, red fox, white fox, cross fox, seal, raccoon, white bear, grizzly bear, wolf, lynx and wolverine. Of these seal, raccoon, musquash, opossum, mink, skunk, beaver and the various kinds of foxes are the most important commercially.

Northern and central Europe and Siberia provide squirrel, Russian sable, ermine, red fox, cross fox, white fox, wolf, bear, badger, kolinsky, mink, marmot, fitch, stone marten, baum marten, otter and a certain amount of musquash. The chief contribution of the British Isles to the list of wild fur supplies is moleskin, of which the best grades come from Scotland. The British Isles also produce wild rabbit and a few otter, wild cat and stoat. Moleskin is also obtained from Holland, France and parts of Africa.

China supplies marmot, kid, goat, lamb, moufflon, etc.; and central Asia, Persian lamb and other lambskins. The principal Australian furs are Australian opossum, red fox, wallaby and rabbit. New Zealand also produces opossums and a large number of rabbit skins. The Australian and New Zealand rabbit skin supply is a factor of great and increasing importance in the fur trade.

From South America come nutria, chinchilla (though this fur is scarce) foxes, skunk, chinchilla rats, etc. The fur production of Africa is relatively unimportant in the commercial sense. The skins of various animals of the deer tribe are obtained from there, together with monkey, panther, lion, otter and hyrax. Of the minor fur producing regions, Japan produces a certain amount of mink and flying squirrel; India, red foxes, tiger and some stone marten; the Balkans, lambskins, fox, martens, etc.; and Italy and Spain, lambskins.

The seal is the principal marine animal whose fur is used in the fur trade, the best skins being obtained from the north Pacific, and particularly from the coast and islands of Alaska. The Alaskan seal herds are protected by an international convention, and since it has been in force their total has increased from under 100,000 to over 800,000. Sealskins are also obtained off the Cape of Good Hope and in the north and south Atlantic. Sea otter, another marine animal with a valuable pelt, is rare; the best specimens live in Alaskan and Canadian waters but are strictly protected.

Collection and Distribution.—Fur skins find their way to the world's markets through two channels. A large number, after being delivered or sold by the trappers to collecting agents, are bought by the representatives of skin merchants in various centres, and pass directly into use. The majority of the world's catch however is consigned to agents or brokers for sale at one or other of the great public fur auctions held periodically in certain centres. The most important of these auctions are those at London, Leipzig and New York, while Montreal, St. Louis (the Alaska seal catch is sold here), Paris, Winnipeg, Copenhagen, Seattle, Edmonton, etc., are fur auction centres of secondary importance. In London, which, from the number and value of the furs sold there, is the chief distributing centre for the world's fur trade, public auctions of skins are held three times a year—in January, April and October—each series lasting from three to four weeks. The offering is made up of (1) fur skins consigned from all parts of the world to about half-a-dozen firms of fur brokers; and (2) the collection of the Hudson's Bay Company. The latter is sold separately by the company, but the other brokers group their collection into sections, including seal skins and Australian furs, Chinese and Japanese furs, and the main catalogue, which comprises furs from North America, Europe, etc., and is the most important part of the sale. Each broker firm sells its own collection, the order of selling being arranged by lot. The offerings in each section, either in bulk or in sample, are open to inspection in various warehouses several days before the auctions commence, and buying in the sale room is done from the catalogue, no lots or samples being shown there. The same procedure as regards inspection and buying is followed at the other fur auction centres, though selling arrangements may vary. In New York there are three major public fur auctions a year, in addition to minor auctions each month at certain periods of the year; and this system also prevails at Leipzig. The New York auctions, though they include furs from all parts of the world, are mainly concerned with American skins; those at Montreal almost entirely so. The Paris and Winnipeg auctions are only of local collections, and at

BY COURTESY OF THE WELLS TREISTER COMPANY, INC.

VARIETIES OF FUR

1. Beaver, a rich, soft fur, used in its natural colour
2. Leopard. The best is Somaliland leopard (African), a deep soft fur
3. Hudson seal (muskrat, plucked, sheared and dyed black)
4. Natural American raccoon, a fur extensively used undyed
5. Alaska seal. This fur is always plucked and dyed before use
6. Natural wolverine, a strong, coarse, brown-striped fur
7. Russian pony pelt of a Russian colt with fairly thick, furry coat
8. American broadtail ("processed" lamb)

Copenhagen there is annually held a sale of Greenland furs.

The Leipzig auctions are of especial importance in connection with Russian furs, for which they provide one of the principal markets. Under the Soviet Government in Russia, the export trade in furs is a state monopoly, and in theory the Russian fur catch is collected by certain state trading organizations which pay the trappers an officially fixed price for the skins. This price, however, is seldom the highest obtainable, and a good deal of private trading, with subsequent smuggling of furs over the frontiers into China and elsewhere, goes on. Nevertheless the greater part of the catch comes eventually into the hands of the appropriate authority, and whatever proportion of it is deemed surplus to domestic requirements is held for export and sold abroad at a convenient time for the account of the Soviet Government.

Buyers from all parts of the world attend the fur auctions in London and Leipzig, the great majority of them being either skin merchants, fur brokers and commission agents or manufacturing furriers. The fur broker buys and sells on commission terms for his clients, while the skin merchant buys for his own stock the kinds of furs for which he anticipates a demand. Each class of trader is of necessity an expert in raw furs, and the skin merchant can tell not only the exact grade and value of a skin, but often the precise district of its country of origin.

The approximate quantities of certain of the more important furs offered at the London auctions during the year 1927 were as follows: Beaver 51,631, musquash 490,558, red fox 625,198, skunk 1,660,161, Australian opossum 1,677,507, mole 1,961,443, squirrel 3,203,317, fur seals 22,866, American opossum 2,430,746, Persian lamb 970,300, marmot 558,486, nutria 31,211, cross fox 17,270, white hare 1,084,590, mink 120,563, Russian ermine 213,708, stone marten 39,347. With these figures may be compared some for 1913, as follows: Red fox 96,395, musquash 3,861,010, Australian opossum 275,600, skunk 863,638, beaver 23,070, fur seal 15,183, mole 1,445,124, squirrel 628,177. Price comparisons have little real significance because fur skins are susceptible of such numerous variations in quality that a common basis is difficult to find. The following, however, are of interest: the figures given are as a rule the highest price paid for a single skin in the auctions of the year in question: Red fox—1913, £5, 1927, £12.5s.; musquash—1913, 4s.6d., 1927, 10s.3d.; Australian opossum—1913, 6s., 1927, 38s.; beaver—1913, £3.8s., 1927, £13; skunk—1913, 35s.6d., 1927, 12s.

Auctions of Australian and New Zealand rabbit skins are held in London about six times a year, the offerings including both furriers' and hatters' skins. The total export of rabbit skins from Australia during the fiscal year 1925-26 was 15,028,304 lb., valued at £2,880,360, of which 5,117,458 lb. were consigned to the United Kingdom and 9,270,118 lb. to the United States of America. During the calendar year 1912 the total export was 9,856,034 lb., valued at £577,050, the United Kingdom receiving 6,034,532 lb. and the United States 1,842,052 lb. The United States imported in 1927, 22,069,111 lb. of rabbit, hare and coney skins. The total imports and manufactures of fur for 1926 were \$117,416,667; for 1927, \$135,573,530. The total exports for 1926 were \$23,215,532 and for 1927, \$30,892,985.

Fur Dressing and Fur Dyeing.—Briefly, the function of the fur skin dresser is to make the skin suitable for use in the later stages of the trade, the objects aimed at being the creation of a soft, pliable leather; the removal of superfluous matter from the pelt; and the preservation and enhancement of the natural lustre of the fur. The details of the process vary widely with the nature and condition of the skin treated, but in every instance there are at least four distinct stages, some being comprised of several processes, in the operation. First of all there is the preliminary cleaning and softening of the pelt; then "fleshing" (removal of fleshy matter from the skin) and stretching; then "leathering" (the formation of a leather on the skin, actually a form of tanning); and then a final cleaning. After each stage, and between many of the intermediate processes, the fur is cleaned, a revolving wooden drum containing sawdust or other suitable material being generally used for this. Separate departments of the fur dresser's art are "unhairing" (the removal of guard-hairs where necessary),

shaving, etc.; while the dressing of seal skins is a complicated business presenting features not found in the majority of furs. Though it doubtless originated in a primitive and haphazard manner, modern fur skin dressing is a highly developed scientific process requiring, incidentally, a considerable mechanical equipment.

Fur dyeing is of great antiquity, but may be said to date its modern development from the latter part of the 19th century. Before that date the dyeing of furs was mainly carried out with vegetable or mineral colouring matters. Since then, however, various chemical compounds known as fur bases have come into general use, and have largely superseded the older materials by reason mainly of the ease with which they can be applied. The use of these synthetic compounds has also enabled fur dyers to produce many new colours on furs, and fresh ones are added every year. This again has led to the adoption by the fur trade of many skins which in their natural colours would be disdained by the public, but which when well dressed and dyed make most attractive furs. Chief among these is rabbit, which, under its trade name of coney, appears in almost innumerable shades, and is one of the most important furs in the world. From the cheapness of the skin, dyeing in this instance has brought furs within the reach of millions who could not otherwise afford them. Another result of the development of fur dyeing is that the public is enabled to obtain excellent substitutes for furs which are scarce or costly. Thus, marmot is dyed to represent the valuable mink, while dyed musquash is widely used in the place of sealskin. The technical side of fur dyeing is a matter upon which great secrecy is maintained. Each dyer has his own processes which are jealously guarded, and though he may achieve the same results as his neighbour it is often by means which are to a large extent different. Leipzig is the chief fur dyeing centre of Europe, a position it owes partly to the skill of its workers, but largely to the success of the German chemists in producing dyestuffs. France and Belgium annually dye millions of imported and domestic rabbit skins, and there is a flourishing fur dyeing industry in London which has long been reputed for the excellence of its dyes on sealskins. The fur dyeing industry of New York, a large and prosperous one, received a great impetus from the cessation of the supply of Leipzig-dyed furs during the war of 1914-18, and has since developed rapidly.

Fur Manufacturing.—Furriery, or the making-up of furs into garments, has progressed from the primitive sewing together of skins to the position of a highly skilled and intricate occupation, and the modern manufacturing furrier often has a good claim to be recognized as an artist in the same sense in which a designer and creator of gowns is so recognized. Design, indeed, plays a large part in furriery, for there are fashions in furs as there are in other articles of dress, a fact which assumes especial importance when it is remembered that fur, from being a masculine prerogative in mediaeval times, has become an almost exclusively feminine article of attire. Paris is the originating centre of most fur fashions, but valuable ideas often come from Vienna, while New York has developed a tradition of its own in fur design. London furriers usually modify Parisian designs to suit their own public. The skill of the manufacturing furrier is exemplified not only in the coat, cloak, stole, tie or other article he produces, but also in the economical use and tasteful combination of the skins that go to make it. The setting of the skins, that is to say, the position of each skin in the garment in relation to its neighbours and to the garment as a whole, is another part of the furrier's work in which there is much scope for taste and ingenuity. The furrier's chief workman is the fur cutter, whose duty it is so to cut the skins for each article that the best possible use is made of them with a minimum of wastage. This is a manual operation for which no adequate machinery exists. The working together of furs is done with specially-made sewing machines, usually power driven. Though this operation calls for less skill than fur cutting it is one upon the proper performance of which the appearance and value of the garment depends. In a skilfully sewn fur coat it is generally impossible to detect the seams without blowing the fur apart. Manufacturing furriers may be classified in

three groups. Wholesale manufacturing furriers sell the article they make to wholesale distributing houses or to retail firms; retail manufacturing furriers sell the work they do in their own shops; and in Great Britain chambermasters undertake work for other manufacturing furriers who may find it difficult or inconvenient to do it in their own workrooms.

According to the Census of Production for 1924, the total value of the goods made and the work done by the fur trade in Great Britain in that year was £6,562,000, as compared with £1,658,000 in 1907. Of the 1924 figure £5,328,000 represented the selling value of made-up fur goods other than mats and rugs; alterations and repairs to fur goods accounted for £443,000; while the amount received by fur dressers and dyers for work done for the trade was £521,000. Each of these figures is considerably above that for 1907, the most notable increase being in the amount received for alterations and repairs, which was only £21,000 in the earlier year.

The Fur Retailer.—The retail branch of the fur trade is the only one with which the public usually comes into direct contact, its function being the sale of fur garments and articles to whoever wishes to buy them. Many fur retailers also undertake to have coats, etc., repaired and remodelled for their customers. Much of the retail business in furs passes through the hands of the drapery and costume trades, but there are also many concerns exclusively interested in the sale of furs. The fur retailer, unless a retail manufacturer, obtains his supplies from the wholesale houses or from manufacturing furriers, and his business is to some extent a seasonal one. The tendency is, however, for its seasonal nature to become less evident owing to the development of a trade in furs suitable for summer wear. It is mainly in connection with their sale to the public that the question of the description of furs arises. The fur trade, using a large variety of skins with many of which the general public is unacquainted, is one in which deception of the purchaser is peculiarly easy; and to protect the public from this certain rules in regard to descriptions have been laid down by the trade associations in most centres. Under the American rules, to describe a fur, the correct name of the fur must be the last word of the description; and if any dye or blend is used to give it the appearance of another fur, the word "dyed" or "blended" must be inserted between the name signifying the fur that is imitated and the true name of the fur, as: "Seal-Dyed Muskrat," or "Mink-Dyed Marmot." All furs shaded, blended, tipped, dyed or pointed, must be described as such; as, "Black-Dyed Fox," or "Pointed Fox." Also where the name of any country or district is used, it must be the actual country of the origin of the fur, as, "American Opossum." When the name of a country or place is used to designate a colour, the fact must be indicated as: "Sitka-Dyed Fox." Those in force in London provide that furs shall be described by, and sold under, their recognized trade names; and that where one fur has been dyed to represent another the name of the original fur shall appear in the description. Thus, musquash dyed to represent seal is described as seal-musquash, opossum dyed to represent stone marten as stone marten opossum, etc. Where rabbit is the fur dyed it is described as coney, that being the trade name; as, beaver coney, nutria coney, etc. The regulations as to description in fur trade centres outside the United Kingdom vary considerably.

The Future.—The most serious problem confronting the fur trade of the world is that of raw material supplies, and its future will be powerfully influenced by the solution of, or the failure to solve, this problem. The world's consumption of raw furs has increased very considerably since the beginning of the 20th century, and with the use of furs becoming more widespread every year this increase is bound to continue. The total number of wild fur-bearing animals, on the other hand, is probably decreasing, this being due not only to the greater demand for their furs, but also to the gradual advance of civilization into regions hitherto open and unsettled. If these tendencies were allowed to operate unchecked a point would be within measurable distance at which grave anxiety as to the future supplies of furs would be justifiable; and in view of this possibility certain tentative precautions have

already been taken. In Canada, the United States of America, Australia and elsewhere a policy of conservation of fur resources has been adopted, involving strict regulations as to preserves, close seasons, etc.; and this, though not alone sufficient to solve the problem, is a wise and valuable step. Further aid in its solution is afforded by the ingenuity of the fur dressing and dyeing industry, which, as has already been pointed out, can provide substitutes for many rare skins by reproducing some of their characteristics on skins more plentiful; and it is probable that scientific progress will enable this work to be extended considerably. The problem is also being attacked by the breeding of fur-bearing wild animals in captivity (*see FUR FARMING*). This has already given excellent results, and promises even more important ones. No doubt there are certain animals which it would be impossible to breed commercially in such conditions, but this method of securing future fur supplies is certainly a most valuable one. Combined with the conservation of existing fur-bearers, and aided by scientific developments within the trade, it should go far towards providing an adequate and permanent supply of furs for the future.

FUR-BEARING ANIMALS (LAND). The classification of animals as fur-bearing and non-fur-bearing has always been arbitrary and with the refinement of modern methods of manipulation of skins the terms are becoming very elastic. Roughly speaking, the term fur is applied to skins which have a double coating of hair, a layer of comparatively short, soft, curly, barbed hairs next to the skin, protected by longer, smoother and stiffer hairs which grow up through these and are known as guard-hair or over-hair.

The greater number of species of fur-bearing mammals belong to the Carnivora, Rodentia, Ungulata and Marsupialia. The more important Carnivora are bears, cats, ermines, fishers, fitch, foxes, fur-seals, hair-seals, kolinskis, leopards, lions, lynxes, martens, minks, ocelots, otters, raccoons, sables, skunks, tigers, weasels, wolverines and wolves. The Rodentia include beavers, chinchillas, hamsters, hares, marmots, muskrats, nutrias, rabbits and squirrels. The Ungulata provide antelopes, goats, ponies and sheep, and the Marsupialia kangaroos, opossums and wallabies. A few skins of moles and other Insectivora and other varieties are used, but are not very important; and even primates, such as the capuchin monkey, are used for trimmings.

Effects of the Fur Trade.—The modern fashion for furs, which has caused an intensive combing of remote parts of the world for the skins of any mammal suitable for the fur trade, has not been purely arbitrary and artificial. Furs give the maximum warmth with the minimum weight, being surpassed by no artificial or synthetic production. The extensive use of cheaper furs has placed fur wearing apparel within the reach of many who could not formerly afford it. The demands of the fur trade, and the constant pushing out for new sources of supply, have been a compelling influence in the exploration and development of the great northern areas in both hemispheres.

The great revival of the fur trade, beginning at the time of the World War, has led to the extension of new posts at various points along the arctic coasts and islands, the principal incentive being the skin of the white or arctic fox, once little valued, but now one of the prizes of the fur trade. The recent influx of white trappers and traders, into regions inhabited by tribes of primitive Eskimos hitherto barely in touch with civilization, has rapidly reduced the big game and food supply and dislocated the whole mode of life of the indigenous population in a way comparable to the changes produced on Indian life by the destruction of the beaver and the buffalo in earlier times, but on a vastly more rapid scale. The white trapper takes more fur out of a given virgin section than the native does, because first, he uses more efficient traps; second, he is a transient and gets while the getting is good; and third, he

FUR-BEARING ANIMALS, BY CHARLES LIVINGSTON BULL

The most valuable fur-bearing animals are those whose skins are provided with two coats of hair, an inner layer of short soft hairs for warmth and an outer protective layer of longer, stiffer hairs which grow out through the inner layer. Most fur-bearers belong to the two great groups known as (1) the flesh-eating mammals or

carnivores, as the ermine and fox, and (2) the gnawing mammals or rodents, as the beaver and chinchilla. However, the skins of animals belonging to various other groups of mammals, as for example certain monkeys, moles, sheep (karakul) and opossums, are also extensively used for fur

1. Guereza Monkey (*Colobus guereza*). 2. Ermine (*Mustela erminea*). 3. Sable (*Mustela zibellina*). 4. Chinchilla (*Chinchilla lanigera*).

5. Leopard (*Felis pardus*). 6. Karakul (*Ovis montanus*). 7. Fur Seal (*Callorhinus ursinus*).

8. Polar Bear (*Thalarctos maritima*). 9. Arctic Fox (*Vulpes lagopus*), showing the blue and the white colour phase

PAINTED FOR THE ENCYCLOPÆDIA BRITANNICA

FUR-BEARING ANIMALS, BY CHARLES LIVINGSTON BULL

Of the fur-bearers here shown three belong to the rodents or gnawers, namely, the beaver, musk-rat and Asiatic grey squirrel; the others, as the raccoon, lynx, etc., are carnivores or flesh-eating mammals. Like

most fur producers, they are natives of the cooler parts of the temperate zone. For further details see the articles on the various animals illustrated

1. Raccoon (*Procyon lotor*). 2. Asiatic Grey Squirrel (*Sciurus vulgaris argenteus*). 3. American Beaver (*Castor canadensis*). 4. Canada Lynx

(*Lynx canadensis*). 5. Otter (*Lutra canadensis*). 6. Musk-rat (*Fiber zibethicus*). 7. Mink (*Putorius vison*). 8. Red Fox (*Vulpes fulva*).

9. Silver or Black Fox (*V. fulva*, colour phase). 10. Cross Fox (*V. fulva*, colour phase). 11. Skunk (*Mephitis mephitis*)

sometimes resorts to poisons which are very destructive of wild life. The native does not trap more than enough to supply his limited wants and he uses home-made traps. Other reasons for the decline of wild life are the draining of swamps, deforestation by fire, which takes its toll of animal life, and the necessity for vermin and predatory animal control by the farmers.

The enormous and increasing pursuit of valuable fur all over the world, and the resulting high prices which have virtually become a bounty on the heads of many species, has inevitably resulted in their decrease and in some cases extinction over much of their former range. High prices for fur bring more trappers and fur-traders to the frontiers, thereby reducing the breeding stock and choking the industry at its source. Some of the greatest operators in the fur industry have come to realize this and have become interested in means of conservation, by protecting fur-bearing mammals by longer closed seasons, encouraging the establishment of breeding reserves and putting the ban on purchase of furs taken at wrong seasons.

The decrease in the supply of rare furs has increased the demand for inferior furs and for skins formerly not regarded as fur. These are plucked, sheared and dyed to improve their appearance. Expert research chemists are employed to evolve new methods of treating skins and furs, and have produced results which defy all but experts.

With the rapid increase of the world's population, the area which can be devoted to wild-fur production is becoming smaller. Experiments in fur-farming (*q.v.*) have been carried on for many years. Although it is well known that many species can be raised successfully in captivity, others are not so adaptable. For long the only really extensive development was in the rearing of silver or black foxes, colour phases of the common red fox, but numerous other species are also reared in this way.

From an early date, Canada has been one of the world's greatest fur-producers. In 1680 Charles II. of England granted to Prince Rupert and his associates of "The Honourable Governor and Company of Gentlemen Adventurers of England trading into Hudson's Bay" a charter giving practical monopoly and control over what is now the northern part of the Dominion of Canada, long known in literature as the "Fur Countries." This control was exercised by "The Company" until many of its rights were relinquished at the time of confederation in 1867. The Hudson's Bay Company is still the largest fur-trading establishment in Canada, although other companies and individuals are equally free to trade. The most highly prized furs are the various kinds of foxes (the white arctic fox and its colour phase the "blue" fox, and the "coloured" foxes, red, cross, silver and black), marten, fisher, beaver, otter, mink and ermine, although the humbler furs, as muskrat, lynx, skunk and badger, swell the fur returns, and in number make a greater aggregate of value than the choicer furs.

Fur-farming has also developed steadily in the United States and Alaska. The U. S. Government has an experimental fur farm at Saratoga, N.Y., and a rabbit experimental fur farm at Fontana, California. The department of agriculture of the Dominion of Canada also maintains an experimental fox ranch at Summerside, P. E. I. At these stations studies have been made of foods and feeding methods, mating with different strains, diseases of foxes and parasitic infestation which contribute to produce inferior pelts. Much work of this character has also been done in Europe, notably by the French Association of Fur Animal Propagation. The scientific branches of the Union of Socialist Soviet Republics have also given considerable attention to the fur industry which is so important in that country, and have been conducting intensive studies and experiments in conservation of fur-bearing mammals in European Russia and in Siberia.

Fluctuations and Periodicity.—While sudden fluctuations in prices may temporarily lead to intensive production in certain areas, swelling the figures, there is a normal and fairly regular periodic fluctuation in the numbers of certain species due to natural causes. The records of the Hudson's Bay Company fur returns for the past hundred years are particularly suitable for data on these fluctuations, as the company was not accustomed to stimulate the production of any particular kind of fur, but

took the whole product in trade from the natives, and sold all the furs at annual fur-sales in London, without holding furs over from year to year. Records were also kept showing the periodic increase and decrease of other forms of wild life, as these keenly affected the life of the Indians and other inhabitants of the north, and directly affected the output of furs. In many districts the Indians starved during bad rabbit years, and were unable to trap to advantage during the fur season, while carnivorous mammals which fed on the rabbits diminished in proportion to the rabbits. Hewitt quotes the periods of maximum abundance of the rabbit, according to the Hudson's Bay Company's returns: 1845, 1854, 1857, 1865, 1877, 1888, 1897 and 1905, or in other words in cycles of 9, 3, 8, 12, 11, 9 and 8, giving an average periodic cycle of 8.5 years, which is not far from the popular belief in a seven-year cycle for this animal. For the lynx an average periodic cycle of 9.5 years is given, the lynx becoming most abundant from the year of rabbit abundance to three and four years later. Foxes show a periodic cycle of about 9.5 years, marten of 9.5 years, fisher and mink of 9.7 years each. Wolves and muskrats, which have a wider range of food supply, show slight and irregular periodic fluctuations in numbers. The ultimate causes of the fluctuations in numbers of these fur-bearers are in many cases obscure or unknown. Some of the rodents, as mice, voles, lemmings and rabbits, are very prolific, and when favoured by a combination of friendly circumstances, such as good climatic conditions, abundant food, and scarcity of natural enemies, increase prodigiously until the overcrowding brings on epidemic disease which reduces the numbers to a minimum. Many predatory mammals as fox, lynx and marten subsist largely upon these smaller mammals and the periods of abundance of the carnivores depends more or less closely upon the presence of their favourite prey. Mammals which feed upon a mixed diet of insects, fish and vegetable matter, do not show such extremes of variation in numbers. Whether the decrease in numbers of the predatory mammals is due to actual starvation, or whether scarcity of food affects their fertility, and whether overfeeding in times of abundance has an adverse effect, are problems which have not been studied sufficiently. Animals which are not directly important as a source of food supply may serve as hosts for internal parasites which are injurious to the welfare of the more valuable species. The problems of wild animal life are so varied and interlocking, that the serious and co-operative studies of zoologists, parasitologists, veterinarians and general ecologists, extending over a period of years, are essential to a thorough elucidation of the questions involved.

(R. M. A.)

FURETIÈRE, ANTOINE (1619-1688), French scholar and miscellaneous writer, was born in Paris and became abbé of Chalivoy in the diocese of Bourges. His satires—*Nouvelle Allégorique, ou histoire des derniers troubles arrivés au royaume d'éloquence* (1658); *Voyage de Mercure* (1653)—won him admission to the French Academy in 1662. When the academicians heard that Furetière was on the point of issuing a dictionary of

the French language, they interfered, alleging that he had used their information, and that they possessed the exclusive privilege of publishing such a book. After much bitter recrimination on both sides the offender was expelled in 1685; but he took his revenge in his satire, *Couches de l'académie* (Amsterdam, 1687). Furetière is best known as the author of *Le Roman bourgeois* (1666; ed. Fournier and Arselineau, 1854), which ridiculed the fashionable romances of Mlle. de Scudéry and of La Calprenède. The author contents himself with stringing together a number of episodes and portraits, obviously drawn from life, without much attempt at sequence. His *Dictionnaire universel* was posthumously published in 1690 at Rotterdam.

FUR FARMING. The keeping and breeding of animals for their fur is one of the oldest occupations. The Chinese have farmed goats and dogs for an unknown number of centuries, using the flesh of the animals as food, and their skins, fur or hair covered, according to species, for the purposes of trade; whilst if one considers the sheep as a fur-bearing animal, the inception of fur farming is lost in the mists of antiquity.

Silver Fox Farming.—The growth of this industry, in the modern sense, is due to the practice of a few Canadian trappers of keeping silver foxes, caught out of season and consequently with inferior coats, until their fur became what is known as "prime"; i.e., at its best and fullest. This practice, which was carried on in secret and known only to a few, was the means of bringing considerable wealth to the trappers, as the value of a "prime" skin is enhanced out of all proportion to a badly furred specimen. The knowledge that men were making fortunes by fox farming gradually spread, and when in the year 1900 a single "farmed" skin fetched £580 at the London Fur Auction Sales, it was recognized that the potentialities of this undertaking were very great indeed. Since the pioneers of the industry, Sir Chas. Dalton and Mr. R. T. Oulton, first demonstrated the financial possibilities resultant from breeding foxes in captivity, 25 years ago, the industry has made such strides that the Canadian Department of Agriculture have taken it up and have undertaken to operate an experimental farm, established by the Canadian National Silver Fox Breeders Association, at Summerside, Prince Edward Island; there they have constructed a laboratory and installed a staff of veterinary surgeons and chemists with the one view of fostering the industry.

The expansion of fox farming really began in 1910; up to this time the idea of the farmers was to sell the skins (known as pelts) only, but such a demand was established for foxes for breeding purposes that in 1911 all available silver foxes were sold alive. The cost of a pair of foxes rose from \$3,000 in 1910 to \$20,000 and even \$35,000 in 1913, and extensive gambling took place—even to options on unborn pups! This phase of trade was stopped by the World War; thereafter speculation gave place to solidity and the industry in 1927 was firmly established.

The pioneers of fox farming thought at first that conditions approximating as closely as possible to nature, i.e., large open spaces, would produce the best results, but experiments have proved that pairs of foxes can be successfully kept in pens, with an area of not less than 700 sq. ft., always provided that the animals have a kennel to which they can retire.

A fox farm consists, then, of a number of wire breeding pens, with a kennel in each, size approximately 35ft. x 25ft., with 6ft. between each enclosure, a broad alley, large enough for a cart to pass through, between each double row of pens, a certain quantity of trees and shrubs to afford the animals shelter and seclusion; small portable pens, size 6ft. x 6ft. x 15ft., each with kennel for transport of the males; storehouses and an isolation hospital: the whole (with the exception of the hospital, certainly, and the storehouses, preferably) surrounded by a wire fence.

The wire used should be 14 gauge with a mesh of 2in., the outer fence firmly erected, should be 10ft. in height, with a further 2ft. sunk in the ground projecting inwards, to prevent the animals burrowing under it, and another 2ft. at the top, also extending inwards, to prevent climbing over. This outer fence should be from 25ft. to 30ft. from the pens. There are two most important points to be borne in mind to make a success of fox farm-

ing; they are seclusion and sanitation.

Seclusion.—The fox is an extraordinarily shy animal, and it is useless to hope for good results if disturbing influences are allowed to bear upon the animals. The kennels therefore should have a right-angled entrance, to exclude light, and should consist of a compartment within a compartment; the inner chamber is termed a den and must be so constructed that it can easily be removed for cleansing purposes. The den should be 20in. square, the outer kennel 2½ft. x 5ft., the roof should slope and a ventilation hole 4in. square must be cut at either end. The inside must be sandpapered smooth to prevent damage to the fur.

The farm should be kept as quiet and secluded as possible; anything that tends to irritate the animals, strange faces for instance, should be rigorously excluded, and no farmer should allow strangers in or about the farm between January and June.

Sanitation.—Foxes in the wild state range over an extremely wide area and therefore have not the same chance of coming in contact with the secretions or excretions of other foxes as when penned up in a small enclosure. These enclosures therefore must be kept scrupulously clean. The sweepings must be burnt, the kennels washed with soap and water and then disinfected, whilst the ground is best sterilized by being scorched.

Disease breaking out amongst such valuable animals is a serious matter and extra care in sanitary matters is repaid a thousand-fold. Feed pans should be removed after each meal, and both these and water pans should be frequently cleansed in boiling water: foxes have the unpleasant habit of soiling their food and water vessels, and on the principle that prevention is better than cure, it should be put out of their power to do so.

Foxes, except during the mating season, do not fight to any extent when in the same enclosure, but if one is removed to an adjacent pen, then trouble begins and the animals try to get at one another through the wires—hence the reason for having the pens 6ft. apart.

In the wild state the fox is monogamous, but in confinement the male should be removed from the female after mating, as his presence seems to excite the female when she is in pup, with resultant bad effects on the young.

In captivity a single male has been successfully mated with four females. The mating season is in February and March and the period of gestation about 51 days. When the pups are weaned, i.e., when two months old, they should be taken from the mother.

The fox resembles the dog in being omnivorous, so that an entirely meat diet is as unfit for the one animal as it is for the other. A quarter pound of meat, bones to gnaw and the vegetable scraps that one gives to a dog, make an ideal diet for the fox. The daily ration of a 12lb. fox should equal 533 calories (heat units), and summer and winter diets approximating this value are appended herewith.

Summer Diet

Lean meat or offal	4½oz. =	133cal.
Cereals, cooked (dry weight)	2½oz. =	266cal.
Milk	½pint =	132cal.
		531cal.

Winter Diet

Fat meat or offal	6½oz. =	267cal.
Fox biscuits	1½oz. =	133cal.
Milk	½pint =	132cal.
		532cal.

Milk should be included in the daily ration throughout the year.

A good deal of space has been devoted to silver fox farming, as this branch of the industry is most efficiently organized both in Canada and in Great Britain; the controlling British society is known as the Silver Fox Breeders' Association of Great Britain, and at the second exhibition held at the Crystal Palace in 1927, 89 British-bred foxes were shown.

Other Fur Farms.—In addition to silver fox farms, of which there were 2,517 in Canada on Dec. 30, 1926, there were also 95 mink, 57 raccoon and 43 of various other animals. The industry is also carried on in the United States and farms for mink,

raccoon, skunk, musquash, beaver, deer, blue and silver fox have been established, whilst chinchillas are farmed in the Andes.

Mention must also be made of the farming of rabbits in Great Britain. The controlling organization, known as the Fur Board (Ltd.) has been in existence for eight years, has a membership of 1,700 and an output of 45,000 pelts. The skunk and pine marten are also farmed in Great Britain, whilst in certain parts of the country are what may be termed mole farms; *i.e.*, the ground is not cultivated in any way, but a highly lucrative crop of moles is annually gathered.

See W. Brumwell, *The Chinchilla Rabbit—Its Culture for Profit* (Watmoughs, Ltd., Ille, Bradford), a full description (popular style) of this branch of fur farming. J. C. Sachs, *Furs and the Fur Trade* (2nd ed. 1927) (Pitmans) written in popular style. R. G. Hodgson, *Raising Beaver* (1924), *Successful Muskrat Farming* (1925).

(J. C. S.)

FURFOOZ, a village some 10 m. from Dinant in the Ardennes, Belgium. Three caves containing prehistoric remains were here excavated in 1872. Of these the *Trou du Frontal* is the most famous. In it were found human skeletons with brachycephalic skulls, associated with animal bones, those of the reindeer being particularly plentiful. People with anthropological characters, similar to the skulls found at Furfooz, seem to have arrived in central Europe soon after the Ice Age. They spread along the Alpine region and adopted the culture of Azilian-Tardenasian folk.

FURFURAN or **FURAN** (Tetrol, tetraphenol), a colourless liquid boiling at $31^{\circ}/750$ mm., slightly soluble in water but miscible in all proportions with alcohol or ether. Its specific gravity is 0.9444 at 15° C. It occurs in the most volatile portions of pine-wood tar and is prepared synthetically by heating pyromucic or furoic acid at 260 – 275° C; by the dry distillation of barium or calcium pyromucate (furoate); and by digesting succinic dialdehyde with water at 180° C. Furfuran develops an emerald-green coloration on a chip of pine wood moistened with hydrochloric acid. It is regarded chemically as a cyclic compound containing four carbon atoms and one oxygen atom:

Furfural (furfuraldehyde, furfural, or furo), the most important derivative in the furan series, is a colourless liquid which turns brown when exposed to air and light; it boils at $161.7^{\circ}/\text{C}760$ mm., freezes at -36.5° C; its specific gravity is 1.1598 at 20° C. It dissolves in water to the extent of 8.3% at 20° C and is also soluble in alcohol and ether. Furfural is obtained from bran, corn cobs, gums, jute, oatmeal, oat hulls and straw when these materials are digested with dilute mineral acids and the consequent mixture is distilled. An effective procedure for the manufacture of furfural has been developed. Oat hulls, obtainable throughout the year in large quantities (200 ton lots), are subjected to the action of steam and acid in large rotary digesters. The distillate from these digesters has a relatively high furfural content, and is neutralized with lime and distilled in a fractionating still; furfural of 95% purity is thus separated and is refined by further rectification at 160° C. Technical furfural of 98–99% purity is now marketed in considerable quantities. Its presence in beer or spirits is detected by the cherry-red coloration developed with aniline acetate or hydrochloride.

Resinous materials are produced by condensing furfural with phenols or aromatic amines. A wide variety of moulded products are manufactured from furfural-phenol resins. Furfural and its organic derivatives are solvents for cellulose esters and ethers, and are applicable to the preparation of cellulose ester plastics. Furfural has been used as a substitute for turpentine in varnish manufacture and as a solvent in the lacquer industry. Hydrofurfamide ("vulcazol"), the condensation product of furfural and ammonia, is an active indiarubber accelerator. Furfural exhibits the characteristic properties of aldehydes (*q.v.*) forming a bisulphite compound, an oxime, and a hydrazone. With potassium cyanide furfural polymerizes to furoin (m.p. 135° C), and with aqueous alkali it yields furfuryl alcohol and *furoic acid*. The

latter compound, which is also termed pyromucic acid, is prepared either by the dry distillation of mucic acid (*q.v.*) or by mild oxidation of furfural. It is a tasteless, inodorous solid melting at 132° C and has useful germicidal properties. Ethyl furoate is a solid melting at 34° C. The other esters, including furyl furoate, are fragrant oily liquids useful as solvents for cellulose esters and for paints and varnishes. Electrolytic oxidation of furfural leads successively to furoic acid and then to maleic and succinic acids (*E.P.*, 253, 877).

BIBLIOGRAPHY.—A. Bender, *Das Furfuran und seine Derivate* (1889); E. Abderhalden, "Furfural," *Biochemischen Handlexikon*, vol. i. (1911), pp. 852 *et seq.*; "Furfural and its Derivatives," the Miner Laboratories, Chicago, *Bulletin* No. 2 (1925), an informative brochure with comprehensive bibliography. (G. T. M.)

FURFURAL, an organic colourless, aromatic, volatile inflammable, oily liquid, which turns brown on exposure to the air ($\text{C}_5\text{H}_4\text{O}_2$ or $\text{C}_4\text{H}_3\text{O}\cdot\text{CHO}$). It is obtained by distilling wood, sugar or bran with moderately-concentrated sulphuric acid. That it belongs to the general class of aldehydes (*q.v.*) and is a derivative of furan $\text{C}_4\text{H}_4\text{O}$, is shown from its structural formula $\text{C}_4\text{H}_3\text{O}\cdot\text{CHO}$. It is also made from corn cobs, oatmeal, oat hulls, straw, jute and certain gums. It can be used as a motor fuel, is used in the lacquer industry and is employed to some extent as a dye base. Some of its derivatives are used as accelerators in the manufacture of rubber (*q.v.*). Recently, furfural has found extensive use in the manufacture of synthetic resins and moulding compounds; in the preparation of disinfectants and deodorizers; in light-sensitive printing plates; and as a preventive of fermentation in glue and in dextrin paste.

FURIES, the Latin translation of Gr. Erinyes (*q.v.*), corresponding to no native idea. The resemblance of name caused occasional confusion with the very ancient, but obscure Roman goddess Furrina, worshipped on the Janiculum, whose functions and the derivation of whose name are unknown.

FURLONG, a measure of length, originally the length of a furrow in the "common field" system (from the O. Eng. *furlang*, *i.e.*, "furrow-long") (see CULTIVATION; LAND TENURE). As the field in this system was generally taken to be a square, 10 acres in extent, and as the acre varied in different districts and at different times, the "furlong" also varied. The side of a square containing 10 statute acres is 220 yd. or 40 poles, which was the usually accepted length of the furlong. This is also the length of $\frac{1}{8}$ of the statute mile. "Furlong" was as early as the 9th century used to translate the Latin *stadium*, $\frac{1}{8}$ of the Roman mile.

FURNACE, ELECTRIC: see ELECTRIC FURNACE.

FURNACE, METALLURGICAL. A contrivance in which metallurgical operations are carried out under the influence of heat derived either from the combustion of fuel or from the heating effect of the electric current. The temperature of the furnace may be high as in the case of the open-hearth furnace used in the manufacture of steel, or low, as in several types of calcining kilns, without affecting the accuracy of the definition.

Furnaces vary very much in shape and size and in the complexity of their internal arrangements, but all, with the exception of the electric furnace, consist of two essential parts: (a) the fire-box in which the fuel is burnt and (b) the hearth or laboratory in which the actual metallurgical operation is carried out. The air necessary for the combustion of the fuel may be introduced under pressure from a fan or some form of blowing engine (in which case the furnace is described as working under forced draught), or it may be drawn into the furnace by a chimney, when the furnace is said to be working under natural draught. All furnaces are equipped with some type of chimney even when it is not used as a draught producer, by which to remove the products of combustion of the fuel and the waste gases from any reaction taking place in the hearth of the furnace. In many cases the fuel, instead of being burned in the fire-box of the furnace, is converted into gas in a separate piece of apparatus called a gas-producer and delivered to the furnace in the gaseous state, an arrangement permitting of greater control of combustion.

The classification of furnaces is very difficult, on account of the large number of forms in use and the looseness of the terms used in their description; perhaps the most satisfactory method is to

arrange them, according to the manner in which the charge is heated, in three main groups:—(1) Those in which the fuel and substance to be heated are in contact; (2) reverberatory furnaces or those where the substance heated is in contact with the products of combustion but not with the fuel itself; (3) those in which the substance heated is not in contact either with the fuel or with the products of combustion, these being again subdivided as follows:

(1a) Shaft furnaces where the height is considerably greater than the diameter.

(1b) Hearth furnaces where the height is only a little greater than the diameter.

(2a) Roasting and calcining furnaces where the charge is not melted.

(2b) Melting furnaces.

(3a) Muffle furnaces, where the heating chamber is fixed and forms part of the furnace structure.

(3b) Crucible furnaces, where the heating chamber is moveable and independent of the furnace structure.

(3c) Retort furnaces, in which the materials are volatilized and afterwards condensed.

Shaft Furnaces.—It is necessary to subdivide these again into (a) kilns or natural draught furnaces and (b) blast or forced draught furnaces.

Shaft furnaces are of very ancient origin; remains in the form of blast pipes have been found in many parts of the world, and native iron-workers in India still use primitive structures of this type. In all members of this group the fire-box and hearth are combined to form a single chamber into which the fuel and material to be heated are charged.

Kilns.—These are used in cases where a high temperature is not necessary and where the products of the operation are not required in the molten state, as in lime burning and in the calcination of ores. Their forms vary according to the specific purpose of which they are to be used, but the vertical shaft is common to all. Internally the shaft may have parallel sides, or sides which gradually approach each other in the form of an inverted cone; in cross section they may be circular, elliptical or rectangular. The best example of this class of furnace is to be found in the large kilns used in the calcination of iron ores, and of these the Gjerns kiln, used extensively in the Cleveland district, may be cited. The body consists of a cylindrical shell of wrought iron lined with fire brick and standing on an iron ring supported by cast iron pillars, thus leaving an open space between the bottom of the shell and the floor upon which it stands. The furnace is continuous in action, the mixture of ore and fuel being fed in at the top and withdrawn at the bottom; in order to cause the calcined material to pass outwards a cast iron cone is placed on the centre of the floor plates supporting the body of the furnace. The bottom of the furnace instead of being open, as in the example just described, may be closed with a step grate and the calcined material withdrawn below the level of the grate.

Blast Furnaces.—This type of furnace (*see* illustration under BLAST FURNACE) is extensively used in the smelting of iron, copper and lead ores. In general form it resembles a kiln, but differs from it in several details. The air is forced into it under pressure, and the charge is tapped in the liquid condition. In size and form it varies from the large iron smelting furnace to the small furnace used in lead smelting. The early furnace was generally rectangular in section, but this in time, so far as iron smelting is concerned, gave place to a circular one, though the rectangular form is still retained in copper and lead smelting. The vertical section on the other hand is subject to considerable variation and is dependent on the nature of the operation carried out in the furnace; if simple fusion is the object as in the foundry cupola the internal cross-section is only slightly smaller at the bottom than at the top, but in ore smelting, where there is a considerable change in volume of the charge as it descends in the furnace, the sides slope inwards towards the bottom of the furnace and generally terminate in a small parallel portion of very much smaller cross-section than the upper part of the furnace. In this part called the "well" the reduced metal collects and is tapped off at intervals. For further information on this subject *see* IRON, LEAD AND COPPER.

Hearths.—These resemble blast furnaces in that the air supply is under pressure, and that the fuel and substance to be heated

are in contact, but differ from them, as has been stated, in the relation between the height and width, the height in the case of hearth furnaces being not much greater than the width. In general they consist of a shallow chamber lined with refractory or other material unacted upon by the products of the operation; the blast is introduced through one or more tuyers or nozzles and impinges either downwards on the charge or in a horizontal direction just under it. On account of the method of introducing the blast the atmosphere of the furnace can be made oxidizing or reducing at will, a factor which enables it to be used in a variety of operations. Examples of its use under oxidizing conditions are to be found in the Yorkshire Refinery and the Walloon Hearth used in the refining of pig-iron and the production of wrought iron respectively; under reducing conditions in the Catalan Forge which is used for the manufacture of wrought iron direct from the ore; and under combined reducing and oxidizing conditions in the Scotch Hearth for the reduction of lead from galena. A familiar example of this type of furnace is also found in the smith's hearth.

Reverberatory Furnaces.—Furnaces of this type are very much used in metallurgy and in principle are entirely different from those already described. The fuel is burnt in a separate chamber and the hot products of combustion led through another, called the hearth, in which the material to be heated is placed, passing from this to the chimney. Between the fire-box and the hearth and again between the hearth and chimney are brickwork ridges called respectively the fire and flue bridges. An arched roof covers the whole and is highest over the fire-box end, from there sloping gradually downwards towards the flue bridge, so that the flame may be deflected or reverberated towards the hearth—hence the name. The weight of the roof exerts considerable pressure on the side walls, tending to push them outwards; to counteract this it is usual to bind the furnace together with stout iron rods and plates, so arranged that they can be easily adjusted to allow for the expansion of the brickwork as the furnace heats up. The hearth is usually carried on a brickwork arch forming a vault under the furnace, but this procedure is sometimes departed from according to the particular process in operation. Working doors are provided in the sides or at the ends of the furnace; when the doors are in the sides, the fire-box or boxes and the chimney flues are arranged at the ends, and vice versa, the latter arrangement being very common in the large calciners and roasting furnaces used in non-ferrous metallurgy.

Reverberatory furnaces are of two types, according as they are required for low or high temperature operations; in the former case the ratio of the area of the hearth to that of the fire-box is greater than in the latter.

Calcining and Roasting Furnaces.—In these the hearth is made of fire-brick set in fire-clay, and is on the same level as the door sills, in order to facilitate the removal of the charge, which is not molten and therefore has to be raked out. If noxious gases are given off from the material under treatment a slot is often left in the furnace hearth just inside the doors through which the charge can be raked into the vault below the furnace and there allowed to cool. The hearth must not be longer than can be uniformly heated by the flame which fixes it at about 20 ft.; the width is usually not greater than 10 ft. as the charge has to be turned over continuously and this is about the greatest width which a workman can handle with a rabble. The charge may be introduced through the working doors or it may be admitted through hoppers placed in the roof of the furnace. The furnace just described is a simple single hearthed one, but more complex forms are common in which use is made of more than one hearth in the same furnace; these may be placed in line, each hearth being raised a few inches above the succeeding one and the charge raked from one to the other as the operation proceeds, or they may be arranged one above the other the charge being raked through a hole in the upper hearth on to the one immediately below until it finally arrives at the bottom hearth of the furnace. As has been already stated the ore under treatment has to be continuously turned over, and various successful attempts have been made to accomplish this mechanically. Thus there are very long calcining furnaces of the O'Hara type in which the ore is turned over and

drawn along the hearth by mechanical rabblers, or the hearth instead of being in a straight line may be curved to form part of a circle as in the Pearce and Brown Horseshoe calciners; again, instead of using rabblers the hearth of the furnace may be made to move as in the Brückner Cylinder. In this modification of the reverberatory furnace the hearth portion consists of a horizontal iron cylinder lined with fire-brick and resting on rollers. The ore is introduced through doors in the side of the cylinder which are afterwards closed and the cylinder slowly rotated. For further information on these mechanical furnaces the reader is referred to COPPER; ZINC and LEAD.

Melting Furnaces.—When designed for melting the furnace arrangement is somewhat different from that already described; the hearth instead of being level and made of fire-brick set in fire-clay is basin shaped, so that the molten charge may collect together and be easily tapped out through an opening in the front wall called the tap-hole. The hearth is roughly shaped in fire-brick and over this is laid the working bottom of slag or other refractory material, which must be unacted upon by the molten material in the furnace. The tap-hole is kept closed with easily removable material, until it is time to tap the furnace, when it is opened with a pointed bar and the charge run out into a ladle or other receptacle. It is necessary in order to preserve the hearth to keep it as cool as possible, and this is accomplished by allowing free circulation of air under it. The fire is usually fed from the side and should not be more than 6 ft. from front to back, otherwise it will be impossible to distribute the fuel by hand. The ratio of the area of the fire-box to that of the hearth varies considerably and is dependent on the temperature required in the furnace. Thus in the puddling furnace where a very high temperature is required, the ratio may be as high as 1:2 or 3, whereas in the case of calciners it may be of the order of 1:13.

It is clear that in the reverberatory furnace the heating effect is entirely due to the flame from the burning fuel and the heated products of combustion; it is therefore necessary to have a flame with a high radiative power, and in this respect the luminous flame from burning coal is probably the most satisfactory. A very hot non-luminous flame could be produced from a deep bed of burning coke in the fire-box, but this flame on account of its want of luminosity has very little power of radiation and is on this account very inefficient. The most suitable coal for use in this class of furnace is one with moderate caking power and yielding a considerable quantity of gas on distillation thus producing a large luminous flame through the hearth of the furnace.

A very important feature of the reverberatory furnace is its great adaptability; the atmosphere can be made oxidizing or reducing at will. If a large excess of air is admitted over the fuel, combustion will be complete and the atmosphere in the furnace strongly oxidizing; on the other hand if the amount of air passing through the furnace is restricted, combustion will be incomplete and the atmosphere in consequence reducing.

Another type of furnace belonging to this group is the Stetefeldt furnace used in the chloridizing roasting of silver ores. It consists of a vertical shaft kept hot by fires arranged around the bottom; the ore mixed with salt is admitted at the top and allowed to fall down the shaft, and as it is in the form of a sulphide no extra fuel is necessary. The roasting takes place under the influence of the hot products of combustion from the fires at the base as the ore falls down, and the treated ore collects in a hopper at the bottom from which it is withdrawn when cold. (See SILVER.)

Muffle, Crucible and Retort Furnaces.—This group is composed of the closed vessel type of furnace, in which the material to be heated is separated from the fuel and from the products of combustion by some form of envelope or closed vessel. The confining vessel is heated either by being placed in the fire or by the flame produced by the burning fuel, the form of the vessel being governed by the nature of the process about to be carried out. If the material undergoing treatment has only to be protected from the products of combustion, and dust carried mechanically by the draught, a muffle furnace is used. This consists of a chamber of brickwork or other suitable material, heated by a fire placed under it, or by the circulation round it of the products

of combustion. If actual melting is the object, then a crucible furnace is employed, the material to be melted is placed in a crucible, which in turn is placed in a deep fire and completely surrounded by the burning fuel until the charge is melted, when the crucible is withdrawn from the furnace and the charge poured into a mould of some form or other, as in the manufacture of crucible steel and many other metallic alloys. Retort furnaces are used when the charge has to be distilled or sublimed as in the metallurgy of mercury and zinc. The best example of this type of furnace is to be found in the Belgian furnace for the reduction of zinc. In this the ore to be reduced is placed in fireclay retorts fitted with clay condensers, in which the zinc vapour condenses, any vapour passing out of the condensers being caught in a wrought iron tubular extension to the retort. The retorts are arranged in rows in the upper portion of a vertical arched chamber with a fireplace at the base. Furnaces of this type may contain as many as 300 to 400 retorts.

Another type of furnace, not included in the above classification and hence forming a class by itself, is the Bessemer converter, which although it is in principle a blast furnace differs from the type in that it is capable of rotation about a horizontal axis, and also in the fact that the charge is introduced in the liquid condition. The heat necessary for the maintenance of the liquid state is derived from the oxidation of certain unwanted elements in the charge, brought about by a powerful stream of air introduced through the side or bottom of the converter. This type of furnace is extensively used in the metallurgy of steel and copper (see BESSEMER STEEL).

In metallurgical furnaces the greater part of the heat given out by the burning fuel escapes through the chimney, and considerable economies can be effected by using the waste heat for steam raising (by passing the escaping gases through waste heat boilers), or for raising the temperature of the air supply to the furnace. The calorific intensity of fuel is very much increased if the air used in burning it has been previously heated, and especially is this the case if the fuel is gaseous.

Two types of recuperators are in general use. The first consists of two chambers filled with brick-work arranged in such a way that the hot gases can circulate freely between the bricks; one of these chambers is fitted in between the out-going end of the furnace and the chimney, the other between the air supply and the fire-grate. When the first mentioned chamber has attained a temperature approximating to that of the waste gases it is switched round by a suitable arrangement of valves into the second place, and these reversals are made at such intervals that a steady supply of heated air is maintained for burning the fuel. In the second type of recuperator the hot gases from the furnace are made to circulate round pipes which supply air to the fire-grate.

Materials of Furnace Construction.—For the construction of the external portions of furnaces ordinary building materials such as red bricks may be used, but in those parts which are exposed to a high temperature and to the scouring action of slags special materials, capable of withstanding their destructive action, must be employed. These substances, generally described as refractory materials, are divided into three classes—Acid, Neutral and Basic, according to their chemical properties. *Acid materials* contain a considerable proportion of silica, and combine readily with basic oxides. Amongst them may be mentioned: flint, ganister, sand, Dinas rock and practically all fire-clays; *Neutral materials* are those in which the acid and basic properties are so balanced that there is little tendency to combine either with basic oxides or silica. The most important members of this group are graphite and chromite; while in *basic materials* silica is practically absent and the basic power of the oxides predominant. These resist the action of metallic oxides but are readily attacked by silica at high temperatures.

The principles underlying the use of refractories in furnace construction are most clearly exemplified in the open-hearth furnace. This is used in the manufacture of steel by the Acid and Basic processes; in the former method the slags produced are very siliceous and would readily attack any basic material with which

they came in contact; in consequence the hearth and banks of the furnace, which do come in contact with the slag must be made of material unattacked under these conditions, viz., siliceous sand fritted together under the intense heat of the furnace. In the Basic process the slag is very largely composed of calcium silicates and phosphates carrying large proportions of lime; it is very basic and would rapidly destroy any siliceous matter, hence in this case the hearth and banks must be made of basic material, calcined dolomite being that most generally employed. The roof and ports of the furnace which have to withstand high temperature only, are always built of silica brick whether the furnace is acid or basic, but in the construction of the side walls not only the high temperature but the fluxing action of the slag has to be taken into consideration. In the Acid process, where the slag is siliceous, side walls must be siliceous also, otherwise serious fluxing will take place which in a very short time will bring about the collapse of the inside walls of the furnace; and for the same reason a basic furnace must have side walls of basic material.

The roof as has already been mentioned is always constructed with silica bricks and precautions must be taken in the case of basic furnaces to prevent fluxing at the joint between the roof and side walls. Formerly this was done by interposing a course of chromite bricks between them, but later it was discovered that the same result could be achieved by relieving the pressure on the joint, and this latter course is the one most usually followed. Refractory materials, according to the part they are to play in furnace construction, may be used in their natural condition or in the form of bricks; in the latter case it is often necessary to add some foreign body to act as a binder, many of the basic refractory materials having little or no binding power.

Of the acid materials fire-clay is by far the most important; it is essentially a hydrated silicate of alumina containing an excess of silica and small quantities of lime, soda, potash and oxide of iron. The latter elements, with the exception of oxide of iron, when present in quantities greater than a few tenths of 1%, reduce the refractory properties of the clay and render it unsuitable for use at high temperatures. The effect of oxide of iron is variable and depends on the conditions prevailing in the furnace. If the atmosphere is oxidizing it is converted into ferric oxide, in which form it has no tendency to form a silicate, but if the atmosphere is reducing the ferric oxide is reduced to the ferrous state and this readily combines with silica to form a very fusible slag. Fire-clay readily absorbs water and becomes very plastic, in which form it can be moulded into any desired shape; on burning it contracts considerably, and this contraction, though not serious in the case of small bricks, has to be provided against when large slabs are being made. This is done by adding a proportion of burnt clay.

Ganister, an argillaceous sandstone, is also largely used for lining Bessemer converters. When made into bricks the clayey matter, naturally present, is sufficient to act as a binder. Ganister bricks are largely used on account of their strength and very refractory nature. Some materials containing even more silica than ganister are used for the manufacture of silica bricks. When employed in this way they are generally mixed with about 1% of lime as binding material, since they have no cohesive power of their own. Among such materials may be mentioned Dinas rock, calcined flints and white sand. Silica bricks are weak and friable but capable of withstanding very high temperatures, hence their exclusive use for the roofs of open-hearth furnaces. As they expand very much on heating provision must be made to take up this expansion as the furnace heats up. Of the neutral materials graphite and chromite are the most frequently used. Graphite, which is almost pure carbon, is used with an admixture of clay in the manufacture of crucibles. Chromite, a very infusible double oxide of chromium and iron, is mainly used in the form of bricks.

Most important amongst the basic refractories are lime, dolomite, magnesite and bauxite. Lime is an exceedingly refractory substance, but it has little binding power and readily absorbs water, and its place in furnace construction has been taken by dolomite, a carbonate of lime and magnesia of varying composition. For furnace construction it ought not to contain less than

20% magnesia and not more than about 4% ferric oxide and alumina. It is first calcined at a high temperature to expel carbon dioxide and render it less liable to deteriorate on exposure to air. It may be used either in the rough ground condition or in the form of bricks; in the former case it is mixed with a small amount of tar, rammed and burnt in position; in the latter, after mixing with tar, it is moulded into bricks under hydraulic pressure and after careful drying fired at a high temperature.

Magnesite, a naturally occurring carbonate of magnesia, is used chiefly in the form of bricks; for this purpose it is first calcined at a very high temperature, withdrawn from the calciner, watered, and allowed to weather for a few days; after this it is ground, mixed with tar and moulded into bricks under pressure, then after very slow drying for some weeks these are fired again at a very high temperature. The bricks are generally chocolate coloured, on account of the presence of a small amount of oxide of iron which is just sufficient to cause the brick to bind without the addition of any extraneous substance.

Bauxite is a hydrated double oxide of iron and alumina, though some samples contain very little iron; when calcined it shrinks considerably, and in this form, after admixture with small percentages of fire-clay, sodium silicate or lime, can be made into bricks. Well made bauxite bricks are more refractory than those made of magnesite but do not appear to have come into general use, as yet, for lining open-hearth furnaces.

Laboratory and Portable Furnaces.—Most laboratory furnaces now use gas, oil or electricity as the heating medium and the furnaces themselves are small copies of the muffle, tube and crucible types. Small portable assay furnaces using coke or coal, and arranged so that they can be used either as muffle or crucible furnaces, are frequently used in places where other methods of heating are not available as in prospecting.

In this article only the general principles of furnace construction have been treated. Another basis of classification would have been according to the nature of the fuel employed—solid, liquid or gaseous—but this was avoided as being likely to cause confusion, since any one of the furnaces can often be fired by all three kinds of fuel (*see FUEL*). For the electric and open-hearth furnaces, see the articles on these subjects.

FURNARIIDAE: *see* OVENBIRD.

FURNEAUX, TOBIAS (1735–1781), English navigator, was born at Swilly, near Plymouth. He entered the royal navy, and was employed on the French and African coasts and in the West Indies during the latter part of the Seven Years' War (1760–63). He served as second lieutenant of the "Dolphin" on her voyage round the globe (Aug. 1766–May 1768), and commanded the "Adventure" which accompanied Captain Cook on his second voyage. On this expedition Furneaux was twice separated from his leader (Feb. 8–May 19, 1773; Oct. 22, 1773–July 14, 1774, the date of his return to England). On the former occasion he explored a great part of the south and east coasts of Tasmania, and made the earliest British chart of the same. Most of his names here survive; Cook, on his third voyage, named after him the islands in Banks strait, opening into Bass's strait, and the group now known as the Low Archipelago. After the "Adventure" was finally separated from the "Resolution" off New Zealand in Oct. 1773, Furneaux returned home alone, bringing with him Omai of Ulaietea. This first South Sea islander seen in the British Isles returned to his home with Cook in 1776–77. Furneaux was made a captain in 1775, and commanded the "Syren" in the British attack of June 28, 1776, upon Charleston, South Carolina. His successful efforts to introduce domestic animals and potatoes into the South Sea islands are worthy of note.

See J. Hawkesworth, *An Account of the Voyages undertaken . . . by Captain Wallis*, etc. (1773); also T. Furneaux's life by Rev. Henry Furneaux in the *Dictionary of National Biography*.

FURNES (Flem. *Veurne*), an old-fashioned little town amid the dunes near the coast in West Flanders, Belgium, about 26 m. S.W. of Bruges. Pop. (1925) 7,900. It is the centre of a considerable area extending to the French frontier, and its market is an important one for the disposal of corn, stock, hops and dairy produce. During the Norman raids Furnes was destroyed, and the present town was built by Baldwin Bras de Fer, first count of Flanders, about the year 870. In the 14th century the barony of Furnes owned 52 rich villages, but these have all disappeared, partly owing to French invasions down to the end of the 18th century, but chiefly through encroachment of the sea followed by accumulation of sand. Furnes contains a Grand Place with many curious old houses and the church of St. Walburga, which is a fine survival of the 13th century with some older portions. Near Furnes on the seashore is the fashionable bathing place called La Panne. On the last Sunday in July the fête of Calvary and the Crucifixion is celebrated. Of all popular festivities in Belgium this is the nearest approach to the old Passion play.

FURNESS, HORACE HOWARD (1833–1912), American Shakespearian scholar, was born in Philadelphia on Nov. 2, 1833, the son of William Henry Furness (1802–96), minister of the First Unitarian church in that city. He graduated at Harvard in 1854, and was admitted to the bar in 1859, but soon devoted himself to the study of Shakespeare. He accumulated a collection of illustrative material of great richness and extent, and brought out in 1871 the first volume of a new Variorum edition, designed to represent and summarize the conclusions of the best authorities in all languages—textual, critical and annotative. The volumes appeared as follows: *Romeo and Juliet* (1871); *Macbeth* (1873, revised by his son, 1903); *Hamlet* (2 vol., 1877); *King Lear* (1880); *Othello* (1886); *The Merchant of Venice* (1888); *As You Like It* (1890); *The Tempest* (1892); *A Midsummer Night's Dream* (1895); *The Winter's Tale* (1898); *Much Ado about Nothing* (1899); *Twelfth Night* (1901); *Love's Labour's Lost* (1904); *Antony and Cleopatra* (1907) and *Cymbeline* (1913). For his first volumes he made an independent text, but beginning with *Othello* he used the first folio. Few American scholars have shown such single-hearted devotion to a formidable task and few have so brightened erudition with unvarying gentleness, sanity and humour. Furness, made doctor by five leading American and foreign universities, was conservative in his methods, but sound in his judgments. He died at Wallingford (Pa.) on Aug. 13, 1912. His wife, Helen Kate Furness (1837–83), compiled *A Concordance to the Poems of Shakespeare* (1874); and his son and namesake (1865–) was a partner in and successor to his father's work.

Dr. Furness's *Letters* were edited by his son in 1922. Among the more notable authors of tributes to him were Agnes Repplier (1912), J. J. Jusserand in *With Americans of Past and Present Days* (1916), and F. E. Schelling in *The Nation* (vol. xcv.).

FURNESS WITHY AND COMPANY LIMITED, a British shipowning and shipbuilding company, dating originally from 1870 and in 1891 registered as Furness Withy and Company, Limited, with a capital of £700,000. The total issued capital at Dec. 1927 was £4,000,000 ordinary shares and £1,500,000 5% preference shares. The shipping companies and kindred businesses acquired or controlled include the Houlder group of companies (comprising Houlder Brothers and Company Ltd., the Houlder Line Ltd., the Empire Transport Company Ltd., the British Empire Steam Navigation Company Ltd.), the Prince Line Ltd., the British and Argentine Steam Navigation Company Ltd., and the Furness Houlder Argentine Lines Ltd., which latter two companies, with the Houlder Line Ltd., operate a fleet of fast refrigerator vessels between South America and Europe. The group of undertakings controlled by Furness Withy and Company Ltd. in 1928 comprised some 40 companies, embracing every phase of the shipping business—insurance, finance, shipbuilding, ship-broking, stevedoring, etc.

The company has chiefly operated cargo liners, but after the acquisition of the Warren Line in 1912 the passenger trade between Liverpool, Newfoundland, Nova Scotia and Boston was developed. With the acquisition of the Quebec Steamship Co.

in 1920 and the Trinidad Line in the same year the company became interested in the West Indian passenger trade from New York.

In the early days of the World War the company proposed to the Government that they should charter neutral tonnage to supplement British requisitioned ships, for use in essential services. The offer was accepted, and the amount of tonnage chartered and managed by Furness Withy in this manner reached enormous proportions, far in excess of anything that was originally contemplated. It is stated with authority that over 500 vessels were chartered for Government account and operated in the Allied cause, the turnover in hire money, etc. running into figures exceeding £100,000,000 per annum. Furness Withy owned the first British steamer fitted with triple expansion engines; the first British built sea-going Diesel-engined vessel, and also the first turbine vessel to cross the Atlantic. (L. C. M.)

FURNESS, a district of Lancashire, England, separated from the major portion of the county by Morecambe bay. It is bounded by Morecambe bay, the Irish sea, the Duddon estuary, Cumberland and Westmorland. Its area is about 250 square miles. It forms the greater part of the Lonsdale parliamentary division of Lancashire and contains the parliamentary and county borough of Barrow-in-Furness. Except for a coastal strip the surface is almost entirely hilly. The northern half is included in the Lake District, and contains such eminences as the Old Man of Conistone and Wetherlam. Apart from the Duddon, the principal rivers are the Leven (which drains Windermere) and the Crake (which drains Lake Conistone). They flow into a common estuary in Morecambe bay. Several of the place-names are suffixed with that of the district, as Barrow-in-Furness, Dalton-in-Furness, Broughton-in-Furness. Between Duddon estuary and Morecambe bay lies Walney island, 8 m. in length, and in the shallow strait between it and the mainland are several smaller islands. The south-western part of Furness is rich in iron ore (haematite) which has been worked from early times by the British and Romans, and by the monks of Furness abbey and Conishead priory. It was owing to the existence of this ore that Barrow grew up in the 19th century; at first as a port from which the ore was exported to South Wales, while later furnaces were established on the spot. The haematite is also worked at Ulverston, Askam, Dalton and elsewhere, but the furnaces now depend in part upon ore imported from Spain. The district is served by the L.M.S. railway passing the watering place of Grange to Ulverston, Dalton and Barrow, with branches to Lake Side, Windermere and Conistone.

Furness has an especial interest on account of its famous abbey, the ruins of which, beautifully situated in a wooded valley, are extensive, and mainly of fine transitional Norman and Early English date. The abbey of Furness, otherwise Furdenesia or the further *nese* (promontory), dedicated to St. Mary, was founded, and built of fine red sandstone in 1127, by monks of the Benedictine order of Savigny. In 1124, they had settled at Tulketh, near Preston, but migrated in 1127 to Furness. In 1148, the brotherhood joined the Cistercian order. Stephen granted to the monks the lordship of Furness, and his charter was confirmed by Henry II., and subsequent kings. The abbot's power throughout the lordship was almost absolute; he had a market and fair at Dalton. The abbey became one of the richest in England and was the largest Cistercian foundation in the kingdom. At the Dissolution of the monasteries its revenues alone amounted to between £750 and £800 a year. The abbot was one of the 20 Cistercian abbots summoned to the parliament of 1264, but was not cited after 1330. The abbey founded offshoot houses, the most important being Rushen abbey in the Isle of Man. In 1535 the royal commissioners reported four of its inmates including the abbot, for incontinence; in 1536 the abbot was charged with complicity in the Pilgrimage of Grace; and on April 7, 1537, surrendered the abbey to the king. In 1540, the estates and revenues were annexed to the duchy of Lancaster. About James I.'s reign the site and territories were alienated to the Prestons, from whom they descended to the dukes of Devonshire. Conishead priory, near Ulverston, an Augustinian foundation of the reign of Henry II., has left no remains, but of the priory of Cartmel (1188) the fine

church is still in use. It is a cruciform structure of transitional Norman and later dates. The chancel contains some superb Jacobean carved oak screens. Cartmel is just outside Furness.

FURNISS, HARRY (1854–1925), British caricaturist and illustrator, was born at Wexford, Ireland, of English and Scottish parents. He was educated in Dublin, and in his schooldays edited a *Schoolboy's Punch* in close imitation of the original. He came to London when he was 19, and began to draw for the illustrated papers, being for some years a regular contributor to the *Illustrated London News*. His first drawing in *Punch* appeared in 1880, and he joined its staff in 1884. He illustrated Lucy's "Diary of Toby, M.P.," in *Punch*, where his political caricatures became a popular feature. In *Royal Academy Antics* (1890) he published a volume of caricatures of the work of leading artists. He resigned from the staff of *Punch* in 1894, produced for a short time a weekly comic paper *Lika Joko*, and in 1898 began a humorous monthly, *Fair Game*; but these were short-lived. Among the numerous books he illustrated were James Payn's *Talk of the Town*, Lewis Carroll's *Sylvie and Bruno*, Gilbert & Beckett's *Comic Blackstone*, G. E. Farrow's *Wallypug Book*, and his own novel, *Poverty Bay* (1905). *Our Joe, his great Fight* (1903), was a collection of original cartoons. His volume of reminiscences, *Confessions of a Caricaturist* (1901), was followed by *Harry Furniss at Home* (1904). In 1905 he published *How to Draw in Pen and Ink*, and produced the first number of *Harry Furniss's Christmas Annual*. Furniss died on Jan. 16, 1925.

FURNITURE: see INTERIOR DECORATION AND FURNITURE.

FURNITURE MANUFACTURE. Furniture manufacturing is one of the oldest industries. Up to the latter part of the 19th century, the trade was essentially a craft industry. Little of it still survives in that form, even in high-grade work, owing to the introduction of machinery, which is always used for doing the heavier operations of planing and sawing, from the log to the board. The extensive use of machinery has enabled furniture to be made at a price to place it within the reach of all classes.

The industry is divided into various sections; in many cases individual firms specialize in one particular class of goods. On the other hand, there are some firms which embrace a variety of these divisions. The principal classifications are bedroom suites, sideboards, chairs, fancy goods and cabinets, office furniture, wood bedsteads, hall and kitchen furniture, school furniture and upholstery. The last division is dealt with under a separate article under that title. (A description of the industry in the United States is given in a section at the end of this article.)

Geographical Distribution.—In the United Kingdom the principal centres of the industry are London, High Wycombe, Birmingham, Manchester, Liverpool, north-east Lancashire, parts of Yorkshire, north-east coast, Nottingham, Bath, Bristol and Barnstaple, and Scotland. The town of High Wycombe is principally engaged in the manufacture of chairs, an industry dating from the time when the windsor chair was first manufactured there, owing to the plentiful supply of beech trees in Buckinghamshire. The Bath area is noted for high-grade furniture. The largest individual British firms are situated at Tottenham, London, and Colwick, Nottingham.

Machine and Hand Work.—The industry is subdivided into what are known as machine shops and hand shops. In the first named, the bulk of the machine work is done on the same premises, and is extensive in its character. In the case of the "hand shop," it must not be thought that the furniture is produced entirely by hand. On the contrary, a considerable amount is still done by machines, but not done on the premises, the work being sent out to what is termed a trade mill, where a complete range of machines is available, and various operations are performed on the timber for the purpose of lessening the cabinet-maker's task. This arrangement is very convenient for small manufacturers who are not in the position to afford the capital cost of laying down an extensive plant. Many of these workers are almost home workers, performing their operations in a part of the house, or in a large shed at the back of it. Cheap furniture made in this class of workshop is sometimes termed garret-made furniture. This process, although wasteful from the point

of view of labour in carrying the material backwards and forwards to the trade machine mill, avoids the stand-by losses caused when workshops are too small to keep a machine shop fully occupied.

The principal machinery employed in machine shops consists of swing or pendulum saws, circular rip saws, overhand planers, planing and thicknessing machines, cross-cut circular saws, band saws, fret saws, spindle moulding machines, fourcutter moulding machines, tenoning machines, lathes, dovetailing machines, boring machines and sand-papering machines of various types, such as triple drum, belt, disk, up-and-down, etc.

Cabinet-making.—The chief methods of jointing used by the cabinet-maker are mortising and tenoning and scribing, dovetailing, dowelling, tonguing and grooving and mitring. Owing to the modern extensive use of machinery the operations of a cabinet-maker are largely reduced to the fitting and running of drawers, the hanging of doors on hinges or centres, and the general assembly of the main carcass of goods. This latter operation, however, is in some works executed in a machine shop, cramping in particular being done by large mechanical cramps, designed to operate in three directions successively—transversely, vertically and longitudinally.

The chair industry is mainly concentrated at High Wycombe. The trade there has developed from the windsor and cheap bedroom chair to high grade reproductions of old styles such as Chippendale, Sheraton, Hepplewhite, etc.

Polishing.—Polishing is divided into French polishing, wax polishing and spray polishing. Most woods are usually stained before polishing. Stains may be made of water, spirit or oil.

The process of french polishing varies slightly, according to the nature of the wood. If it is intended to have what is known as a full polished effect, it is necessary to fill the grain of the wood, full polished being the term used to denote an even smooth surface over all the wood, no open grain showing in its natural state. Various fillers are employed, usually either plaster or what is known as American patent filler. The filler is well rubbed into the grain of the wood, and then allowed to stand a considerable time to harden. If plaster is used, it is usual to oil the whole of the work with linseed oil, to "kill the plaster," i.e., to prevent it looking white and murky, and to give a transparent effect to the subsequent coating of polish.

The next process is known as bodying up, and consists in applying a coat of shellac polish (consisting of shellac dissolved in methylated spirits) by means of what is known as a rubber, which consists of a pad of cotton-wool saturated to a suitable extent with shellac polish and covered with a piece of linen rag which acts as a filter and allows the polish to be distributed evenly. After a certain amount of work, it is necessary to apply a small amount of linseed oil to the rubber to prevent it from "hanging," that is from dragging the polish off. After this process has been continued for a certain length of time, the work is allowed to stand so that the polish can sink into the wood and harden. The surface is then cut down, as it is termed, either by fine sand-paper or pumice powder. After that, it is again bodied up. Every process is continued in succession according to the degree of finish required. The greater the length of time allowed to elapse between the operations, the safer is the result obtained in permanence and beauty of finish. A fortnight or three weeks is by no means an excessive time for these operations to take in high-class work. The greatest objection to this process is the difficulty in the use of oil, any excessive amount being subsequently exuded by the polish as sweating. As it is a matter of individual judgment, greatly dependent also on atmospheric conditions and temperature, it is very difficult to get uniformity of working, and consequently the french polishing process cannot be termed absolutely reliable.

Wax polishing is a much simpler process and consists in applying to the wood beeswax and turpentine which has been melted to a suitable consistency and subsequently allowed to get cold. A stiff brush is used to ensure that the wax does not remain in the grain of the timber. This is nearly always used for open grain effects. The wood is not filled in this method.

Spray polishing has been introduced for the purpose of using

PREPARATION OF LUMBER IN FURNITURE-MAKING

1. Oak beams from England, estimated to be 400 years old. Old wood is frequently used in manufacturing modern copies of antique furniture
2. Selecting seasoned lumber from warehouse, where it has been stored to finish drying
3. Circular ripping-saw. This saw, which cuts with the grain of the wood, has forward raking teeth. A treadle controls speed
4. Pendulum cross-cut saw. It can be swung back and forth from an overhead pivot by a handle attached to the guard
5. Hand-feed planer or facing-machine, of fixed-blade type. Used for smoothing the reducing timber
6. Table cross-cut saw. The teeth of cross-cutting saws have backward rake as opposed to the forward rake of ripping-saws (see fig. 3)
7. Planing machine of 4-spindle type; used for planing boards on all four sides at the highest speed (maximum 250-300 ft. a minute)
8. Vertical band-saw. A band of fine steel, set with teeth, revolves about two large pulleys one above and one below the table. This saw can be raised or lowered as required, and is used for both straight and curved cutting
9. Sand-papering machine of flexible-belt type. The belt is pressed down to the material by means of a lever

FURNITURE MANUFACTURE

SHAPING AND CARVING WOOD FOR FURNITURE

1. Saw-table tilted for cutting corners
2. Shaping cutter
3. Dove-tailing machine
4. Workman carving at lathe

5. A machine which carves four chair-tops simultaneously, by the same mechanical process
6. A skilled craftsman in the Stratfords shops, carving by hand

7. Hand carvers at work on furniture detail
8. Jig-saw, a band-saw which can be adjusted to cut in any direction
9. Clamp used in gluing

cellulose lacquers, either nitro-cellulose or cellulose-acetate dissolved in suitable solvents such as acetone, amyl acetate, butyl acetate, with the addition of certain other substances termed plasticisers to prevent excessive brittleness, such as tri-phenol phosphate. Usually in addition there is a certain amount of petrol or benzol in the mixture to facilitate rapid drying. It is on account of the rapid drying of these lacquers that it is necessary to spray them on to the wood. To effect this a pistol or gun is used, which works like a scent-spray. Compressed air at about 45 to 70 lb. pressure is used to spray liquid from a jet, the air acting as an atomizer and causing the liquid to be broken up into a fine cloud. When this process is used it is necessary to avoid all use of oil, as that is detrimental to the cellulose compounds. The fact that no oil is used avoids the defects above mentioned in regard to french polishing.

Works Organization.—In large works the principal departments are as follows, and the order of working is in the sequence mentioned:

The drawing office produces original ideas or works on the traditional designs and examples of the old cabinet-masters. This section also makes full-size working details, which are then passed over to the works proper, where the job is technically known as "set out," every piece of wood employed in the job being marked out on a board or rod. From this, a cutting or works order is made (in U.S.A. termed a stock bill), giving the exact dimensions of each finished piece. In some works a duplicate order giving outside dimensions to allow for trimming and shrinking, is also supplied. This order is issued to the timber yard so that the requisite timber can be taken from store and delivered to the machine shop to be cut up in accordance with the instructions.

If the timber has not been purchased as dry timber it is necessary to ensure its being seasoned, either by natural or artificial methods. This consists in what is known as sticking, that is, piling the timber board by board or plank by plank, one above the other with a narrow strip of timber placed in between every board cross-wise, at approximately every 18in. along the length of the plank or board. It is most essential that these sticks be kept vertically over one another as the pile is increased in height, otherwise there is a tendency for the timber to warp or become wavy owing to the pressure on each board not being sustained by the one immediately underneath. Much good timber is often spoiled through careless sticking. If the natural method of seasoning is employed, the timber is piled first of all in the open and then subsequently put under cover, or alternatively is put under cover straight away, but so situated that there is a good current of air through the building. If, however, the wood is to be seasoned by an artificial process, it is still stucked, but placed in a drying kiln, usually on specially constructed trolleys which allow it to be easily pushed along from one kiln to another in successive stages. The process consists in some suitable method of introducing hot moist air, humidity at the start being at its greatest and gradually being reduced in subsequent stages. By this means the outside of the timber is not hardened, but the excess internal moisture of the wood is driven out by the heat, the humidity of the air not being fully at saturation point. As this process is continued, the moisture content of the air is gradually reduced until the whole timber becomes what is known as bone dry. The moisture content of the wood should then be from 6% to 12%.

When the timber passes to the machine shop it is first dealt with by the swing or pendulum saw and cross-cut into lengths for all those parts which are required to have all their edges worked upon. On the other hand, where long lengths are required, mouldings sometimes are worked in those long lengths to be cut up subsequently, this being a matter of convenience for ease of feeding the machines. All timber which is used for large flat surfaces is then passed over the overhand planers for the purpose of planing "out of wind," as it is termed, that is, ensuring that the whole surface of the timber is uniform, and able to rest on a flat surface without rocking. After that, according to the particular nature of the piece and its ultimate destination in the assembly of the goods to be made, it passes to the various

individual machines above mentioned, either for bringing to a definite thickness, or moulding, boring, tenoning, sand-papering, etc.

When the wood has been fully machined, there are two distinct methods employed according to the type of works. One is to store these various parts in a special place where they can be drawn upon as required, the other is immediately to assemble the whole of the quantity machined. In some shops, a good deal of the work formerly executed by the cabinet-makers is done in either a cabinet or second machine shop, or is passed back after the cabinet-maker has done certain operations. For instance, cramping up various frames such as door frames, glass frames, etc., may be done in the machine shop, or may be done entirely in the cabinet-maker's shop by means of hand cramps instead of cramping machines. Then again, drawers may be fitted by hand by the cabinet-maker, or they may be sent back after assembly to be fitted in a drawer-fitting machine.

Some firms have so specialized the various processes that there is very little cabinet-maker's work to be done, and the cabinet-maker becomes really an assembler, who only requires a glue pot, a hammer and a screw driver.

In the United States a beginning is being made in line assembly on a belt conveyor similar to that used by motor-car manufacturers. Nothing like that has been attempted in England, the nearest approach being a system of roller conveyors in the machine shop for ease of movement in shifting the timber.

Scientific Research.—Work in this direction has been performed by two separate bodies working in co-operation. The Forest Products Research Laboratory has been investigating the ravages of worm in timber work which has proved of great value to the trade. Also the Advisory Committee on Timbers of the Imperial Institute, South Kensington, London, has been conducting an exhaustive survey of British empire timbers, many of which, being suitable for furniture construction, have been introduced to the market and should gradually come into extensive use.

Trade Unions.—The principal trade unions, on the operatives' side, are the National Amalgamated Furnishing Trades Association, the Amalgamated Society of Wood-cutting Machinists, the Amalgamated Union of Upholsterers and the Progressive Society of French Polishers.

The first named has endeavoured to embrace all sections of the industry, but is chiefly concerned with cabinet-makers and polishers. The others confine themselves to their particular sections. On the employers' side, the principal organizations are the National Federation of Furniture Trades, the London Cabinet and Upholstery Trades Federation, Yorkshire Employers Federation and Master Carvers Association, London. All these bodies except the last embrace both manufacturers and retailers in the industry, although they are divided into separate groups.

The operatives employed in the British industry, and the employers also, may be grouped into two divisions, the one British and the other Jewish. The trade is very largely in the hands of the Jews in many areas, particularly so in London. It is unusual to find Jewish workers in British shops, and vice versa.

Raw Materials: Timber.—The chief timbers used are oak, principally American, but also some Russian, Austrian and Japanese; the mahogany used is chiefly Honduras, African and Cuba. Other woods are American walnut, satin walnut or red gum, hazel pine or sap red gum, whitewood, satinwood, beech, Canadian birch and deal and pine and various veneers, some of which are superimposed upon the woods above named.

Apart from timber, which naturally must be the principal raw material, and which is dealt with under a separate article on FURNITURE WOODS, the principal raw material employed in the industry is plywood, which is a manufactured product consisting of three or more separate veneers cemented together with the grain of each layer running at right angles to the previous layer, and which may be veneered with a final layer of some more expensive wood, the core being of cheaper grade timber which readily lends itself to cutting on a rotary veneer lathe. Plywood is principally manufactured in Finland, Estonia, Latvia, Germany

and Belgium.

The other principal raw material is glass, of which the bulk is produced in Belgium. Brass-foundry work and locks are chiefly obtained from Birmingham and district. Materials for polishing consist of gums and lacs, the lac coming from India and gums from various tropical countries. Where cellulose is employed for the finishing process, it is largely manufactured in England.

It will be seen that little of the raw material of which furniture is made is British, the bulk being procured from abroad.

Furniture Styles.—Styles of furniture in England can be grouped into two categories, period styles and modern. The principal period styles are Tudor, Elizabethan, Charles, Jacobean, William and Mary, Queen Anne, Chippendale, Adams, Sheraton, Hepplewhite, Empire and Georgian. In addition to these essentially British styles, there are the well-known Continental styles, Louis XIV., XV. and XVI. Of the older Continental styles which influence modern tendencies, may be mentioned Dutch Marquetry and Italian Renaissance.

Among modern styles, as from the end of the Victorian era, may be mentioned the quaint art style, and the subsequent versions of the old period styles. Modern Jacobean is in no way a true example of old Jacobean furniture, it rather expresses the feeling, or is influenced by the tradition, of that period. The same is true of modern examples of so called Sheraton, Chippendale, Adams, etc. But many reproductions are manufactured as exact copies of fine old examples.

British Furniture Output.—The output of the British furniture trade has been investigated by the official census of production. The following figures are returned for the years 1907 and 1924:—

Products	Selling value, 1924	Selling value, 1907
	£	£
Furniture of wood, upholstered or not upholstered	18,129,000	7,338,000
Sofa and chair frames and other parts of furniture	655,000	94,000
Furniture of wood, frames and parts, not separately distinguished	305,000	..
Fittings for shops, offices, banks, churches, ships, etc., and architectural woodwork	2,096,000	1,128,000

In considering these figures it should be remembered that there was a great rise in prices between 1907 and 1924, and that it is very difficult, therefore, to compare them with accuracy. It is also recorded with regard to the repairs of furniture that there was a selling value of £220,000 in 1907 and of £1,315,000 in 1924.

In the year 1924 the British exports of furniture were valued at £1,317,000, and the net imports at £563,000. In 1927 the British exports of furniture were valued at £1,232,000, while the net imports were valued at £815,000.

It is also shown that the number of persons employed in British furniture-making in 1924 was 82,841, of whom 71,238 were recorded as operatives and 11,603 as belonging to the managing, clerical and technical staffs. These figures, however, cover, in addition to furniture and cabinet-making, the persons employed in the upholstering, bedding and mattress trades.

BIBLIOGRAPHY.—The following works relate chiefly to styles, and are profusely illustrated, showing past examples of period styles: H. Cescinsky, *English Furniture of the Eighteenth Century*; K. W. Clouston, *Chippendale Period in English Furniture*; G. M. Ellwood, *English Furniture and Decoration, 1680-1800*; P. Macquoid and R. Edwards, *Dictionary of English Furniture*; H. P. Shapland, *Encyclopædia of Furniture*, with introduction. The following are technical works: S. Ransome, *Modern Wood-working Machinery*; R. W. Todd, *The Practical Saw Doctor*; H. D. Tiemann, *The Kiln Drying of Lumber*; J. H. Rudd, *Practical Cabinet Making and Draughting*; A. Parkhouse, *Practical Polishing and Staining*; P. Wells and J. Hooper, *Modern Cabinet Work, Furniture and Fittings*. The most extensive list of standard works on Cabinet-Making, Furniture and Furnishings, is inserted in *The Cabinet Maker's Diary*, 1928.

(W. H. S.)

UNITED STATES

The classification of the furniture manufacture in the United States is as follows: upholstered furniture; case goods (dining

room and bedroom); kitchen (refrigerators, breakfast sets, etc.); novelty furniture; reed and fibre porch furniture; wrought cast iron.

Materials.—Metal, reed and glass are used in the manufacture of furniture but wood is in far more general use. The woods chiefly used are white ash, beech, birch, cherry, chestnut, elm, gum, mahogany, maple, oak, sycamore and walnut (see FURNITURE Woods). Of recent years such scarce woods as ebony, amaranth, prima vera, tulipwood, teak, snakewood, rosewood and Ceylon satinwood have come into greater use because of their decorative possibilities.

Manufacture and Machinery.—Air-dried lumber is brought in by carloads into the factory yards, where it is so arranged that it may easily be conveyed by small electric trucks to the drying kilns. The lumber is carried from the kilns by electric lifts direct to the cutting room. The designing room after detailing the item to be manufactured enters a cutting order for the different lengths of lumber, and trucks convey the lumber to the cut-off saws. Electric motors blow the refuse of the furniture plant to a central point outside the factory and automatically the shavings, sawdust and cuttings are separated and conveyed or blown to the boilers as fuel. Waste material which is too heavy for the exhaust or blower is carried away by other methods to large revolving cylinders containing powerful knives which cut the refuse into small pieces and then deposit it in a bin.

After leaving the cut-off saw the material then proceeds to the straight line ripper, which has an automatic feed. This machine removes the edges and rips the boards to a specified width; gluing then follows for the core work. The feed jointer operated by three motors is the next machine in line. For work requiring gluing, the automatic revolving clamp carrier then follows. The pieces to be glued are placed edgewise on plates, which are kept hot by steam coils. From the hot plates the work is taken to a revolving single roll glue spreader and then arranged in a clamp carrier. This clamp carrier holds the pieces together from 2 to 14 hours.

The rail lengths are sent direct to the surfacing machine, where they are planed to the desired width and thickness. The mitre saw then cuts the lengths to required size and a boring machine is used to place holes for dowel pins. A shaping machine is used if a special shape for rails and legs is desired.

Modern Machines.—The latest method eliminates considerable handling in having the truck loads stopped at the "straito-plane." Here lumber is fed in at one end of the machine and comes out at the other end in boards of standard thickness and size. Next is the planer, which removes a thin coating, leaving the board ready for the veneer or sanding room. In the veneer room, the veneer clipper is used for cutting the various widths and lengths. For matching veneer the taping machine is required which binds and glues. In the final machine room are the moulders which have automatic feeders that are used for making large quantities of the same type of legs. Here also are the hand planers, mitre saws, high speed band sawers, double end cut-off saws, jig-saws, shapers and routers as well as dovetailers. Various high-speed boring machines are then in line on this machine floor.

A machine in common usage is the multiple speed carver, operated by electric motors. Four to thirty-six carvings are duplicated at one time under the direction of a single operator. The sanding in preparation for finishing is also done by machines. Legs and framing used in furniture are often bent into desired shape. This is done under steam and pressure. Forms and shapes so bent are stronger than when machined, as it entirely eliminates end or cross-grain wood (see WOODWORKING MACHINERY).

Plywood and Veneer.—Usually the finer grains of woods are used for the outer surface to provide decorative effects. Irregular forms can be made of plywood more readily when glued and pressed into desired shapes. Veneers permit the use of the beautiful grain woods cut from selected logs which are too costly to be used as solid wood. If the board is to be veneered, cross-grained veneer sheets are glued on to the surface of the board and thence taken to a power press, where they are held under hydraulic or motor pressure until perfect adhesion is secured. Then they are placed on the panel dry kiln, and then they undergo the sanding

BY COURTESY OF THE STRATFORDS SHOPS, INC.

STEPS IN THE MANUFACTURE OF FURNITURE

1. Showing a type of press used in the making of veneered furniture. The two pieces of wood—one the base, the other the fine veneer—after being glued together, are laid between two plates upon which pressure can be exerted
2. A workman using the comparatively new method of spray polishing. A compressed-air pistol sprays the polish onto the wood in a fine cloud. Nitro-cellulose lacquers are most commonly applied in this way
3. An electrically driven "rubber," used in the so-called French method of polishing. Oscillating felt pads, moving in a long or short stroke, travel back and forth over the surface to be polished
4. Workman operating a perforating machine for stencils. The movable arm ends in a kind of drill or punch which perforates a sheet of paper, metal or fibre
5. Painted decoration applied by hand. The craftsman may work from a design copied onto the wood-surface, or in a freehand manner
6. Gilding. A gold size is applied to the shellacked surface of the wood, after it has dried, gold-leaf is applied, as shown in the illustration

and finishing processes. Ash, basswood, beech, birch, cedar, cherry, cottonwood, cypress, Douglas fir, elm, gum, maple, mahogany, oak, pine, poplar, spruce, redwood, sycamore and walnut, as well as all the rare woods, are used as veneers (*see* PLYWOOD).

Finishing.—The piece is first sanded with fine sand-paper and stained. Stains may be evenly applied with a brush, rags or with a sponge, but a spraying device, according to many manufacturers, is the best method. Dipping in a large vat is sometimes resorted to. Stains comprise the several classes of water stains, acid stains, spirit stains and oil stains. To fill up the pores of the wood a thin coat or filler is next applied.

After this operation the final finish is given. The *wax finish* is obtained by applying two coats of shellac to the stained piece; sanding; and following with a coat of paste wax, which is rubbed about the surface with sand-paper until it is polished. *Shellac finish* is procured by applying two or three coats of shellac and sanding. When dry, a very fine pumice soap is sprinkled over the surface, upon which is poured rubbing oil that is rubbed with the grain. *Varnish finish* is made by coating the object with shellac; then sanding, and applying the desired number of coats of varnish.

Satin finishes are completed by polishing the varnished surfaces with rotten stone and water. *Lacquer finish* is gradually displacing varnish. The application is the same as varnish. Each successive lacquer coat forms part of the previous coat, whereas the varnish finish is an application of separate coats, one upon the other. Crackled finish is the result of applying a fast drying coat over a slower drying one. *Polychrome finish* is used only on surfaces having carvings, turnings or flutings. After the shellac coat is applied, which generally dries quickly, the basic coat follows, which may be coloured bronze, gold, oil colours or enamel. Upon drying, the dominant colour or smutting solution is applied, then wiped off with a cloth in spots to give the "high lighting" effect.

Production.—The U.S. Department of Commerce census of manufacturers' figures for furniture production are shown in the accompanying table.

United States Furniture Industry

Census year	Number of establishments	Wage earners (average number)	Wages	Cost of materials	Value of products
1925	3,235	180,895	\$225,200,027	\$384,507,648	\$868,145,913
1921	3,033	124,311	144,109,675	253,544,635	550,163,554
1919	3,273	140,188	143,111,976	265,555,188	579,650,641
1914	3,324	130,138	73,282,139	123,734,772	270,938,988

The principal furniture manufacturing centres in the United States are Chicago, Ill., New York, N.Y., Grand Rapids, Mich., Rockford, Ill., Jamestown, N.Y., High Point, N.C. Considerable furniture is also manufactured in the States of Massachusetts, Pennsylvania, Indiana, California and Oregon. (*See* WOODWORKING MACHINERY.) (L. KA.)

FURNITURE POLISH. The two varieties in most common use are furniture creams and furniture wax polishes, the quality of the polish differing with the ingredients used in its preparation.

Furniture creams are thick milky white liquids, and are made by dissolving beeswax in turpentine by means of steam heat in a double-jacketed pan. The use of steam heat is on account of the dangerous inflammability of turpentine vapour in the presence of a naked light. After the beeswax has thoroughly melted the steam is shut off and a solution of soft soap in hot water is added. The whole mass is then well beaten up to a thick milky emulsion and packed in bottles ready for use. The beeswax may also be replaced, or partially replaced, by other waxes such as Carnauba wax, Japan wax, Ceresine wax, etc. The proportions of 9 oz. of pure beeswax (finely shredded) to 1½ pt. of American spirits of turpentine, with the after addition of 1½ pt. of hot water containing 2 oz. of soft soap dissolved in it, is considered to make a good mixture.

Furniture wax polishes are made by similarly dissolving beeswax and other waxes in turpentine with the aid of heat, about 1 lb. of wax to 1 qt. of turpentine being used. The clear melted liquid is then poured into tins, and on cooling sets hard and is

ready for use. The addition of a little wax-soluble aniline dye-stuff to the polish when in the liquid state is made in order to give it a more pleasing appearance.

An easily made polish, particularly suitable for cleaning old and dirty furniture is obtained by shaking together 1 part of raw linseed oil, 1 part of turpentine, and 1 part of vinegar.

A polish of good quality is distinguished by its yielding a high gloss that does not smear or take a finger-mark. (*See* FRENCH POLISH.)

FURNITURE WOODS: *see* TIMBER; HARDWOODS.

FURNIVALL, FREDERICK JAMES (1825-1910), English philologist and editor, was born at Egham, Surrey, on Feb. 4, 1825, the son of a surgeon. He gave Frederick Denison Maurice valuable assistance in the Christian Socialist movement, and was one of the founders of the Working Men's College, London. During half a century he promoted the study of early English literature, partly by his own work as editor, and partly by the foundation of learned societies, especially the Early English Text Society (1864), the Chaucer, Ballad, New Shakespeare and Wyclif Societies, and at a later period societies for the special study of Browning and Shelley. He edited texts for the Early English Text Society, for the Roxburghe Club and the Rolls Series. His most important work was his "Six-Text" edition of the *Canterbury Tales*. He was the honorary secretary of the Philological Society, and was one of the original promoters of the Oxford *New English Dictionary*. He co-operated with its first editor, Herbert Coleridge, and after his death was for some time principal editor during the preliminary period of the collection of material. Dr. Furnivall was always an enthusiastic oarsman, and till the end kept up his interest in rowing; with John Beesley in 1845 he introduced the new type of narrow sculling boat, and in 1886 started races on the Thames for sculling fours and sculling eights. He died on July 2, 1910.

See Frederick James Furnivall: *A Volume of Personal Record* (1911).

FURSE, CHARLES WELLINGTON (1868-1904), English painter, born at Staines, son of the Rev. C. W. Furse, archdeacon of Westminster, was descended collaterally from Sir Joshua Reynolds. He entered the Slade school in 1884, winning the Slade scholarship in the following year, and completed his education at Julian's atelier in Paris. An important canvas called "Cain" was his first contribution (1888) to the Royal Academy, to the associateship of which he was elected in the year of his death. For some years before he had been a regular contributor to the exhibitions of the New English art club. He married in Oct. 1900 Katherine, daughter of John Addington Symonds. She received the D.B.E. for her services during the World War and was director of the Women's Royal Naval Service from 1917 to 1919. Among his more famous pictures are: "Diana of the Up-lands," "Lord Roberts" and "The Return from the Ride" at the Tate Gallery, London; the four children in "Cubbing with the York and Ainsty," "The Lilac Gown," "Mr. and Mrs. Oliver fishing" and the portrait of Lord Charles Beresford.

FURSE, DAME KATHARINE (1875-), D.B.E. (1917), founder of the English V.A.D. force, was born at Bristol on Nov. 23, 1875, the daughter of the poet and critic John Addington Symonds (*q.v.*). In 1900 she married the painter Charles Wellington Furse (*q.v.*), who died prematurely in 1904. On the outbreak of war in 1914 Mrs. Furse realized the inadequacy of the existing number of nurses to deal with the situation, and in Sept. 1914 she went to France with a number of assistants who formed the nucleus of the V.A.D. force (Voluntary Aid Detachment). In 1915 she returned to England, and the V.A.D. work was then officially recognized as a department of the Red Cross organization. In 1917 she became director of the W.R.N.S. In 1922 she was appointed assessor, representing the international organization of Boy Scouts and Girl Guides, on the Child Welfare Committee of the League of Nations Advisory Committee for the Protection and Welfare of Children and Young People.

FUR-SEALS, a little group of marine carnivorous mammals forming the genus *Callorhinus* of the naturalists. The fur-seals resort, or once resorted, in vast numbers to crowded "rookeries."

All the islands of the Southern ocean were densely peopled by fur-seals when first discovered; so were Juan Fernandez, the neighbouring Mas-a-Fuero, the Kuriles and the islands in Behring sea. On the other side of America, in the Plate estuary, the Lobos islands also have their seal herd. The history of nearly all these rookeries is one of wanton waste and rapid extermination. At Mas-a-Fuero, 3,000,000 skins are said to have been taken within ten years, but by 1807 the fishery was no longer profitable. The South Shetlands were discovered in 1819; within two years 95 vessels had loaded up with sealskins, and to all intents and purposes the rookeries were already exterminated. The only herds which have been more or less cared for, and the only ones which have escaped destruction, are those of the Lobos islands (Uruguay), those of the Pribyloff islands (United States), and, though to a much less extent, those of the Russian Commander islands.

The fur-seal is polygamous as well as gregarious. The bulls or *sikatchi*, live to a great age and grow to a great size, far beyond that of the females. They arrive on their breeding-places in spring, choose their quarters on the rocky beach, and are joined a few weeks later by the cows (or *matkas*), who come in heavy with young. The pups (or *kotik*) are born soon after, and the comparative quiet of the rookery becomes a babel of angry noise. The bulls fight for possession of the cows, each striving to gather and keep a "harem" round him. The cows go out to sea to feed, but the bulls never leave their posts and fast throughout the season; they come in fat and vigorous in May, and leave in autumn gaunt, lean and battle-scarred. The young males or bachelors (*holloschickie*) keep to themselves, "hauling out" behind the breeding herd. Males and females are born in equal numbers; and the economic management of a rookery consists in protecting all females, in leaving the harems undisturbed, and in taking such toll of the young bachelors as to leave enough to take the places of the breeding bulls.

The Pribyloff islands, discovered in 1786, passed into the hands of the United States with the Territory of Alaska in 1867; their great rookeries had been wastefully used and ruinously depleted to begin with, but the Russian Government had nursed them back into prosperity for 30 years, till at the time of the purchase they yielded 100,000 skins a year, and did so for some 20 years after. But about 1880, pelagic sealing grew up, wherein young and old, males and females were killed without discrimination. This fishery soon showed its injurious effects upon the herd. After much arbitration the U.S. Government in 1911 took the fishery into their own hands, and pelagic sealing was finally abolished, on terms of equitable compensation. Moreover the killing of seals upon the islands was suspended for a number of years. The seal-population of the two Pribyloff islands had dwindled down to a bare 200,000 in 1912; it has increased steadily since, according to the official count, and amounted to over 800,000 in 1927. The Commander islands on the Russian side have a different tale to tell. The war and then the revolution led to neglect ashore and to piratical raids from the sea; and an expert who had visited these islands in 1897 and came again in 1922 was "dismayed" at the shrunken rookeries.

See SEAL FISHERIES, CARNIVORA; also H. W. Elliott, "Seal Islands of Alaska," *U.S. Fish Commission Reports* (1882); D. S. Jordan and others, *Fur Seals and Fur Seal Islands of the North Pacific Ocean* (1898); "Reports by D'Arcy W. Thompson and others in *British Parliamentary Papers* (U.S.) (1897-98); "Report on . . . the Falkland Islands" (1920); and "Annual Reports" in the *Bulletin of the Bureau of Fisheries, U.S.A.* (D. W. T.)

FÜRST, JULIUS (1805-1873), German orientalist, was born of Jewish parents at Zerkowo in Posen, on May 12, 1805. He was lecturer (1857) and then professor (1864) of Aramaic at Leipzig, where he died on Feb. 9, 1873. Among his writings may be mentioned *Lehrgebäude der aramäischen Idiome* (Leipzig, 1835); *Librorum sacrorum Veteris Testamenti concordantie Hebraicae atque Chaldaicae* (Leipzig, 1837-40); *Hebräisches und chaldäisches Wörterbuch* (1851, Eng. trans. by S. Davidson 1867); *Kultur und Literaturgeschichte der Juden in Asien* (1849).

FÜRSTENBERG, the name of two noble houses of Germany.

1. The more important ruled in a mediatised principality in the

district of the Black Forest and the Upper Danube, which comprises the countship of Heiligenberg, about 7 m. N. of the Lake of Constance, the landgraviates of Stühlinger and Baar, and the lordships of Jungnau, Trochtelfingen, Hauser and Möskirch or Messkirch. The territory is discontinuous; and lies partly in Baden, partly in Württemberg, and partly in the Prussian province of Sigmaringen. The relations of the principality with Baden are defined by the treaty of May 1825, and its relations with Württemberg by the royal declaration of 1839. The *Stammort* or ancestral seat of the family is Fürstenberg in the Black Forest, but the principal residence of the Fürstenbergs is at Donaueschingen.

The family of Fürstenberg claims descent from a certain Count Unruoch, a contemporary of Charlemagne, but their authentic pedigree is only traceable to Eginio II., count of Urach, who died before 1136. In 1218 his successors built the town and castle of Fürstenberg. Of the two sons of Eginio V. of Urach, Conrad, the elder, inherited the Breisgau and founded the line of the counts of Freiburg, while the younger, Heinrich (1215-1284), received the territories lying in the Kinzigthal and Baar, and from 1250 onward styled himself first lord, then count, of Fürstenberg. His territories were subsequently divided, though temporarily reunited under Count Friedrich III., whose wife, Anna, heiress of the last count of Wardenberg, brought him the countship of Heiligenberg and lordships of Jungnau and Trochtelfingen in 1534. On Friedrich's death (1559) his territories were divided between his two sons, Joachim and Christof I. Of these the former founded the line of Heiligenberg, the latter that of Kinzigthal.

In 1909 there were two branches of the princely house of Fürstenberg: (1) the main branch, that of Fürstenberg-Donaueschingen, the head of which was Prince Maximilian Egon (b. 1863), who succeeded his cousin Karl Egon III. in 1896; (2) that of Fürstenberg-Königshof, in Bohemia, the head of which was Prince Emil Egon (b. 1876), chamberlain and secretary of legation to the Austro-Hungarian embassy in London (1907). The cadet line of the landgraves of Fürstenberg is now extinct, its last representative having been the landgrave Joseph Friedrich Ernst of Fürstenberg-Weitra (1860-1896), son of the landgrave Ernst (1816-1889) by a morganatic marriage. He was not recognized as *ebenbürtig* by the family. The landgraves of Fürstenberg were in 1909 represented only by the landgravines Theresa (b. 1839) and Gabrielle (b. 1844), daughters of the landgrave Johann Egon (1802-1879).

From the days of Heinrich of Urach, a relative and notable supporter of Rudolph of Habsburg, the Fürstenbergs have played a stirring part in Germany history as statesmen, ecclesiastics and notably soldiers. There was a popular saying that "the emperor fights no great battle but a Fürstenberg falls." In the Heiligenberg line the following may be more particularly noticed.

FRANZ EGON (1625-1682), bishop of Strasbourg, was the elder son of Egon VII., count of Fürstenberg (1588-1635), who served with distinction as a Bavarian general in the Thirty Years' War. He began life as a soldier in the imperial service, but on the elevation of his friend Maximilian Henry of Bavaria to the electorate of Cologne in 1650, he went to his court and embraced the ecclesiastical career. He soon gained a complete ascendancy over the weak-minded elector, whose Francophile policy he instigated. Ecclesiastical preferments were heaped upon him, and in 1663 he became bishop of Strasbourg. On the conclusion of a treaty between the emperor and the elector of Cologne, on May 11, 1674, Franz was deprived of all his preferments in Germany, and was compelled to take refuge in France. He was, however, amnestied with his brother William by a special article of the Treaty of Nijmegen (1679), whereupon he returned to Cologne. He died on April 1, 1682 at Strasbourg.

His brother WILLIAM EGON (1629-1704), bishop of Strasbourg, began his career as a soldier in the French service. He went to the court of the elector of Cologne at the same time as Franz Egon, whose policy he shared. In 1672 William was seized by imperial soldiers in the monastery of St. Pantaleon at Cologne, hurried off to Vienna and there tried for his life. He was saved by the intervention of the papal nuncio, but was kept in prison

till the signature of the Treaty of Nijmegen (1679). As a reward for his services Louis XIV. appointed him bishop of Strasbourg in succession to his brother in 1682, in 1686 obtained for him from Pope Innocent XI. the cardinal's hat, and in 1688 succeeded in obtaining his election as coadjutor-archbishop of Cologne and successor to the elector Maximilian Henry. At the instance of the emperor, however, the pope interposed his veto; the canons followed the papal lead, and, the progress of the Allies against Louis XIV. depriving him of all prospect of success, William Egon retired to France. He died on April 10, 1704 near Paris.

In the Stühlingen line the most notable was KARL EGON (1796–1854), prince of Fürstenberg, the son of Prince Karl Alois of Fürstenberg, a general in the Austrian service, who was killed at the battle of Loptingen on March 25, 1799. In 1804 he inherited the Swabian principality of Fürstenberg and all the possessions of the family except the Moravian estates. By the mediatization of his principality in 1806 the greater part of his vast estates fell under the sovereignty of the grand-duke of Baden. In politics he distinguished himself by a liberalism rare in a great German noble, carrying through by his personal influence with his peers the abolition of tithes and feudal dues and stanchly advocating the freedom of the press. His palace of Donaueschingen, with its collections of paintings, engravings and coins, was a centre of culture, where poets, painters and musicians met with princely entertainment. He died on Sept. 14, 1869, and was succeeded by his son Karl Egon II. (1820–1892), with the death of whose son, Karl Egon III., in 1896, the title and estates passed to Prince Maximilian Egon, head of the cadet line of Fürstenberg-Pürglitz.

See München, *Gesch. des Hauses und des Landes Fürstenberg*, 4 vols. (Aix-la-Chapelle, 1829–47); S. Riezler, *Gesch. des fürstlichen Hauses Fürstenberg bis 1507* (Tübingen, 1883); *Fürstenbergisches Urkundenbuch*, ed. S. Riezler and F. L. Baumann, vols. i.–vii. (Tübingen, 1877–91), continued s. tit. *Mitteilungen aus dem fürstlich. Fürstenbergischem Archiv* by Baumann and G. Tumbült, 2 vols. (ib. 1899–1902); Stokvis, *Manuel d'histoire* (Leiden, 1890–1893); *Almanach de Gotha*; *Allgemeine deutsche Biographie*.

2. The second Fürstenberg family has its possessions in Westphalia and the country of the Rhine, and takes its name from the castle of Fürstenberg on the Ruhr. The two most remarkable men whom it has produced are Franz Friedrich Wilhelm, freiherr von Fürstenberg, and Franz Egon, count von Fürstenberg-Stammheim. The former (1728–1810) became ultimately vicar-general of the prince-bishop of Münster, and effected a great number of important reforms in the administration of the country, besides doing much for its educational and industrial development. The latter (1797–1859) was an enthusiastic patron of art, who assisted the completion of the Cologne cathedral, and erected the beautiful church of St. Apollinaris near Remagen on the Rhine. He was a member of the Prussian Upper House in 1849, collaborated in founding the *Preussisches Wochenblatt*, and was an ardent defender of Catholic interests.

FÜRSTENWALDE, a town in the Prussian province of Brandenburg, on the right bank of the Spree, and 28 m. E. of Berlin on the railway to Frankfurt-on-Oder. Pop. (1925) 23,334. Fürstenwalde is one of the oldest towns of Brandenburg. From 1385 it was the seat of the bishop of Lebus, whose bishopric was incorporated with the electorate of Brunswick in 1595. The industries are important, including, besides brewing and malting, manufactures of chemicals, boots, organs, stoves, etc., iron founding and wool-weaving.

FÜRTH, a manufacturing town of Germany, in the Republic of Bavaria, at the confluence of the Pegnitz with the Regnitz, 5 m. N.W. from Nuremberg by rail, at the junction of lines to Hof and Würzburg. Pop. (1885) 35,455; (1925), 73,693. Fürth was founded, according to tradition, by Charlemagne, and was for a time under the burgraves of Nuremberg, but about 1314 it was bequeathed to the see of Bamberg. In 1806 it came into the possession of Bavaria. The old St. Michaeliskirche is a handsome structure; but its chief edifices are the new town hall, with a tower 175 ft. high. Fürth owes its prosperity to the tolerance it meted out to the Jews, who found here an asylum from the oppression under which they suffered in Nuremberg, and who have

here a synagogue and a high school. There are besides a wood-carving and an agricultural school. Industries include production of chromolithographs and picture-books, manufacture of mirrors and mirror-frames, bronze and gold-leaf wares, pencils, toys, haberdashery, optical instruments, silver work, turnery, machinery and fancy boxes, and a trade is carried on also in hops, metals, wool and coal. A large annual fair is held at Michaelmas and lasts for 11 days. The earliest railway in Germany was that between Nuremberg and Fürth (opened Dec. 7, 1835).

FURTWÄNGLER, ADOLF (1853–1907), German archaeologist, was born on June 30, 1853, at Freiburg-im-Breisgau, and died at Athens on Oct. 10, 1907. From 1878 to 1879 he was engaged in work on the excavations at Olympia, and in 1884 became professor of archaeology in Berlin, exchanging his chair in 1894 for one at Munich. He conducted the excavations at Aegina and Orchomenos in 1901–03, and was the author of many important works on archaeology, notably *Die antiken Gemmen* (1900), and *Griechische Vasenmalerei*, begun in 1900 with Reichold, and continued by other scholars.

FURTWÄNGLER, WILHELM (1886–), German conductor, was born in Berlin Jan. 25, 1886, the son of the archaeologist Adolf Furtwängler (1853–1907). He received his musical education in Munich from Beer-Walbrunn, Rheinberger and Schillings, and then acted as conductor at Zürich. Later he occupied similar positions at Strasbourg, Lübeck, Mannheim, Vienna and Frankfurt-on-Main. In 1922, on the death of Arthur Nikisch, he became director of the Berlin Philharmonic Orchestra and of the *Gewandhaus* concerts at Leipzig. Ranked among the finest conductors in Germany, Furtwängler also gained an international reputation, which was considerably enhanced by his annual concerts in New York.

FURZE, GORSE or WHIN, botanical name *Ulex*, a genus of thorny papilionaceous shrubs of the family Leguminosae, comprising 20 species, confined to west and central Europe and north-west Africa. Common furze, *U. europaeus*, is found on heaths and commons in western Europe from Denmark to Italy and Greece, and in the Canaries and Azores, and is abundant in the British Isles. It grows to a height of 2–6 ft.; it has hairy stems, and the smaller branches end each in a spine; the leaves, sometimes lanceolate on the lowermost branches, are mostly represented by spines from 2 to 6 lines long, and branching at their base; and the flowers, about three-quarters of an inch in length, have a shaggy, yellowish-olive calyx, with two small ovate bracts at its base, and appear in early spring and late autumn. They are yellow and sweet-scented and visited by bees. The pods are few-seeded; their crackling as they burst may often be heard in hot weather. This species comprises *U. europaeus* proper, which has spreading branches, and strong, many-ridged spines, and *U. strictus* (Irish furze), with erect branches, and slender 4-edged spines. Another British species of furze is *U. nanus*, dwarf furze, also a native of Belgium, Spain and the west of France; it is a procumbent plant, less hairy than *U. europaeus*, with smaller and more orange-coloured flowers, which spring from the primary spines, and have a nearly smooth calyx, with minute basal bracts. Furze, or gorse, is sometimes employed for fences.

Notwithstanding its formidable spines, the young shoots yield a palatable and nutritious winter forage for horses and cattle. To fit it for this purpose it must be chopped and bruised to destroy the spines. There are now a variety of machines by which this is done rapidly and efficiently, and which are in use where this kind of forage is used to any extent. The agricultural value of this plant has often been over-rated by writers. In the case of poor, dry soils it does, however, yield much valuable food at a season when green forage is not otherwise to be had. It is given to horses and cows in combination with chopped hay or straw.

This plant is invaluable in mountain sheep-walks. The rounded form of the furze bushes in such situations shows how diligently the annual growth, as far as it is accessible, is nibbled by the sheep. The food and shelter afforded to them in snowstorms by clusters of such bushes is also of much importance. Young plants of whin are so kept down by the sheep that they can seldom attain to a profitable size unless protected by a fence for a few

years. In various parts of England it is cut for fuel. The ashes contain a large proportion of alkali, and are a good manure, especially for peaty land.

FUSARO, LAGO, a lake of Campania, Italy, $\frac{1}{2}$ m. west of Baiae, and 1 m. south of the acropolis of Cumae. It is the ancient *Acherusia palus*, separated from the sea on the west by a line of sandhills. It may have been the harbour of Cumae in early antiquity. In the 1st century A.D. an artificial outlet was dug for it at its south end, with a tunnel, under the hill of Torregaveta. This hill is covered with the remains of a large villa, which is almost certainly that of Servilius Vatia, described by Seneca. There are remains of other villas on the shores of the lake. Oyster cultivation is carried on there and there is a hydrobiological station in the former royal *casino* on an island in the lake.

FUSE or **FUZE**, an appliance for firing explosives in blasting operations, military shells, etc. (see **BLASTING** and **AMMUNITION**). The spelling is not governed by authority, but modern convenience has dictated the adoption of the "z" by military engineers as a general rule, in order to distinguish this sense from that of melting by heat (see below). The word, according to the *New English Dictionary*, is one of the forms in which the Lat. *fusius*, spindle, has been adapted through Romanic into English, the ordinary fuze taking the shape of a spindle-like tube.

In electrical engineering a "fuse" (always so spelled) is a safety device, commonly consisting of a strip or wire of easily fusible metal, which melts and thus interrupts the circuit of which it forms part, whenever that circuit, through some accident or derangement, is caused to carry a current larger than that for which it is intended. In this sense the word must be connected with *fusius*, the past participle of Lat. *fundere*, to pour, whence comes the verb "fuse," to melt by heat.

FUSEE: see **MATCHES**.

FUSELAGE, the central structure of an aeroplane (*q.v.*), connecting the wings with the tail surfaces, and containing the

FIG. 1.—ABOVE, THE FUSELAGE OF A LARGE MULTI-SEATER MACHINE; BELOW, INTER-PLANE MOUNTING OF ENGINE IN NACELLE ON A BIG PLANE

crew, passengers, and sometimes the power plant and fuel. "Body" is in general use in a similar sense but includes also both the

FIG. 2.—FUSELAGE OF THE "BRACED" TYPE, WITH FABRIC REMOVED
shorter nacelle of the aeroplane with "pusher" air screw, and the engine nacelle of the multi-engine aeroplane (see fig. 1).

There are two chief forms of fuselage construction. In one an underlying braced framework is used (formerly of wood and steel, now generally of metal throughout) with a covering of fabric, the

latter kept in a "fair" shape by light supporting ribs (fig. 2). The other is on the lines of a boat, comprising a thin continuous skin with strengthening ribs, of wood or of metal throughout (fig. 3). Such a scheme has the advantage that cross bulkheads

FIG. 3.—"BOAT-BUILT" FUSELAGE, SHOWING METHOD OF CONSTRUCTION IN EITHER WOOD OR METAL, CONVENIENT WHEN MUCH SPACE IS NEEDED

are not essential, and is therefore convenient when large cabin space is required. In practice however the construction of fig. 2 can be made sufficiently free from obstructions, and is generally preferred on account of lightness. (W. S. F.)

FUSELI, HENRY (1741–1825), Anglo-Swiss painter and author, was born at Zürich on Feb. 7, 1741, the son of John Caspar Füssli, painter and lexicographer. At the Collegium Carolinum at Zürich he formed a fast friendship with Lavater, and on leaving college both the friends took orders. They were soon forced to leave Zürich on account of the stir raised by the publication of a pamphlet of theirs attacking one of the bailiwicks of Zürich for extortion. They travelled via Germany to England, where they arrived at the end of 1763, and where they were well received. Fuseli supported himself by writing, but was persuaded by Sir Joshua Reynolds to devote himself to art. He visited Rome in 1770, and there made many sketches for the Shakespeare illustrations, which afterwards made his fame. He was back in London in 1779, and became a regular exhibitor at the Royal Academy, where he was admitted A.R.A. in 1788 and R.A. in 1790. In the meantime he had accomplished his most important work, nine pictures on Shakespearean subjects, contributed to Alderman Boydell's Shakespeare gallery. A proposal was made to him in 1790 by Johnson, the publisher, to open a Milton gallery. This was opened in 1799 with 40 pictures, but was a failure from the artistic point of view. In that year Fuseli was appointed professor of painting at the Royal Academy, and his first lecture was delivered in 1801. He died on April 16, 1825.

See the *Life* by John Knowles, prefixed to his collected *Works* (1831).

FUSEL OIL, a term applied to a mixture of volatile oily liquids of characteristic odour and taste which arises during the fermentation of potatoes, beetroots, grain, and the "marc" of grapes. The amount produced is comparatively small, the proportion being largest in the case of potatoes. When such fermented liquors are submitted to distillation the various alcohols present become partially separated, owing to their varying volatilities. Ethyl alcohol (wine spirit) distils over first and the fusel oil containing several other alcohols is then collected in the distillate obtained at temperatures ranging from 105° to 137° C. Fusel oil consists mainly of two higher alcohols (*q.v.*) distilling between 128° and 132° C; one of these is inactive isoamyl alcohol or isobutylcarbinol, $(\text{CH}_3)_2\text{CH}\cdot\text{CH}_2\cdot\text{CH}_2\cdot\text{OH}$, and the other is active amyl alcohol or secondary butylcarbinol,

the latter is laevo-rotatory, *i.e.*, rotates the plane of polarized light to the left, and the former is optically inactive. These oily alcohols are partially miscible with water, dissolving in about 40 parts at 14° C. A more volatile constituent of fusel oil, isobutyl alcohol, $(\text{CH}_3)_2\text{CH}\cdot\text{CH}_2\cdot\text{OH}$, is found in the distillates boiling between 105° and 120° C; it dissolves in 10 parts of water at 15° C. In small doses fusel oil causes thirst and headache; in larger doses it is a convulsive poison.

The amyl alcohols present in fusel oil are largely used in the manufacture of amyl acetate, a fragrant liquid used in flavouring essences (pear oil, etc.), in confectionery and as a solvent in making varnishes, lacquers and artificial leathers having a nitro-

cellulose composition. Fusel oil is used as a solvent for alkaloids and fats; it is employed in the flotation process for separating sulphide ores and is the starting material in a process for synthetic rubber.

See the article "Fusel Oil" in Thorpe's *Dictionary of Applied Chemistry*, vol. iii. (1922). (G. T. M.)

FUSIBLE METAL, a term applied to certain alloys, generally composed of bismuth, lead and tin, which possess the property of melting at comparatively low temperatures. Newton's fusible metal (named after Sir Isaac Newton) contains 50 parts of bismuth, 31.25 of lead and 18.75 of tin; that of Jean Darcet (1725–1801), 50 parts of bismuth with 25 each of lead and tin; and that of Valentin Rose the elder, 50 of bismuth with 28.1 of lead and 24.1 of tin. These melt between 91° and 95°C. The addition of cadmium gives still greater fusibility; in Wood's metal, for instance, which is Darcet's metal with half the tin replaced by cadmium, the melting point is lowered to 66°–71°C; while another described by Lipowitz and containing 15 parts of bismuth, eight of lead, four of tin and three of cadmium, softens at about 55° and is completely liquid a little above 60°. By the addition of mercury to Darcet's metal the melting point may be reduced so low as 45°. These fusible metals have the peculiarity of expanding as they cool; Rose's metal, for instance, remains pasty for a considerable range of temperature below its fusing point, contracts somewhat rapidly from 80° to 55°, expands from 55° to 35°, and contracts again from 35° to 0°. For this reason they may be used for taking casts of anatomical specimens or making *clichés* from wood-blocks, the expansion on cooling securing sharp impressions.

By suitable modification in the proportions of the components, a series of alloys can be made which melt at various temperatures above the boiling point of water; for example, with eight parts of bismuth, eight of lead and three of tin the melting point is 123°, and with eight of bismuth, 30 of lead and 24 of tin it is 172°. With tin and lead only in equal proportions it is 241°. Such alloys are used for making the fusible plugs inserted in the furnace-crowns of steam-boilers, as a safeguard in the event of the water-level being allowed to fall too low. When this happens the plug, being no longer covered with water, is heated to such a temperature that it melts and allows the contents of the boiler to escape into the furnace. In automatic fire-sprinklers the orifices of the pipes are closed with fusible metal, which melts and liberates the water when, owing to an outbreak of fire in the room, the temperature rises above a predetermined limit.

FUSION. In business and finance, fusion is a term signifying a complete combination of several concerns into one. Fusion is accomplished by two methods, by merger and by consolidation. When the fusion of two or more business organizations takes place by merger one of them absorbs the other or others, maintaining its own corporate existence under its own charter (amended if necessary), and taking either its own name or that of one of the concerns absorbed. All of the concerns to a merger which are absorbed into the remaining one give up their charters and corporate existence.

When fusion by consolidation takes place two or more companies organize a *new* company, transfer to it all of their assets, and then dissolve their own respective organizations. In popular usage the terms fusion, merger, consolidation, and several others are often confused and used incorrectly. Fusion is the general term embracing both mergers and consolidations. If companies A, B and C fuse by merger, two of them, let us say B and C, will go out of existence and all of their assets will go to build up the enlarged company A. If, however, companies X, Y and Z are to be consolidated, *all* of them will go out of existence and their assets will go to form the new company under a new charter.

For Fusion in Physics see HEAT.

FÜSSEN, a town of Germany, in the republic of Bavaria, at the foot of the Alps (Tirol), on the Lech, 2,500 ft. above the sea. Pop. (1925) 6,215. Rope-making is an important industry. In the castle was signed in 1745 the peace between the elector Maximilian III., Joseph of Bavaria and Maria Theresa. Two miles south-east, on the Austrian frontier, is the castle of Hohen-

schwangu, and a little to the north, that of Neuschwanstein, built by Louis II. of Bavaria.

FUST, JOHANN (c. 1400–1466), early German printer, belonged to a rich and respectable burgher family of Mainz, which is known to have flourished from 1423, and to have held many civil and religious offices. Johann Fust appears to have been a money-lender or banker. He advanced money to Gutenberg (apparently 800 guilders in 1450, and another 800 in 1452) for carrying on his experiments in printing, and, in 1455, brought a suit against Gutenberg to recover the money he had lent, claiming 2,020 (more correctly 2,026) guilders for principal and interest. It appears that he had not paid in the 300 guilders a year which he had undertaken to furnish for expenses, wages, etc., and, according to Gutenberg, had said that he had no intention of claiming interest. The suit was apparently decided in Fust's favour, Nov. 6, 1455, in the refectory of the Barefooted Friars of Mainz, when Fust made oath that he himself had borrowed 1,550 guilders and given them to Gutenberg. There is no evidence that Fust, as is usually supposed, removed the portion of the printing materials covered by his mortgage to his own house, and carried on printing there with the aid of Peter Schöffer, of Gernsheim (who is known to have been a scribe at Paris in 1449), to whom, probably about 1455, he gave his only daughter Dyna or Christina in marriage. Their first publication was the Psalter, Aug. 14, 1457, a folio of 350 pages, the first printed book with a complete date, and remarkable for the beauty of the large initials printed each in two colours, red and blue, from types made in two pieces. The Psalter was reprinted with the same types, 1549 (Aug. 29), 1490, 1502 (Schöffer's last publication) and 1516. In addition to the works already mentioned Fust and Schöffer printed: Durandus, *Rationale divinarum officiorum* (1459), folio, 160 leaves; the *Clementine Constitutions*, with the gloss of Johannes Andreae (1460), 51 leaves; *Biblia Sacra Latina* (1462), folio, 2 vols., 242 and 239 leaves, 48 lines to a full page; the Sixth Book of Decretals, with Andreae's gloss, Dec. 17, 1465, folio, 141 leaves; Cicero, *De officiis* (1465), 4to, 88 leaves, the first edition of a Latin classic and the first book containing Greek characters, while in the colophon Fust for the first time calls Schöffer "puerum suum"; the same, Feb. 4, 1466; *Grammatica rhythmica* (1466), folio, 11 leaves. They also printed in 1461–62 several papal bulls, proclamations of Adolf of Nassau, etc.

Fust is said to have gone to Paris in 1466 and to have died of the plague which raged there in August and September. He was formerly often confused with the famous magician Dr. Johann Faust, who, though an historical figure, had nothing to do with him (see FAUST).

See further the articles GUTENBERG and TYPOGRAPHY.

FUSTEL DE COULANGES, NUMA DENIS (1830–1889), French historian, was born in Paris on March 18, 1830, of Breton descent. After studying at the École Normale Supérieure he was sent to the French school at Athens in 1853, directed some excavations in Chios, and wrote an historical account of the island. From 1860 to 1870 he was professor of history at the faculty of letters at Strasbourg, where he had a brilliant career as a teacher.

In *La Cité antique* (Strasbourg, 1864; rev. ed. 1875) he showed forcibly the part played by religion in the political and social evolution of Greece and Rome. Although in making religion the sole factor of this evolution he perverted the historical facts, the book was so consistent throughout, so full of ingenious ideas, and written in so striking a style, that it ranks as one of the masterpieces of the French language in the 19th century.

Appointed to a lectureship at the École Normale Supérieure in Feb. 1870, to a professorship at the Paris faculty of letters in 1875, to the chair of mediæval history created for him at the Sorbonne in 1878 and in 1880 to the directorship of the École Normale, he applied himself to the study of the political institutions of ancient France, and, under the influence of the events of 1870–71, to the Germanic invasions under the Roman empire. He maintained that those invasions were not marked by the violent and destructive character usually attributed to them; that the penetration of the German barbarians into Gaul was a slow

process; that the Germans submitted to the imperial administration; that the political institutions of the Merovingians had their origins in the Roman laws at least as much as, if not more than, in German usages; and, consequently, that there was no conquest of Gaul by the Germans. This thesis he sustained brilliantly in his *Histoire des institutions politiques de l'ancienne France*, the first volume of which appeared in 1874. As the first volume was keenly attacked in Germany as well as in France, Fustel recast the book entirely. He re-examined all the texts and wrote a number of dissertations, of which, though several (e.g., those on the Germanic mark and on the *allodium* and *beneficium*) were models of learning and sagacity, all were dominated by his general idea. From this crucible issued an entirely new work, less well arranged than the original, but richer in facts and critical comments. The first volume was expanded into three volumes, *La Gaule romaine* (1891), *L'invasion germanique et la fin de l'empire* (1891) and *La Monarchie franque* (1888), followed by three other volumes, *L'Alleu et le domaine rural pendant l'époque mérovingienne* (1889), *Les Origines du système féodal: le bénéfice et le patronat* . . . (1890) and *Les Transformations de la royauté pendant l'époque carolingienne* (1892). Thus, in six volumes, he had carried the work no farther than the Carolingian period. The result of this enormous labour, albeit worthy of a great historian, showed little sense of historical proportion. The dissertations not embodied in his great work were collected by himself and (after his death) by his pupil, Camille Julian, and published as volumes of miscellanies: *Recherches sur quelques problèmes d'histoire* (1885), dealing with the Roman colonate, the land system in Normandy, the Germanic mark, and the judiciary organization in the kingdom of the Franks; *Nouvelles recherches sur quelques problèmes d'histoire* (1891); and *Questions historiques* (1893), which contains his paper on Chios and his thesis on Polybius.

He died at Massy (Seine-et-Oise) on Sept. 12, 1889.

See Paul Guiraud, *Fustel de Coulanges* (1896); H. d'Arbois de Jubainville, *Deux Manières d'écrire l'histoire: critique de Bossuet, d'Augustin Thierry et de Fustel de Coulanges* (1896); P. Champion, *Les idées politiques et religieuses de Fustel de Coulanges* (1903).

FUSTIAN, a technical term descriptive of an important class of cotton fabrics comprising several distinctive types and varieties of which "moleskin," corduroy, and velveteen are the three principal types. Each of these types also comprises various modifications in respect of the minor details of their construction, such as "beaverteen," "cantoon" or "diagonal," "imperial sateen" or "swansdown," "lambskin" and other varieties. Fustian fabrics, with the exception of "swansdown" and velveteen, are firm and compact textures of great strength and durability, adapted for hard wear and chiefly employed in the production of clothing for both sexes. These characteristics are obtained by employing warp threads usually of folded yarn and of great strength, in combination with a relatively high rate of picks per inch, of soft-spun single weft.

The simplest varieties of fustian fabrics are those known as "imperials," comprising "swansdown," "lambskin" and reversible "sateen," of which the designs showing the weave structures are given in figs. 1, 2 and 3 respectively.

Swansdown.—Swansdown is based on the five-end weft face satin weave, but with two contiguous warp threads raised together, instead of singly, as indicated in the design, fig. 1. After weaving, these fabrics are submitted to an operation of "perching" or "raising," in order to develop on the face side of the fabric a soft furry "nap" or "down" which characterizes a swansdown fabric and gives it additional warming properties suitable for underclothing and night attire. One quality of "swansdown" contains 60 warp threads per inch, of 18's T., and 120 picks per inch, of 20's soft weft of good quality to develop a good "nap."

FIG. 8.—FINE-RIBBED "THICKSET" CORDUROY FABRIC WOVEN FROM DESIGN IN FIG. 9

Imperial Sateen.—Imperial sateen is virtually "swansdown" of stronger and heavier texture and based on the eight-end weft face satin weave structure, but with two contiguous warp threads raised together, as indicated in the design, fig. 2. This weave produces relatively longer weft floats and permits of a greater density of picks being inserted in the fabric. When "perched" on the face side, "imperial sateen" is sold as "lambskin," from the long, soft and woolly "nap." It is also sometimes dyed and finished to imitate a light texture of "moleskin." A good quality of "lambskin" contains 46 warp ends of 2/20's, and 450 picks of 20's weft, per inch; whilst a medium quality of dyed "imperial sateen" contains 68 warp ends of 16's T. and 150 picks of 16's weft, per inch.

Reversible imperial is a variation of "imperial sateen" simply by floating the weft equally on both sides of the fabric, as indicated in the design, fig. 3, showing the weave structure of this variety of which a good quality contains 62 warp ends of 14's T. and 330 picks of 30's weft, per inch.

Cantoon.—Cantoon or diagonal is a strong and compact texture produced with fine diagonal cords or ribs of twill running at a low angle of about 18°, and based on the twill weave structure indicated in fig. 4. It is usually dyed a fawn or a drab hue, "perched" on the back, and largely employed for men's and ladies' riding and sporting habits. A good quality of "cantoon" contains 54 warp ends of 2/20's, and 400 picks of 20's weft, per inch.

Moleskin.—Moleskin is a thicker, stronger, and heavier texture than other varieties of fustian and is more suitable for men's clothing requiring very hard wear and durable qualities, and especially for rough occupations as iron and brass-moulding, navvying, and similar work. Moleskin is a semi-compound texture consisting of one series of warp threads and two series of weft, viz., "face" picks and "back" picks (of the same kind of weft) inserted in the ratio of two "face" picks to one "back" pick, uniformly, as indicated in fig. 5, showing a design for a "moleskin" fabric which is virtually a stronger and heavier texture of uncut velveteen, as described in a separate article (q.v.). A "moleskin" of good quality contains 38 warp ends of 3/34's and 400 picks of 14's weft, per inch.

Beaverteen is virtually a light texture of "moleskin" which, after weaving, is dyed, printed, and "perched" on the back to produce a short "nap." Two designs for "beaverteen" are given in figs. 6 and 7. The design fig. 6 will produce what is practically a "tabby" back "beaverteen," with three "face" picks to one "back" pick; while the design fig. 7, will produce a fabric with two "face" picks to one "back" pick, and a three-end weft twill back which is better for "perching." A good quality of "beaverteen" contains 32 warp ends of 2/18's, and 280 picks of 18's weft, per inch.

FIG. 9.—DESIGN FOR FINE-RIBBED CORDUROY FABRIC Shown in Fig. 8, containing two pile picks to one back pick

FIGS. 1 TO 7.—FUSTIAN DESIGNS

Corduroy and Velveteen.—Unlike other varieties of fustian fabrics, corduroy and velveteen are characterized by having a short plush or velvet weft pile formed on the face of the fabric. In corduroy, the pile is formed in a series of more or less crowned ribs or cords of uniform width extending lengthwise of the fabric, in the direction of warp threads; whilst in velveteen, the pile forms an even and level surface. In both of these types of fabric the pile surface is developed subsequent to weaving, by submitting the cloth to an operation of "fustian cutting" in which the "face" or "pile" picks of weft are severed, either manually or mechanically, by means of special knife blades or circular discs, thereby causing the severed weft threads to assume a vertical position and thus constitute the tufts of pile which characterize these fabrics.

Corduroy fabrics consist of a foundation texture based on the three-end or four-end twill or other simple weave structure that will ensure sufficient stability in the fabric. The cords are usually of uniform width, and sometimes of different width, in the same fabric. When the cords are of uniform width, they are formed at regular intervals ranging from three to 16 or 20 warp threads, uniformly, chiefly according to the width of cords required and the style of clothing for which the fabric is intended, as, for example, suits for artisans, or for sporting and riding suits for both men and women.

Corduroy fabrics are produced in a variety of different textures, styles and qualities, according to the special purpose for which they are intended. The simplest variety, and one of the neatest styles employed for boys' and men's clothing is commonly termed "thickset" corduroy of which an example is illustrated in fig. 8. This fabric is constructed with two "pile" picks to one "back" pick, uniformly, in accordance with the design shown in fig. 9, which is for a corduroy fabric formed with a three-end twill back, though it may be formed with a "tabby" back. The cords in this example recur on the smallest possible number of warp threads, viz., three, with two cords constituting one repeat of the design which, therefore, repeats on six warp threads, as indicated. A corduroy fabric constructed with much wider and bolder cords is illustrated in fig. 10, of which the design is given in fig. 11. This example is based on the four-end 2 x 2 twill foundation texture, with two "pile" picks to one "back" pick, and with the cords recurring at regular intervals of eight warp threads, uniformly, as indicated in the design. Corduroy fabrics comprise many other modifications of structure both in respect of their foundation textures and also in the particular manner of intersecting the "pile" picks with the "stitching" or "binding" warp threads that form the cuttings or furrows between the cords: but the two examples here given will serve to indicate the general principle of their construction. See also the article VELVETEEN.

See H. Nisbet, *Grammar of Textile Design* (1927). (H. N.)

FUSTIC, YELLOW WOOD or OLD FUSTIC, is the wood of a large tree (*Chlorophora tinctoria*) of the mulberry family (Moraceae) growing in the West Indies and tropical America. The best quality comes from Cuba and the poorer from Jamaica and Brazil. It is still employed in the form of extract for wool dyeing, mainly in conjunction with other dyewoods, for the production of browns, olives and compound colours, and for deadening the shade of blacks. The mordant mainly in use is bichromate of potash, and the olive yellow thus obtained is fairly fast to light. In other respects, the dyeing properties of this wood closely resemble those of Quercitron Bark. It contains two colouring matters, *Morin*, $C_{15}H_{10}O_7$, and *Machurin*, $C_{15}H_{10}O_8$, of which the former is the more important. The dye-stuff termed *young fustic*, or

Zante fustic and Venetian sumach, is the wood of the smoke tree (*Rhus Cotinus*), a southern European and Asiatic shrub of the Cashew family (Anacardiaceae). (A. G. P.)

FUTURES, contracts which provide for the delivery by the seller to the buyer of some commodity, generally wheat, corn, oats, cotton, coffee, sugar, and so on, or foreign exchange, or certain securities at a specified future date. A future is designated by the name of the month at which delivery must be made. Thus one buying October cotton, or other commodity, receives a contract providing for the delivery to him of a specified amount of the commodity in the following October. Much speculation is carried on in *futures* but the practice is not legally regarded as gambling.

FUTURISM: see PAINTING.

FUX, JOHANN JOSEPH (1660–1741), Austrian musician, was born at Hirtenfeld, Styria. In 1696 he was organist at one of the principal churches of Vienna, and in 1698 was appointed by the emperor Leopold I. as his "imperial court-composer" with a salary of about £6 a month. At the court of Leopold and of his successors Joseph I. and Charles VI., Fux remained for the rest of his life. To his various court dignities that of organist at St. Stephen's cathedral was added in 1704. He married the daughter of the Government secretary Schnitzbaum. Fux died at Vienna on Feb. 13, 1741. His life, although passed in the great world, was uneventful, and his only troubles arose from the intrigues of his Italian rivals at court. The numerous operas which Fux wrote do not differ essentially from the style of the Italian *opera seria* of the time. Of greater importance are his sacred compositions, psalms, motets, oratorios and masses, amongst the latter the celebrated *Missa Canonica* which is written in canon throughout. As a contrapuntist and musical scholar generally, Fux was unsurpassed by any of his contemporaries, and his great theoretical work, the *Gradus ad Parnassum* (Vienna 1715), written in Latin, long remained by far the most thorough treatment of counterpoint and its various developments, and was translated into most European languages during the 18th century.

See Ludwig von Köchel, *J. J. Fux, Hofcompositor und Hofkapellmeister der Kaiser Leopold I., Joseph I. and Karl VI. von 1698 bis 1740* (1872). This is based on minute original research and contains a complete catalogue of the composer's numerous works.

FYNE, LOCH, inlet of the sea, Argyllshire, Scotland. From the head, 6 m. above Inveraray, to the mouth on the Sound of Bute, it has a south-westerly and then southerly trend and is 44 m. long, its width varying from $\frac{1}{4}$ m. to 6 m. On the western side it gives off Lochs Shira, Gair, Gilp (with Ardrishaig, the Crinan Canal and Lochgilphead) and East Tarbert (with Tarbert village). The glens debouching on the lake are Fyne, Shira, Aray, Kinglas and Hell's Glen. The coast generally is picturesque and in many parts well wooded. All vessels using the Crinan Canal navigate the loch to and from Ardrishaig, and there is daily communication with Glasgow, as far up as Inveraray. There are ferries at St. Catherine's and Otter, and piers at Tarbert, Ardrishaig, Kilmory, Crarae, Furnace, Inveraray and Strachur. The industries comprise granite quarrying at Furnace, distilling at Ardrishaig and valuable fisheries. The "Loch Fyne herrings" are famous.

FYRD, the name given to the English militia during the Anglo-Saxon period (see ARMY). In early times the ealdorman of the shire was probably charged with the duty of calling out and leading the fyrd, which appears always to have retained a local character, as during the time of the Danish invasions we read of the fyrd of Kent, of Somerset and of Devon. It is probable that originally all free landholders were required to attend the fyrd, and exemption from this duty was only very sparingly granted. The fyrd was gradually superseded by the gathering of the thegns and their retainers, but it was occasionally called out for defensive purposes even after the Norman Conquest.

FYT, JOHANNES (1609–1661), Belgian animal painter, was born at Antwerp and christened on Aug. 19, 1609. He was registered apprentice to Hans van den Berghe in 1621. At 20 Johannes Fyt entered the gild of St. Luke as a master, and from that time till his death in 1661 he produced a vast number of pictures in

FIG. 10.—CORDUROY FABRIC WITH WIDE RIBS. WOVEN FROM THE DESIGN IN FIG. 11

FIG. 11.—DESIGN FOR WIDE-RIBBED CORDUROY FABRIC, SHOWN IN FIG. 10, CONTAINING TWO PILE PICKS TO ONE BACK PICK

which the bold facility of Snyders is united to the powerful effects of Rembrandt. There never was such a master of technical processes as Fyt in the rendering of animal life in its most varied forms. He was not clever at figures, and he sometimes trusted for these to the co-operation of Cornelius Schut or Willeborts, whilst his architectural backgrounds were sometimes executed by Quellyn. "Silenus amongst Fruit and Flowers," in the Harrach collection at Vienna, "Diana and her Nymphs with the Produce of the Chase," in the Belvedere at Vienna, and "Dead Game and Fruit in front of a Triumphal Arch," belonging to Baron von Rothschild at Vienna, are specimens of the co-operation respectively of Schut, Willeborts and Quellyn. They are also Fyt's masterpieces. The earliest dated work of the master is a cat grabbing at a piece of dead poultry near a hare and birds, belonging to Baron Cetto at Munich, and executed in 1644. The latest is a "Dead Snipe with Ducks," of 1660, sold with the Jager collection at Cologne in 1871. Great power is shown in the bear and boar hunts at Munich and Ravensworth castle and in the "Hunted Roedeer with Dogs in the Water," in the Berlin museum. A splendid specimen is the Page and Parrot near a table covered with game, guarded by a dog staring at a monkey, in the Wallace collection, London.

FYZABAD, a city, district and division of British India in the United Provinces. The city stands on the left bank of the

river Gogra, 78 m. by rail E. of Lucknow. Pop. (1921) 51,342. To the east of Fyzabad is the ancient site of Ajodhya (q.v.). Fyzabad was founded about 1730 by Sa'adat Ali Khan, the first nawab wazir of Oudh, who built a hunting-lodge here. It received its present name in the reign of his successor; and Shuja-ud-daula, the third nawab, laid out a large town and fortified it, and here he was buried. It was afterwards the residence of the begums of Oudh. On the outbreak of the Mutiny, many of the European women and children were sheltered by one of the great landholders of Oudh, and others were sent to less disturbed parts of the country; but the officers of the Indian garrison were almost all murdered by their own troops. Fyzabad is now a station for European as well as for Indian troops, and the headquarters of a brigade. There is a government college. Sugar refining and trade in agricultural produce are important.

The DISTRICT OF FYZABAD, lying between the two great rivers Gogra and Gumti, has an area of 17 sq.m. It is entirely alluvial and well wooded, and has a good climate. Pop. (1921) 1,171,930. Tanda, with a population in 1921 of 18,058, has the largest production of cotton goods in Oudh.

The DIVISION OF FYZABAD has an area of 12,101 sq.m., and comprises the six districts of Fyzabad, Gonda, Bahraich, Sultanpur, Partabgarh and Bara Banki. Pop. (1921) 6,599,401.

G The history of this letter began with the Latin alphabet. The Chalcidic alphabet, from which the Latin derived, represented the voiced velar stop by its third letter *gamma* . This passed into Latin and was used, in its rounded form, **C**, to represent the same sound in early times, *e.g.*, in the word **RECEI**, occurring in an early Latin inscription. The letter however came to represent the unvoiced velar stop, thus ousting **K**. This was probably due to Etruscan influence. To avoid confusion a new letter **G** was differentiated from **C** and used to represent the voiced velar, while **C** henceforward stood for the unvoiced velar only. The new letter was placed in the alphabet in the place of Greek Z (zeta) which was not required in the Latin alphabet.

The uncial form of the letter in the 6th and 7th centuries was  or . The form with rounded head , from which our minuscule *g* is derived, appears first in Latin cursive writing about the beginning of the 7th century taking the place of such earlier forms as . It was standardised in Carolingian as .

The minuscule flat-headed form was adopted by Irish writing of the 6th and 7th centuries, *e.g.*,  or . Such a form had been in use in Latin cursive, *e.g.*,  (5th cent.),  (late 7th cent.),  (7th or 8th cent.). A form  appears in Merovingian (pre-Carolingian French) writing in the 8th century, and a descendant of this was adopted into the Carolingian hand, not being entirely ousted by the round-headed form till the 11th century. The flat-headed form was adopted by the Early English hand from the Irish, and remained the only form of the letter in use in England until the introduction of Carolingian writing by the Norman scribes in the 12th century. Meanwhile certain changes had taken place in the sound represented by the letter. The voiced velar had become palatalised before the front vowels *e* and *i*. Thus the flat-headed form of the letter, the only form in use in pre-Norman England, represented the velar before back vowels, the palatal (a sound akin to that heard in German *Tag*, *Zug*) before front vowels. It also stood for the sound now represented by *y* initially before front vowels. In Middle English the palatal stop developed into the sound now represented by *j*, a similar change having taken place in the development of the Latin velar on the continent. This sound was therefore introduced to English ears by the Normans, and in the Middle English period we find the two forms of the minuscule letter in use to represent different sounds.  represented the voiced velar (modern "hard" *g*) and the sound of *j*,  represented the palatal stop (*γ*) and the sound of *y*. As the palatal stop (in such words as *might*, *high*, *enough*, etc.) disappeared from the language, the use of the flat-headed form was discontinued. It survived in remote parts, and by its similarity to the form of *z* produced confusion with the latter.

In modern English the letter represents two sounds: i) the voiced velar; ii) the sound of *j* (dʒ) before the vowels *e*, *i*, and *y* in words of Romance origin, *e.g.* *gesture*, *ginger*, *gymnastics* (contrast *give*, *gilt*).

THE DEVELOPMENT OF THE LETTER G FROM THE PHOENICIAN, THROUGH THE LATIN DOWN TO MODERN FORM

In music, G is the name of the seventh note of the musical alphabet or otherwise the fifth note of the scale of C. It gives its name also to the treble (or violin) clef, the distinguishing sign of which is placed upon the line representing this note in the treble stave. To which it may be added that the said sign itself was originally nothing but a capital G which in the course of time has come to assume the conventionalized form which we now have.

GA'ALIIN: *see* ARABS.

GABARDINE. The term applied in the cloth trade originally to a particular type of water-proofed fabric employed for the manufacture of raincoats, but later as a general description of several varieties of worsted, cotton, silk, and union or mixture fabrics, embodying certain features in common, and chiefly made up into cloaks and over-coats. The original material of this name was a union fabric produced from a fine two-fold Botany worsted warp picked with two-fold cotton weft and in which warp and weft threads are in the proportion of two to one, approximately, and the fabric is still essentially of a warp-faced texture developed with a steep warp-face twill weave producing a relatively strong and firm cloth somewhat resembling "whipcord," but of lighter texture. "Covert coating" fabrics are virtually gabardines of a

lighter texture suitable for summer wear and for use in hot climates.

Owing to the predominance of warp over weft threads in gabardine fabrics, the weft lies entirely at the back and is therefore not visible from the front, a circumstance which allows the use of weft of inferior quality without loss of durability, for the warp surface only is exposed to wear. Although all varieties of gabardine fabrics have the same general textural appearance, they vary considerably both in respect of the particular twill weave and in the character, quality and counts of material employed in their construction, as well as in the number of warp threads and picks of weft per inch in the fabric. Some gabardine fabrics are produced entirely from cotton yarn. The better qualities of these are made from super-grades of combed two-fold warp and weft, while those of coarser texture and inferior quality are made from single yarn both for warp and weft. A so-called "voile gabardine" fabric of a more open and much lighter texture is produced entirely of silk. (H. N.)

GABA TEPE, LANDING AT, 1915: *see* DARDANELLES CAMPAIGN.

GABBRO, in petrology a group of plutonic basic rocks, holocrystalline and usually rather coarse-grained, consisting essentially of a basic plagioclase feldspar and one or more ferro-magnesian minerals (such as augite, hornblende, hypersthene and olivine). The name was given originally in north Italy to certain coarsely crystalline dark green rocks, some of which are true gabbros, while others are serpentines. The gabbros are the plutonic or deep-seated representatives of the dolerites and basalts (also of some varieties of andesite) with which they agree closely in mineral composition, but not in minute structure. Of their minerals feldspar is usually the most abundant, and is principally labradorite and bytownite, though anorthite occurs in some, while oligoclase and orthoclase have been found in others. The feldspar is sometimes very clear and fresh, its crystals being for the most part short and broad, with rather irregular or rounded outlines; albite and pericline twinning is very frequent. Equally characteristic of the gabbros is the alteration of the feldspars to cloudy, semi-opaque masses of saussurite. These are compact, tough, devoid of cleavage, and have a waxy lustre and usually a greenish-white colour. When this substance can be resolved by the microscope it proves to consist usually of zoisite or epidote, with garnet and albite, but mixed with it are also chlorite, amphibole, serpentine, prehnite, sericite, and other minerals. The olivine in most cases is altered to green or yellow serpentine, often with bands of dark magnetite granules along its cleavages and cracks. Hornblende, when primary, may surround augite or be intergrown with it; it is more frequently secondary. Dark-brown biotite, although by no means an important constituent of these rocks, occurs in many of them. Quartz is rare, but is occasionally seen intergrown with feldspar as micro-pegmatite. Among the accessory minerals may be mentioned apatite, magnetite, ilmenite, picotite and garnet.

In a very large number of the rocks of this group the plagioclase feldspar has crystallized in large measure before the pyroxene, and is enveloped by it in ophitic manner exactly as occurs in the dolerites. When these rocks become fine-grained they pass gradually into ophitic dolerite; only very rarely does olivine enclose feldspar in this way. A fluxion structure or flow banding also can be observed in some of the rocks of this series, and is characterized by the occurrence of parallel sinuous bands of dark colour, rich in ferro-magnesian minerals, and of lighter shades in which feldspars predominate.

These basic holocrystalline rocks form a large and numerous class which can be subdivided into many groups according to their mineral composition; if we take it that typical gabbro consists of plagioclase and augite or diallage, norite of plagioclase and hypersthene, and troctolite of plagioclase and olivine, we must add to these olivine-gabbro and olivine-norite in which that mineral occurs in addition to those enumerated above. Hornblende-gabbros are distinctly rare, except when the hornblende has been developed from pyroxene by pressure and shearing, but many rocks may be described as hornblende or biotite-bearing gabbro and norite, when they contain these ingredients in

addition to the normal plagioclase, augite and hypersthene. We may recognize also quartz-gabbro and quartz-norite (containing primary quartz or micropegmatite) and orthoclase-gabbro (with a little orthoclase). The name eucrite has been given to gabbros in which the feldspar is mainly anorthite; many of them also contain hypersthene or enstatite and olivine, while allivalites are anorthite-olivine rocks in which the two minerals occur in nearly equal proportions; harrisites have preponderating olivine, anorthite feldspar and a little pyroxene. In areas of gabbro there are often masses consisting nearly entirely of a single mineral, for example, feldspar rocks (anorthosites), augite or hornblende rocks (pyroxenites and hornblendites), and olivine rocks (dunites or peridotites). Segregations of iron ores, such as ilmenite, usually with pyroxene or olivine, occur in association with some gabbro and anorthosite masses.

Some gabbros are exceedingly coarse-grained and consist of individual crystals several inches in length; such a type often forms dikes or veins in serpentine or gabbro, and may be called gabbro-pegmatite. Still more common is the occurrence of sheared, foliated or schistose forms of gabbro. In these the minerals have a parallel arrangement, the feldspars are often broken down by pressure into a mosaic of irregular grains, while greenish fibrous or bladed amphibole takes the place of pyroxene and olivine. The diallage may be present as rounded or oval crystals around which the crushed feldspar has flowed (augen-gabbro); or the whole rock may have a well-foliated structure (hornblende-schists and amphibolites). Very often a mass of normal gabbro with typical igneous character passes at its margins or along localized zones into foliated rocks of this kind, and every transition can be found between the different types. Some authors believe that the development of saussurite from feldspar is also dependent on pressure rather than on weathering, and an analogous change may affect the olivine, replacing it by talc, chlorite, actinolite and garnet. Rocks showing changes of the latter type have been described from Switzerland under the name allalinites.

Rocks of the gabbro group, though not so common nor occurring in so great masses as granites, are exceedingly widespread. In Great Britain, for example, there are areas of gabbro in Shetland, Aberdeenshire, and other parts of the Highlands, Ayrshire, the Lizard (Cornwall), Carrock Fell (Cumberland) and St. David's (Wales). Most of these occur along with troctolites, norites, serpentine and peridotite. In Skye, an interesting group of fresh olivine-gabbros is found in the Cuillin hills; here also peridotites occur and there are sills and dikes of olivine-dolerite, while a great series of basaltic lavas and ash beds marks the site of volcanic outbursts in early Tertiary time. In this case it is clearly seen that the gabbros are the deep-seated and slowly crystallized representatives of the basalts which were poured out at the surfaces, and of the dolerites which consolidated in fissures. The older gabbros of Britain, such as those of the Lizard, Aberdeenshire and Ayrshire, are often more or less foliated and show a tendency to pass into hornblende-schists and amphibolites. In Germany, gabbros are well known in the Harz Mountains, Saxony, the Odenwald and the Black Forest. Many outcrops of similar rocks have been traced in the northern zones of the Alps, often with serpentine and hornblende-schist. They occupy considerable tracts of country in Norway and Sweden, as for instance in the vicinity of Bergen. The Pyrenees, Ligurian Alps, Dauphiné and Tuscany are other European localities for gabbro. In Canada, great parts of the eastern portion of the Dominion are formed of gabbros, norite, anorthosite and allied rock types. In the United States gabbros and norites occur near Baltimore and near Peekskill on the Hudson river. Probably the largest mass of basic intrusive rock in the world is the great Duluth gabbro laccolith in Minnesota, which is computed to have a volume of 50 cubic miles. As a rule, each of these occurrences contains a diversity of petrographical types, which appear also in certain of the others; but there is often a well-marked individuality about the rocks of the various districts in which gabbros are found.

From an economic standpoint gabbros are not of great

importance. They are used locally for building and for road-metal, but are too dark in colour, too tough and difficult to dress, to be popular as building stones, and, though occasionally polished, are not to be compared for beauty with the serpentines and the granites. Segregations of iron ores are found in connection with many of them (Norway and Sweden) and are sometimes mined as sources of the metal, but the ore is often too rich in titanium to be of any value. Many great masses of iron pyrites, often copper-bearing, occur in association with rocks having the composition of gabbros, as in Norway and the Urals, and it is an interesting fact that in many cases the masses of sulphide found in association with norites are rich in nickel, as at Sudbury in Ontario and several localities in Norway.

Chemically the gabbros are typical rocks of the basic subdivision and show the characters of that group in the clearest way. They have low silica, much iron and magnesia, and the abundance of lime distinguishes them in a marked fashion from both the granites and the peridotites. A few analyses of well-known gabbros are cited here.

(J. S. F.)

GABELEN TZ, HANS CONON VON DER (1807–1874), German linguist and ethnologist, born at Altenburg on Oct. 13, 1807, was the only son of Leopold von der Gabelentz, chancellor and privy-councillor of the duchy of Altenburg. He studied at Leipzig and Göttingen and after 1830 held various public offices. He died at Lemnitz, in Saxe-Weimar, on Sept. 3, 1874.

Gabelentz is said to have learned no fewer than 80 languages, 30 of which he spoke fluently. Immediately after quitting the university, he followed up his Chinese researches by a study of the Finno-Ugrian languages, which resulted in the publication of his *Eléments de la grammaire mandchoue* in 1832. In 1837 he became one of the promoters, and a joint-editor, of the *Zeitschrift für die Kunde des Morgenlandes*. His works include: *Grundzüge der syrischen Grammatik* (1841); a complete edition (with J. Löbe), with translation, glossary and grammar, of Ulfilas's Gothic version of the Bible (1843–46); articles on the languages of the Swahilis, the Samoyedes, the Hazaras, the Aimaks, the Formosans and other widely-separated tribes in the *Zeitschr. d. deut. morgenländ. Gesell.*; *Beiträge zur Sprachkunde* (1852) containing Dyak, Dakota, and Kiriri grammars; a *Grammatik u. Wörterbuch der Kassiasprache* (1857); an edition of the Manchu translations of the Chinese Sse-shu, Shu-king and Shi-king, with a dictionary (1864); and *Die melanesischen Sprachen nach ihrem grammatischen Bau und ihrer Verwandtschaft unter sich und mit den malaiisch-polynesischen Sprachen untersucht* (1860–73). The last-named work treats of the language of the Fiji islands, New Hebrides, Loyalty islands, New Caledonia, etc., and shows their radical affinity with the Polynesian class.

GABELLE, a term which, in France, was originally applied to taxes on all commodities, but was gradually limited to the tax on salt. In process of time it became one of the most hated and most grossly unequal taxes in the country, but, though condemned by all supporters of reform, it was not abolished until 1790. First imposed in 1286, in the reign of Philip IV., as a temporary expedient, it was made a permanent tax by Charles V. Repressive as a state monopoly, it was made doubly so from the fact that the government obliged every individual above the age of eight years to purchase weekly a minimum amount of salt at a fixed price. When first instituted, it was levied uniformly on all the provinces in France, but for the greater part of its history the

price varied in different provinces. There were five distinct groups of provinces, classified as follows: (a) the *Pays de grandes gabelles*, in which the tax was heaviest, (b) the *Pays de petites gabelles*, which paid a tax of about half the rate of the former; (c) the *Pays de salines*, in which the tax was levied on the salt extracted from the salt marshes; (d) the *Pays rédimés*, which had purchased redemption in 1549; and (e) the *Pays exempts*, which had stipulated for exemption on entering into union with the kingdom of France. *Greniers à sel* (dating from 1342) were established in each province, and to these all salt had to be taken by the producer on penalty of confiscation. The *grenier* fixed the price which it paid for the salt and then sold it to retail dealers at a higher rate.

See Necker, *Compte rendu* (1781); J. J. Clamagérin, *Histoire de l'impôt en France* (1876); A. Gasquet, *Précis des institutions politiques de l'ancienne France* (1885).

GABELSBERGER, FRANZ XAVER (1789–1849), inventor of the German system of stenography, was born on Feb. 9, 1789, at Munich. His system was tested at the first session of the Bavarian estates in 1819, and he was placed in charge of the stenographic reports of the Bavarian Chamber. His system is explained in his *Anleitung zur deutschen Redezeichenkunst oder Stenographie* (1834; new ed. 1900), and *Neuen Vervollkommen der deutschen Redezeichenkunst* (1843; new ed. 1904) (see SHORTHAND: *Foreign Shorthand Systems*). Gabelsberger also invented a calculating machine.

See A. K. Stubenrauch, *Gabelsberger und der deutsche Geist* (1924), and J. G. Schwaebel, *Erinnerungen an Gabelsberger* (1925).

GABERDINE or **GABARDINE**, any long, loose overgarment, reaching to the feet and girt round the waist. It was commonly worn in the middle ages by pilgrims, beggars and almsmen. The Jews, conservatively attached to the loose and flowing garments of the East, continued to wear the long upper garment to which the name "gaberdine" could be applied, long after it had ceased to be worn by Gentiles.

GABES, a town of Tunisia, at the head of the gulf of the same name, and 70 m. by sea S.W. of Sfax, with which it is connected by rail. It occupies the site of the Tacape of the Romans and consists of an open port and European quarter and several small Arab towns built in an oasis of date palms. This oasis is copiously watered by a stream called the Wad Gades. The European quarter is situated on the right bank of the Wad near its mouth, and adjacent are the Arab towns of Jara and Menzel. The houses of the native towns are built largely of dressed stones and broken columns from the ruins of Tacape. Gabes is the chief town of a civil jurisdiction. The population of the oasis is about 20,000, including some 1,500 Europeans. There is a considerable export trade in dates.

GABII, an ancient city of Latium, 12 m. E. of Rome, on the Via Praenestina, which was in early times known as the Via Gabina. Its early history is obscure, though its importance was considerable; but we only hear of it again in the 1st century B.C. as a small and insignificant place, though its desolation is no doubt exaggerated by the poets. Its baths were well known, and Hadrian, who was responsible for much of the renewed prosperity of the small towns of Latium, appears to have been a very liberal patron, building a senate-house and an aqueduct. Its bishops continue to be mentioned in ecclesiastical documents till the end of the 9th century. The primitive city was on the eastern bank of the lake, the citadel being now marked by the ruins of the mediaeval fortress of Castiglione, while the Roman town extended farther to the south. The most conspicuous relic of the latter is a ruined temple, generally attributed to Juno, probably belonging to 250–200 B.C. To the east of the temple lay the Forum, where excavations were made by Gavin Hamilton in 1792. All the objects found were placed in the Villa Borghese, but many of them were carried off to Paris by Napoleon after his conquest of Italy in 1797, and are in the Louvre.

See E. Q. Visconti, *Monumenti Gabini della Villa Pinciana* (Rome, 1797, and Milan, 1835); T. Ashby in *Papers of the British School at Rome*, i. 180 seq.; G. Pinza in *Bull. Com.* (1903), 321 seq. for archaeological information. (T. A.)

GABINIUS, AULUS, Roman statesman and general, and supporter of Pompey. In 67 B.C., when tribune of the people, he brought forward the *Lex Gabinia*, conferring upon Pompey the command in the war against the Mediterranean pirates, with absolute control over that sea and the coasts for 50m. inland. By other measures of Gabinius loans of money to foreign ambassadors in Rome were made non-actionable (as a check on the corruption of the senate) and the senate was ordered to give audience to foreign envoys on certain fixed days (1st of Feb.—1st of March). In 58 he was elected consul, not without suspicion of bribery. During his term of office he helped Clodius to send Cicero into exile. In 57 Gabinius went as proconsul to Syria. On his arrival he reinstated Hyrcanus in the high-priesthood at Jerusalem, suppressed revolts, introduced important changes in the government of Judaea, and rebuilt several towns. During his absence in Egypt, whither he had been sent by Pompey, without the consent of the senate, to restore Ptolemy Auletes to his kingdom, Syria was devastated by robbers, and an insurrection had arisen against Hyrcanus. With some difficulty Gabinius restored order, and in 54 handed over the province to his successor, M. Licinius Crassus. The tax-farming interests, which had suffered from the disorders, had him impeached on his return. Gabinius went into exile, and his property was confiscated. After the outbreak of the civil war, he was recalled by Caesar in 49, and entered his service, but took

no active part against Pompey. He died on service in Dalmatia against M. Octavius in 48 or early 47.

See Dio Cassius xxxvi. 23-36, xxxviii. 13. 30, xxxix. 55-63; Plutarch, *Pompey*, 25. 48; Josephus, *Antiq.* xiv. 4-6; Appian, *Illyrica*, 12, *Bell. Civ.* ii. 24. 59; Cicero, *ad Att.* vi. 2, *ad Q. Fratrem*, ii. 13, *Post reditum in senatu*, 4-8, *Pro lege Manilia*, 17, 18, 19; exhaustive article by Bähr in Ersch and Gruber's *Allgemeine Encyclopädie*; and monograph by G. Stocchi, *Aulo Gabinio e i suoi processi* (1892).

GABLE, the upper part of the end-walls of a building cov-

ered by a roof that slopes down from the centre to each side; hence the gable is always pointed in general form and usually triangular. In cases like the gambrel roof (*q.v.*) where the roof is in two slopes on each side, the gable becomes pentagonal. In classic work, where the slopes are low and where a cornice is continued across the end-walls connecting the eaves, the gable is called a pediment (*q.v.*). The architectural treatment of the gable results from the effort to find a beautiful solution to the problem of keeping water out of the intersection of walls and roof. This was done either by carrying the roof out over the top of the end-walls and finishing it with a moulding, sloping cornices or a projecting, bracketed board known as a bargeboard (*q.v.*); or by carrying up the end-walls above the roof level and capping them with a water-proof coping or cap. The former method is general in wooden buildings, and in those of small size or little architectural formality; the latter in larger and more monumental masonry structures, particularly in the Gothic and early Renaissance styles. In north and west Europe, where roofs of steep pitch are general, gables are often richly decorated and finished at the top with a series of steps or fantastic breaks often curved, and in the Renaissance period further ornamented with obelisks, urns, statues and scrolls, as in the town-hall of Bremen (1609), the Friedrichsbau at Heidelberg castle (c. 1590), or the town-hall of Antwerp (1561). In England, stepped and curved sided gables are common during the Elizabethan and Jacobean periods, as in many of the colleges of Oxford and Cambridge; more complicated forms rich with scrolls and strap work are used as decorations for wall coverings, as in Wollaton hall, Nottingham (last quarter of the 16th century).

During the Gothic period gables were decorated with crockets (*q.v.*) and finials (*q.v.*), and sometimes, especially from the 14th century on, with tracery. Gables were also used purely as decoration, without roofs behind; the French flamboyant churches are unusually rich with examples of pierced and traceried gables, very similar to those of the porch of St. Maclou at Rouen (begun 1432).

Gables are important features in the architecture of China and Japan (see *CHINESE ARCHITECTURE*, *JAPANESE ARCHITECTURE*). In north China and Japan, gables follow the roof slope and are ornamented with rich projecting roof tiles, grotesque animals at the ridge and eaves, and occasionally with surface patterns. In south China stepped gables are more common.

GABLET, diminutive of gable (*q.v.*), in architecture, a small gable, especially if used for decorative purposes, or to form the upper termination of a buttress. In many cases Gothic buttress offsets take the form of gablets. Gablets are frequently decorated with finials (*q.v.*) and are sometimes crocketed (ornamented with a row of projecting knobs, usually of foliage). In all the late Gothic styles gablets are used with great profusion and treated with lavishness and variety; always steep in slope, their sides are often curved, sometimes concave and sometimes with that double curve known as the ogee (*q.v.*).

GABLONZ: see JABLONEC NAD NISON.

GABORIAU, EMILE (1833-1873), French novelist, was born at Saujon (Charente Inférieure). He became secretary to Paul Féval, and, after publishing some novels and miscellaneous writings, found his real gift in *L'Afrique Leger* (1866), a detective novel which was published in the *Pays* and at once made his reputation. The story was produced on the stage in 1872. A long series of detective novels, which are classics in their kind, followed. Among them are: *Le Crime d'Orléans* (1867), *Monsieur Lecoq* (1869), *La Vie infernale* (1870), *Les Esclaves de Paris* (1869), *L'Argent des autres* (1874). Gaboriau died in Paris on Sept. 28, 1873.

GABRIEL, in the Bible, the heavenly messenger (see *ANGEL*) sent to Daniel to explain the vision of the ram and the he-goat, and to communicate the prediction of the Seventy Weeks (Dan. viii. 16, ix. 21). He was also employed to announce the birth of John the Baptist to Zacharias, and that of the Messiah to the Virgin Mary (Luke i. 19, 26). Because he stood in the divine presence (see Luke i. 19; Rev. viii. 2; and cf. Tobit xii. 15), both Jewish and Christian writers generally speak of him as an arch-

angel. In the *Book of Enoch* "the four great archangels" are Michael, Uriel, Suriel (Raphael), and Gabriel.

GABRIELINO. This extinct Shoshonean group of California Indians inhabited Santa Catalina island; named from the Franciscan mission of San Gabriel. They numbered about 5,000. They shared their arts with the adjoining Chumash of Santa Barbara channel and had developed a religion with named gods. A form of this, referring to the supreme deity Chungichnish, and making use of *Datura* as a vision-producing narcotic, continued to spread to neighbouring tribes until after 1850.

GABRIEL HOUNDS, a spectral pack supposed in the North of England to foretell death by their yelping at night. The legend is that they are the souls of unbaptized children wandering through the air till the day of judgment. They are also sometimes called Gabriel or Gabbie Ratchet.

See Joseph Lucas, *Studies in Nidderdale* (1882), pp. 156-157.

GABRIELI, a family of great Italian musicians of the 16th century, of whom ANDREA and his nephew and pupil GIOVANNI were the most important.

ANDREA GABRIELI (c. 1510-1586), Venetian composer and teacher, was born in Venice, in the quarter called Canareggio, about 1510. He became a pupil of the Flemish master Willaert, maestro di cappella at St. Mark's. In 1566 he succeeded Merulo as second organist of St. Mark's and was later appointed first organist, a post which he held until his death in 1586. Willaert, who had settled in Venice in 1527, was the virtual founder of the new Venetian school, for it was under his pupils Andrea Gabrieli and Joseffo Zarlino that Italian music began to free itself from the supremacy of the Netherland masters, which had been unshaken for nearly a century. The rambling "Ricercar" for organ was given form and meaning by the two Gabrielis, in whose hands it finally became the "canzone alle francese," the first canzoni for organ being those written by Andrea in 1571. The canzone form was also adopted for combinations of strings or other instruments. Another form associated with Andrea is the Toccata, which was the earliest form of virtuoso composition for organ. Andrea enjoyed great fame as a teacher. His most celebrated pupils were his nephew Giovanni and Leo Hassler.

His works include: *Psalmi Davidici, qui poenitentiales nuncupantur, tum omnis generis instrumentorum, tum ad vocis modulationum accomodati sex vorum* (Venice 1583); *Sacrae cantiones quinque vorum, liber primus* (1565); *Madrigali, lib. 1 a 5* (1566), *lib. 2 a 5, 6 & 8* (1570); *Missarum sex vorum, lib. primus* (1572); *Canzoni alla francese per l'organo* (1571); *Madrigali a 6 v* (1574); *a 3 v.* (1575); *Cantiones ecclesiasticae* (1576); *Canti concertati a 6, 7, 8, 10 e 16 v.* (incl. 10 pieces by Giovanni) 1587; Choruses for *Oedipus tyrannus* (printed 1588); *Mascherate* (1601); a *Missa brevis* and motets in Proske's *Musica divina*; 6 vocal pieces in Torchi's *Arte musicale in Italia* vol. ii., and 4 organ pieces in vol. iii.; and organ compositions, printed with Giovanni's, in 3 vols. of *Ricercari* (1593-96). A Ricercar in 8 parts has been published by Dr. Riemann (Augener). See Eitner: *Quellenlexikon*; Spemann: *Goldenes Buch der Musik*.

GIOVANNI GABRIELI (1557-1612?), nephew and pupil of Andrea, was born in Venice in 1557. He became first organist of St. Mark's in 1585. His monument in San Stefano gives the date of his death as Aug. 12, 1613, but this may be a mistake for 1612 as his post was filled on Aug. 12 of that year. He was a brilliant contrapuntist and, like his uncle, became a celebrated teacher. Heinrich Schütz, Alois Grani and Michael Praetorius were the most famous of his pupils. He experimented boldly with new combinations of instruments, new forms and new harmonies. New editions of some of his organ works appear in Ritter's *Zur Geschichte des Orgelspieles* (1884) and J. v. Wassilievski's *Gesch. d. Instrumentalmusik im 16 Jahrhundert* (1878).

See Karl v. Winterfeld: *Johannes Gabrieli und sein Zeitalter* in 3 vols. (1834) of which one vol. contains mus. examples.

GABRILOWITSCH, OSSIP (1878-), pianist and conductor, was born in St. Petersburg (now Leningrad), on Feb. 7, 1878. He studied music at the Imperial Conservatoire in that city in the class of Tolstov and under the personal supervision of Anton Rubinstein, winning the Rubinstein prize in 1894. Later

he continued his studies under Leschetizky in Vienna. At 18 he toured in Germany, Austria and England. In 1900 he toured the United States, and again in 1902, 1907-08. He married Mark Twain's daughter, Clara Clemens, the singer, in 1909. After having conducted in Munich and Vienna he became conductor of the Detroit symphony orchestra in 1918.

GABROVO, a town of Bulgaria, situated on the upper Yantra, in the northern foothills of the Balkan mountains, on a branch of the Transbalkan railway from Stara Zagora to Trnovo. Pop. (1926), 10,516. It is the centre of the textile and tannery industry. The old gabled wooden houses along the Yantra are particularly fine specimens of Balkan architecture, and the Turkish bridge is also famous. The first Bulgarian national school was opened in 1835 at Gabrovo, which thus became to some extent the cradle of the national resurrection. About 10 miles away is the Sokol monastery, beautifully situated on a wooden cliff.

GABUN, a district on the west coast of Africa, one of the colonies forming French Equatorial Africa (*q.v.*). It derives its name from the settlements on the Gabun river or Rio de Gabão. The Gabun, in reality an estuary of the sea, lies immediately north of the equator. At the entrance, between Cape Joinville or Santa Clara on the north and Cape Pangara or Sandy Point on the south, it is about 10 m. wide. It is 7 m. broad for 40 m. inland, when it contracts into what is known as the Rio Olambo, which is not more than 2 or 3 m. wide. Several rivers, of which the Komo is the chief, discharge into the estuary. The Gabun was discovered by Portuguese navigators at the end of the 15th century, and was named from its fanciful resemblance to a *gabão* or cabin. Libreville, on the estuary near its mouth, the capital of Gabun colony, was founded by the French in 1849.

GACE BRULÉ (d. c. 1220), French *trouvère*, was a native of Champagne. It has generally been asserted that he taught Thibaut of Champagne the art of verse, an assumption which is based on a statement in the *Chroniques de Saint-Denis*: "Si fist entre lui [Thibaut] et Gace Brulé les plus belles chansons et les plus délitables et melodieuses qui onque fussent oïes." This has been taken as evidence of collaboration between the two poets. The passage will bear the interpretation that with those of Gace the songs of Thibaut were the best hitherto known. Paulin Paris, in the *Histoire littéraire de la France* (vol. xxiii.), quotes a number of facts that fix an earlier date for Gace's songs. Gace is the author of the earliest known *jeu parti*. The interlocutors are Gace and a count of Brittany who is identified with Geoffrey of Brittany, son of Henry II. of England. Gace appears to have been banished from Champagne and to have found refuge in Brittany. A deed dated 1212 attests a contract between Gatho Bruslé (Gace Brulé) and the Templars for a piece of land in Dreux. It seems most probable that Gace died before 1220, at the latest in 1225.

See Gédéon Busken Huet, *Chansons de Gace Brulé*, edited for the Société des Anciens Textes Français (1902), with an exhaustive introduction. Dante quotes a song by Gace, *Ire d'amor qui en mon cuer repaire*, which he attributes erroneously to Thibaut of Navarre (*De vulgari eloquentia*, p. 151, ed. P. Rajna, Florence, 1895).

GACHARD, LOUIS PROSPER (1800-1885), Belgian man of letters, was born in Paris on Mar. 12, 1800. He entered the administration of the royal archives in 1826, and was appointed director-general, a post which he held for 55 years. Gachard died at Brussels on Dec. 24, 1885. Among his best known works are: *Don Carlos et Philippe II.* (1867), *Etudes et notices historiques concernant l'histoire des Pays-Bas* (1863), *Histoire de la Belgique au commencement du XVIII^e siècle* (1880), *Histoire politique et diplomatique de P. P. Rubens* (1877), all published at Brussels.

GAD, a Semitic name. 1. A god of fortune, originally, perhaps, Aramaean, whose name occurs not infrequently in compound place names. The god himself is mentioned in Is. lxxv. 11 (R.V.).

2. The name of a seer at the court of David, 1 Sam. xxii. 5, xxiv., 1 Chron. xxix. 25, 2 Chron. xxix. 25.

3. An Israelite tribe claiming descent from Jacob and Zilpah, Leah's maid.

The name is now generally supposed to be that of the god (1), but the traditional derivation is that which connects it

with a word meaning "a raiding troop" (*cf.* Gen. xlix. 19). The territory of Gad lay to the east of Jordan, between Manasseh (Machir) and Reuben, and the more usual term for this district is Gilead. From Jud. v. 17, where Gilead is condemned for not following Barak, we gather that this name might be used for the tribe as well as for its territory. Gad is mentioned in the inscription of Mesha, and it is noteworthy that by this time Reuben has entirely disappeared, having been absorbed, apparently, partly by Gad and partly by Moab. Gad belonged nominally to the northern kingdom of Israel, but was liable to be raided from the desert, while it was also exposed to attack from the Syrians of Damascus in the north and from Moab in the south; hence the control exercised by the court of Samaria was uncertain and irregular.

GADAG or GARAG, a town of British India, in the Dharwar district of Bombay, 43 m. E. of Dharwar town. Pop. (1921) 41,208. It is an important railway junction on the Madras and Southern Mahratta system, with trade in cotton and silk and cotton stuffs, factories for ginning and pressing cotton, and a spinning and weaving mill. The town contains temples exhibiting fine carving, with inscriptions from as early as the 10th century.

GADARA, an ancient city of Trans-Jordan, a member of the Decapolis, capital of Peraea (so at least Josephus), and political centre of the district of Gadara. It is now represented by the group of ruins, Umm Kēs, which are spread over the summit of a hill 1,193 ft. high and about 6 m. S.E. of the southern end of the Sea of Galilee. "There could hardly be found a second point in this part of 'Ajlūn which combines so perfectly the advantages due to a magnificent soil and a commanding position."

Although the Mishna asserts that it was fortified by Joshua, Gadara was probably of Greek origin and it certainly maintained a religious interest in Zeus. It first appears in history as a place which fell to Antiochus the Great after his victory over Scopas at Paneas (Bāniās). Alexander Jannaeus took it after 10 months siege (*c.* 100 B.C.). Pompey restored it (64–63 B.C.) and Augustus gifted it to Herod the Great (30 B.C.). During the Jewish revolt Vespasian took possession of the city, the inhabitants pulling down the walls as an earnest of peace. Josephus knew it as a "place of strength with many rich citizens" and during the time of the Antonines it was adorned with buildings of some magnificence. There exist to-day the remains of three large theatres, a basilica, a temple, a colonnaded street, a reservoir, the city wall, and an aqueduct which brought water from the Hauran. On the eastern side of the site there is a large necropolis with rock-hewn tomb-chambers (many with stone doors), which some of the modern inhabitants use as dwellings, together with numerous carved sarcophagi.

About 3 m. to the north beside the river Yarmuk (Hieromax) are the celebrated hot springs and baths of Amatha described by Eusebius and Strabo. "To Gadara the pleasure-loving Romans, after having enjoyed the restorative effects of the hot springs, retired for refreshment, enjoying the cooler heights of the city and solacing their leisure with the plays performed in the theatres." From its leisured populace it produced many fine litterateurs; Philodemus, the Epicurean and epigrammatist; Meleager the anthologist; Menippus the satirist; Theodorus the rhetorician, and others.

The healing of the demoniac in the Gospel narrative has nothing to do with Gadara, but is rather to be associated with Kersa on the eastern shore of the Sea of Galilee.

See C. Warren in *Hastings Dictionary of the Bible*; G. Schumacher, *Northern 'Ajlūn* (1890); G. A. Smith, *Hast. Geog. of the Holy Land* (1895). (E. Ro.)

GADDI, the name of a famous Florentine family, some of whose members—father, son and two grandsons in the 13th and 14th century—were artists. A third grandson, Zanobi (d. 1400) was a banker and ambassador of Florence to Venice. He laid the foundation of a large fortune and placed the family in a highly distinguished position from which sprang cardinals, statesmen and literary men. The art collection of the Gaddi family was rich in drawings, manuscripts and gems.

1. **GADDO GADDI**, Florentine painter and mosaicist, according to

Vasari, died in 1312 at the age of 73; but according to older records he was still alive in 1330. Vasari states that he was a friend of Cimabue and Giotto and ascribes to him works very different in style (the mosaics inside the portico of S. Maria Maggiore in Rome, which are very much restored, and the mosaics representing the Coronation of the Virgin inside the portal of the cathedral at Florence).

2. **TADDEO GADDI** (*c.* 1300–1366) son of Gaddo, was born in Florence. According to Cennino he worked under Giotto for 24 years, being that master's most distinguished pupil. His most important works are the frescoes in the Baroncelli chapel in S. Croce in Florence, representing incidents in the legend of the Virgin. On the ceiling of the same chapel are the "Eight Virtues," and on the funeral monument the "Virgin and Child between four Prophets." In the refectory at the same church is a "Last Supper," which reveals the master at the height of his powers (*c.* 1350). Other frescoes by Taddeo are at Ognisanti in Florence, in the church of San Miniato, and in the choir of San Francesco at Pisa. There are two altar-pieces signed by Taddeo representing the Madonna; one, dated 1334, is in the Museum at Berlin; the other, dated 1355 was removed from Poggibonsi to the Uffizi. Other works which are generally ascribed to the master are: Two large altar-pieces of the "Madonna with Saints," one at S. Felicità in Florence, the other at San Giovanni Fuoricivitas at Pistoia (1353), and two small triptychs at the Strasbourg and Naples Museums. There is a "Madonna with Saints" at the Metropolitan Museum in New York and a Madonna in the collection of F. L. Babbot at Brooklyn. A series of paintings, partly scenes from the life of St. Francis, executed for the presses in S. Croce and now divided between the Florentine Academy and the Berlin museum, have also been attributed to the master. Taddeo Gaddi's art did not rise to Giotto's monumental simplicity and dramatic expression, but developed on independent lines with a tendency towards realism.

3. **AGNOLO GADDI**, was the son and pupil of Taddeo. The date of his birth has been given as 1326, but 1350 is probably nearer the mark. He died in Florence in Oct. 1396. In 1369 he was called to Rome to assist in painting frescoes in the Vatican (now lost). In the years 1380, 1383, 1386, he carried out designs for statuary in the Loggia dei Lanzi. He also did some work for the cathedral. His most important paintings are the frescoes in S. Croce in Florence, "representing every circumstance of the discovery of the cross; a work which certainly displays considerable facility, but very little force of design, the colouring only being tolerably well done," as Vasari says.

4. **GIOVANNI GADDI**, brother of Agnolo, was a painter of promise, a pupil of his brother. He died young in 1383.

BIBLIOGRAPHY.—G. Vasari, *Vite de' pittori*, etc., ed. G. Milanesi (1878–85); C. Frey, *Loggia dei Lanzi* (1885) and *Il Codice Magliabecchiano* (1897); J. A. Crowe and G. B. Cavalcaselle, *A history of painting in Italy* ed. Douglas (1903); O. Siren, *Giotto and some of his Followers* (1917); B. G. Vitzthum and W. F. Volbach, *Die Malerei und Plastik des Mittelalters* (1924). On the Gaddi collections see Aurelio Gotti: *Le gallerie di Firenze* (1875).

GADE, NIELS VILHELM (1817–1890), Danish composer, was born at Copenhagen, on Feb. 22, 1817, his father being a musical instrument maker. Though he studied the violin under Wexschall, and theory under Weyse and Berggreen, he was largely self-taught. In 1840 his *Aladdin* and his overture of *Ossian* attracted attention, and in 1841 his *Nachklänge aus Ossian* overture gained the local musical society's prize, the judges being Spohr and Schneider. A further stipend from the king enabled him to go to Leipzig and Italy. In 1844 Gade conducted the Gewandhaus concerts in Leipzig during Mendelssohn's absence, and on the latter's death became chief conductor. In 1848, on the outbreak of the Holstein War, he returned to Copenhagen, where he was appointed organist and conductor of the Musik-Verein. In 1852 he married a daughter of the composer J. P. E. Hartmann. He became court conductor in 1861, and was pensioned in 1876—the year in which he visited Birmingham to conduct his *Crusaders*. This work, and the *Frühlingsfantasie*, the *Erk Königs Tochter*, *Frühlingsbotschaft* and *Psyche* (written for Birmingham in 1882) enjoyed great popularity. Of his eight symphonies the best are the first and fourth. A friend of Mendelssohn and of Schubert, Gade

was a romanticist, whose music owes much to Scandinavian folk-song. He died at Copenhagen on Dec. 21, 1890.

See W. Behrend, *Niels W. Gade* (Leipzig, 1917); C. Kjerulf, *Niels W. Gade, Hans Liv og Kunst* (Copenhagen, 1917).

GADIDAE, a family of fishes including the cod, whiting haddock, etc., inhabiting the waters of the northern hemisphere. (See FISH, COD, WHITING.)

GADOLINIUM is a metallic element belonging to the rare-earth group (symbol Gd, atomic number 64, atomic weight 157.3). The early history of this element is in a rather confused state. Marignac in 1880 obtained a new earth in an impure condition and termed it Y_a and then in 1886 he gave it the name it now bears. Pure gadolinium salts were obtained by Demarcay in 1900. It occurs in many minerals, some varieties of Norwegian ytterspar being quite rich sources; other common sources are gadolinite, samarskite, monazite. It is best separated from other members of the group by first crystallizing the double magnesium nitrates. The most soluble portion of these nitrates is then converted to the bromates and further fractionally crystallized. Gadolinium gives a white oxide and colourless salts, the simple nitrate being the least soluble of the rare-earth series; in solution these give absorption bands in the ultra violet. While gadolinium is far from common, it is not as rare as is generally believed. (See RARE EARTHS.) (C. J.)

GADSDEN, JAMES (1788–1858), American soldier and diplomat, was born at Charleston, S.C., on the 15th of May 1788, the grandson of Christopher Gadsden. After graduating at Yale in 1806, he became a merchant in his native city, and in the war of 1812 served in the regular U.S. Army as a lieutenant of engineers. In 1818 he served against the Seminole Indians, with the rank of captain, as aide on the staff of Gen. Andrew Jackson. In October 1820 he became inspector general of the Southern Division, with the rank of colonel, and as such assisted in the establishment of posts in Florida after its acquisition. He was adjutant general from August, 1821 to March, 1822, when he left the army and became a planter in Florida. As Federal commissioner he superintended in 1823 the removal of the Seminole Indians to South Florida, and in 1832 negotiated with them a treaty which provided for their removal to what is now the state of Oklahoma; they, however, refused to move, hostilities again broke out, and in the second Seminole War (1836) Gadsden was quartermaster-general of the Florida Volunteers. Returning to South Carolina he became a rice planter and president of the South Carolina railway. In 1853 President Franklin Pierce appointed him minister to Mexico, with which country he negotiated the so-called "Gadsden treaty" (signed Dec. 30, 1853), which gave to the United States freedom of transit for mails, merchandise and troops across the Isthmus of Tehuantepec, and provided for a readjustment of the boundary established by the treaty of Guadalupe Hidalgo, the United States acquiring 45,535 sq. m. of land, since known as the "Gadsden Purchase," in what is now New Mexico and Arizona. In addition, the provision of the treaty of Guadalupe Hidalgo which bound the United States to prevent incursions of Indians from the United States into Mexico and to restore Mexican prisoners captured by such Indians was abrogated, and for these considerations the United States paid to Mexico the sum of \$10,000,000. Ratifications of the treaty, slightly modified by the Senate, were exchanged on June 30, 1854. Gadsden died at Charleston, S.C., Dec. 25, 1858.

GADSDEN, a rapidly growing city of Etowah county, Alabama, U.S.A., on the Coosa river, 65 m. N.E. of Birmingham, Ala. It is on Federal highway 11, and is served by the Louisville and Nashville, the Nashville, Chattanooga and St. Louis, the Southern and the Tennessee, Alabama and Georgia railways, and by numerous motor bus lines. The population was 14,737 in 1920 (29% negroes) and was 24,042 in 1930 by the Federal census. Gadsden is in the iron and coal region of Alabama, and has abundant hydro-electric power from the Coosa river. The city has a large trade in lumber, cotton and grain, and is an important manufacturing centre, with an output in 1927 valued at \$17,490,111. Among its products are iron and steel, cotton yarns, sashes and doors. Gadsden was founded about 1860 and incorporated as a city in

1871. In the decade 1900–10 the population increased from 4,282 to 10,557 (147%).

GADWALL, the common name of the duck *Anas strepera*. Its habits and distribution are very similar to those of the common wild duck (see DUCK), but, save in India, where it is abundant during the cold weather, it is hardly anywhere so numerous. Its small head, flat back, elongated form and elevated stern render it easily recognizable. In coloration the two sexes are almost equally sombre; but the drake exhibits chestnut upper wing-coverts. Both resemble the female of the mallard in colour, but the white secondary quills form one of the most readily perceived characters of the species. The gadwall is increasing as a breeding species in Britain. It has been always esteemed for the table. The gadwall is found throughout the greater part of North America, but is uncommon in the Northeastern States, though occasionally seen near New York city.

GAEKWAR (gah'ik-war), the family name of the Mahratta rulers of Baroda (*q.v.*), in India, which has been made by the English into a dynastic title. It is derived from the vernacular word for the cow, but it is a mistake to suppose that the family are of the cowherd caste; they belong to the upper class of Mahrattas proper, sometimes claiming a Rajput origin.

GAELIC LANGUAGE. The term Gaelic is used for the surviving Celtic languages other than Welsh, Cornish and Breton, *i.e.* for Erse, Manx and Scottish Gaelic. In these languages the *qu* sound is often used where the *p* sound would be used in the other group. Gaelic spread from Ireland to Scotland with the Dalriadic Scots. Scottish Gaelic has given up the nasal mutation (or eclipse), *e.g.*, Scottish *or bò*, "our cow," Irish *ar m-bó*; Scottish *mantèr* "of the countries," Irish *na d-tìr*. In some Gaelic speaking areas, however (Skye and the Outer Isles), the mutations have been partly restored. See also in this connection CELTIC LANGUAGES.

GAELIC LITERATURE: see IRISH LITERATURE: *Gaelic*; SCOTTISH LITERATURE: *Gaelic*.

GAETA, a seaport and episcopal see of Lazio, Italy, province of Rome (anc. *Caletae Portus*), 5 m. by rail west of Formia (*q.v.*). Pop. (1921) 6,393, town; 18,096, commune. It occupies a lower projecting point of the promontory which forms the southwest extremity of the Bay of Gaeta. The tomb of Munatius Plancus, on the summit of the promontory (see CAIETAE PORTUS), is now a naval signal station. The harbour, well sheltered except on the east, is entirely a naval station. To the north-west is the suburb of Elena. Above the town is a castle erected by the Angevin kings, and strengthened at various periods. The cathedral of St. Erasmus (S. Elmo), consecrated in 1106, has a fine campanile begun in 860 and completed in 1279, and a nave and four aisles; the interior has, however, been modernized. Opposite the door of the cathedral is a candelabrum with interesting sculptures of the end of the 13th century. Behind the high altar of the cathedral is the banner sent by Pope Pius V. to Don John of Austria, the victor of Lepanto. The constable of Bourbon, who fell in the sack of Rome of 1527, is buried here. Close to the church of La Trinità is the Montagna Spaccata, where a vertical fissure from 6 to 15 ft. wide runs right down to the sea-level. Over the chasm is a chapel *del Crocefisso*, the mountain having split, it is said, at the death of Christ.

During the break-up of the Roman empire, Gaeta, like Amalfi and Naples, would seem to have established itself as a practically independent port and to have carried on a thriving trade with the Levant. Its history, however, is obscure until, in 839, it appears as a lordship ruled by hereditary *hypati* or consuls. According to tradition, the Caetani or Gaetani family (*q.v.*) is descended from these *hypati*. In 844 the town fell into the hands of the Arabs, but four years later they were driven out with help supplied by Pope Leo IV. In 875 Pope John VIII. gave it to the count of Capua as a fief of the Holy See, which had long claimed jurisdiction over it. In 877, however, the *hypatus* John (Ioannes) II. succeeded in recovering the lordship, which he established as a duchy under the suzerainty of the East Roman emperors. In the 11th century the duchy fell into the hands of the Norman counts of Aversa, afterwards princes of Capua, and in 1135 it was

annexed to his kingdom by Roger of Sicily. Its fortifications were strengthened in the 15th century. On the 30th of September 1707 it was stormed, after a three months' siege, by the Austrians under Daun; and on the 6th of August 1734 it was taken, after a siege of four months, by French, Spanish and Sardinian troops. The fortifications were again strengthened; and in 1799 it was temporarily occupied by the French. On the 18th of July 1806 it was captured, after an heroic defence, by the French under Masséna; and on the 18th of July 1815 it capitulated, after a three months' siege, to the Austrians. In November 1848 Pope Pius IX., after his flight in disguise from Rome, found a refuge at Gaeta, where he remained till the 4th of September, 1849. In 1860, it was the scene of the last stand of Francis II. of Naples (*q.v.*) against the forces of United Italy. (T. A.)

See G. Caetani, *Caetanorum Genealogia* (Perugia, 1920); Rocca S. Casciano, i., ii. (1927), *Epistolarium Honorati Caetani*, *ib.* (1927); *Domus Caetana Regesta Chartarum* *ib.*, i., ii. (1922-26), for the history of the family.

GAETANI or **CAETANI**, the name of the oldest of the Roman princely families which played a great part in history. They are of Longobard origin, and the founder of the house is said to be Dominus Constantinus Caetanus, who flourished in the 10th century, but the family had no great importance until the election of Benedetto Gaetani to the papacy as Boniface VIII. in 1294, when they at once became the most notable in the city.

At present (in 1928) there are two lines: (1) Gaetani, princes of Teano and dukes of Sermoneta, founded by Giacobello Gaetani, whose grandson, Guglielmo Gaetani, was granted the duchy of Sermoneta by Pius III. in 1503, the marquise of Cisterna being conferred on the family by Sixtus V. in 1585. In 1642, Francesco, the 7th duke of Sermoneta, acquired by marriage the county of Caserta, which was exchanged for the principality of Teano in 1750. The present head of the house, Onorato Gaetani, 14th duke of Sermoneta, 4th prince of Teano, duke of San Marco, marquis of Cisterna, etc., is a senator of the kingdom of Italy, and was minister for foreign affairs for a short time. (2) Gaetani dell' Aquila d'Aragona, princes of Piedimonte and dukes of Laurenzana, founded by Onorato Gaetani dell' Aquila, count of Fondi, Traetto, Alife and Morcone, lord of Piedimonte and Gioia, in 1454. The additional surname of Aragona was assumed after the marriage of Onorato Gaetani, duke of Traetto (d. 1529), with Lucrezia of Aragon, natural daughter of King Ferdinand I. of Naples. The duchy of Laurenzana, in the kingdom of Naples, was acquired by Alfonso Gaetani by his marriage in 1606 with Giulia di Ruggiero, duchess of Laurenzana. The lordship of Piedimonte was raised to a principality in 1715. The present head of the house is Nicola Gaetani dell' Aquila d'Aragona (b. 1857), 7th prince of Piedimonte and 12th duke of Laurenzana.

See A. von Reumont, *Geschichte der Stadt Rom* (1868); F. Gregorovius, *Geschichte der Stadt Rom* (Stuttgart, 1872), and S. A. Guarnieri, *Cenni storici-biografici-genealogici dei Gaetani* (1904).

GAETULIA, a district in the north of Africa, which in the usage of Roman writers comprised the wandering tribes of the southern slopes of Mount Aures and the Atlas, as far as the Atlantic, and the oases in the northern part of the Sahara. They were distinguished from the Negro people to the south, and belonged to the Berber race which formed the population of Numidia (*q.v.*). The tribes to be found there at the present day are probably of the same race, and retain the same wandering habits. They were noted for the rearing of horses, were clad in skins, lived on flesh and milk, and the only manufacture connected with their name is that of purple dye.

For bibliography see AFRICA, ROMAN.

GAFFNEY, a town of South Carolina, U.S.A., 20m. N.E. of Spartanburg, on Federal highway 29 and the Southern railway; the county seat of Cherokee county. The population was 5,065 in 1920 (25% negro) and was 6,827 in 1930 by the Federal census. It has large cotton mills, with a total (1928) of over 5,300 looms and 185,000 spindles, and is the seat of Limestone college for women (established 1845). The town was founded about 1872 and incorporated in 1874.

GAGE, LYMAN JUDSON (1836-1927), American financier, was born at De Ruyter, Madison county, N.Y., on June 28, 1836. At the age of 17 he became a bank clerk. In 1855 he removed to Chicago, served for three years as bookkeeper in a planing-mill, and in 1858 entered the banking house of the Merchant's Loan and Trust Company, of which he was cashier in 1861-68. Afterwards he became successively assistant cashier (1868), vice president (1882) and president (1891) of the First National Bank of Chicago. He was chosen in 1892 president of the board of directors of the World's Columbian Exposition. From March 1897 until Jan. 1902 he was secretary of the Treasury in the cabinets successively of Presidents McKinley and Roosevelt. From April 1902 until 1906 he was president of the United States Trust Company in New York city. He died on Jan. 26, 1927.

GAGE, THOMAS (1721-1787), British general and governor of Massachusetts, second son of the first Viscount Gage, entered the army in 1741 and saw service in Flanders and in the campaign of Culloden, becoming lieutenant-colonel in the 44th foot in March 1751. In 1754 he served in America, and he took part in the following year in General Braddock's disastrous expedition. In 1758 he became colonel of a new regiment and served in Amherst's operations against Montreal. He was made governor of Montreal, and promoted major-general in 1761, and in 1763 succeeded Amherst in the command of the British forces in America; in 1770 he was made a lieutenant-general. In 1774 he was appointed governor of Massachusetts, and in that capacity was entrusted with carrying into effect the Boston Port Act. The difficulties which surrounded him in the execution of his office at this time of the gravest unrest culminated in 1775, and the action of April 19 at Lexington initiated the American War of Independence. After the battle of Bunker Hill, Gage was superseded by Howe, and returned to England. He became general in 1782, and died on April 2, 1787.

GAGE, a pledge, something deposited as security for the performance of an agreement. A particular form of "gage" was the glove or gauntlet thrown down as a challenge to a combat, and as a "pledge" that the parties would appear on the field; hence the common phrase "to throw down the gage of defiance" for any challenge. (See GLOVE and WAGER.)

GAGER, CHARLES STUART (1872-), American botanist, was born on Dec. 23, 1872, at Norwich, N.Y., and educated at Syracuse (A.B., 1895) and Cornell (Ph.D., 1902) universities. He was professor of biological sciences and physiography at New York State Normal college, 1897-1905; director of laboratories, New York Botanical Garden, 1906-08; and professor of botany at the University of Missouri, 1908-10. In 1910 he became director of the Brooklyn Botanic Garden, and in this position rose rapidly to a position of leadership in the field of botanical education and administration in the United States. Since 1912 he has edited the *Brooklyn Botanic Garden Record*. From 1918 to 1925 he was a member of the editorial board of *Botanical Abstracts*. He became business manager of *American Journal of Botany* in 1914, also of *Ecology* in 1920, and of *Genetics* in 1922.

Besides numerous papers and addresses in scientific and educational journals he has published *Errors in Science Teaching* (1901); *Effects of the Rays of Radium on Plants* (1908); *Fundamentals of Botany* (1916); *Heredity and Evolution of Plants* (1920); *The Relation between Science and Theology* (1925); *General Botany with Special Reference to its Economic Aspects* (1926).

GAGERN, HANS CHRISTOPH ERNST, BARON VON (1766-1852), German statesman and political writer, was born at Kleinniedesheim, near Worms, on Jan. 25, 1766. After studying law at the universities of Leipzig and Göttingen, he entered the service of the prince of Nassau-Weilburg. He was the prince's envoy at Paris until 1811, and in 1812 he took part in the abortive attempt to excite a second insurrection against Napoleon in Tirol. He joined the headquarters of the Prussian army (1813), and became a member of the board of administration for north Germany. In 1814 he was appointed administrator of the Orange principalities; and, when the prince of Orange became king of the Netherlands, Baron Gager became his prime minister. In 1815 he repre-

sented him at the congress of Vienna, and obtained for the Netherlands a considerable augmentation of territory. From 1816 to 1818 he was Luxemburg envoy at the German diet, but was recalled, at the instance of Metternich, owing to his too independent advocacy of state constitutions. In 1820 he retired with a pension to his estate at Hornau, near Höchst, in Hesse-Darmstadt, where he died on Oct. 22, 1852. Baron von Gagern wrote some historical works, but the best known is his autobiography, *Mein Anteil an der Politik*, 5 vols. (Stuttgart and Leipzig, 1823-1845).

Of Hans Christoph von Gagern's sons three attained considerable eminence:—

FRIEDRICH BALDUIN, Freiherr von Gagern (1794-1848), the eldest, took service in the Austrian army, fought in the Russian campaign of 1812, and at Dresden, Kulm and Leipzig. He then entered the Dutch service, took part in the campaigns of 1815, and, after studying another year at Heidelberg, was member for Luxemburg of the military commission of the German federal diet (1824, 1825). In 1830 and 1831 he took part in the Dutch campaign in Belgium, and in 1844, was sent on a military mission to the Dutch East Indies. In 1847 he was appointed governor at the Hague, and commandant in South Holland. In the spring of 1848 he commanded the Baden forces against the insurgent "free companies" (*Freischaren*). At Kandern, on April 20, he was mortally wounded. His *Life*, in 3 vols. (Heidelberg and Leipzig, 1856-1857), was written by his brother Heinrich von Gagern.

HEINRICH, Freiherr von Gagern (1799-1880), the third son, fought at Waterloo in the Nassau contingent. After the war, he studied law at Heidelberg, Göttingen, Jena and Geneva. As a student he had been a member of the *Burschenschaft*, and he now threw himself into open opposition to the unconstitutional spirit of the Hessian government, and was dismissed from the state service in 1833. Henceforth he lived in retirement at Monsheim until the February revolution of 1848 and its echoes in Germany recalled him to active political life. At the Heidelberg meeting and the preliminary convention (*Vorparlament*) of Frankfurt he deeply impressed the assemblies; and when the German national parliament met (May 18), he was elected its first president. He was mainly instrumental in imposing the principle of a united empire with a common parliament, and in carrying the election of the Archduke John as regent. On Dec. 15, when Schmerling and the Austrian members had left the cabinet, Gagern became head of the imperial ministry, and on the 18th he introduced a programme (known as the *Gagernsche Programm*) according to which Austria was to be excluded from the new federal state, but bound to it by a treaty of union. After a severe struggle this proposal was accepted; but on May 20 Gagern and his friends resigned. He died at Darmstadt on May 22, 1880.

MAXIMILIAN, Freiherr von Gagern (1810-1889), the youngest son, was a member of the German national parliament in 1848. Throughout the revolutionary years he supported his brother's policy, and, after the collapse of the national movement, returned to the service of the duchy of Nassau. In 1855 he entered the Austrian service in the department of foreign affairs. In 1871 he retired, and in 1881 was nominated a life member of the Upper Chamber (*Herrenhaus*). He died at Vienna on Oct. 17, 1889.

See *Allgemeine deutsche Biographie*, Band viii, p. 301, etc. (1878) and Band xlix, p. 654 (1904).

GAG LAWS, a series of laws passed by the United States Congress of 1836 in direct violation of the First Amendment to the Federal constitution, which provided for the right to petition in matters connected with the abolition of slavery. This report formed one of the most dramatic incidents of American history. The first "Gag rule" passed in 1836, called the Pinckney resolution, provided that all petitions relating to slavery should be put forward without reference to committee or being printed; the substance of this was subsequently adopted and passed by succeeding sessions of congress in the Patton Resolution of Dec., 1837, the Atherton Resolution in 1838, the Twenty-first Rule in 1840, and subsequently till repealed.

The President of the United States, John Quincy Adams led the opposition for their rescindment and the laws were finally abolished in 1844. See ADAMS, JOHN QUINCY and HALE, JOHN

PARKER.

GAHANBAR, festivals of the ancient Avesta calendar celebrated by the Parsees at six seasons of the year which correspond with the six periods of creation: (1) *Maidhyozaremaya* (mid-spring), (2) *Maidhyoshema* (midsummer), (3) *Paitishahya* (creation of the earth), (4) *Ayathrema* (creation of plants), (5) *Maidhyarya* (winter solstice), (6) *Hamaspahmaedha* (festival of sacrifices).

GAHNITE, or zinc spinel, $ZnO \cdot Al_2O_3$, a rather rare mineral found at Franklin Furnace, N.J., and in Norway, along with other zinc ores. (See FRANKLINITE.)

GAILLAC, town, south-western France, capital of an arrondissement in the department of Tarn, on the right bank of the Tarn, 15 m. W. of Albi on the railway from that city to Toulouse. Pop. (1926) 4,921. Gaillac grew up round the Benedictine abbey of St. Michel, founded in the 10th century. The churches of St. Michel and St. Pierre, both dating from the 13th and 14th centuries, have little architectural importance. The Maison Yversen, of the Renaissance, is remarkable for the rich carving of its doors. The public institutions include the sub-prefecture and a tribunal of first instance. Industries include the manufacture of bricks and tiles and there is a considerable trade in grain, flour, vegetables, dried plums, anise, coriander, etc., and in wine, the white and red wines having a high reputation.

GAINE, in architecture, a support, usually taking the place of a column or pilaster, and consisting of a lower form, rectangular in section and tapering downwards, and the upper portion made by a human head, shoulders and bust, either male or female. Frequently the whole is topped by a capital often pseudo-Ionic in form, with large side volutes or spirals. The gaine first appears as a minor decorative motive in the stucco work of the middle 16th century work in Italy. Later it was used architecturally, flanking doors, windows and niches, especially in the fantastic baroque work common in the villas and during the late 17th century. The gaine form was an especial favourite in the Renaissance work of Germany, Belgium and Holland, and owing to Flemish influence, it was much used in the Jacobean work of England.

GAINESVILLE, a city in the interior of Florida, U.S.A., 70m. S.W. of Jacksonville; the county seat of Alachua county. It is served by the Atlantic Coast Line, the Jacksonville, Gainesville and Gulf and the Seaboard Air Line railways. The population in 1925 (State census) was 8,466 (40% negroes) and in 1930 it was 10,465 by the Federal census of that year. Gainesville is a shipping point for garden produce, citrus and other fruits, and other agricultural products; the centre of the new tung-oil industry of America, with over 1,000,000 Chinese tung trees; a health and pleasure resort, and the seat of the University of Florida, opened at Lake City in 1905 and moved in 1906 to its present site (953 acres). The Florida Agricultural college (opened in 1884 at Lake City) and the Florida Agricultural Experiment station (established 1887) are part of the university. There are many points of natural beauty and interest in the vicinity, including the Alachua Sink, Payne's Prairie, Newman's Lake and the Devil's Millhopper, and 15m. west of the city are rich phosphate mines. Gainesville is in the midst of the famous Seminole country. It was settled about 1850, named after Gen. E. P. Gaines, incorporated as a town in 1869, and as a city in 1907.

GAINESVILLE, a city of Georgia, U.S.A., 54m. N.E. of Atlanta, near the Chattahoochee river; the county seat of Hall county. It is on Federal highways 19 and 129, and is served by the Gainesville and Northwestern, the Gainesville Midland and the Southern railways. The population was 6,272 in 1920 (24% negroes) and was 8,624 in 1930 by the Federal census of that year. The city lies at an altitude of 1,300ft. in the foot-hills of the Blue Ridge, and there are mineral springs in the vicinity. Its manufacturing industries include cotton mills with 2,700 looms and 128,000 spindles in 1928. It is the seat of Riverside military academy, and of Brenau college for women (Baptist), founded in 1878 as the Georgia Baptist seminary. Gainesville was settled about 1818 and incorporated as a city in 1821.

GAINESVILLE, a city of Texas, U.S.A., 65m. N. of Fort Worth and Dallas, near the Red river; the county-seat of Cooke

county. It is on Federal highway 77, and is served by the Missouri-Kansas-Texas and the Santa Fe railways. The population was 8,915 in 1930. The Muenster oilfield is 17m. W., and the region produces cotton, grain and live stock. The city is an important shipping point, and has an oil refinery and various other manufacturing industries. The State training school for girls is located here. Gainesville was settled about 1851, and named after Gen. Edmund Pendleton Gaines (1777-1849), who commanded the department of the south-west during the Mexican War. It was chartered as a city in 1879.

GAINSBOROUGH, THOMAS (1727-1788), English painter, one of the first and greatest masters of the English school, was born at Sudbury, Suffolk, in the spring of 1727. His father was a woollencrape maker in that town. Thomas was the youngest of nine children. At 14 years old he had sketched every fine tree and picturesque cottage near his home and had persuaded his father to let him go to London, where he had instruction in etching from Hubert Gravelot and studied at the academy in St. Martin's lane, under Francis Hayman. After his return to Sudbury in 1745 he married Margaret Burr, the sister of a man employed by Gainsborough's father as a traveller, and at the age of 20 he became a householder at Ipswich. Here he painted portraits and landscapes and he spent his leisure hours in a musical club. He numbered among his friends Joshua Kirby, president of the Society of Artists, and Philip Thicknesse, then governor of the Landquart fort near by, who was to be his first biographer. It was Thicknesse's merit to have discovered Gainsborough. He encouraged him by commissions and recommendations to his friends, and it was on his advice that Gainsborough, in 1759, went to Bath, then the general resort of wealth and fashion. Here, in the midst of England's finest society, the artist expanded to the full. His studio in the circus was thronged with visitors. At Wilton and other country seats of his patrons he had opportunities of studying the masterpieces of his beloved Vandyck; and he contributed both portraits and landscapes to the annual exhibition in London. He haunted the greenroom of Palmer's theatre and painted the portraits of many actors. His house harboured many musicians of various nationalities and he learned to play the viola-da-gamba, the harp, the hautboy and the violoncello.

In 1774, having attained a position of prosperity, he went to London and settled at Schomberg House, Pall Mall. He had not been there many months before he received a summons to the palace. He painted George III. eight times and also portrayed the queen and other members of the royal family. Sheridan, Burke, Johnson, Franklin, Canning, Pitt, Lady Mary Wortley-Montagu, Mrs. Siddons, Clive, Blackstone, Hurd were among those who sat to him. In 1768 he was elected one of the original 36 members of the Royal Academy; and he sent both landscapes and portraits to the annual exhibitions until 1783, when being dissatisfied with the position assigned to his portrait of the three princesses, he withdrew that and his other pictures. After his secession he arranged an exhibition in his own house, not successfully. He died on Aug. 2, 1788, and was buried at Kew. The Royal Academy possesses a fine example of a self portrait of the artist and the National Gallery has a good likeness of him by Zoffany.

Sir Joshua Reynolds made a true prophecy when he said, soon after Gainsborough's death, "Should England ever become so fruitful in talent that we can venture to speak of an English school, then will Gainsborough's name be handed down to posterity as one of the first." What distinguished him from Reynolds was his greater independence of the old masters. For while Reynolds had studied the classical art of Italy, Gainsborough in his rural seclusion had developed mainly by the study of nature, although in his earlier days he made a practice of copying works by Vandyck, Rembrandt, Wynants, Velasquez and Murillo. Perhaps his art was most akin to that of Watteau. Gainsborough began his landscape painting under Dutch influences. His early landscapes, painted in Suffolk, were executed with laborious Dutch minuteness. The spirit of Wynants is evident in the landscape at the National Gallery of Ireland. The "Cornard Wood" (c. 1753) in the National Gallery, London, and the "Sunset" in the

Tate Gallery show Dutch influence. During his stay in Bath he experienced the impact of Rubens and of Vandyck and he achieved the romantic beauty of such works as "the Watering Place" (c. 1775) in the Tate gallery; "the Cottage Door" (c. 1777) in the collection of the duke of Westminster; "the Market Cart" and "the Bridge" (1777) in the National Gallery. The landscapes which Gainsborough painted at Bath, with their low brown tones and rich impasto, are his finest. He was among the first English artists who represented the scenery of their own native land, thus breaking with the tradition followed by his predecessors and contemporaries, of painting imaginary Italian scenery in the style of Claude le Lorrain.

After his move to London, Gainsborough's landscapes were mostly painted from memory, his style became somewhat conventional and the trees were generalized into masses of feathery greenery. The artist is said to have admitted to George III. that he preferred landscape painting to portraiture and he complained that he was compelled to earn his living by painting portraits as he could not sell his landscapes. On his first visit to Gainsborough at Ipswich Thicknesse criticized his early portraits ("Admiral Vernon," painted c. 1749, in the National Portrait Gallery, and "the Painter's Two Daughters," in the National Gallery in London) as being stiffly painted; but he was charmed with his little landscapes and drawings for "these were works of fancy and gave him infinite delight." To the artist's mature period in Bath belong: "Sir Charles Holte," Birmingham Art gallery; "the duke of Northumberland," Dublin gallery; "Mrs. Sheridan" and "Mrs. Tickell," Dulwich gallery; "Garrick," Christ Church, Oxford; the "Blue Boy" (Master Buttall), now in the Huntington collection in California, and "the Hon. Mrs. Graham," National gallery, Edinburgh. The following are representative of his later period when he had reached perfect freedom in execution:—"The earl and the countess of Spencer" and the "Duchess of Devonshire," at Althorp; "Mrs. Siddons," "Dr. Ralph Schomberg," "the Baillie Family" in the National Gallery; "the Morning Walk," "Mrs. Sheridan," in the collection of Lord Rothschild; "the Pink Boy," with Baron Ferd. de Rothschild; "the Mall," "the Miss Linleys" at Dulwich; "Orpin, the Parish Clerk," in the Tate Gallery.

Gainsborough's portraits are painted in clear and transparent tone, in a colour scheme where blue and green predominate, with the same fluttering touch which he had acquired in sketching trees and skies. He often placed his figures against a landscape background which harmonized with the sentiment animating the sitter. He may indeed fairly be accounted as a forerunner of Impressionism although he was ignorant of the scientific theories and analytic qualities which inspired that movement. His work is the expression of a poet and musician.

Gainsborough painted some 500 pictures; he etched some 18 plates, three in aquatint; there is a representative collection of his drawings at the British Museum. Important exhibitions of his works were held at the Gallery of the British Institution in 1814 and at the Grosvenor gallery in 1885. His portrait of "Elizabeth, duchess of Devonshire" was mysteriously stolen in London in 1876, immediately after it had been purchased by Messrs. Agnew. The picture was taken to New York and to Chicago, and in April 1901 it was traced by American detectives working for Messrs. Agnew; it was then sold to J. Pierpont Morgan, Sr.

See P. Thicknesse, *Sketch of the Life and Paintings of Thomas Gainsborough* (1788), and *Memoirs and Anecdotes* (1788-91); J. Reynolds, *Discourses*; A. Cunningham, *Lives of the most eminent British Painters* (1829); T. W. Fulcher, *Life of T. Gainsborough* (1850); G. W. Brock-Arnold, *Thomas Gainsborough* (1889); Sir M. Conway, *Artistic Development of Reynolds and Gainsborough* (1886); Sir W. Armstrong, *T. Gainsborough* (1898 and 1904); Mrs. Arthur Bell, *T. Gainsborough* (1902); Lord R. Gower, *T. Gainsborough* (1903), and *Drawings of Gainsborough* (1906); also the works by G. Pauli in Germany (1904 and 1909); by J. Greig (1909); and W. T. Whitley (1915).

GAINSBOROUGH, market town, Lincolnshire, England; on the right (E.) bank of the Trent. Pop. of urban district (1931) 18,684. It is served by the L.N.E.R., by which it is 16 m. N.W. of Lincoln. Gainsborough (*Gegnesburh*) was probably inhabited by the Saxons on account of the fishing in the Trent. The *Saxon Chronicle* states that in 1013 the Danish king Sweyn

landed here and subjugated the inhabitants. Gainsborough was probably a borough by prescription, for mention is made of burghal tenure in 1280. Mention is made in 1204 of a Wednesday market, but there is no extant grant before 1258, when Henry III. granted a Tuesday market to William de Valence, earl of Pembroke, who also obtained from Edward I. in 1291 licence for an annual fair on All Saints' Day, and the seven preceding and eight following days. In 1243 Henry III. granted to John Talbot licence for a yearly fair on the eve, day and morrow of St. James the Apostle. Queen Elizabeth in 1592 granted to Thomas Lord Burgh two fairs, to begin on Easter Monday and on Oct. 9, each lasting three days. Charles I. in 1635-36 extended the duration of each to nine days. The Tuesday market is still held, and the fair days are Tuesday and Wednesday in Easter-week, and the Tuesday and Wednesday after Oct. 20. The parish church of All Saints is classic of the 18th century, excepting the Perpendicular tower. The Old Hall, of the 15th century, enlarged in the 16th, forms three sides of a quadrangle, partially timber-framed, but having a beautiful oriel window and other parts of stone. There is also a Tudor tower of brick. Gainsborough possesses a grammar school (founded in 1589 by a charter of Queen Elizabeth). There is a large carrying trade by water on the Trent and neighbouring canals. Shipbuilding and iron-founding are carried on; also manufactures of linseed cake, and agricultural machinery.

GAIRDNER, JAMES (1828-1912), English historian, son of John Gairdner, M.D., was born in Edinburgh on March 22, 1828. Educated in his native city, he entered the Public Record Office in London in 1846, becoming assistant keeper of the public records (1859-93). He died at Pinner, Middlesex, on Nov. 4, 1912. Gairdner's valuable contributions to English history relate chiefly to the reigns of Richard III., Henry VII. and Henry VIII. For the "Rolls Series" he edited *Letters and Papers illustrative of the Reigns of Richard III. and Henry VII.* (1861-63), and *Memoirs of Henry VII.* (1858); and he succeeded J. S. Brewer in editing the *Letters and Papers*, foreign and domestic, of the reign of Henry VIII. (1862-1910), being responsible for the volumes issued between 1880 and 1910. He edited the *Paston Letters* (1872-75, and again 1896). His other works include monographs on *Richard III.* (1878, new and enlarged edition, 1898), and on *Henry VII.* (1889, and subsequently); *The Houses of Lancaster and York* (1874, and other editions); *The English Church in the 16th century* (1902); *Lollardy and the Reformation in England* (4 vols., 1908-13), completed by J. W. Hunt.

See obituary notice of Gairdner in the *Times* for Nov. 6, 1912; also J. W. Hunt's preface to Gairdner's *Lollardy and the Reformation in England* (1908).

GAIRDNER LAKE: see AUSTRALIA.

GAIRLOCH, see loch, village and parish in the west of the county of Ross and Cromarty, Scotland. Pop. of parish (1931) 2,380. The parish covers a large district on the coast, and stretches inland beyond the farther banks of Loch Maree, the whole of which lies within its bounds. It also includes the islands of Dry and Horisdale in the loch, and Ewe in Loch Ewe. Formerly an appanage of the earldom of Ross, Gairloch has belonged to the Mackenzies since the end of the 15th century.

GAISERIC or **GENSERIC** (c. 390-477), king of the Vandals, son of King Godegisel (d. 406) and king on the death of his brother Gonderic in 428. In 428 or 429 he led a host of Vandals from Spain into Roman Africa, and took Mauretania, and later Hippo. Having pillaged and conquered almost the whole of Roman Africa, the Vandal king concluded a treaty with the emperor Valentinian III. in 435, by which he retained his conquests. This peace was broken, and in Oct. 439 he captured Carthage, which he made the capital of his kingdom. In 455 he plundered Rome and returned to Africa laden with spoil. Among his captives was the empress Eudoxia, who is said to have invited the Vandals into Italy. The Romans made two unsuccessful attempts to avenge themselves, one by the Western emperor, Majorianus, in 460, and the other by the Eastern emperor, Leo I., eight years later. Gaiseric brought Sicily, Sardinia, Corsica and the Balearic Islands under his rule, and even extended his conquests into Thrace, Egypt and Asia Minor. Having made peace

with the Eastern emperor Zeno in 476, he died on Jan. 25, 477. Gaiseric was a cruel and cunning man, possessing great military talents and superior mental gifts. Though the effect of his victories was afterwards neutralized by the successes of Belisarius, his name long remained the glory of the Vandals. (See VANDALS.)

GAIUS, a celebrated Roman jurist. Of his personal history very little is known. It is impossible to discover even his full name, Gaius or Caius being merely the personal name (*praenomen*) so common in Rome. His works were composed between the years 130 and 180, at the time when the Roman empire was most prosperous, and its government the best. Most probably Gaius lived in some provincial town, and hence we find no contemporary notices of his life or works. After his death, however, his writings were recognized as authoritative, and the emperor Valentinian named him, along with Papinian, Ulpian, Modestinus and Paulus, as one of the five jurists whose opinions were to be followed by judicial officers in deciding cases. The works of these jurists accordingly became most important sources of Roman law.

Besides the *Institutes*, which are a complete exposition of the elements of Roman law, Gaius was the author of a treatise on the *Edicts of the Magistrates*, of *Commentaries on the Twelve Tables*, and on the important *Lex Papia Poppaea*, and several other works. His interest in the antiquities of Roman law makes his work valuable to the historian of early institutions. In the disputes between the two schools of Roman jurists he generally attached himself to that of the Sabinians, who were said to be followers of Ateius Capito, of whose life we have some account in the *Annals* of Tacitus, and to advocate a strict adherence as far as possible to ancient rules, and to resist innovation. Many quotations from the works of Gaius occur in the *Digest* of Justinian, and so acquired a permanent place in the system of Roman law; while a comparison of the *Institutes* of Justinian with those of Gaius shows that the whole method and arrangement of the later work were copied from that of the earlier, and very numerous passages are word for word the same.

Unfortunately the work was lost to modern scholars, until, in 1816, a manuscript was discovered by B. G. Niebuhr in the chapter library of Verona, in which certain of the works of St. Jerome were written over some earlier writings, which proved to be the lost work of Gaius. The greater part of the palimpsest has, however, been deciphered and the text is now fairly complete. This discovery elucidated portions of the history of Roman law which had previously been obscure.

The *Institutes* of Gaius are divided into four books—the first treating of persons and the differences of the status they may occupy in the eye of the law; the second of things, and the modes in which rights over them may be acquired, including the law relating to wills; the third of intestate succession and of obligations; the fourth of actions and their forms.

There are several carefully prepared editions of the *Institutes*, starting from that of Göschen (1820), down to that of Studemund and Krüger (1900). The most complete English edition is that of E. Poste, which includes beside the text an English translation and copious commentary (1885). A comparison of the early forms of actions mentioned by Gaius with those used by other primitive societies will be found in Sir H. Maine's *Early Institutions* (1875) cap. 9. For further information see ROMAN LAW.

GAIUS: see CALIGULA.

GALAGO, the name of the long-tailed African lemur-like Primates (*q.v.*); classed with the lorises and pottos in the *Lorissiformes*. They are characterized by the great elongation of the upper portion of the feet (tarsus) and the power of folding the large ears. They pass the day in sleep, but are active at night, feeding on fruits, insects and small birds. When they descend to the ground they sit upright, and move about by jumping with their hindlegs like jerboas. They are pretty little animals, varying from the size of a small cat to less than that of a rat, with large eyes and ears, soft woolly fur, and long tails. There are

several species, of which *G. crassicaudatus* from Mozambique is the largest.

GALANGAL, formerly written "galingale," and sometimes "garingal," *rhizoma galanga*, a drug, now obsolete, tasting like mingled ginger and pepper. Lesser galangal root, the galangal of commerce, is the dried rhizome of *Alpinia officinarum*, a plant of the natural family Zingiberaceae, growing in the Chinese island of Hainan, where it is cultivated, and closely allied to *Alpinia calcarata*, the rhizome of which is sold in the bazaars of some parts of India as a sort of galangal. Its stems are about 4 ft. long and its light-green leaves are slender, lanceolate and pungent; the flowers are white with red veins and in simple racemes; the roots form dense masses, sometimes more than a foot in diameter; and the rhizomes grow horizontally, and are $\frac{3}{4}$ in. in thickness.

GALÁPAGOS ISLANDS, an archipelago in the Pacific, consisting of 12 large and several hundred small islands on the equator, 500 m. due W. of Ecuador, to which country they belong. They were discovered by the Spaniards early in the 16th century, but only three islands have ever been utilized; these chiefly as convict stations. At various times they have been visited by British ships of war, New England whalers, pirates, buccaneers and numerous scientific expeditions. Charles Darwin, when on the voyage of the *Beagle*, obtained from the insular forms of Galápagos finches valuable data for his "Origin of Species." The English names of the major islands are Albemarle, Indefatigable, James, Narborough, Charles, Chatham, Hood, Barrington, Duncan, Tower, Bindelow and Abington. Albemarle is irregular in shape but most of the others are roughly circular, with a single high crater in the centre. Albemarle is the largest, 75 m. in length, and in 1925 broke into eruption. Since then the craters of Narborough have been active. The shores of the islands are low, while in the interior, craters may rise to an extreme height of 5,000 feet. The coast shows an alternation of dense mangroves, beaches of white sand and rugged cliffs of grey lava. Very little rain falls near the sea, where the vegetation is semi-desert, chiefly cactus and thorn-trees. The luxuriance increases on the uplands where the moisture becomes more general. The Antarctic Humboldt current keeps the temperature of the surrounding water well below equatorial average.

The name is derived from the Spanish *galápagos*, a tortoise, and refers to the giant forms which have evolved on the islands. Some of these have reached a length of 4 ft. or more, weighing nearly 400 lb., and individuals perhaps attain an age of 300 to 400 years, making them the oldest living animals on the earth. In past years almost every island had its peculiar species of tortoise, but they are now on the verge of extinction. This has been due to the carrying away of thousands, by whalers, for food, to the slaughter of great numbers for their oil and the wholesale devouring of eggs and young by wild dogs and pigs. A remarkable fact about the Galápagos fauna is the large proportion of forms peculiar to the islands, namely, 37% of all the species of shore fish, 40% of the plants and 96% of the reptiles. But the amount of zoological work remaining to be done is indicated by a collection of moths brought back by one of the most recent expeditions, of which half of the 52 species were new to science.

The virtual absence of mankind since the times of the buccaneers has resulted in a remarkable absence of fear on the part of all forms of native animal life. In fact the only really wild creatures are the dogs, cats, pigs, goats and donkeys which have been wrecked or intentionally left on the islands in past years. The sea-lions, which are abundant and astonishingly tame, are of southern derivation, doubtless via the Humboldt current. Besides small lizards and snakes there are two large iguana-like lizards, one marine and feeding on algae, and both showing many primitive characters. Fifteen species of giant tortoises formerly inhabited the islands and 85 kinds of birds have been recorded. Of special interest are the flamingos which breed on James island, and the flightless cormorants with diminutive wings which are found only near Albemarle; but it is doubtful if there are more than half a hundred of these adult cormorants left in existence to-day. The small black finches exhibit amazing variation, some having bills heavier and thicker than a grosbeak's, while in others

the mandibles are as slender as those of a warbler.

The dominant theory of the formation of these islands, first sponsored by Darwin, is that they have always been isolated both from one another and from the mainland, the gradual stocking being by accidental arrivals. Important evidence is accumulating, however, that at one time the submerged plateau which connects the archipelago with Central America was dry land. For instance, except for the penguins (which even to-day could easily swim from Peru along the Antarctic Humboldt current) every species of native bird shows closer relations with Central than with South America, and much the same is true of other groups such as the shore fish and land plants, while the nearest relations of the giant tortoises are found fossil in Cuba. If the stocking of the Galápagos with living creatures had been by adventitious arrivals, they could only have come by the southern current which turns westward at the latitude of Peru. There seems little doubt that the archipelago was at one time a single island. Furthermore, the presence of five forms of tortoises on Albemarle hints that formerly this island was more deeply submerged, so that only its five major craters were above water. The results of the many scientific expeditions which have visited the islands are indicated in the accompanying selected bibliography. The most recent are those sent out by the New York Zoological Society, two under the direction of William Beebe and the last under C. H. Townsend. The latter was successful in bringing back over 200 tortoises from Albemarle for distribution to various favourable situations, where efforts will be made to breed them and save the race from extinction.

GALASHIELS, municipal burgh and parish, Selkirkshire, Scotland. Pop. (1931) 13,102. It is on Gala Water, within a short distance of its junction with the Tweed, 33½ m. S.S.E. of Edinburgh by the L.N.E.R. The town stretches for more than 2 m. along both banks of the river, the mills and factories occupying the valley by the stream, the better houses the higher ground on either side. The town is under a provost, bailies and council. The woollen manufactures, dating from the close of the 16th century, are important, though now mainly confined to the weaving of tweeds. Other industries are hosiery manufacture and tanning. Galashiels was originally a village built for accommodation of pilgrims to Melrose abbey (4 m. E. by S.), and was created into a burgh of barony in 1599. The Catrail or Picts' Work begins near the town and passes immediately to the west. Clovenfords, 3½ m. W., is noted for the large Tweed vineries. Two miles farther W. by S. is Ashiestiel, where Sir Walter Scott resided from 1804 to 1812, wrote his most famous poems, and began *Waverley*.

GALATIA. I. In the strict sense this is the name applied to a large inland district of Asia Minor occupied by Gaulish tribes in the 3rd century B.C. It was bounded on the north by Bithynia and Paphlagonia, west by Phrygia, south by Lycaonia and Cappadocia, east by Pontus.

Galatia is part of the great central plateau of Asia Minor, here ranging from 2,000 to 3,000 ft. above sea-level, and falls geographically into two parts separated by the Halys (*Kizil Irmak*), a small eastern district lying chiefly in the basin of the Delije Irmak, the principal affluent of the Halys, and a large western region drained by the Sangarius (Sakaria) and its tributaries. On the north side Galatia consists of a series of plains with

fairly fertile soil, lying between bare hills. But the greater part is a stretch of barren, undulating uplands, intersected by tiny streams and passing gradually into the vast level waste of treeless plain that runs south to Lycaonia; these uplands are little cultivated but afford pasturage for large flocks of sheep and goats.

The Gaulish invaders appeared in Asia Minor in 278-277 B.C. They numbered 20,000 of which only one-half were fighting men; not long after their arrival we find them divided into three tribes, Trocmi, Tolistoboi and Tectosages. They had split off from the army which invaded Greece under Brennus in 279 B.C., and crossed over to Asia at the invitation of Nicomedes I. of Bithynia, who required help in his struggle against his brother. For about 46 years they were the scourge of the western half of Asia Minor, ravaging the country without any serious check, until Attalus I., king of Pergamum, inflicted several severe defeats upon them, and about 232 B.C. forced them to settle permanently in the region to which they gave their name. In the settlement of 64 B.C. Galatia became a client-state of the Roman empire, and three chiefs were appointed, one for each tribe. But this arrangement soon gave way before the ambition of the chief Deiotarus (q.v.), the contemporary of Cicero and Caesar, who was recognized by the Romans as king of Galatia. On the death of the third king, Amyntas, in 25 B.C., Galatia was incorporated by Augustus in the Roman empire, and few of the provinces were more enthusiastically loyal.

The population of Galatia was not entirely Gallic. Before the arrival of the Gauls, western Galatia up to the Halys was inhabited by Phrygians, and eastern Galatia by Cappadocians and other native races. This native population remained, and constituted the majority of the inhabitants of the rural parts and almost the sole inhabitants of the towns. They were left in possession of two-thirds of the land (Caesar, *B.G.* i. 31) on condition of paying part of the produce to their new lords, and agriculture and commerce with all the arts and crafts remained in their hands. They ranked as "Galatians" equally with their overlords, and it was from their numbers that the "Galatian" slaves were drawn. The conquerors, who were few in number, formed a small military aristocracy, living not in the towns, but in fortified villages, where the chiefs in their castles kept up a barbaric state, surrounded by their tribesmen. With the decline of their warlike vigour they began gradually to mix with the natives and to adopt their religion: the amalgamation was accelerated under Roman influence and ultimately became complete; but they gave to the mixed race a distinctive tone and spirit, and long retained their national characteristics and social customs, as well as their language (which continued in use, side by side with Greek, in the 4th century A.D.). In the 1st century, when St. Paul made his missionary journeys, even the towns Ancyra (mod. Angora), Pessinus and Tavium (where Gauls were few) were not hellenized; while the rural population was unaffected by Greek civilization. Hellenic ways and modes of thought begin to appear in the towns only in the later 2nd century. In the rustic parts a knowledge of Greek begins to spread in the 3rd century; but only in the 4th and 5th centuries, after the transference of the centre of government to Constantinople placed Galatia on the highway of imperial communication, was Hellenism in its Christian form gradually diffused over the country. (See also ANCYRA; PESSINUS; GORDIUM.)

II. The Roman province of Galatia, constituted 25 B.C., included the greater part of the country ruled by Amyntas, viz., Galatia Proper, part of Phrygia towards Pisidia (Apollonia, Antioch and Iconium), Pisidia, part of Lycaonia (including Lystra and Derbe) and Isauria. For nearly 100 years it was the frontier province, and the changes in its boundaries are an epitome of the Roman advance to the Euphrates. Under Diocletian's reorganization Galatia was divided, about 295, into two parts, and the name retained for the northern. After suffering from Persian and Arabic raids, Galatia was conquered by the Seljuk Turks in the 11th century and passed to the Ottoman Turks in the middle of the 14th.

GALATIANS, EPISTLE TO THE, one of the New Testament books. "The churches of Galatia," to whom this vigorous letter is written, had been founded by the apostle Paul himself. On this mission he had been broken down by illness (iv. 13), but his preaching had proved effective, he had been enthusiastically received by the natives, and the result had been an enthusiastic start of Christianity in the local communities. "You did run well" (v. 7), he confesses. But something happened to damp the initial ardour. This appears to have been not only inner discord but a tendency towards 'legalism' on the part of the members. Hence, on a second visit, the apostle had to speak firmly and frankly. In some quarters this appears to have given offence, but it was not ineffective. The departure from the apostle's teaching had not gone very far as yet. It was only later that he heard of the danger of a relapse, owing to the influence of some agitators, who persuaded the Galatians that the apostle was not really authorised, that his gospel required to be supplemented by closer adherence to the Jewish code, that ritual and even circumcision were needful to a full Christian life, as the primitive and original apostles taught. In other words, the Galatians were induced to believe that the sole valid charter to privileges in the Messianic order of Christ lay in observance of the Jewish law, which remained obligatory upon all converts, even on those who came over from paganism (iii. 6-9, 16, vi. 12-16, i. 6-9). These intruders belonged to the Jewish Christian party in the primitive Church; they feared deeply that the ethical interests of the Church would be compromised if the Jewish law were dropped, and also their sympathies were with the party of James, as reflected in the story of Acts xv. Apparently they were headed by some leading individual (v. 10), who unsettled the minds of the Galatian Christians. The news of this defection took Paul by surprise. Unable for some reason to revisit the churches, he sent them this sharp and searching remonstrance. Things had not yet gone too far; only a few had been circumcised; their founder considered that it was still possible to arrest the downward course, to counteract the intrigues of his opponents, and to recall the Galatians to the true principles of Christianity as he had inculcated them on his original visit. Such was the occasion which called forth this pungent letter.

The address is unusually bare—"to the churches of Galatia"—, and Paul does not associate anyone with himself. Even the "we" in i. 8, 9 is the singular reference to himself. Whoever may have been with him on the original mission, he concentrates attention on his own personal character and credentials, since it had been on these that his opponents had turned their fire, in the hope of discrediting his influence. There is no word of commendation, as is frequent in his other epistles; he plunges into (i. 6-ii. 21) personal vindication of his apostolic independence and authority. Indeed here, as at the close (vi. 17), the apostle "stands before us like an ancient general who bares his breast before his mutinous legions, and shows them the scars of the wounds that proclaim him not unworthy to be called Imperator" (Hausrath's *History of New Testament Times*, iii., 181f). The vindication is developed negatively and positively, to meet the charges brought by his critics. He traces back his apostolate to the direct revelation by which he had been converted (i. 15f), shows how he was no upstart eccentric but in line with the twelve apostles, whom he had consulted, and from whom he had received a full recognition of his vocation. Indeed, he describes how (ii. 11f) he had once to recall Peter himself to the true line of the gospel. So far from Peter being set up as the standard by which Paul was to be measured—an argument evidently used by his opponents—the rock-apostle had at Antioch to be reproved by Paul for failing to adhere to the right position.

Such is the first of the three parts of the letter. The closing monologue on the incompatibility of the Mosaic law with the Christian gospel (ii. 15-21) starts him on the second phase of

his argument (iii. 1-v. 12), *i.e.*, on the alternatives of Faith and Law. Personal allusions still recur, for he is writing a letter, not an abstract treatise; but the main current of thought flows along exposition of the inherent vitality of faith, faith being described as the dominating principle which, implicit already in Abraham, has come to flower under the Spirit of Christ, with an ethical authority of its own. The much-vaunted Law is shown to have been a provisional episode; the real purpose of God culminates in the gospel of Christ as a message of filial confidence and freedom (iii. 29f). His opponents claimed that only Christians who became circumcised were really sons of Abraham; Paul insists that believers are sons of Abraham by their faith, not by any obedience to the Law, which came after Abraham. A passionate outburst then follows, in which, employing some rabbinic methods of exegesis, he seeks to establish the absolute supremacy of spiritual Christianity over legalism as the religion of faith and freedom, applying this to the situation of the Galatians themselves.

The third part of the letter (v. 13f) is a description of the moral responsibilities of this faith, in order to remove any misconceptions.

THE EPILOGUE

The epilogue (vi. 11f) consists of a number of abrupt, emphatic sentences, which reiterate the message of the letter. This epilogue is written in his own hand-writing. The Authorised English version renders the verse, "Ye see how large a letter I have written to you with mine own hand," as though Paul meant the entire letter. But the aorist is epistolary, at the close of a letter, and means what now follows. Taking the pen from his amanuensis, he dictates the paragraph, as in 1 Corinthians, xvi. 21-24. "See what big letters I make, when I write to you in my own hand" (ver. 11). Evidently the Galatians were intended to see the autograph, and to contrast the writing of the secretary, to whom he had been up till now dictating, and his own calligraphy; "the handwriting of the amanuensis was probably cursive, and the autograph signature of St. Paul the stiff, heavy uncials of a manual labourer" (Deissmann, *Light from the Ancient East*, 1927, p. 174). Some have taken this allusion as referring to the whole of the letter (so Chrysostom and Augustine, for example), but with Jerome we are safe in believing that it refers to the closing paragraph alone, and that he wrote these words for the sake of emphasis. An autograph conclusion to an ancient letter was not uncommon, sometimes for the sake of assuring the recipients that the letter was genuine. This may be the case in 2 Thessalonians iii. 17-18. Here it is less likely. Nor is it probable that the apostle inserted this postscript in his own handwriting because he felt an ironical playfulness at the end, wishing to make the Galatians realise that, after the sterner notes of the earlier chapters, he was now prepared to treat them as children, "playfully hinting that surely the large letters will touch their hearts" (Deissmann, *Bible Studies*, pp. 346f). The tone of the counsels is too urgent for this interpretation.

The identification of these "churches of Galatia" depends largely on the view taken of the two passages in Acts where Galatia is mentioned. In xvi. 6 Paul, Silas and Timotheus "went through Phrygia and the region of Galatia"; in xviii. 23 Paul goes from Antioch on a tour "right through the country of Galatia and Phrygia, strengthening the disciples." As in the former passage we learn next that the missionaries were attempting to enter Bithynia, it is natural to suppose that by Galatia is meant the northern district south of Bithynia and east of Mysia, where the inhabitants were ethnologically Galatians. These would be the two visits mentioned in the epistle. The inhabitants of the southern part of the province were Galatians only politically; their leading towns were Antioch, Iconium, Lystra, and Derbe. Critics who demur to the apostle evangelising so distant a territory as North Galatia prefer to make the letter written to the South Galatians, in which case, of course, it may be earlier than on the North Galatian theory, for the visit mentioned in xviii. 23 would be subsequent to the composition of the letter. The problem raised by this difficulty involves not only geographical problems but the whole question of the identity of the incidents described in Gal. ii.

1-10 with Acts xi. 28f or xv. These intricate data will be found discussed, in favour of the North Galatian theory, by Schmiedel in the *Encyclopaedia Biblica* (1592-1616), and by Sir William Ramsay in Hastings's *Dictionary of the Bible* (ii. 81f) on the other side, as well as by modern editors like Rendall and Burton. A succinct statement of both sides is given by G. W. Wade in *New Testament History* (1922, pp. 264-273). The present writer sees no reason to depart from the position he advocated in his *Introduction to the N.T. Literature* (3rd ed., 1918, pp. 83-107), viz., that the letter was intended for the Christian churches of north Galatia, that Gal. ii. 1-10 and Acts xv. are descriptions of the same crisis, and that the letter was written sometime after the date mentioned in Acts xviii. 23, perhaps from Ephesus (Acts xix. 1-10), when he was on the point of starting for Corinth, or even from Greece, *i.e.*, from Corinth. The situation presupposed on this view is as follows. After the settlement at the Council of Jerusalem (Acts xv.), which involved a temporary check to the conservative party of Jewish Christians, they revived their energies not only at Antioch (Gal. ii. 12f) but further afield; they adroitly carried their countermission into districts where people were less well acquainted with what had transpired at Jerusalem and Antioch. The disturbance in the Galatian churches was therefore a recrudescence of the earlier movement against Gentile Christianity as Paul preached it, and these reactionaries took advantage of his absence in order to undermine his authority, the burning question being as at Jerusalem the question of circumcision, which carried with it an acknowledgement of the validity of the Law for all Christians. It is now recognised that north Galatia, though remote, did not lie off the natural route of the apostle, that the country was not void of sufficient education to enable the natives to understand what he wrote, *e.g.*, on Roman law, and that, so far as our knowledge goes, the allusions to Greek customs would have been as intelligible to northern Galatians as to southern.

The authenticity of the letter is beyond reasonable doubt; it is a mere curiosity of criticism that during last century some disputed its authorship, or even attempted to disentangle a genuine nucleus from later additions. Traces of it soon occur in the second century literature of the Church, from Justin Martyr and Marcion onwards. Marcion indeed seems to have put it first among the Pauline letters, but this was due to its importance as an anti-Jewish document, not to any independent knowledge of its chronological position in the apostle's life. The early Church naturally valued it chiefly as an apostolic religious document, which powerfully stated the essentials of the faith. Such was indeed the reason why it appealed to Luther in a later age. Modern scholars have done justice to its revelation of the personality of Paul himself in his rush and eagerness of feeling, in his concern for his churches, and in his eagerness to defend his own character, since opponents were striking at his converts through that. At several points, notably at this, it is right with Jowett to observe the resemblance between Galatians and Second Corinthians. "In both there is the same sensitiveness in the Apostle to the behaviour of his converts to himself, the same earnestness about the points of difference, the same remembrance of his own 'infirmity' while he was yet with them, the same consciousness of the precarious basis on which his own authority rested in the existing state of the two Churches. Abruptness of style is characteristic of both; the excitement of feeling seems to clog the current of ideas." Only, the Galatian Christians had not vexed him by personal misconduct towards himself, as the Corinthians had. He was distressed by the religious lapse of the Galatians, not by their rudeness and insubordination. Hence Galatians is a letter of remonstrance on higher grounds than Second Corinthians. Unluckily in neither case do we know its effect.

BIBLIOGRAPHY.—The most adequate editions in English, based on the Greek text, are by C. J. Ellicott (4th edition, 1867), J. B. Lightfoot (11th edition, 1892), Alford (3rd edition, 1862), F. Rendall (in *Expositor's Greek Testament*, 1903), A. L. Williams (*Cambridge Greek Testament*, 1910), and Burton (*International Critical Commentary*, 1921), the last-named being the fullest and finest in the language. The following commentaries are based on the English text—Sanday (in Ellicott's *Commentary*, 1879), B. Jowett (3rd edition, 1894), and C. W. Emmet (London, 1912). Particular value attaches to the editions of Lightfoot and Jowett for their subsidiary

essays, whilst Sir W. M. Ramsay's *Historical Commentary on Galatians* (1899) throws a flood of light upon many archaeological items from the standpoint of the South Galatian hypothesis. The best French edition is by P. Lagrange (Paris, 2nd edition, 1926). In German the most up-to-date editions are those by R. A. Lipsius (*Hand-Commentar*, 1892), Sieffert (in Meyer, 1899), and Lietzmann (in his *NT Handbuch*, 1910), with Theodor Zahn's edition in his *Commentar* (2nd edition, 1907). Zahn and Lightfoot give useful summaries of the patristic work. The religious thought of the epistle is expounded lucidly by writers like C. Holsten (*das Evangelium Paulus*, Teil I. 1889), A. B. Bruce (*St. Paul's Conception of Christianity*, 1894, pp. 49-70), Professor G. G. Findlay (*Expositor's Bible*), W. M. MacGregor (*Christian Freedom*, 1914), and A. W. F. Blunt (edition in *Clarendon Bible*, 1925), W. S. Wood's *Studies in St. Paul's Epistle to the Galatians* (1887) criticizes Lightfoot, and the South Galatian hypothesis is presented ably by Douglass Round (*The Date of St. Paul's Epistle to the Galatians*, 1906) and by E. H. Askwith (*Epistle to the Galatians, its Date and Destination*, 1899). The general criticism of the epistle may be studied in works like those of Sabatier (*The Apostle Paul*, pp. 187ff), B. W. Bacon's *Story of St. Paul* (pp. 116f), and Kirsopp Lake's *The Earlier Epistles of St. Paul*, as well as in Lütgert's *Gesetz und Geist* (1919). See further under PAUL. (J. MOR.)

GALATZ, a city of Rumania, capital of the department of Covurlui; on the left bank of the river Danube, 90 m. W. by N. of its mouth at Sulina. Pop. (1928) 154,000, including many Jews. The Danube is joined by the Seret 3 m. S.W. of Galatz, and by the Pruth 10 m. E. Galatz is built on a slight eminence among the marshes which line the intervening shore and form, beside the western bank of the Pruth, the wide but shallow mere called Lake Bratych (*Brateşul*). It is the seat of the Rumanian III. Army Corps, the Rumanian naval school, the bishopric of the Lower Danube, a prefecture, and the international commission for the control of the Danube (*q.v.*), the main Danubian shipping companies, and 3 Chambers of Commerce. It contains a cathedral and many other churches; St. Mary's Church contains the tomb of Mazeppa. Galatz is connected by rail with Braila and Bucharest and the main Moldavian system. It has an important industry, manufacturing candles, wire, nails, soap, buttons and chemical products; it also possesses many saw-mills, paste-mills, flour-mills, roperies and petroleum refineries. It is the chief Rumanian port of entry for imports, and the chief port of export for timber, while in grain it comes second to Braila.

GALAXY, properly the MILKY WAY, from the Greek name γαλαξίας, *sc.* κύκλος, from γάλα, milk, *cf.* the Lat. *via lactea*. The word is more generally employed in its figurative or transferred sense, to describe a gathering of brilliant or distinguished persons or objects.

The Galactic Plane, or plane of the Milky Way, is frequently used as a reference plane in studies of the structure of the stellar system, since the distribution of the different classes of stars is found to be strongly related to it. The North Galactic Pole is approximately in R.A. 12^h 40^m, Dec. +28°. Positions are expressed in galactic latitude and longitude, the latter being reckoned from the ascending node of the galactic plane on the equator.

GALBA, SERVIUS SULPICIUS, Roman emperor (June A.D. 68 to Jan. 69), born near Terracina, on Dec. 24, 5 B.C. He came of a noble family and was a man of great wealth, but unconnected either by birth or by adoption with the first six Caesars. In his early years it is said that both Augustus and Tiberius prophesied his future eminence (Tacitus, *Annals*, vi. 20; Suetonius, *Galba*, 4). Praetor in 20, and consul in 33, he acquired a well-merited reputation in the provinces of Gaul, Germany, Africa and Spain. On the death of Caligula, he refused the invitation of his friends to make a bid for empire, and loyally served Claudius. For the first half of Nero's reign he lived in retirement, till, in 61, the emperor gave him the province of Hispania Tarraconensis. In the spring of 68 Galba was informed of Nero's intention to put him to death, and of the insurrection of Iulius Vindex in Gaul. He was at first inclined to follow the example of Vindex, but the defeat and suicide of the latter renewed his hesitation. When news came that Nero had been killed and the praetorians had declared for him, he marched to Rome. At first he was welcomed by the senate and the party of order, but he was never popular with the soldiers or the people. He incurred the hatred of the praetorians by scornfully refusing to pay them the reward

promised in his name, and disgusted the mob by his meanness and dislike of display. Otho's successful conspiracy followed. Galba was murdered by some cavalry near the Lacus Curtius. Tacitus rightly says that all would have pronounced him worthy of empire if he had never been emperor ("*omnium consensu capax imperii nisi imperasset*").

See his life by Plutarch and Suetonius; Tacitus, *Histories*, i. 7-49; Dio Cassius lxi. 23-lxiv. 6; B. W. Henderson, *Civil War and Rebellion in the Roman Empire, A.D. 69-70* (1908); W. A. Spooner, *On the Characters of Galba, Otho and Vitellius* in *Introduct.* to his edition (1891) of the *Histories* of Tacitus.

GALBANUM, a gum-resin, the product of *Ferula galbaniflua*, indigenous to Persia. It occurs usually in irregular, more or less translucent and shining lumps, or occasionally in separate tears, of a light-brown, yellowish or greenish-yellow colour, and has a bitter taste, a musky odour, and a specific gravity of 1.212. It contains about 8% of terpene, 65% of a resin which contains sulphur, 20% of gum; and a very small quantity of the colourless crystalline substance *umbelliferone*, C₈H₆O₃. Galbanum is one of the oldest of drugs. In Exodus xxx. 34 it is mentioned as a sweet spice. Hippocrates employed it in medicine, and Pliny (Nat. Hist., xxiv. 13) ascribes to it extraordinary curative powers. Its use in medicine is obsolescent.

GALBULIDAE: see JACAMAR.

GALE, ZONA (1874-), American author, was born at Portage, Wis., on Aug. 26, 1874. After her graduation from the University of Wisconsin, she did newspaper work in Milwaukee, and in 1901 joined the staff of the *New York World*. After 1904 she gave her full time to writing, publishing among other books *The Loves of Pelleas and Etarre* (1907), *Friendship Village* (1908), *Birth* (1918), *Miss Lulu Bett* (1920), *The Secret Way*, verse (1921), *Faint Perfume* (1923), *Preface to a Life* (1926). The publication of *Miss Lulu Bett* first directed interest to her as a promising novelist of the new realistic school, and she was awarded a Pulitzer prize for her play, *Miss Lulu Bett*, dramatized from the book, and produced in New York in 1920.

GALE. 1. A wind of considerable power, appreciably stronger than a breeze, but not severe enough to be called a storm. In nautical language it is usually combined with some qualifying word, as "half a gale," a "stiff gale." In poetical and figurative language "gale" is often used in a pleasant sense, as in "favouring gale"; in America, it is used in a slang sense for boisterous or excited behaviour.

2. The payment of rent, customs or duty at regular intervals; a "hanging gale" is an arrear of rent left over after each successive "gale" or rent day. The term survives in the Forest of Dean, for leases granted to the "free miners" of the forest.

3. The popular name of a plant, *Myrica Gale*, also known as the sweet gale or gaul, sweet willow, bog or Dutch myrtle.

GALEN (c. A.D. 130-c. 200), 1 Greek physician, was born in Pergamum (*q.v.*), the capital of Mysia in Asia Minor, a city renowned for its magnificent library, the creation of the Attalid Kings. He is sometimes wrongly spoken of as Claudius Galen, but the cognomen Claudius has no authenticity and is a result of a misunderstanding on the part of Renaissance scholars. From his earliest years Galen was familiar with the Platonic, Peripatetic, Stoic and Epicurean schools of thought. He began the study of medicine in 146, and two years later went to Smyrna to attend the lectures of Pelops, a celebrated physician. In search of knowledge he roamed through Greece, Cilicia, Phoenicia, Palestine, Crete, Cyprus and finally visited the famous medical school at Alexandria (*q.v.*). Settling at Rome in 164, Galen became acquainted with some of the highest officers of the state, among them the consul Boethus, Severus the future emperor, and the uncle of Lucius. Many of these eminent people attended his lectures and demonstrations. Galen used an unsparing pen against medical sects, the methodists, dogmatists, pneumatists and empirics, then flourishing in Rome, and thus provoked the hostility of his professional brethren. He belonged to no particular school, though in philosophy he favoured Aristotelianism. Later he left Rome for Pergamum, but was recalled by the emperor Marcus Aurelius (*q.v.*) for service in the Germanic wars. This he managed to evade, returning to Rome to look after the health of the

youthful Commodus, heir of Marcus Aurelius. Little is known of the rest of his life. Apparently he was in Rome during the fire of 191, when many of his works were burnt, and he was still lecturing in the reign of Pertinax. He probably died in Sicily in A.D. 200.

Galen was the author of some 500 treatises written in clear Attic Greek. In his *De Libris propriis* he mentions 124 purely philosophical treatises, which include commentaries on the *Categories* and *Analytics* of Aristotle, and on the *Timaeus* and *Philebus* of Plato. He wrote five treatises on Ancient Comedy which are lost. Only an insignificant fraction remains of his non-medical works. Of the surviving medical works 98 are held to be genuine, 19 doubtful, 45 spurious, and 19 are merely fragments. (H. Choulant, *Bücherkunde für die Aeltere Medizin*, 1841, pp. 100-112.)

Galen may be regarded as the founder of experimental physiology, and after Hippocrates, as the most distinguished physician of antiquity. To Hippocrates he acknowledges his deep obligations in practical medicine, and he is equally frank about his indebtedness to the Alexandrian anatomists.

Researches in Anatomy.—Galen's anatomical investigations were unrivalled in antiquity for their fullness and accuracy. He was an indefatigable dissector, describing mainly what he actually saw. He dissected apes and lower animals, though much that is relevant to the human body is incorporated in his works. As a specimen of his accuracy it may be mentioned that he recognised the lacteal vessels, and described the ducts of the lingual and submaxillary glands, though of their function he was unaware. Many structures, by which the names of 16th and 17th century anatomists eponymously linger, were observed by Galen, e.g., the aqueduct of Sylvius and the *foramen ovale* known as le trou Botal. The mode of closure of the latter Galen describes in language hardly since excelled.

Researches in Physiology.—Galen's physiological investigations were revolutionary. He knew of insensible perspiration, he ligatured the recurrent laryngeal nerve, he performed section of the spinal cord at various levels and observed the resulting sensory and motor disturbances and incontinence. He correctly interpreted the effect of cutting above the origin of the phrenic nerve. He described the heart with its three layers of fibres, which he hesitated to call muscle. The reasons for his reluctance are greatly to his credit. Thus, firstly, he noted that the cardiac substance presented characteristics different from those of ordinary muscle, as, for instance, in that its action was independent of volition, and, secondly, he recorded that section of its nerve supply was not followed by cessation of its activities. The valves of the heart are accurately described by him, and it is probable that he knew of the anastomosis of the vessels. One of his greatest contributions was the demonstration that the arteries contain blood, and not air as the Alexandrian school had taught for over four hundred years. He partially grasped the principle of the lesser circulation, as Harvey (*q.v.*) pointed out. Galen described aneurism, differentiating the traumatic from the dilated variety and he was also familiar with the use of the catheter. His facile teleology led him, however, to some strange errors. Among them was the elaborate hypothesis which he formulated concerning the *pneumata* or spirits, to the influence of which he attributes many vital processes. He is also the author, or at least the propagator, of the fateful theory that the septum of the heart was pierced by imperceptible foramina, through which some of the blood was supposed to exude from the right into the left ventricle.

Monotheistic Views.—Apart from his medical work Galen occupies a position of considerable interest in the history of both religion and philosophy. He was a firm believer in God as the supreme creator of the universe in all its parts. He had set himself to prove that the bodily organs are in such perfect relation to the functions to which they minister that it is impossible to imagine any better arrangement. Thus, following the Aristotelian principle that Nature makes naught in vain, he develops the problem of final causes along definite lines. These lines amount to determinism with God as determiner. The peculiar feature of Galen's doctrine, however, is neither his determinism nor his monotheism,

both of which were familiar to the thinkers of the day, but his extraordinary claim that God's purposes could be elicited in great detail from the examination of his works. This comes out most strikingly, perhaps, in his famous description of the hand, contained in his treatise *On the Uses of the Parts of the Body of Man*.

In several places in his works Galen mentions both Judaism and Christianity, though without much respect. In the great anatomical work under discussion he explains that in his belief God always works by law, and that it is just for this reason that natural law reveals him, and he adds that "in this matter our view . . . differs from that of Moses." It seems very probable that he had read some books of the Bible. His position can thus be summed up as intermediate between Stoicism and Christianity. On the one hand he accepted the natural law of the Stoic philosophy, but rejected its astrological corollary. On the other hand he accepted the divine guide and architect of the universe which corresponded to the Christian scheme, but rejected all idea of miracle.

Influence on Logic.—Galen is held to have had a certain influence on the development of logic. He was, however, simply purveying the ordinary Peripatetic doctrines of his day. Nevertheless he is of some importance as the carrier or transmitter of these doctrines by reason of the avidity with which his medical works were read during the middle ages. He is thus in some sense responsible for both scholastic methods and scholastic philosophy. His chief philosophical influence is, however, to be traced in the mediaeval doctrine of *pneuma* and the resulting conception of the nature of life.

Galen's monotheism no doubt contributed to his popularity in the ages that followed him. Nevertheless nearly all writings were lost to western Europe after the break-up of the Roman empire. They were, however, translated into Arabic and about the 11th century the *Methodus Medendi*, and the *Ars Parva* or so-called *Microtegni*, were recovered in Latin versions from Arabic sources. The fifteenth century saw the effective completion of the Galenic canon in Greek by humanist scholars. Latin translations were studied in the medical schools until the dawn of the 19th century.

BIBLIOGRAPHY.—The standard edition of Galen is still that of C. G. Kühn in 20 (22) volumes, Leipzig (1821-33). A critical edition is being produced in the *Corpus Medicorum Graecorum*, of which several fascicules have appeared. A French translation of the important anatomical and physiological writings is that of C. Daremberg (2 vols., Paris 1854). A section of the *De anatomicis administrandis*, of which the Greek original is lost, is edited with German translation by M. Simon *Sieben Bücher der Anatomie des Galen* (2 vols., Leipzig 1906). The only work on Galen available in English is *On the Natural Faculties*, by A. Brock (1916).

On the philosophy of Galen there is little in English. Reference may be made to C. Singer in *Religion, Science and Reality* (edited by Joseph Needham 1926), and R. O. Moon, *Relation of Medicine to Philosophy* (1909). Other works are Iwan Müller, *Galen libellus quo demonstratur optimum medicum esse Philosophum* (Erlangen, 1875), C. Kalbfleisch, *Galen Institutio logica* (Leipzig, 1896); I. Zimmermann, *Material zur Würdigung Galens als Geschichtsschreiber der Medizin, Forscher und Commentator* (1902). A bibliography of recent work on Galen is given by Ernest Kind in the *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft*, vol. 180 (Leipzig, 1919). A list of the mss. of Galen has been prepared by H. Diels, *Die Handschriften der antiken Aerzte* (1905). (J. S. P.)

GALENA, a city near the north-west corner of Illinois, U.S.A., on the Galena river, 4m. from the Mississippi; the county seat of Jo Daviess county. It is on Federal highway 20, and is served by the Burlington, the Chicago and North Western, and the Illinois Central railways. The population was 4,742 in 1920; 1930 it was 3,878. It is built on rocky limestone bluffs, rising abruptly on either side of the river, and the parallel streets, on different levels, are connected by flights of steps. Lead and zinc are mined in the vicinity, and the city has smelters, reduction works, iron foundries, marble and stone works and a glove factory. Galena was originally a trading post, called by the French "La Pointe," and by the English "Fevre River," as the river had been named after a French trader, Le Fevre, who had been responsible for the first settlement in the area. In 1826 the town was laid out and named after the deposits of sulphide of lead that had been discovered. It was incorporated in 1835. Ulysses S. Grant was living in Galena when the Civil War broke out.

GALENA, a city of Cherokee county, Kansas, U.S.A., in the south-eastern corner of the State, on Short creek, near Spring river. It is on Federal highway 73E, and is served by the Frisco and the Missouri-Kansas-Texas railways. The population in 1930 Federal census was 4,736. It is in the midst of lead and zinc deposits which were discovered in 1877. The city has stamping and smelting works and concentration plants. After the discovery of the minerals, rival companies founded Galena, south of the creek, and Empire city, north of it. Galena was incorporated in 1877. Its population reached 10,155 in 1900, and in 1907 Empire city was annexed to it. The workings here have reached a considerable depth, and in recent years many workers have moved to the newer mines at Picher, Okla., 15m. S.W.

GALENA, lead sulphide (PbS), the chief ore of lead. The mineral was mentioned by Pliny under this name, and it is sometimes now known as lead-glance (Ger. *Bleiglanz*). It crystallizes in the cubic system, and well-developed crystals are of common occurrence; the usual form is the cube or the cubo-octahedron. An important character, and one by which the mineral may always be recognized, is the perfect cubical cleavage, on which the lustre is brilliant and metallic. The colour of the mineral and of its streak is lead-grey; it is opaque; the hardness is $2\frac{1}{2}$ and the specific gravity 7.5. Large masses with a coarse or fine granular structure are of common occurrence; the fractured surfaces of such masses present a spangled appearance owing to the numerous bright cleavages.

The formula PbS corresponds with lead 86.6 and sulphur 13.4%. The mineral nearly always contains a small amount of silver, and sometimes antimony, arsenic, copper, gold, selenium, etc. Argentiferous galena is an important source of silver; this is present in amounts rarely exceeding 0.1%, equal to about 30 oz. per ton. Since argentite (Ag₂S) is isomorphous with galena, it is probable that the silver isomorphously replaces lead, but it is to be noted that native silver has been detected as an enclosure in galena.

Galena is of wide distribution, and occurs usually in metaliferous veins traversing crystalline rocks, clay-slates and limestones, and also as pockets in limestones. It is often associated with blende and pyrites, and with calcite, fluorspar, quartz, barytes, chalybite and pearlspar as gangue minerals; in the upper oxidized parts of the deposits cerussite and anglesite occur as alteration products. The mineral has occasionally been observed as a recent formation replacing organic matter, such as wood; and it is sometimes found in beds of coal. In the lead-mining districts of Derbyshire and the north of England the ore occurs as veins and flats in the Carboniferous Limestone series, whilst in Cornwall the veins traverse clay-slates. In the Upper Mississippi lead region of Missouri, Illinois, Iowa and Wisconsin the ore fills large cavities or chambers in limestone.

Galena is met with at all places where lead is mined; of localities which have yielded finely crystallized specimens the following may be selected for mention: Derbyshire, Alston in Cumberland, Laxey in the Isle of Man (where crystals measuring almost a foot across have been found), Neudorf in the Harz, Rossie, N.Y., and Joplin, Missouri. Good crystals have also been obtained as a furnace product. (L. J. S.)

GALEOPTHECUS and **GALEOPTERUS**, the scientific names of the two species of *Colugo* (q.v.) or *Cobego*, commonly known as flying-lemurs and alone representing the family *Galeopteridae* of the *Insectivora* (q.v.). The characters of the family are as follows: Herbivorous, climbing, unguiculate mammals, provided with a very extensive flying-membrane, and having the dental formula $i. \frac{2}{2}, c. \frac{0}{1}, p. \frac{3}{3}, m. \frac{3}{3}$, total 34. The lower incisors are directed forwards and have a comb-like structure of their crowns, while the outermost of these teeth and the canines are double-rooted, being in these respects, taken together, quite unlike those of all other mammals; the cheek-teeth have numerous sharp cusps; and there is the normal replacement of milk-molars by premolars. In the skull the orbit is surrounded by bone, and the tympanic has a bulla and an ossified external meatus. The ulna and fibula are to some extent inclined backwards; the carpus has a scapho-lunar; and the feet are five-toed. The hemispheres

of the brain are short and but slightly convoluted; the stomach is simple; there is a large caecum; the testes are received into inguinal pouches; the uterus is two-horned; the placenta is discoidal; and there are two pairs of pectoral teats. A single offspring is produced at a birth.

There are two well-marked species, *Galeopterus temminckii*, ranging from Burma, Siam and the Malay Peninsula to Borneo, Sumatra and Java, and *Galeopterus volans*, of the Philippine group. The former, which is nearly 2 ft. in total length, is distinguished by its larger upper incisors, shorter ears and smaller skull. In both species not only are the long and slender limbs connected by a broad integumentary expansion extending outwards from the sides of the neck and body, but there is also a web between the fingers and toes reaching as far as the base of the claws; and the hind-limbs are further connected by a similar expansion passing outwards along the back of the feet to the base of the claws, and, inwardly, involving the long tail to the tip, forming a true interfemoral membrane, as in bats.

GALERIUS (GALERIUS VALERIUS MAXIMIANUS), Roman emperor from A.D. 305 to 311, was born near Sardica in Thrace. He served with distinction as a soldier under Aurelian and Probus, and in 293 was designated Caesar along with Constantius Chlorus. In 305, on the abdication of Diocletian and Maximianus, he at once assumed the title of Augustus, with Constantius his former colleague, and having procured the promotion to the rank of Caesar of Flavius Valerius Severus, a faithful servant, and Daia (Maximinus), his nephew, he hoped on the death of Constantius to become sole master of the Roman world. This scheme, however, was defeated by the sudden elevation of Constantine at Eboracum (York) on the death of his father, and by the action of Maximianus and Maxentius in Italy. In 307 he elevated his friend Licinius to the rank of Augustus, and devoted the remaining years of his life "to the enjoyment of pleasure and to the execution of some works of public utility." It was at his instance that the first of the celebrated edicts of persecution against the Christians was published, on Feb. 24, 303, and this policy of repression was maintained by him until the appearance of the general edict of toleration (311), issued in his own name and in those of Licinius and Constantine. He died in May 311.

See Zosimus ii. 8-11; Zonaras xii. 31-34; Eutropius ix. 24, x. 1.

GALESBURG, a city of western Illinois, U.S.A., 163m. S.W. of Chicago; the county seat of Knox county. It is on Federal highways 34 and 124, has a municipal airport, and is served by the Burlington, the Rock Island, and the Santa Fe railways. The population was 23,834 in 1920 (84% native white), and was, in 1930, 28,830 by the Federal census. It is the general trade centre of a rich agricultural region, and one of the leading horse and mule markets in the country; the largest division headquarters of the Burlington Route; an important manufacturing centre; and the seat of Knox college (1837; co-educational since 1849) and Lombard college (1851). Clay, coal, sand and gravel abound within a few miles. The Burlington employs more than 3,000 persons in its machine and repair shops, steel-car factories, icing stations, coal chutes, store department, hump switching-yards, tie-treating plant and other departments. It has its own water supply, from three beautiful artificial lakes near the city. There are some 60 other manufacturing establishments in the city, making a great variety of products, notably paving brick, butter, oil burners, engines and boilers, farm gates and many other agricultural necessities. The aggregate factory output within the city limits in 1925 was valued at \$12,407,572.

Galesburg and Knox college were founded by a colonization society, formed by the Rev. George Washington Gale (1789-1862), a Presbyterian preacher of Whitestown, N.Y., to promote Christian education and to counteract the pro-slavery influences in Illinois. The society bought from the United States, at \$1.25 per acre, half a township in the "Military Tract" of western Illinois, where lands had been set aside for the veterans of the War of 1812. The members individually then bought the land, from themselves as a society, at \$5.00 per acre, thus creating a fund for establishing the college and for other public purposes. The first settlers arrived in 1836, and the college was chartered in 1837, as

Knox Manual Labor college. The city was incorporated in 1857. It was an important "station" on the "Underground Railroad."

GALGACUS, or perhaps rather **CALGACUS**, a Caledonian chief who led the tribes of North Britain against the invading Roman army under Cn. Julius Agricola about A.D. 85 and was defeated at the battle of Mons Graupius (Tac. *Agric.* 29).

GALIANI, FERDINANDO (1728-1787), Italian economist, was born at Chieti on Dec. 2, 1728, and educated for the Church at Naples and Rome. He occupied various official positions. In his *Trattato della Moneta* (1750) he evolved a theory of value and a conception of utility, which to some extent anticipates the work of Jevons and Menger, while in *Dialoghi sul Commercio dei Grani* (Paris, 1770) he made important contributions to the theory of international trade. Though tinged with mercantilistic doctrines, this latter work has been considered the most notable treatise of that period on practical economics. Galiani also won a reputation as a wit, which he sustained in his work *Raccolte in Morte del Boia* (1750). He died on Oct. 30, 1787.

See A. Margheri, *L'Abbate Galiani* (1878); and Vieusseux, *L'Archivio Storico* (Florence, 1878) containing his correspondence with Tanucci.

GALICIA. Galicia is the name applied to that portion of Poland lying on the northern slopes of the Carpathians, which constituted an Austrian *Kronland* between the years 1772 and 1918. The area was then 30,299 sq.m., the population (1910) 7,980,477. Of these, 4,672,500 were given as Poles, 3,208,092 as Ruthenian or Ukrainian. The linguistic frontier between these two races ran roughly north and south of Przemyśl, east of which town 72% of the population was Ruthenian. The majority of the urban population, especially in the east, is Jewish.

The early history of west Galicia is that of Poland (*q.v.*). In the east, an independent Ruthenian principality of Halicz appears in the 11th century. It grew in importance with the decay of Kiev, whence many refugees emigrated to Galicia. In the 12th century Galicia, under its prince Osmomysl, was one of the chief principalities of Russia. Many towns were founded, and much trade passed through Lemberg (Lvov), from Asia and the Black sea to Europe. Galicia failed, however, to achieve stability, largely owing to the character of its own nobles, who are described as rebellious to their king and tyrannical to their serfs. It was alternately allied and at war with the neighbouring principality of Lodomeria; and Poland, Hungary and Novgorod intrigued for possession of both districts. Hungary became master for short periods in 1190 and 1215; but the powerful native dynasty founded by Roman of Lodomeria (d. 1205) retained its independence. Roman's son, Daniel (1205-64), was one of the strongest princes of eastern Europe, and was even crowned by a Papal Legate, temporarily deserting the Orthodox Church. In 1223, however, he lost his eastern provinces to the Mongols, who overran and ruined all Galicia in 1241. In 1324 the Romanov line died out, and Casimir of Poland occupied Galicia in 1340, Lodomeria in 1366. On his death both provinces again came under Hungary, but reverted to Poland in 1372. Under the Jagellion kings prosperity revived, to sink again when the world trade routes changed. The Ruthenian nobles adopted the Catholic faith and the Polish tongue, the Ruthenian nationality surviving only among the serfs, who were as wild and backward as any in Europe, and lived in almost unrelieved misery, despite the natural wealth of the soil. Galicia was repeatedly harassed by Cossacks, Tatars and Turks, and disorganized by the anarchy of the Polish State.

At the partitions of Poland, Galicia (including Lodomeria) was assigned to Austria, for the first time in 1772, definitively, with a slightly altered frontier in 1814, Cracow becoming an independent republic. Austrian rule introduced many improvements, but progress was slow. The Polish revolution of 1830 affected Galicia little, but Austria allowed legions to be formed here, and sheltered refugees from Russian Poland. In 1846, however, widespread and almost unconcealed preparations for revolution, to break out in mid-February, were made by the Polish nobles. The danger for Austria was averted by a rising of the Polish (not Ruthenian) peasants, whom disastrous floods had reduced to great misery. The peasants massacred a number of nobles in the Tarnów district. The revolt soon broke down, but as it had been largely directed

from Cracow, Metternich took this pretext of incorporating the city in Galicia, as from Nov. 11, 1846.

In 1848 the Austrian Government countered the revolutionary movement among the Polish nobles by winning the peasants through land reforms, and the Governor of Galicia, Count Stadion, also for the first time encouraged the Ruthenians and won their support against the Poles. A period of centralized bureaucratic rule followed, during which Galicia was divided, on roughly ethnographical lines, into first three, and later two administrative districts; but the Polish nobles supported the Hungarian in their demand for decentralization, and after the Hungarian "Ausgleich" of 1867, Galicia, thanks to the efforts of Count Goluchowski, obtained more liberty than any other Austrian province. Under a special minister for Galicia, the Poles enjoyed *de facto* home rule and a free hand against the Ruthenians, Galicia being reunited into a single province with Polish as the official language. In return, the Poles formed the chief support of the successive Austrian Governments, and took a large part in directing Austrian policy, the Polish irritanda in Galicia never being serious. Besides being the largest Austrian province, Galicia was now acquiring great importance owing to the discovery and exploitation of its oil fields, although these were mainly in Jewish hands and the provincial budget to the last was subsidized from the Austrian treasury; the strategic importance was also great, and was probably the main reason why the Austrian Government never yielded to the wish of the German nationalists to give Galicia an independent status within the monarchy. The Ruthenian national movement made slow progress, discouraged by Poles and Austrians alike, while Russia gave it no support, for fear of awaking a national movement in the Ukraine. Leaders were lacking, and the movement itself divided.

The Neo-Slav movement had by 1910 laid the foundations for a reconciliation between Poles and Russians. The Galician Poles ceased to be safe supporters of the Austrian Government, which in return reverted to the idea of encouraging the "loyal" Ruthenians; but this new development was cut short by the war of 1914. The Central Powers were obliged to grant the Poles wider independence, and to promise them still more; and by 1918 Galicia was virtually independent of Austria. The Poles renounced allegiance to Austria in Oct. 1918, claiming all Galicia for the new Polish state. The Ruthenians, however, who had also been promised greater liberty after the Peace of Brest-Litovsk, also claimed the right to self-determination, and in November formed a Government under Dr. Petrushevich in Lemberg, this being recognized by the liquidating Austrian Government. The Poles occupied Lemberg (Nov. 5), and the Ruthenian Government retired finally to Vienna. The Ruthenian troops joined the Ukrainian army of Petlura; the latter marched against the Poles and claimed East Galicia for the Ukrainian Republic—a claim first recognized, but later disallowed by Petrushevich. Fighting continued throughout 1919. On May 8, 1919, the supreme council assigned West Galicia to Poland, and on June 24 allowed East Galicia the right of self-determination, while authorizing the continued Polish occupation. In December it announced that East Galicia should be granted autonomy under a Polish protectorate for 25 years, after which the League of Nations was to decide on its future. Petlura had meanwhile abandoned his claim to Galicia in return for recognition by Poland in the Ukraine; but he was overthrown by the Soviet troops, who continued the struggle with Poland until the treaties of Riga (Oct. 12, 1920, and March 18, 1921) finally reaffirmed the old Galician frontier. The Ruthenian Governments, of which there were many, were quite helpless, from lack of funds and internal dissension. Finding their repeated appeals ignored, some of them made terms with Soviet Russia, which carried on a lively agitation in East Galicia, some were reconciled to Poland, a few abandoned politics. Poland continued to treat East Galicia as an integral part of herself, and it was recognized as such by the Council of Ambassadors on March 14, 1923. Under her minority legislation, Poland subsequently accorded her Ruthenian population a limited degree of self-government, and the active agitation against her rule diminished.

GALICIA (the ancient *Gallaecia* or *Callaecia*, Καλλαϊκία or Καλαϊκία), a captaincy-general, and formerly a kingdom, county and province, in the north-western angle of Spain; bounded on the north by the Bay of Biscay, east by Leon and Asturias, south by Portugal and west by the Atlantic ocean. Pop. (1920) 2,124,244; area, 11,254 sq.m. In 1833 Galicia was divided for administrative purposes into the provinces of Corunna, Lugo, Orense and Pontevedra. The high land north of the headwaters of the Miño forms the sole connecting link between the Cantabrians properly so-called and the mountains of central and western Galicia. The average elevation of the province is considerable, and the maximum height (6,593 ft.) is reached in the Peña Trevinca on the eastern border of Orense.

The principal river is the Miño (Portuguese *Minho*; Lat. *Minius*; so named, it is said, from the *minium* or vermilion found in its bed). Rising near Mondoñedo, within 25 m. of the northern coast, the Miño enters the Atlantic near the port of Guardia, after a course of 170 m. south and south-west. Of its numerous affluents the most important is the Sil. Among other rivers having a westerly direction may be mentioned the Tambre, the Ulla and the Lerez or Ler, which falls into the Atlantic by estuaries or *rias* called respectively Ría de Muros y Noya, Ría de Arosa and Ría de Pontevedra.

Gallaecia, the country of the Galacci, *Callaici* or *Gallaici*, seems to have been very imperfectly known to the earlier geographers. According to Eratosthenes (276-196 B.C.) the entire population of the peninsula were at one time called *Galatae*. The region properly called by their name, bounded on the south by the Douro and on the east by the Navia, was first entered by the Roman legions under Decius Junius Brutus in 137-136 B.C. (Livy lv., lvi., *Epit.*); but the final subjugation cannot be placed earlier than the time of Augustus (31 B.C.-A.D. 14).

The coast-line of Galicia, extending to about 240 m., is everywhere bold and deeply indented, presenting a large number of secure harbours, and in this respect forming a marked contrast to the neighbouring province. The Eo, which bounds Galicia on the east, has a deep estuary, the Rivadeo or Ribadeo, which is a good harbour. Vivero bay and the Ría del Barquero y Váres are of a similar character; while the harbour of Ferrol is an important naval station. On the opposite side of Betanzos bay (the μέγας λιμὴν or *Portus Magnus* of the ancients) is the great port of Corunna or Coruña. The principal port on the western coast is that formed by the deep and sheltered bay of Vigo, but there are also some good roadsteads at Corcubion, at Marin and at Carril.

The rainfall is exceptionally heavy, and snow lies on some of the high ground for a considerable portion of the year. Much timber is grown on the high lands, and the rich valley pastures support large herds of cattle, while the abundance of oaks and chestnuts favours the rearing of swine. In the lowland districts good crops of maize, wheat, barley, oats and rye, as well as of turnips and potatoes, are obtained. The *dehesas* or moorlands abound in game, and fish are plentiful in all the streams. The mineral resources of the province, which are considerable, were known to some extent to the ancients. Strabo (c. 63 B.C.-A.D. 21) speaks of its gold and tin, and Pliny (A.D. 23-79) mentions the *gemma Gallaica*, a precious stone. Galicia is also remarkable for the number of its sulphur and other warm springs, the most important of which are those at Lugo and Orense.

The largest town in Galicia is Corunna (*q.v.*); Santiago de Compostela is the ancient capital and an archiepiscopal see; Lugo, Tuy, Mondoñedo and Orense are bishoprics.

GALIGNANI, GIOVANNI ANTONIO (1752-1821), newspaper publisher, was born at Brescia, Italy. After living some time in London, he went to Paris, where he started in 1800 an English library, and in 1808 a monthly publication, the *Repertory*

of English Literature. In 1814 he began to publish, in Paris, *Galignani's Messenger*, a daily paper in English aiming at the promotion of good feeling between England and France. From 1884 until 1904, when it was discontinued it was published as the *Daily Messenger*.

GALILEE, a Roman province of Palestine, bounded on the south by Samaria and Carmel, on the east by Jordan, on the north by the river Leontes (Litāni), and on the west by the Mediterranean. It has a maximum length of 60 m. and a breadth of 30. Galilee represents a relatively low, but detached, continuation of the Lebanon ranges. The basic formation of its hills is limestone, and on this the vulcanism of a later geological age has superimposed extensively a layer of lava whose crumbling has produced a soil remarkable for its fertility. The province was divided into two districts, Upper and Lower, reflecting a change in the configuration of the land distinct enough in nature, but not easy to recognize on the map. The dividing line is a ridge running east and west, reaching the Jordan valley at a point midway between Lake Huleh and the Sea of Galilee.

Upper Galilee is the northern district and is in substance a broad mountain range up-tilted towards the Sea of Galilee. The eastern slopes dominating the Jordan valley are abrupt and rise to a height of 2,800 feet. On the west, the descent towards the sea and the plain of Acre is more gradual. In the southern part of the district the rocky range of Jebel Jarmuk reaches a height of 3,900 feet. The whole region is well watered. The height of the mountains causes a relatively heavy rainfall, and springs abound. Hence the valleys are full of vegetation and the mountain slopes are clothed on the west with small oaks, and on the east with scrub. The occasional level stretches and gentler slopes are covered with fertile grain fields. Upper Galilee was proverbially famous for its fine olives and vines. "It is easier," says the Talmud, "to raise a legion of olives in Galilee than to bring up a child in Palestine." Safed, the chief town, has a population of 18,000, of whom one half are Jews. It suffered severely in the earthquake of 1837, when 4,000 of its inhabitants perished.

Lower Galilee is the southern district of the province. Its highest hills are not more than 1,800 ft. Across the province, at its southern end, stretches the plain of Esdraelon (also called Jezreel). Triangular in shape it is drained by the river Kishon which, springing from the Gilboa hills, winds through the plain. For the most part a dry torrent bed in the height of summer, it becomes almost impassable at times during the rains, as when the hosts of Sisera were discomfited on its banks and "the River Kishon swept them away, that ancient river, the River Kishon." The eastern end of the plain forms the chief gateway to Palestine from regions beyond Jordan. The whole of Lower Galilee is well supplied with water. Springs abound in eastern Esdraelon, Wady-el-Melek and in the plain El-Buttauf. The great plains of Galilee, Esdraelon, El-Buttauf and the plateau of Sahel el-Ahma, are exceedingly fertile, producing wheat, cotton, maize, sesame, tobacco, millet and a variety of vegetables. The principal towns are Nazareth (*q.v.*); Tiberias (*q.v.*); Seffuriyeh (Sepphoris), a rival to Tiberias as capital and for a short period the abode of the Sanhedrin when it first transferred to Galilee; Jenin (En-Gannim), on the southern edge of the plain of Esdraelon; Jezreel (*q.v.*), now a poor village (Zer 'in) but once a royal residence, situated on Mt. Gilboa; Endür (Endor, *q.v.*); Nein (Nain, the scene of one of Christ's miracles); Lejjün (the Legio of the Romans), now identified with ancient Megiddo, on the west side of the plain, where the mighty empires of Egypt and Hattiland met in a famous conflict in the 15th century B.C.; Jefât, a town amongst the hills north of El-Buttauf, the Jotapata which Josephus so vigorously defended against Vespasian; Kefr Kenna (*q.v.*) probably Cana of Galilee, and Kānā, 6 m. north of it, another suggested identification with Cana.

Galilee of old was a highly prosperous land peopled by bold and hardy hillmen, who knew how to defend their homes, as, indeed, they had often occasion to do, since "they were encompassed with so many nations of foreigners." Josephus (*Bell. Jud.* iii. 3, 2), who in his capacity of military governor of the Galilees, knew the country well, gives an interesting account of the people

and the land of his time. "The Galileans are inured to war from their infancy, and have been always very numerous; nor hath the country ever been destitute of men of courage, nor wanted a numerous set of them; for their soil is universally rich and fruitful and full of the plantations of trees of all sorts . . . and no part of it lies idle. Moreover, the cities lie here very thick, and the very many villages are full of people." The Galilee of to-day is not so prosperous nor so populous as in the days of Josephus, but faith in its future is not wanting. Within recent years 16 Jewish colonies have been established by Jewish organizations within its borders.

History.—The name (in origin, a "circle" or "circuit") was in early times loosely applied. In Isaiah (ix. 1) the full name of the district is given as "Galilee of the Gentiles," viz., the Phoenicians, Syrians and Aramaeans, who hemmed it in. In 1 Kings (xv. 29) it is the name of a district whose population was deported by Tiglath Pileser. The fortunes of the tribe, with its loose and varying territorial connections, interested the Hebrew more than the political history of a rigidly delimited district. Hence Galilee can hardly be said to have, as a whole, a history. The return of the Jews from captivity concentrated re-awakened national interest and prestige at Jerusalem, and Galilee was frowned upon and left to the hybrid race evolved from the mingling of the Jewish residue and fresh Assyrian colonization. The date of Galilee's reconquest for the Israelites is uncertain, but it is generally ascribed to John Hyrcanus; and the sturdy race which peopled its hills and valleys soon developed a fervid patriotism and nationalistic spirit. The contempt of the metropolitan for the Galilean provincial was probably intensified by the latter's uncouth speech, emphasized by his inability to pronounce some of the Hebrew consonants. The jibe "Out of Galilee cometh no prophet" (although Deborah, Jonah, Elisha and perhaps Hosea were Galileans) is not so much a reflection on the religious and cultural interest of the Galilean as a reflection of the biased and prejudiced mind of the metropolitan. We cannot forget that it was amongst the hills of Galilee and by its sea that Christianity was shaped and developed. In the Persian period too, the Mandaean religion took final shape in lone Galilee.

Galilee was moulded into a province by the Romans and became a tetrarchate governed by members of the Herod family. Galilee was the land of Christ's childhood and the chief centre of his ministry. In the neighbourhood of its great lake some of his chief discourses were uttered, and the scenes and incidents of its landscape inspired his parables. When the destruction of Jerusalem left the Rabbinic Schools homeless they sought refuge in despised Galilee, and Safed and Tiberias (*q.v.*) became their chief centres. It is in Galilee that the remains of ancient synagogues are found, and within its confines lie buried many Jewish doctors and philosophers whose tombs are still venerated.

Archaeology.—In Galilee there are relics of the Stone Age in dolmens and menhirs. Rock-cut tombs and wine presses, remains of Byzantine monasteries, the churches and fortresses of Crusading times bring archaeological interest down to a more recent time. A discovery of particular interest, furnishing a link with Palaeolithic man, was that made in a Galilean cave in 1925. In a cave in the Wady el 'Amūd, a valley abutting on the plain of Gennesareth, were unearthed portions of a human skull of the Neanderthal species. The fragments consist of nearly the whole of the frontal bone, the right zygomatic bone, and the right half of the sphenoid bone.

In 1927 Professor Garstang announced the discovery in the Huleh basin of a large permanent camp, about 1,000 metres in length and 400 across, at a point about $3\frac{1}{2}$ m. west of the point where the Jordan leaves the lake. Occupation throughout the three phases of the Bronze Age is indicated, and an identification with Hazor, Jabin's royal city, has been suggested.

The great Galilean field of excavation, however, is the Plain of Esdraelon. At Tell-Husn (Beisān, *q.v.*) extensive excavations are being carried out with important results. At Ta'annak (the Taanach of Judges v. 19), the walls were laid bare, traces of child sacrifice discovered, and several cuneiform tablets of the Amarna period unearthed. Excavations are proceeding at Me-

giddo, on the western border of the plain, and the soundings made at Tell Harbaj in the plain of Acre, near to its junction with the plain of Esdraelon make it reasonably certain that it, rather than Hārithiyeh, is the site of Harosheth of the Gentiles. Of great interest are the ancient synagogues, of which about a dozen have been discovered at ancient sites, such as Capernaum (*q.v.*), Kerāzeh, Kefr Bir'im, Irbid, Meirūn, and elsewhere. The architecture is generally held to be a peculiar and debased imitation of the classical style associated with the 2nd century A.D.

Crusading fortresses were spread over the land in the 12th century as outposts of the kingdom of Jerusalem. Torou (Tibnān), on the summit of the mountains of Upper Galilee, Bēauvoir (Kaukab el-Hawa), south-west of the Sea of Galilee, Chateau Neuf (Hunin), above Huleh lake, Belfort (Esh-Shakif), on the north bank of the Litāni, Montfort (Kala'at el-Kurn), north-east of Acre, and the castle at Bāniās formed a strong chain of frontier fortresses.

GALILEE, an architectural term used of a certain kind of porch (*q.v.*) or chapel.

GALILEE, SEA OF, a lake in Palestine through which flows the river Jordan. It is 14 m. long, 8 m. broad, has a superficial area of 112 sq.m. and lies 680 ft. below the level of the Mediterranean sea. Its maximum depth is 150 ft. The excessive depth which Lortet believed he had discovered at the northern end of the lake has been disproved. The shape of the lake has been likened to a harp or a pear. In the Old Testament it is known as the Sea of Chinnereth or 'Chinneroth. In the books of the Maccabees and Josephus it is named Gennesar; in the Gospels it is usually the Sea of Galilee. Once it is called the Lake of Gennesaret (Luke v. 1), and twice the Sea of Tiberias (John vi. 1, xxi. 1), a name which has survived in the modern *Bahr Tabariyeh*.

The sea of Galilee lies in the great Jordan valley trough-fault. During the Pluvial period almost the whole of this depression was occupied by a great inland sea extending from Huleh to a point 40 m. beyond the present southern limit of the Dead sea. Late in geological time the lava which flowed from the volcanoes amongst the southern Galilean hills into the depression combined with lava which flowed down the Yarmuk valley to the east, as well as with the silt washed down later to cause a blockage behind which the waters of the Jordan were pent to form a lake.

The hills which close in upon the sea on the south-west side recede from the shore towards the north to form a great natural amphitheatre with the Plain of Gennesareth as arena. On the east the plateau of Jaulan presents its steep and heavily-scored side towards the lake. Yet, unlike the Dead sea, there is between the water's edge and the foot of the hills a clear passage all round the lake. The Jordan enters it on the north, emerging from a narrow gorge and having on its left bank the marshy plain of El-Batihah. On the north-western shore is the plain of El-Ghuweir, generally supposed to be the plain of Gennesareth whose wonderful fertility is so glowingly described by Josephus. It is a land which "supplies men with the principal fruits, with grapes and figs continually, during ten months of the year, and the rest of the fruits as they become ripe together through the whole year." (*Bell. Jud.* iii. 10. 8.) The plain, which is to-day covered with rank grass and bushes, has been purchased by the Jews and may be expected to recover some of its former glory. North of El-Ghuweir are several warm springs of moderate temperature. At Hamath (Emmaus), a short distance south of Tiberias, are seven hot springs the largest of which has a temperature of 137° F. The lake is well stocked with fish of the genera *Chromis*, *Barbus*, *Capoeta*, *Discognathus*, *Nemachilus*, *Blennius* and *Clarias*. There is a close affinity between the fish of Galilee and those of the East African lakes and streams. The *Chromis Simonis*, according to popular belief, is the fish from

which Peter took the piece of money (Matt. xviii. 27). Bird life is abundant. Grebes of all kinds, gulls and pelicans frequent the lake. On its shores are to be found tortoises and mud-turtles, crayfish and sandhoppers. Twenty-six boats and 115 men are engaged in fishing the lake.

The hills surrounding the sea are brown and bare in the summer-time but in the spring are clothed with vegetation. Oleander brakes flourish round the lake and the tall papyrus plant is found on the north shore. Set deep amongst hills and consequently subject to sudden squalls and violent storms, which develop rapidly, sailing on the lake is not unattended with risk. The best view of the lake is obtained from the top of the hills on its western shore. The absence of boats from its waters and the lack of industry on its shores tinge the scene with melancholy. In the days of Josephus the lake was alive with craft; populous towns and villages throbbing with life were clustered on its coasts. On a day when nature is herself gloomy, the sense of desolation and dreariness pierces to the very soul of the onlooker; but to the view of the lake glistening and sparkling in the sun, the soul leaps joyous, and the vision of what was calls into being an attractive vision of what may yet be.

Archaeology.—The principal sites of archaeological interest in the area of the lake are (1) *Kerāzeh* (Chorazin) 2 m. from the north shore in a wady of the same name. Its ruins include a notable synagogue built with black basalt. (2) *Tell-Hūm* (Capernaum, *q.v.*) on the lake shore south of Kerāzeh with the remains of an early synagogue and possibly a church. (3) *Khān Minyeh*, with extensive ruins at the north end of the plain of Gennesareth. Its identification with Bethsaida is suggested. (4) *Tell 'Ureimeh*, between Khān Minyeh and Tell-Hūm, the site of an Amorite city whose name has been forgotten. (5) *Mejdel* (Magdala), south of the plain of Gennesareth with rock-cut tombs. (6) *Tabariyeh* (Tiberias) with remains of the mediaeval period. (7) *Khirbet Kerak* at the south-west corner of the lake with a ruined citadel and traces of a large and important town. It has been generally identified with Taricheae but more recently an identification with the Beth-Yerah of the Talmud, called by the Greeks Philoteria, has been advocated. (8) *Sinn en-Nabreh* (Sennabris), near to Kerak where Vespasian fixed his camp in his advance from the south on Taricheae and Tiberias. (9) *Khirbet Susieh*, on the eastern shore, identified with Hippos one of the cities of the Decapolis. (10) *Kal 'at el-Husn*, opposite Tiberias, exhibiting ruins of a city that was walled, broken sarcophagi and rock-cut tombs; suggested identification with the Gamala of Josephus. (11) *Fik*, about 2 m. E. of Kal 'at el-Husn, a large village with ruins of ancient buildings, identified by Eusebius with Aphek. (12) *Khirbet Kersa*, opposite Mejdel, the Gerasa or Gergesa of the 4th century. The *Wady el-Amūd*, where the "Galilee skull" was found, opens on to the plain of Gennesareth. (See GALILEE.) Dolmans and other stone erections have been found at *Ain Tābigha* and *Khān Jubb Yusif*.

See P. Karge, *Prähistorische Denkmäler am Westufer des Gennesaret Sees* (1914); L. Sukenik, *Journal Pal. Orient. Soc.* 2 (1922) 101 seq. (Kerak-Beth-Yerah). For other literature see under GALILEE.

(E. Ro.)

GALILEO GALILEI (1564–1642), Italian astronomer and experimental philosopher, was born at Pisa on Feb. 15, 1564. He came of a noble but impoverished Florentine family; his father Vincenzo Galilei was a competent mathematician and an able musician. Galileo received his early education at the monastery of Vallombrosa, near Florence. Here he studied Greek, Latin and logic but showed a distaste for the science he was taught. He acquired a reputation for intellectual aptitude as well as for mechanical invention. In 1581 his father sent him to the University of Pisa to study medicine.

Galileo was endowed with many natural gifts; he was a skilful musician and showed a taste for painting and it seemed possible that he might develop in any direction determined by choice or by chance.

The Pendulum and Velocities.—In 1581, while watching a lamp set swinging in the cathedral of Pisa, he observed that, whatever the range of its oscillations, they were invariably executed

in equal times. The experimental verification of this fact led him to the important discovery of the isochronism of the pendulum. He applied the new principle to the timing of the human pulse. Up to this time he was entirely ignorant of mathematics, his father having carefully held him aloof from a study which he rightly apprehended would lead to his total alienation from that of medicine. Accident, however, frustrated this purpose. A lesson in geometry which he overheard by chance awakened his interest, and with his father's reluctant permission he began to study mathematics and science. In 1585 he was withdrawn from the university, through lack of means, before he had taken a degree, and returned to Florence. He lectured to the Florentine Academy and in 1586 he published an essay descriptive of his invention of the hydrostatic balance, which rapidly made his name known throughout Italy. At the request of his first patron, the Marchese Guidubaldo del Monte of Pesaro, a man equally eminent in science and influential through family connections, he wrote, in 1588, a treatise on the centre of gravity in solids, which obtained for him the honourable though not lucrative post of mathematical lecturer at the Pisan university. During the ensuing two years (1589–91) he carried on that remarkable series of experiments by which he established the first principles of dynamics. From the Leaning Tower of Pisa he afforded to all the professors and students of the university ocular demonstration that bodies of different weights fall with the same velocities. He also showed that the path of a projectile is a parabola. His sarcasm roused the anger of men holding different views. He became unpopular, resigned his professorship and withdrew to Florence in 1591.

In the following year he was appointed to the chair of mathematics at Padua. He remained here until 1610; his appointment was three times renewed and his salary continually increased.

Researches with the Telescope.—Galileo seems, at an early period of his life, to have adopted the Copernican theory of the solar system, but was deterred from avowing his opinions—as is proved by his letter to Kepler of Aug. 4, 1597—by the fear of ridicule rather than of persecution. A rumour of the invention of the telescope (*q.v.*) which reached Venice in June 1609, sufficed to set Galileo on the track; and he succeeded in producing a telescope of threefold magnifying power. Upon this first attempt he rapidly improved, until he attained to a power of 32, and his instruments, of which he manufactured hundreds with his own hands, were soon in request in every part of Europe. This form of telescope, which is known by his name, is used for opera-glasses. Galileo began to make observations with his telescope and published the *Sidereus Nuncius* in 1610. He observed the mountainous configuration of the moon and he showed that the Milky Way was a collection of lesser stars. An important discovery was that of Jupiter's satellites, first seen by Galileo on Jan. 7, 1610, and by him named *Sidera Medicea*, in honour of the grand duke of Tuscany, Cosimo II., who had been his pupil and was about to become his employer. This was a strong confirmation of the Copernican theory which was triumphantly received by its advocates. Later he observed what appeared to him as the triple form of Saturn, the phases of Venus and sun spots.

In Sept. 1610 Galileo finally abandoned Padua for Florence. His researches with the telescope had been rewarded by the Venetian senate with the appointment for life to his professorship, at a high salary. He was also appointed as philosopher and mathematician extraordinary to the grand duke of Tuscany. This sinecure presented him with an increased opportunity of continuing his scientific labours.

DISCOVERIES AND HERESIES

In 1611 Galileo visited Rome, and exhibited the telescopic wonders of the heavens to the most eminent personages at the pontifical court. Encouraged by the flattering reception accorded to him, he ventured, in his *Letters on the Solar Spots*, printed at Rome in 1613, to take up a more decided position with regard to the Copernican theory. Galileo's brilliant researches, enhanced by his formidable dialectic and enthusiastic zeal, drew the attention of the authorities to the discrepancies between the new view of the solar system and certain passages in the Scriptures.

Although he had no desire to raise the theological issue, it must be admitted that, the discussion once set on foot, he threw himself into it with characteristic impetuosity, and thus helped to precipitate a decision which it was in his interest to avert. Not only did Galileo explain adverse texts but he tried to produce scriptural confirmation of the Copernican system. The agitation against him increased and in 1615 he received a semi-official warning to avoid theology and limit himself to physical reasoning. In Feb. 1616 the consulting theologians of the Holy Office characterized the proposition that the sun is immovable in the centre of the world and that the earth has a diurnal motion of rotation as heretical. Shortly afterwards Galileo was admonished by the pope, Paul V., not to "hold, teach or defend" the condemned doctrine. This injunction he promised to obey.

Galileo returned to Florence three months later, not ill-pleased, as his letters testify, with the result of his visit to Rome. For seven years, during which he led a life of studious retirement at Bellosguardo, near Florence, he maintained an almost unbroken silence. At the end of that time he appeared in public with his *Saggiatore*, in which he dealt with the nature of comets. His views were erroneous, since he held comets to be mere atmospheric emanations reflecting sunlight after the fashion of a halo or a rainbow. The *Saggiatore* was printed at Rome in Oct. 1623 by the Academy of the Lincei, of which Galileo was a member, with a dedication to the new pope, Urban VIII., and notwithstanding some passages containing a covert defence of Copernican opinions, was received with acclamation by ecclesiastical no less than by scientific authorities.

Ecclesiastical Censure.—Everything seemed now to promise a close of unbroken prosperity to Galileo's career. He tried, unsuccessfully, to obtain the revocation of the decree of 1616. Yet there seemed reason to expect that it would at least be interpreted in a liberal spirit, and Galileo's friends encouraged his imprudent confidence. Thus, in the full anticipation of added renown, and without any misgiving as to ulterior consequences, Galileo set himself, on his return to Florence, to complete his famous but ill-starred work, the *Dialogo dei due massimi sistemi del mondo*. Finished in 1630, it was not until Jan. 1632 that it emerged from the presses of Landini at Florence. A tumult of applause from every part of Europe followed its publication; and it would be difficult to find in any language a book in which animation and elegance of style are so happily combined with strength and clearness of scientific exposition.

It was at once evident that the whole tenor of this remarkable work was in flagrant contradiction with the edict passed 16 years before its publication, as well as with the author's personal pledge of conformity to it. The theological censures which the book did not fail to incur were not slow in making themselves felt. Towards the end of August the sale was prohibited; on Oct. 1 the author was cited to Rome by the Inquisition. He pleaded his age and infirm health, but no excuse was admitted. At length, on Feb. 13, 1633, he arrived at Rome where he was detained but treated with indulgence. He was finally examined by the Inquisition on June 21 under menace of torture which was not carried out and which it was never intended to execute. The following day Galileo recanted and was sentenced to incarceration at the pleasure of the tribunal, and by way of penance was enjoined to recite once a week for three years the seven penitential psalms. This sentence was signed by seven cardinals, but did not receive the customary papal ratification. The legend according to which Galileo, rising from his knees after repeating the formula of abjuration, stamped on the ground, and exclaimed, "*Eppur si muove!*" is, as may readily be supposed, entirely apocryphal. Its earliest ascertained appearance is in the Abbé Iraiili's *Querelles littéraires* (vol. iii, p. 49, 1761).

Galileo remained in the custody of the Inquisition from the 21st to the 24th of June, on which day he was relegated to the Villa Medici on the Trinità de Monti. Thence, on July 6, he was permitted to depart for Siena, where he spent several months in the house of the archbishop, Ascanio Piccolomini, one of his numerous and trusty friends.

It was not until December that his earnest desire of returning

to Florence was realized, and the remaining eight years of his life were spent in his villa at Arcetri, in the strict seclusion which was the prescribed condition of his comparative freedom.

His prodigious mental activity continued undiminished to the last. In 1636 he completed his *Dialoghi delle nuove scienze*, in which he recapitulated the results of his early experiments and mature meditations on the principles of mechanics. This in many respects his most valuable work was printed by the Elzevirs at Leyden in 1638, and excited admiration equally universal and more lasting than that accorded to his astronomical treatises. His last telescopic discovery—that of the moon's diurnal and monthly librations—was made in 1637, only a few months before he became blind. But the fire of his genius was not even yet extinct. He continued his scientific correspondence with unbroken interest and undiminished acumen; he thought out the application of the pendulum to the regulation of clockwork, which Huygens successfully realized 15 years later; and he was engaged in dictating to his disciples, Viviani and Torricelli, his latest ideas on the theory of impact when he was seized with the slow fever which resulted in his death on Jan. 8, 1642.

VALUE OF HIS WORK

The direct services of permanent value which Galileo rendered to astronomy are virtually summed up in his telescopic discoveries. To the theoretical perfection of the science he contributed little or nothing. The circumstance, however, which most seriously detracts from his scientific reputation is his neglect of the discoveries made during his lifetime by Kepler, the greatest of his contemporaries. His name is nevertheless justly associated with a vast extension of the bounds of the visible universe, and his telescopic observations are a standing monument to his ability. Within two years of their first discovery, he had constructed approximately accurate tables of the revolutions of Jupiter's satellites, and he proposed their frequent eclipses as a means of determining longitudes, not only on land, but at sea. The idea, though ingenious, has been found of little practical utility at sea. His observations on sun spots are noteworthy for their accuracy and the deductions he drew from them with regard to the rotation of the sun and the revolution of the earth.

The idea of a universal force of gravitation seems to have hovered on the borders of this great man's mind, without ever fully entering it. More valid instances of the anticipation of modern discoveries may be found in his prevision that a small annual parallax would eventually be found for some of the fixed stars, and that extra-Saturnian planets would at some future time be ascertained to exist, and in his conviction that light travels with a measurable although, in relation to terrestrial distances, infinite velocity. Although Galileo discovered, in 1610, a means of adapting his telescope to the examination of minute objects, he did not become acquainted with the compound microscope until 1624 when he saw one of Drebbel's instruments in Rome, and, with characteristic ingenuity, immediately introduced some material improvements into its construction.

The most substantial part of his work consisted undoubtedly in his contributions towards the establishment of mechanics as a science. Some valuable but isolated facts and theorems had been previously discovered and proved, but it was he who first clearly grasped the idea of force as a mechanical agent. The interdependence of motion and force was not indeed formulated into definite laws by Galileo, but his writings on dynamics are everywhere suggestive of those laws, and his solutions of dynamical problems involve their recognition. In this branch of science he paved the way for Newton. The extraordinary advances made by him were owing to his happy method of applying mathematical analysis to physical problems.

The method which was peculiarly his consisted in the combination of experiment with calculation—in the transformation of the concrete into the abstract, and the assiduous comparison of results. This was applied to the investigation of the laws of falling bodies, of equilibrium and motion on an inclined plane and of the motion of a projectile. The latter, together with his definition of momentum and other parts of his work, implied a knowledge of the laws of motion as later stated by Newton,

but Galileo did not enunciate these laws in a definite form. In his *Discorso intorno alle cose che stanno su l'acqua*, published in 1612, he used the principle of virtual velocities to demonstrate the more elementary theorems of hydrostatics, deducing from it the equilibrium of fluid in a siphon, and worked out the conditions for the flotation of solid bodies in a liquid. He also constructed an elementary form of thermometer.

The first complete edition of Galileo's writings was published at Florence (1842-56), in 16 vols., under the supervision of Eugenio Albèri. Besides the works already enumerated, it contained the *Sermones de motu gravium* composed at Pisa between 1589 and 1591; his letters to his friends, with many of their replies, as well as several of the essays of his scientific opponents; his laudatory comments on the *Orlando Furioso*, and depreciatory notes on the *Gerusalemme Liberata*, some stanzas and sonnets of no great merit, together with the sketch of a comedy; finally, a reprint of Viviani's *Life*, with valuable notes and corrections. The original documents from the archives of the Inquisition, relating to the events of 1616 and 1633, recovered from Paris in 1846 by the efforts of Count Rossi, and now in the Vatican library, were to a limited extent made public by Monsignor Marino-Marini in 1850, and more unreservedly by M. Henri de l'Épinois, in an essay entitled "Galilée, son procès, sa condamnation," published in 1867 in the *Revue des questions historiques*. He was followed by Karl von Gebler, who, in an able and exhaustive but somewhat prejudiced work, *Galileo Galilei und die römische Curie* (Stuttgart, 1876), sought to impeach the authenticity of a document of prime importance in the trial of 1633. He was victoriously answered by Domenico Berti, in *Il Processo originale di Galileo Galilei* (1876), and by M. de l'Épinois, with *Les pièces du procès de Galilée* (1877). The touching letters of Galileo's eldest daughter, Sister Maria Celeste, to her father were printed in 1864 by Carlo Arduini, in a publication entitled *La Primogenita di Galileo Galilei*.

The issue of a "national edition" of the Works of Galileo, in 20 large volumes, was begun at Florence in 1890. It includes a mass of previously inedited correspondence and other documents, collected by the indefatigable director, Antonio Favaro, among whose numerous publications on Galilean subjects may be mentioned: *Galileo e lo studio di Padova* (2 vols., 1883); *Scampoli Galileiani* (12 series, 1886-97); *Nuovi Studii Galileiani* (1891); *Galileo Galilei e Suor Maria Celeste* (1891). See also Th. Henri Martin, *Galilée, les droits de la science et la méthode des sciences physiques* (1868); *Private Life of Galileo* (by Mrs. Olney, 1870); J. J. Fahie, *Galileo; his Life and Work* (1903); J. A. C. Oudemans and J. Bosscha, *Galilée et Marius* (1903). The relations of Galileo to the church are temperately and ably discussed by F. R. Wegg-Prosser in *Galileo and his Judges* (1889), and in two articles published in the *American Catholic Quarterly* for April and July 1901. "La questione Copernicana dal primo al secondo processo di Galileo," *Civiltà cattolica*, anno 78 Vol. 2, p. 229-242, 331-345, 521-534, Vol. 3, p. 228-242 (Roma, 1927). (A. M. C.; X.)

GALION, a city of Crawford county, O., U.S.A., 75m. S.W. of Cleveland, at an altitude of 1,165 feet. It is on Federal highway 30 and is served by the Big Four and the Erie railways and by electric inter-urban lines. The population was 7,374 in 1920 and 7,674 in 1930. There are large railroad shops here and various manufacturing industries. Galion was laid out in 1831, incorporated as a borough in 1840 and chartered as a city in 1878.

GALIUM, a genus of plants of the madder family (Rubiaceae), comprising 250 species of world-wide distribution, mostly slender herbs. Of these, 10 species are found in Great Britain and about 60 in North America. Well-known examples are *G. Aparine* (cleavers, goose-grass), *G. boreale* (northern bedstraw), *G. verum* (lady's bedstraw) and *G. Mollugo* (hedge bedstraw, baby's-breath). See CLEAVERS; RUBIACEAE.

GALL, FRANZ JOSEPH (1758-1828), anatomist, physiologist and founder of phrenology (*q.v.*), was born at Tiefenbrunn near Pforzheim, Baden, on March 9, 1758. He studied at Baden, Strasbourg and Vienna, where in 1785 he began to practise as a physician. Gall gradually reached the conviction that the talents and dispositions of men are dependent upon the functions of the brain, and that they may be inferred with precision from the external appearances of the skull. In 1791 appeared his *Philosophisch-medizinische Untersuchungen über Natur u. Kunst im kranken u. gesunden Zustande des Menschen*. His phrenological lectures in Vienna begun in 1796 met with increasing success until in 1802 they were interdicted by the Government as dangerous to religion. In 1823 Gall made an unsuccessful attempt to lecture in London. He died in Paris on Aug. 22, 1828. (See PHRENOLOGY.)

See C. Blondel, *La Psycho-Physiologie de Gall* (1914).

GALL, the secretion of the liver known as "bile," the term being also used of the pear-shaped *diverticulum* of the bile-duct,

which forms a reservoir for the bile, more generally known as the "gall-bladder" (see LIVER). From the extreme bitterness of the secretion, "gall," like the Lat. *fel*, is used for anything extremely bitter, whether actually or metaphorically.

"Gall," meaning a sore or painful swelling, especially on a horse, may be derived from an early use of the word as meaning "poison." But in Romanic languages, the Fr. *galle*, Sp. *agalla*, a wind-gall or puffy distension of the synovial bursa on the fetlock joint of a horse, is derived from the Lat. *galla*, oak-apple, from which comes the English "gall," meaning an excrescence on trees caused by certain insects. (See GALLS.)

GALLABAT or GALABAT, called by the Abyssinians Mattemma, a town of the Anglo-Egyptian Sudan, in 13° N. 36° 12' E. It is built at the foot of a steep slope, on the left bank of a tributary of the Atbara. Gallabat lies 90 m. W. by N. of Gondar, the capital of Amhara, and being on the main route from Sennar to Abyssinia, is a trade centre of some importance. Pop. about 3,000.

GALLAIT, LOUIS (1810-1887), Belgian painter, was born at Tournay, Hainaut, on May 9, 1810. He studied at Tournay under Hennequin, and at Antwerp under Van Brée. He then settled in Paris, sending from there to the Belgian salons a series of important historical pictures. He was then urged to return to Brussels, where the latter half of his life was spent, and where he died on Nov. 20, 1887. Among his most famous works are: "The Abdication of Charles V." (1841), in the Brussels gallery; "The Last Honours paid to Counts Egmont and Horn by the Corporations of the Town of Brussels," now at Tournay; "The Death of Egmont," in the Berlin gallery; and the "Coronation of Baudouin, Emperor of Constantinople," painted for Versailles. Other pictures are in the Brussels gallery.

See Teichlin, *Louis Gallait und die Malerei in Deutschland* (1853); C. Lemonnier, *Histoire des beaux-arts en Belgique* (1881); J. Dujardin, *L'Art flamand* (1899).

GALLAND, ANTOINE (1646-1715), French Orientalist and archaeologist and first European translator of the *Arabian Nights*, was born on April 4, 1646, at Rollot (Somme). After working on a catalogue of the Oriental manuscripts at the Sorbonne, he made between 1670 and 1680 several visits to the Levant, studying historical monuments and inscriptions, and was made "antiquary to the King." While living at Caen he began the publication (12 vols., 1704-1717) of *Les mille et une nuits*, which is still the standard French translation. In 1701 Galland had been admitted into the Academy of Inscriptions, and in 1709 was appointed to the chair of Arabic in the Collège de France.

BIBLIOGRAPHY.—Besides a number of archaeological works, especially in the department of numismatics, he published a compilation from the Arabic, Persian and Turkish, entitled *Paroles remarquables, bons mots et maximes des orientaux* (1694, Eng. trans. 1795); and a translation from an Arabic manuscript, *De l'origine et du progrès du café* (1699). His *Contes et fables indiennes de Bidpai et de Lokman* was published (1724) after his death. Among his numerous unpublished mss. are a translation of the Koran and a *Histoire générale des empereurs turcs*. See *Journal d'A.G. pendant son séjour à Constantinople, 1672-1673*, ed. C. Schefer (1881); and *Journal parisien d'A. Galland, 1708-1715*, with his *Autobiography, 1646-1715* (1919).

GALLARATE, a town of Lombardy, Italy, in the province of Varese, 25 m. N.W. of Milan by rail. Pop. (1921), 9,577 (town), 21,894 (commune). The town is of mediæval origin. It is remarkable for its textile factories. Nearly a tenth of all Italian looms are to be found in and around it, producing annually from 70,000 to 80,000 metres of cotton cloth. It is also the centre of the machine embroidery trade.

GALLAS, MATTHIAS, COUNT OF CAMPO, DUKE OF LUCERA (1584-1647), Austrian soldier, first saw service in Flanders, and in Savoy with the Spaniards, and subsequently joined the forces of the Catholic League as captain. On the general outbreak of hostilities in Germany, he distinguished himself, at Stadtlohn (1623) and elsewhere. In 1630 he was serving as *General-Feldwachtmeister* under Collalto in Italy, and was mainly instrumental in the capture of Mantua. Made count of the Empire for this service, he returned to Germany for the campaign against Gustavus Adolphus, covered Bohemia against the Swedes in 1631-1632, and served at the Alte Veste and also at Lützen

against Bernhard of Saxe-Weimar, rising to be lieutenant-general in the Emperor's own army. He was one of the chief conspirators against Wallenstein, and after the tragedy of Eger was appointed to the command of the army which Wallenstein had formed and led. At Nördlingen (Aug. 23, 1634) in which the army of Sweden was almost annihilated, Gallas commanded the victorious Imperialists. In northern Germany, where he commanded against the Swedish general Banér in 1637 and 1638, and in later crises he was unsuccessful. He resigned his command, and died in 1647 at Vienna. His army had earned a reputation as the most cruel and rapacious force even in the Thirty Years' War, and his *Merode Brüder* have survived in the word *marauder*.

GALLAS, or more correctly **GALLA**, a powerful Hamitic people of eastern Africa, scattered over the central parts of Abyssinia to the neighbourhood of the river Sabaki in Kenya Colony. The name "Galla" or "Gala" appears to be an Abyssinian nickname, unknown to the people, who call themselves *Im' Orma*, "sons of men" or "sons of Orma," an eponymous hero. In Shoa (Abyssinia) the word is connected with the river Gála in Guragie, on the banks of which a great battle is said to have been fought between the Galla and the Abyssinians. Arnaud d'Abbadie says that the Abyssinian Muslims recount that, when summoned by the Prophet's messenger to adopt Islam, the chief of the Galla said "No,"—in Arabic *kāl* (or *gāl*) *la*,—and the Prophet on hearing this said, "Then let their very name imply their denial of the Faith."

They appear to have occupied the southern part of their present territory since the 16th century. The tribes near Mount Kenya are stated to go on periodical pilgrimages to the mountain, making offerings to it as if to their mother. As a geographical term Galla-land is now used mainly to denote the south-central regions of the Abyssinian empire, the country in which the Galla are numerically strongest. There is no sharp dividing line between the territory occupied respectively by the Galla and by the Somali.

The Galla are members of the eastern Hamitic family with their neighbours, the Somali, the Afars (Danakil) and the Abyssinians. There is a strain of Negro blood in the Galla, who are "a wonderfully handsome race, with high foreheads, brown skins and soft wavy hair quite different from the wool of the Bantus." As a rule their features are quite European. Their colour is dark brown, but many of the northern Galla are of a coffee and milk tint. They are fine nosed with long heads.

The Galla are for the most part nomadic pastoralists, though in Abyssinia they have some agricultural settlements. Their dwellings, circles of rough stones, roofed with grasses, are generally built under trees. Their wealth consists chiefly in cattle and horses. The ordinary food consists of flesh, blood, milk, butter and honey. A rude system of bee-keeping is in vogue, and the husband who fails to furnish his wife with a sufficient supply of honey may be excluded from all conjugal rights. In the south monogamy is the rule, but in the north the number of a man's wives is limited only by his wealth. Marriage forms are numerous. The dual organization into exogamous moieties is a special feature. Each tribe has its chief, who is the only merchant for his people, but in all public concerns must take advice of the fathers of families in council. In general they worship a supreme god Waka, and the subordinate god and goddess Oglieh and Atetieh, whose favour is secured by sacrifices of oxen and sheep. They say that at a certain time of the year Waka leaves them and goes to attend to the wants of their enemies the Somali, whom also he has created. Some have been converted to Mohammedanism and are very bigoted. In the north, under Abyssinian rule, a kind of superficial Christianization has taken place, but to all practical intents paganism is still in force. The serpent is wor-

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY
BORAN CHIEF OF THE GALLAS TRIBE

shipped, the northern Galla believing that he is the author of the human race. There is a belief in were-wolves (*buda*), and the northern Galla have sorcerers who terrorize the people. Though cruel in war, all Galla respect their pledged word. They are armed with a lance, a two-edged knife, and a shield of buffalo or rhinoceros hide.

Among the more important tribes in the south (the name in each instance being compounded with Galla) are the Ramatta, the Kukatta, the Baöle, the Aurova, the Wadjole, the Ilani, the Arrar and the Kanigo Galla; the Borani, a very powerful tribe, may be considered to mark the division between north and south; and in the north we find the Amoro, the Jarso, the Toolama, the Wollo, the Ambassil, the Aijjo, and the Azobo Galla.

See C. T. Beke, "On the Origin of the Gallas," in *Trans. of Brit. Assoc.* (1847); J. Ludwig Krapf, *Travels in Eastern Africa* (1860); and *Vocabulary of the Galla Language* (London, 1842); Arnaud d'Abbadie, *Douze Ans dans la Haute-Éthiopie* (1868); Ph. Paulitschke, *Ethnographie Nord-Ost-Afrikas; Die geistige Kultur der Dan'akil, Galla u. Somäl* (Berlin, 1896); P. M. de Salviac, *Les Galla* (Paris, 1901); E. C. Foot, *A Galla-English Dictionary* (Cambridge, 1913); A. W. Hodson and C. H. Walker, *An Elementary and Practical Grammar of the Galla Language* (1922).

GALLATIN, ALBERT (1761-1849), American statesman, was born in Geneva, Switzerland, on Jan. 29, 1761, of an old and noble family. His father died in 1765, his mother five years later, and he was cared for by his grandparents and by a Mlle. Pictet, an intimate friend of his mother. In 1779 he graduated with honour from the college in Geneva, and, giving up fortune and social position, slipped away from home and embarked for America despite the wishes of his relatives. In July 1780 Gallatin and his friend Henri Serre (d. 1784) landed in Massachusetts and entered business; but, conditions in the country being unsettled, they failed. For a time Gallatin taught French in Harvard college, then removed to the backwoods of Pennsylvania and Virginia, where he engaged in land speculation.

Beginning his service in Congress in Dec. 1795, Gallatin immediately made himself a conspicuous figure and before his first term was over became the Federalists' most dangerous opponent in Congress, and they attacked him not only politically but personally, for at this time they were opposed to the French Revolution and so resented Gallatin's ancestry. Gallatin became the financier of his party and succeeded in inaugurating the committee on finance, which is now the ways and means committee, and fought for his cardinal doctrines of simplicity and economy in government. In debate (1796) over the Jay Treaty he defended the constitutional right of the House to consider treaties, admitting that the President and Senate had the right to make treaties, but maintaining that the House could refuse to pass the finances to carry them out. When in May 1797 President Adams asked for appropriations for war because of France's refusal to receive American ambassadors, Gallatin struggled successfully to keep down appropriations and to prevent the three United States frigates from being equipped for sea. He continued his opposition to a strong navy, the mainspring of Washington's foreign policy, and in the following year helped to defeat a resolution for the preparation of 16 armed vessels and a declaration of war against France. He also opposed (Jan. 1798) commercial treaties and diplomatic intercourse, maintaining that all political intercourse should be gradually given up, and commercial intercourse protected by the consular system.

The greatest period of Gallatin's career in Congress was in 1798, when, after the publication of the famous X.V.Z. despatches had inflamed the people against France and given the Federalists control of the Government, he was attacked as a French agent, and Jefferson believed that the Sedition bill was intended to drive him from office. However, the strong measures of the Federalists shocked the country, and the Republicans carried the elections of 1800. Gallatin led his party in the contest in the House of Representatives, which elected Jefferson over Burr.

When Jefferson became President (1801) he made James Madison secretary of State and Gallatin secretary of the Treasury. Gallatin made few changes in Hamilton's arrangements, but he did seek for simplicity of Government and the extinction of the

public debt. He preferred to bribe the Barbary pirates to spending the money to subdue them, wished to avoid commercial warfare at all costs, and thought that (1803) the Government should seize east Louisiana and west Florida. Despite the fact that he could not reduce naval expenditures as he wished, he achieved his goal and, despite the Louisiana Purchase (1803), reduced the public debt by \$14,260,000 within six years and acquired a surplus. However, relations with Europe became strained and in Dec. 1807 Jefferson put into execution the embargo, though Gallatin, recognizing the consequences, declared, "I prefer war to a permanent embargo," and reported that a continuous embargo would necessitate a loan while war would not. The embargo proved futile and was repealed (1809) in favour of the non-intercourse act, after causing a deficiency in the Treasury, and Jefferson retired to be succeeded by Madison.

Madison had regarded Gallatin as his successor as secretary of State; but a cabal in the Senate opposed him and Gallatin was left as secretary of the Treasury. The cabal continued to attack him, and in addition he lost the support of Pennsylvania and of the House.

In June 1812 war was declared against England. This shattered Gallatin's cherished schemes, for he believed war was fatal to prosperity and progress; like Jefferson, he had thought Government could be carried on upon *a priori* principles, resting on the assumed perfectness of human nature. However, he put the finances in the best order he could, and set himself to attain an early peace. With this end in view he grasped at the proffered mediation of Russia, and with Madison's permission sailed with James A. Bayard for Europe in May 1813 without resigning as secretary of the Treasury. Great Britain refused to negotiate through Russia, and in addition Gallatin heard that the Senate had refused to confirm his appointment because he was still secretary of the Treasury. He sent in his resignation and worked unofficially until his second appointment was confirmed. In the meantime Great Britain had expressed its willingness to proceed with direct negotiations. The English and American commissioners finally met at Ghent, Gallatin, Bayard and John Quincy Adams, who was minister to Russia, being supplemented by Jonathan Russel and Henry Clay. In the tedious discussions which followed, Gallatin played the leading part, preserving peace among his colleagues and establishing a reputation as a diplomatist. He refused to push the American claim to Florida, but stood firmly on other points with his colleagues. Peace rewarded them; the treaty was signed on Dec. 24, 1814. After visiting Geneva for the first time since his boyhood, and assisting in negotiating a commercial convention (1815) with England by which discriminating duties were abolished, Gallatin returned to America in July 1815.

While still in Europe he had been asked by Madison to become minister to France; this appointment he accepted in Jan. 1816, and adhered to his acceptance in spite of his being asked in April 1816 to serve once more as secretary of the Treasury. He remained in France for the next seven years, and in 1818 assisted Richard Rush, then United States minister in London, in negotiating a commercial convention.

In June 1823 he returned to the United States, where he found himself in the bitter struggle then in progress for the Presidency. His favourite candidate was his personal friend, William H. Crawford, with whom he consented in May 1824 to stand for the vice-presidency. The contest was bitter and full of intrigue. Martin Van Buren, then in the Crawford interest, came to the conclusion that Gallatin, by his foreign origin, weakened the ticket, and in October Gallatin retired from the contest. The election was thrown into the House, and resulted in the choice of John Quincy Adams, who in 1826 drew Gallatin from his retirement and sent him as minister to England, where he avoided an open breach on the delicate question of the north-east boundary of the United States by referring it to the arbitration of the king of the Netherlands. In Nov. 1827 he once more returned to the United States and bade farewell to public life.

Taking up his residence in New York, he was in 1832-39 president of the National Bank (afterwards the Gallatin Bank) of New York. By writing his *Synopsis of the Indian Tribes within*

the United States East of the Rocky Mountains and in the British and Russian Possessions in North America (1836), and by founding the American Ethnological Society of New York in 1842, he earned the title of "Father of American Ethnology." He died in Astoria, L.I., on Aug. 12, 1849.

BIBLIOGRAPHY.—*The Writings of Albert Gallatin*, edited by Henry Adams, as published at Philadelphia in 1879. With this was published an excellent biography, *The Life of Albert Gallatin*, also by Henry Adams; another good biography is John Austin Stevens' "Albert Gallatin" (Boston, 1884) in the *American Statesmen* series. See also *The Diary of James Gallatin* (1915); vol. iii. of *The American Secretaries of State* (Bemis ed., 1927); L. M. Sear's *Jefferson and the Embargo* (Durham, N.C., 1927); H. W. Temperley's *The Foreign Policy of Canning* (1925); *The Cambridge History of British Foreign Policy* (vol. iii.), edited by A. W. Ward and G. P. Gooch.

GALLAUDET, THOMAS HOPKINS (1787-1851), American educator of the deaf and dumb, was born in Philadelphia, Pa., of French Huguenot ancestry, on Dec. 10, 1787. He graduated at Yale in 1805, was a tutor there, studied theology at Andover, but determined to devote his life to the education of deaf-mutes. He visited Europe and studied the methods of the abbé Sicard in Paris, and of Thomas Braidwood and his successor Joseph Watson in Great Britain. Returning to the United States in 1816, he established at Hartford, Conn., a school for deaf-mutes, in support of which Congress, largely through the influence of Henry Clay, made a land grant. Gallaudet presided over the school with great success until ill-health compelled him to retire in 1830. It was the first institution of the sort in the United States. He died at Hartford on Sept. 10, 1851.

His son, THOMAS GALLAUDET (1822-1902), was born in Hartford, on June 3, 1822. After graduating at Trinity college in 1842, he entered the Protestant Episcopal ministry, settled in New York city, and there, in 1852, organized St. Anne's Episcopal church, where he conducted services for deaf-mutes. In 1872 he became general manager of the church mission to deaf-mutes, and in 1885 founded the Gallaudet home for deaf-mutes, near Poughkeepsie, New York. He died on Aug. 27, 1902.

Another son, EDWARD MINER GALLAUDET (1837-1917), was born at Hartford, Conn., on Feb. 5, 1837, and graduated at Trinity college in 1856. After teaching for a year in the institution founded by his father at Hartford, he organized and took charge of the Columbia Institution for the deaf and dumb in Washington, District of Columbia. This institution was the first to furnish actual collegiate education for deaf-mutes. After 1911 Gallaudet was president emeritus of the college. He died on Sept. 26, 1917.

BIBLIOGRAPHY.—Henry Barnard (1852), Heman Humphrey (1857) and E. M. Gallaudet (1888) have all written biographies of Thomas Hopkins Gallaudet, the last being the best. For his son Thomas see *A Memorial Tribute* (1902).

GALLE or **POINT DE GALLE**, a town and port of Ceylon on the south-west coast. Galle is hardly noticed in the native chronicles before 1267, and Ibn Batuta, in the middle of the 14th century, distinctly states that Kali—that is, Galle—was a *small* town. It was not till the period of Portuguese occupation that it rose to importance. The opening of the Suez canal in 1869, and the construction of a breakwater at Colombo, leading to the transfer of the mail and most of the commercial steamers to the capital of the island, seriously diminished the prosperity of Galle. The export trade is chiefly represented by coco-nut oil, rubber, coir yarn, fibre, rope and tea. Both the export and import trade for the district, however, now chiefly passes through Colombo. Pop. (1921) 39,073.

GALLEN-KALLELA, AKSELI VALDEMAR (1865-), Finnish painter, was born on April 26, 1865, at Pori. He established himself in 1884 in Paris. He is best known for his symbolic scenes from the Kalevala, for his landscapes, especially snow scenes, and for some admirable portraits, notably one of Gorki. He also executed work in black and white. His illustrations to *Seitsemän Veljestä*, by Aleksis Kivi (1906-07), are well composed and imaginative.

GALLEON, the name formerly given to large ships of war used by the Spaniards, having three or four decks armed with batteries. The name was in later times applied to Spanish merchant vessels.

GALLEY, a long single or half-decked vessel of war, with low free-board, propelled primarily by oars or sweeps, but also having masts for sails. The word is used generally to refer to the ancient war vessels of Greece and Rome of various types, whose chief propelling power was the oar or sweep, but its more specific application is to the mediaeval war vessel which survived in the navies of the Mediterranean sea-powers after the general

FROM "DON JUAN DE AUSTRIA ALS ADMIRAL DER HEILIGEN LIGA UND DIE SCHLACHT BEI LEPANTO" (CARL GEROLD)

GALLEASS AND GALLEON, ILLUSTRATING THEIR DIFFERENCES

A galleass was first a large galley and then became a sailing ship, while a galleon, standing high out of the water and having several decks, was used by the Spaniards to transport treasure from their colonies

adoption of the larger many-decked ship of war, propelled solely by sail-power. Lepanto (1571) was the last great naval battle in which the galley played the principal part. It became the custom among the Mediterranean powers to sentence condemned criminals to row in the war galleys of the state. Traces of this in France can be found as early as 1532, but the first legislative enactment is in the *Ordonnance d'Orléans* of 1561. In 1564 Charles IX. forbade the sentencing of prisoners to the galleys for less than ten years. The galley-slaves were branded with the letters GAL. At the end of the reign of Louis XIV. the use of the galley for war purposes had practically ceased, but the corps of the galleys was not incorporated with the navy till 1748. The headquarters of the galleys and of the convict rowers (*galériens*) was at Marseilles. The majority of these latter were brought to Toulon, the others were sent to Rochefort and Brest, where they were used for work in the arsenal. At Toulon the convicts remained in chains on the galleys, which were moored as hulks in the harbour. Shore prisons were, however, provided for them, known as *bagnes*, baths, a name given to such penal establishments first by the Italians (*bagno*), and said to have been derived from the prison at Constantinople situated close by or attached to the great baths there. The name *galérien* was still given to all convicts, though the galleys had been abandoned, and it was not till the French Revolution that the hated name with all it signified was changed to *forçat*. In Spain *galera* is still used for a criminal condemned to penal servitude. (See also SHIP.)

The word "galley" is also applied to an oblong receptacle or tray, usually of brass, but sometimes of wood or zinc, having upright sides and used to hold type which has been set. Galleys vary in width and length depending upon the use to which they are put. One form, known as a slice galley, has a sliding bottom. The word is also used elliptically for a proof from type on a galley (in full a galley proof).

A vivid account of the life of galley-slaves in France is given in Jean Marteilhes's *Memoirs of a Protestant*, translated by Oliver Goldsmith (new edition, 1895), which describes the experiences of one of the Huguenots who suffered after the revocation of the edict of Nantes.

GALLIA CISALPINA, that portion of northern Italy north of Liguria and Umbria and south of the Alps which was inhabited by various Celtic and other peoples, of whom the Celts were in continual hostility to Rome and rendered assistance to Hannibal. In early times it was bounded on the south by Liguria and the Aesis; Sulla readjusted the boundaries and in Caesar's time the south-east boundary was the Rubicon. (See Mommsen, *Hist. of Rome*, Eng. trans., bk. iv. c. 10.) For the early Celtic and other peoples and the later history of the district see ITALY: Ancient, and Rome: History, Ancient.

GALLIARD. An old dance tune of lively character, char-

acteristic of 16th and 17th century music, forming a contrast to the stately pavan which generally preceded it.

GALLIC ACID, the *acidum gallicum* of pharmacy, was discovered by K. W. Scheele. It occurs in sumach, dividivi, Chinese tea, pomegranate, root-bark and gall-nuts, being present in the last of these to the extent of 3%. A paste of powdered gall-nuts and water is allowed to remain exposed to air for several weeks at 20–25° C, the mould on the surface of the material being removed from time to time. The tannins present are slowly decomposed by the moulds (*Penicillium glaucum* and *Aspergillus niger*), and a more rapid and quantitative hydrolysis is effected by the use of a pure culture of *Aspergillus gallomyces*. Finally the paste is boiled with water, and the hot, filtered solution, on cooling, yields crude gallic acid, which is purified by recrystallization from boiling water. The acid is soluble in 100 parts of cold and three parts of boiling water from which it crystallizes in silky needles or prisms containing water (1 mol. H₂O) of crystallization; it loses this water at 120° C and melts at 222–224° C. When heated to higher temperatures it loses carbon dioxide and yields pyrogallol or pyrogallol acid, the well known photographic developer. It is inodorous but has an astringent and acidic taste. With ferric salts it gives a deep blue colour, and with ferrous salts, on exposure to air it furnishes blue-black ferrosiferic gallate. (See INK.)

Gallic acid has the formula (HO)₃C₆H₂CO₂H, and is 3,4,5-trihydroxybenzoic acid. It is used in the manufacture of several colouring matters, anthragallol, anthracene brown, galloxyaniline, galloflavin, gallamin blue. Methyl gallate (m.p. 202° C) is employed in the production of prune. (See DYES, SYNTHETIC.) Basic bismuth gallate, C₇H₅O₅Bi.H₂O, obtained from gallic acid and bismuth nitrate in presence of potassium nitrate and acetic acid, is a crystalline yellow powder, used as an inodorous antiseptic under the name *dermatol* in substitution for iodoform.

(G. T. M.)

GALLICANISM, a name for various theories maintaining that both the church and the state in France had ecclesiastical rights of their own, independent and exclusive of the jurisdiction of the pope. These theories were developed in opposition to ultramontanist (q.v.). As regards the church, it was held that infallible authority was committed to pope and bishops jointly; the pope decided in the first instance, but his judgments must be tacitly or expressly confirmed by the bishops before they had the force of law. And as regards the state, Gallicanism goes back to the protests raised against the theocratic pretensions of the mediaeval popes. They claimed that they, as vicars of Christ, had the right to interfere in the temporal concerns of princes, and even to depose sovereigns of whom they disapproved. Gallicanism answered that kings held their power directly of God; hence their temporal concerns lay altogether outside the jurisdiction of the pope. During the troubles of the Reformation era, when the papal deposing power threatened to become a reality, the Gallican theory became of great importance. It was incorporated by Bossuet in a solemn Declaration of the French Clergy, made in 1682. This document lays down: (1) that the temporal sovereignty of kings is independent of the pope; (2) that a general council is above the pope; (3) that the ancient liberties of the Gallican Church are sacred; (4) that the infallible teaching authority of the church belongs to pope and bishops jointly. This declaration led to a violent quarrel with Rome, and was officially withdrawn in 1693, though its doctrines continued to be largely held. In 1802 Napoleon contented himself by embodying Bossuet's declaration textually in a statute. Long before his time, however, the issue had been narrowed down to determining exactly how far the pope should be allowed to interfere in French ecclesiastical affairs. Down to the repeal of the Concordat in 1905 all French governments continued to uphold two of the ancient "Gallican Liberties." The secular courts took cognizance of ecclesiastical affairs whenever the law of the land was alleged to have been broken; and papal bulls were not allowed to be published without the leave of the state. See FEBRONIANISM; ULTRAMONTANISM.

GALLI-CURCI, AMELITA (1889–), Italian-American coloratura soprano, was born at Milan, Italy, on Nov. 18,

1889, of Italian and Spanish parentage. After a general education in the schools of Milan she entered the Royal Conservatory in the same city and studied piano and harmony. As a vocalist, however, she was self-taught. Her operatic début was at Rome in 1909 as Gilda in Verdi's *Rigoletto*. She later toured the smaller cities in Italy, appeared at Barcelona and Madrid in Spain, and had several successful seasons in South America, Cuba and Mexico. Her fame in these countries was immediate, but she was almost unknown in the United States when in 1916 she was engaged by the Chicago Opera Association. Her Chicago début on Nov. 18, 1916, was again as Gilda in *Rigoletto*. She was re-engaged for four seasons. On Jan. 27, 1918, she appeared for the first time in New York city in the title rôle of Meyerbeer's *Dimorah* at the Lexington opera house. She joined the Metropolitan Opera Company in 1921, opening the season that year as Violetta in *La Traviata*. Besides the rôles mentioned her favourite repertoire includes the rôles of Juliette in *Romeo et Juliette*, Lucia in *Lucia de Lammermoor*, Mimi in *La Bohème* and Leïla in Bizet's *Pearl Fishers*. Her voice reaches astonishing heights with tone smooth, warm and well rounded. It is also a voice of great fluency, enabling its owner to sing many intricate rôles with simplicity and naturalness. See autobiographical articles in *The Ladies Home Journal* (Feb., Mar. and May, 1924).

GALLIENI, JOSEPH SIMON (1849-1916), French general and statesman, is immortalized by his vital share in the strategically decisive victory of the Marne (*q.v.*). He was born at Saint-Béat, Haute-Garonne, on April 24, 1849. He left the military academy of Saint-Cyr in July 1870 as second lieutenant in the marines, becoming lieutenant in 1873 and captain in 1878. He saw service in the Franco-German War, and from 1877 to 1881 took an important part in the explorations and military expeditions by which the French dominion was extended in the basin of the upper Niger. In March 1881 he obtained a treaty from Ahmadu, almany of Segu, giving the French exclusive rights of commerce on the upper Niger, for which he received the gold medal of the Société de Géographie. From 1883 to 1886 Gallieni was stationed at Martinique. On June 24, 1886 he became lieutenant colonel, and on Dec. 20, governor of Upper Senegal. He obtained several successes against Ahmadu in 1887, and compelled Samory to agree to a treaty abandoning the left bank of the Niger. (See *SENEGAL: History*). In 1888 he was made an officer of the Legion of Honour. In 1891 he was promoted colonel, and from 1893 to 1895 he commanded the second military division of Tongking.

In 1896 Madagascar was made a French colony, and Gallieni was appointed resident-general (afterwards governor-general) and commander-in-chief. He completed the subjugation of the island, which was in revolt against the French. He also destroyed the political supremacy of the Hovas and restored the autonomy of the other tribes. The application of the French customs, and other similar measures disastrous to British and American trade, were matters for which Gallieni was not wholly responsible. His policy was directed to the development of the economic resources of the island and was conciliatory towards the non-French European population. He also secured for the Protestants religious liberty. In 1905, when he resigned the governorship, Madagascar enjoyed peace and considerable prosperity. In 1906 General Gallieni was appointed to command the XIV. Army Corps and the military government of Lyons.

Gallieni had reached the age limit for retirement in April 1914, but was retained on the active list without duty, and on mobilization in 1914 he was notified that in case of need he would be the successor of the commander-in-chief Joffre—who had been appointed on his recommendation. On Aug. 26, in face of the imminent approach of the invading German armies, he was appointed military governor of Paris. He took energetic steps for the defence of the capital, abandoned by the government, and in addition to the garrison Maunoury's VI. Army was placed under his control. Visualizing his rôle as one not merely of passive defence, his close watch on the German armies, and his military intuition, led him to see and seize the opportunity for a counterstroke. From air information received during Sept 3, Gallieni concluded that

the German forces marching on Paris had inclined to the south-east, thus offering him an exposed flank. He convinced Joffre first of the opportunity, and ultimately that the attack ought to be made on the line of the Ourcq north of the Marne. On the night of Sept. 4 Joffre issued orders for a general counter-offensive on Sept. 6. The outcome was the retreat of the right wing and with it the turning of the tide of the war. These events are described under *Marne, First Battle of*, and *World War*. Controversy has raged over the distribution of credit for this achievement, but it is at least indisputable that the first perception of the opportunity and the initiative to seize it were Gallieni's. With the German retreat the operations passed out of the zone over which Gallieni held command.

Joffre showed no haste to offer Gallieni a more active command, but on Oct. 29, 1915 he became minister of war in Briand's cabinet. In this office he sought to bring about reforms in the administration and higher command, while defending Joffre against the growing storm of criticism. The German attack on Verdun (*q.v.*), however, revealed a serious failure of foresight on the part of the higher command. Gallieni then proposed an extensive scheme of reorganization for the better co-ordination of the whole war-effort of France. In the military sphere this involved a clearer separation between the strategical direction and the administration of resources, and to implement it Joffre was to be brought back to Paris as commander-in-chief of all the French armies while de Castelnau (*q.v.*) was placed in executive command of the field armies on the western front. Finding that his colleagues in the Cabinet shrank from the risk of causing a political crisis, Gallieni resigned, ostensibly for reasons of ill-health, on March 16, 1916. The pretext was, in part, justified, for in order to fit himself for active service he underwent an operation—without taking the preliminary rest that had been prescribed. The first operation was not successful and after a second he died at Versailles on May 27, 1916. His body was given a state funeral, and lay for a time under the dome of the Invalides. He was buried at St. Raphael. On April 21, 1921 the dignity of marshal of France was conferred on him posthumously.

He published *Mission d'exploration du Haut-Niger, 1879-1881* (1885); *Deux Campagnes au Soudan français* (1891); *Trois Colonnes au Tonkin* (1899); *Rapport d'ensemble sur la situation générale de Madagascar* (1899); and *Neuf ans à Madagascar* (1908).

GALLIENUS, PUBLIUS LICINIUS EGNATIUS, Roman emperor from A.D. 260 to 268, son of the emperor Valerian, was born about 218. From 253 to 260 he reigned conjointly with his father, during which time he gave proof of military ability. But when his father was taken prisoner by Shapur I. of Persia, in 260, Gallienus made no effort to obtain his release, or to withstand the incursions of the invaders who threatened the empire from all sides. He deprived the senators of their military and provincial commands, which were transferred to equites. During his reign the empire was ravaged by a pestilence, and the chief cities of Greece were sacked by the Goths. His generals rebelled against him in almost every province of the empire, and this period of Roman history came to be called the reign of the Thirty Tyrants. Gallienus was killed at Mediolanum by his own soldiers while besieging Aureolus, who was proclaimed emperor by the Illyrian legions. His sons Valerianus and Saloninus predeceased him.

Life by Trebellius Pollio in *Script. Hist. Aug.*; on coins see articles in *Numism. Zeit.* (1908) and *Riv. ital. d. num.* (1908).

GALLIERA, MARIE, DUCHESS OF (1812-1888), daughter of the Marquis di Brignola, a Sardinian, was born in Ghent and died in Paris on Dec. 9, 1888. She married the railway contractor, Rafael Ferrari (d. 1876) upon whom the pope conferred the title of duke of Galliera. The duchess acquired notoriety by her colossal gifts of money to Paris and to Genoa. She bequeathed her palatial residence in Paris to the Austrian-Hungarian embassy.

GALLIFFET, GASTON ALEXANDRE AUGUSTE, MARQUIS DE, Prince de Martignes (1830-1909), French general, was born in Paris on Jan. 23, 1830. He entered the army in 1848; served with distinction at the siege of Sevastopol in 1855, in the Italian campaign of 1859, and in Algeria in 1860, after which for

a time he served on the personal staff of the emperor Napoleon III. He displayed great gallantry as a captain at the siege and storm of Puebla, in Mexico, in 1863, when he was severely wounded. He went again to Algeria in 1864, took part in expeditions against the Arabs, returned to Mexico as lieutenant-colonel, and, after winning further distinction, became, in 1867, colonel of the 3rd Chasseurs d'Afrique. In the Franco-German War of 1870-71 he commanded this regiment in the Army of the Rhine, until promoted to be general of brigade on Aug. 30. At the battle of Sedan he led the brigade of Chasseurs d'Afrique in the heroic charge of Gen. Margueritte's cavalry division, which extorted the admiration of the old king of Prussia. Made prisoner of war at the capitulation, he returned to France during the siege of Paris by the French army of Versailles, and commanded a brigade against the Communists. In the suppression of the Commune he earned a reputation for severity, which, throughout his later career, and in all his efforts to improve the French army, made him the object of unceasing attacks in the press and the Chamber of Deputies. In 1872 he took command of the Batna subdivision of Algeria, and commanded an expedition against El Golea, surmounting great difficulties in a rapid march across the desert, and inflicting severe chastisement on the revolted tribes. Promoted general of division in 1875, he successively commanded the 15th Infantry Division at Dijon, the IX. Army Corps at Tours, and in 1882 the XII. Army Corps at Limoges. In 1885 he became a member of the Conseil Supérieur de la Guerre. He retired from the active list in 1894. Gallifet was war minister (June 22, 1899-May 29, 1900) in M. Waldeck-Rousseau's cabinet. He died on July 8, 1909.

See L. Thomas, *Le général Gallifet* (1910).

GALLIFORMES, an order of birds, comprising the gamebirds (see ORNITHOLOGY, PHEASANT, PARTRIDGE, GROUSE, FOWL, PEACOCK, etc.).

GALLINULE, the name applied to several aquatic birds of the family *Rallidae*, especially to two North American species, the purple gallinule (*Ionornis martinicus*), which ranges over tropical and sub-tropical America north to Illinois and South Carolina; and the Florida gallinule (*Gallinula galeata*), which breeds north to Maine, Quebec and central California, wintering from southern California and the Gulf States southwards. Both species are about 13 in. long and resemble the moorhen (*q.v.*) in appearance and habits.

GALLIO, IUNIUS ANNAEUS (originally LUCIUS ANNAEUS NOVATUS), son of the rhetorician L. Annaeus Seneca and the elder brother of L. Annaeus Seneca the philosopher, was born at Corduba (Cordova) about the beginning of the Christian era. At Rome he was adopted by L. Iunius Gallio, a rhetorician. Both Seneca and Statius speak of his charm of disposition. It is probable that he was banished to Corsica with his brother, and that both returned to Rome when Agrippina selected Seneca to be tutor to Nero. For a few years Gallio was proconsul of the newly constituted senatorial province of Achaëa. During his tenure of office (in A.D. 53) he dismissed the charge brought by the Jews against the apostle Paul (Acts xviii.). His behaviour on this occasion ("But Gallio cared for none of these things") shows the impartial attitude of the Roman officials towards Christianity in its early days. He survived his brother Seneca, but was subsequently put to death by order of Nero (in 65) or committed suicide.

Tacitus, *Annals*, xv. 73; Dio Cassius lx. 35, lxii. 25; Sir W. M. Ramsay, *St. Paul the Traveller*, pp. 257-261; art. in *Hastings' Dict. of the Bible* (H. Cowan).

GALLIPOLI (anc. *Callipolis*), seaport town and episcopal see of Apulia, Italy, province of Lecce, 31 m. S. by W. of Lecce by rail, 46 ft. above sea-level. Pop. town, 8,019; commune, 12,715. It is situated on a rocky island in the Gulf of Taranto but is united to the mainland by a bridge, protected by a castle constructed by Charles I. of Anjou. The handsome cathedral dates from 1629.

See G. Gigli, *Gallipoli, Otranto e dintorni* (Bergamo, Arti Grafiche, 1912), well illustrated.

GALLIPOLI (Turk. *Gelibolu*, anc. *Καλλιπολις*), a seaport and city of European Turkey, in the vilayet of Adrianople; at the

north-western extremity of the Dardanelles, on a narrow peninsula 132 m. W.S.W. of Constantinople, and 90 m. S. of Adrianople, in 40° 24' N. and 26° 40' 30" E. Pop. (1905) about 25,000. Nearly opposite is Lapsaki on the Asiatic side of the channel, which is here about 2 m. wide. Gallipoli is still largely in ruins as a result of bombardment during the war of 1914-1918. There are several mosques, none of them remarkable, and many interesting Roman and Byzantine remains, especially a magazine of the emperor Justinian (483-565), a square castle and tower attributed to Bayezid I. (1389-1403), and some tumuli on the south, popularly called the tombs of the Thracian kings. It has two good harbours. From its position as the key of the Dardanelles, it was occupied by the allied French and British armies in 1854. Then the isthmus a few miles north of the town, between it and Bulair, was fortified with strong earthworks by English and French engineers, mainly on the lines of the old works constructed in 1357. These fortifications were renewed and enlarged in January 1878, on the Russians threatening to take possession of Constantinople. The peninsula thus isolated by the fortified positions has the Gulf of Saros on the N.W., and extends some 50 m. S.W. The guns of Gallipoli commanded the Dardanelles just before the strait joins the Sea of Marmora.

The district (*sanjak*) of Gallipoli is exceedingly fertile and well adapted for agriculture. It has about 100,000 inhabitants, and comprises four *kazas* (cantons), namely (1) Maidos; (2) Keshan, lying inland north of Gallipoli, near which are lignite mines; (3) Myriofyto; and (4) Sharkeui (Peristeri) on the coast of the Sea of Marmora. Copper ore and petroleum are worked at Sharkeui, and the neighbourhood formerly produced wine that was highly esteemed and largely exported to France for blending. The line of railway between Adrianople and the Aegean Sea has been prejudicial to the transit trade of Gallipoli. Steamers to and from Constantinople call regularly. In 1904 the total value of the exports was £80,000. Live stock, principally sheep, pass through Gallipoli in transit to Constantinople and Smyrna.

For an account of the Gallipoli campaign in the World War, see DARDANELLES CAMPAIGN.

GALLIPOLIS, a city of southern Ohio, U.S.A., on the Ohio river, room. S.E. of Columbus; the county seat of Gallia county. It is served by the Hocking Valley, the New York Central, and (at Gallipolis, West Virginia) the Baltimore and Ohio railways and by river steamers. The population was 6,070 in 1920 and 7,106 in 1930. The city is a shipping and trading centre for a rich agricultural and coal-mining region, and it has sundry manufacturing industries. A U.S. Marine hospital and a State hospital for epileptics are situated there. Gallipolis was settled in 1790 by colonists from France, who had received worthless deeds to lands in Ohio from the Scioto Land company. This company arranged in 1787 with the Ohio company for the use of 4,000,000 ac., on which the Ohio company merely had an option. Its unbusiness-like methods and the dishonesty of its agents in France caused its collapse in 1790. Meanwhile 150,000 ac. had been sold in France to prospective colonists, who in Oct. 1790, after a detention of two months at Alexandria, Va., arrived on the site of Gallipolis. In 1794 the attorney-general of the United States decided that all rights in the 4,000,000 ac. were legally vested in the Ohio company, and in 1795 the Ohio company sold to the French settlers at \$1.25 an acre the land they occupied and adjacent improved lots, and the United States granted to them 24,000 ac. in the southern part of what is now Scioto county. Gallipolis was incorporated as a village in 1842, as a city in 1865.

GALLITZIN, DEMETRIUS AUGUSTINE (1770-1840), American Roman Catholic priest, called "The Apostle of the Alleghenies," was born at The Hague on Dec. 22, 1770. His father, Dimitri Alexeievich Gallitzin, Russian ambassador to Holland, was an intimate friend of Voltaire and a follower of Diderot; so, too, for many years was his mother, until a severe illness in 1786 led her back to the Roman Catholic church, in which she had been reared. At the age of 17 he, too, became a member of that church. Dismissed from the Austrian service after the assassination of the king of Sweden, he gave up the military or diplomatic career planned by his father and set out to complete

his education by travel. In 1792 he arrived in Baltimore (Md.), where he decided to enter the priesthood. After engaging in mission work in Maryland and Pennsylvania, in 1799 he planned a settlement in what is now Cambria county (Pa.), and bought up much land, which he gave or sold at low prices to Catholic immigrants, spending \$150,000 or more in the purchase of about 20,000 ac. in a spot singularly ill suited for such an enterprise. His disinheritation by the emperor of Russia because of his religion caused him to lose his half of the estate, save for some money sent by his sister, and he was soon deeply in debt. Consequently when Gallitzin was suggested for the see of Philadelphia in 1814, Bishop Carroll gave as an objection Gallitzin's "great load of debt rashly, though for excellent and charitable purposes, contracted." Gallitzin died at Loretto, a settlement he had founded, on May 6, 1840. Among his parishioners he was a great power for good. It is said that at his death there were 10,000 members of his church in the district, where 40 years before he had found a scant dozen. One of the villages he founded bears his name. Among his controversial pamphlets are: *A Defence of Catholic Principles* (1816); *Letter to a Protestant Friend on the Holy Scriptures* (1820); *Appeal to the Protestant Public* (1834); and *Six Letters of Advice* (1834), in reply to attacks on the Catholic Church by a Presbyterian synod.

Lambing in *American Catholic Records* (Pittsburgh, Oct., 1886, pp. 58–68); and a good bibliography by Thomas C. Middleton in *The Gallitzin Memorandum Book*; in *American Catholic Historical Society in Philadelphia, Records*, vol. iv. p. 32 seq. For further bibliography see *Catholic Encyclopedia*.

GALLIUM, a metallic element of steel-grey colour melting at 30.15° C and boiling at about 1700° C. Owing to these properties it has been recommended as a thermometer liquid for high temperatures (S. Boyer, 1926). Gallium (symbol Ga, atomic number 31, atomic weight 69.9), contracts on melting—the specific gravity in the solid state is 5.885 and in the liquid 6.081. It was discovered in 1875 through its spectrum (violet lines λ 4172 and 4033) in a specimen of zinc blende of Pièrefitte (Haute Pyrenées) by Lecoq de Boisbaudran. Its chief physical and chemical properties had been predicted six years previously by D. I. Mendeléeff, who attributed certain qualities to an undiscovered element, eka-aluminium, which coincided with those actually possessed by gallium. It is one of the scarcest of elements although widely distributed through nature in minute quantities, occurring especially in many zinc blendes and bauxites, the black blende of Bensberg containing 0.0016% gallium.

Gallium accumulates in the final residues of the distillation of zinc spelters from Bartlesville, Oklahoma. The alloy containing gallium, indium and zinc is converted into anhydrous chlorides, and gallium trichloride, being by far the most volatile chloride present, is purified from the others by distillation (L. M. Dennis and J. A. Bridgman, 1918). From its ores gallium is extracted by dissolving in aqua regia, and after removal of acid other metals are precipitated by metallic zinc, whereas only after prolonged boiling with this metal is a basic gallium salt deposited. This process is repeated, and finally metallic gallium is isolated by electrolysis of an alkaline solution of its salts (de Boisbaudran, 1877).

Metallic gallium dissolves only slowly in nitric acid but more readily in hydrochloric acid, aqua regia or aqueous caustic potash. In these respects it shows its relationship to aluminium. It forms a well-defined oxide, Ga_2O_3 , infusible at a red heat; the corresponding hydroxide, $\text{Ga}(\text{OH})_3$, is amphoteric, like aluminium hydroxide, dissolving either in acids or in aqueous alkalis. De Boisbaudran recorded two chlorides, GaCl_2 and GaCl_3 ; the latter is a crystalline, hygroscopic solid melting at 75.5° C and boiling at 210–215° C.

Gallium sulphate, $\text{Ga}_2(\text{SO}_4)_3$, forms well-defined alums with the sulphates of ammonium, potassium, rubidium and caesium having the general formula $\text{R}^1\text{Ga}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$ where $\text{R}^1 = \text{NH}_4$ or an alkali metal. (See ALUM.)

Gallium acetylacetonate, $\text{Ga}(\text{C}_5\text{H}_7\text{O}_2)_3$, prepared by the interaction of acetylacetone and freshly precipitated gallium hydroxide,

separates from chloroform or acetone in acicular or tabular crystals and melts at 194°–195° C. It sublimes under reduced pressure with partial decomposition and exhibits isomorphous relationships with the acetylacetonates of indium, aluminium and iron (G. T. Morgan, H. D. K. Drew and T. V. Barker, 1921).

Gallium aluminium alloys are suggested for optical mirrors and as cathodes in metal vapour lamps. In a monochromatic lamp a gallium-cadmium alloy produces a pure red light.

GALLON, an English measure of capacity, usually of liquids, but also used as a dry measure for corn. A gallon contains four quarts. The word was adapted from an O.Nor.Fr. *galon*, Central Fr. *jalon* and was Latinized as *galo* and *galona*. It appears to be connected with the modern French *jale*, a bowl, but the ultimate origin is unknown; it has been referred without much plausibility to Gr. $\gamma\alpha\lambda\acute{o}\varsigma$, a milk pail. The British imperial gallon of four quarts contains 277.274 cu.in. The old English wine gallon of 231 cu.in. capacity is the standard gallon of the United States.

GALLOWAY, JOSEPH (1731–1803), American lawyer and politician, was born in West River, Md., in 1731. He early removed to Philadelphia, where he acquired a high standing as a lawyer. From 1756 until 1774 (except in 1764) he was one of the most influential members of the Pennsylvania assembly, over which he presided in 1766–73. With the approach of the crisis in the relations between Great Britain and the American colonies he adopted a conservative course, and, while recognizing the justice of many of the colonial complaints, discouraged radical action and advocated a compromise. As a member of the first Continental Congress, he introduced (Sept. 28, 1774) a "Plan of a Proposed Union between Great Britain and the Colonies," and it is for this chiefly that he is remembered. The measure was debated at length, was advocated by such influential members as John Jay and James Duane of New York and Edward Rutledge of South Carolina, and was eventually defeated only by the vote of six colonies to five. Galloway declined a second election to Congress in 1775, joined the British army at New Brunswick, N.J., in December, 1776, advised the British to attack Philadelphia by the Delaware, and during the British occupation of Philadelphia (1777–78) was superintendent of the port. In Oct. 1778 he went to England, where he remained until his death on Aug. 29, 1803. After he left America his property, valued at £40,000, was confiscated by the Pennsylvania assembly, a loss for which he received a partial recompense in the form of a small parliamentary pension. He was one of the clearest thinkers and ablest political writers among the American Loyalists.

Among his pamphlets are *A Candid Examination of the Mutual Claims of Great Britain and the Colonies* (1775); *Cool Thoughts on the Consequences to Great Britain of American Independence* (1780); and *The Claim of the American Loyalists Reviewed and Maintained upon Incontrovertible Principles of Law and Justice* (1788).

See Thomas Balch (Ed.), *The Examination of Joseph Galloway by a Committee of the House of Commons* (Philadelphia, 1855); Ernest H. Baldwin, *Joseph Galloway, the Loyalist Politician* (New Haven, 1903); and M. C. Tyler, *Literary History of the American Revolution* (1897).

GALLOWAY, a district in south-west Scotland, comprising the counties of Kirkcudbright and Wigtown. It was the *Novantia* of the Romans, and till the end of the 12th century included Carrick, now the southern division of Ayrshire. Though the designation has not been adopted civilly, its use historically and locally has been long established. Thus the Bruces were lords of Galloway, and the title of earl of Galloway (created 1623) is now held by a branch of the Stewarts. Galloway also gives its name to a famous indigenous breed of black hornless cattle.

GALLOWS or GIBBET: see CAPITAL PUNISHMENT; HANGING.

GALLS. This term may be applied to any excrescences caused in plants or animals by the action of living animals, usually insects. In animals, galls may be produced under the skin of mammals or birds by acarids or by dipterous insects. The term, however, is mostly confined to vegetable excrescences of a particular type.

Accepting the definition of Lacaze-Authiers they comprise "all abnormal vegetable productions developed on plants by the action of animals, more particularly by insects, whatever may be their form, bulk or situation."

History.—The hypertrophies of plant tissues known as galls have been known from early times. Theophrastus (372–286 B.C.) referred to the gall-nuts as an article of trade and to the superior quality of those from Syria. The nature of galls was, however unknown until recent times. It was naturally assumed that they arose spontaneously, *i.e.*, directly from the plant, without the intervention of any other animal or plant. John Evelyn, the diarist states in his *Sylva* (published 1664): "Pliny affirms that the Galls break out all together in one Night, about the beginning of June, and arrive to their full growth in one Day." Evelyn was familiar with the oak galls of commerce imported for their tannin content but he did not realize that the oaks in England bore numerous galls of different kinds—80–100 kinds are known. The association of insects with most galls appears to have been discovered by Martin Lister (1630–1712) who was physician to Queen Anne. Malpighi (1620–1694) the physician and botanist seems to have been the first to deal systematically with galls, publishing a treatise entitled *De Gallis* which dealt with the galls of Italy and Sicily. In England, Dr. Derham, Canon of Windsor, seems to have been the first to take up the study of galls; he refers to Malpighi's work in his Boyle Lectures given in 1711 and 1712.

Nature.—Galls arise from the abnormal development of meristematic tissue of the plant as a result of an abnormal stimulus. The stimulus is caused by an animal parasite. The parasite is usually an insect which lays an egg in the plant tissue but some galls are due to the action of eelworms (nematodes). The stimulus causing the abnormal development of the plant cells may be due in some cases to a chemical substance injected by the insect but in many cases, as in those of the wasps producing oak galls, gall formation is due to the action of the larva developing from the eggs; in this the movements of the larva probably play a part. It must be borne in mind that the gall is the result of the interaction of two living organisms, the plant and the parasite. It is true that the gall is built up out of the tissues of the plant, but its special form and structure depends on the nature of the animal. The interaction is made clear from the fact that the same plant attacked by different insects will produce very different galls. In fact the differences between galls on the same plant may be the best means of distinguishing the insects, as in the case of gall-gnats of the willow, where ten different species attack *Salix humilis*, the insects being almost impossible to distinguish in the fully grown state except by the galls they produce.

Form.—Galls are very variable in form and size but very constant for the special insect and special host plant concerned. Often the galls are entirely different from the structure on which they have developed or which they have replaced. Commonly, however, the tissues outside the larval chamber enclosing the insect, *i.e.*, tissues which give the gall its distinctive form, indicate the special organ (leaf, etc.) from which the gall has developed. In

the gall known as "Robin's pincushion" or "bedeguar" (produced by the action of the female gall-wasp, *Rhodites rosae*, on a leaf or bud in spring) the moss-like covering represents rudimentary leaves, consisting of fibro-vascular bundles with very little parenchyma between. Other galls represent in the case of the oak the arrested acorn. The size of the galls produced by insects varies enormously, some may be only a millimetre ($\frac{1}{24}$ inch) or two in length while those on the roots of old oak trees may reach the size of a man's fist. Many of the various galls are brightly coloured.

Classification.—The most satisfactory classification is that by the insects which cause them and the plant on which they are produced. Different types can however be distinguished by their external appearance and internal structure. Most of them are unilocular or monothalamous (containing but one chamber or cell), while others are plurilocular (polythalamous), *i.e.*, many-celled and contain a number of insects. The ordinary oak galls produced by the attack of a wasp (*Cynips*) on a leaf bud of oak are unilocular. Following mainly Kerner and Oliver and Swanton (see Bibliography) galls may be distinguished as the *simple* and *compound*. The simple galls are produced from a single plant organ such as a leaf. These may again be distinguished as (1) *felt galls* where the epidermal cells become hypertrophied and grow into hair-like projections, and (2) *mantle galls* where a chamber is developed round the insect. Mantle galls may further be distinguished as *scroll galls* (where the leaf or petiole becomes rolled and thickened), *pocket galls* (where a pocket or excavated chamber is produced) and *covering galls* (where the insect is covered in by the over-arching of tissues but the tissues do not fuse where they meet, and finally shrivel and leave a slit for the escape of the insect). The simple galls also include (3) the *solid* or *tubercular galls* of which the well known spherical marble gall on the oak is a good example, and the root galls. In addition there are *compound galls* in the growth of which several organs of the plant are concerned. These may be (1) *bud-like galls* which may arise from modified foliage buds or modified flower buds; (2) *galls at the base of shoots*, where the upper part of the shoot continues a normal growth beyond the gall; (3) *rosette galls* which may be developed either in the foliage or the floral region.

Causal Agents.—As already stated insects are the chief agents while eelworms play a part, fungi not being properly included. Of the insects the classes concerned may be Hymenoptera (wasps and sawflies), Coleoptera (beetles), Lepidoptera (moths), Diptera (flies), as well as Hemiptera (aphides), and Acari (mites). The eelworms (Nematoda) belong to such genera as *Heterodera* and *Tylenchus*. Among the Hymenoptera (*q.v.*), the group *Cynipidae* (gall-wasps) are best known as gall producers. The members of this group (e.g., *Cynips*, *Andricus*, *Biorrhiza*, *Rhodites*), have received more attention as gall producers than any other insects. This is partly due to the fact that they are responsible for many of the galls so commonly found on the oak but also to the fact that many of the insects show alternation of generation, *i.e.*, the young produced do not resemble their parents but their grandparents, and with these two different generations different galls may be associated. In the case, for example, of *Biorrhiza pallida* the female gall-wasp pricks the oak bud and lays its eggs therein with the result that the familiar gall known as "oak-apple" is produced. From this gall the wasps emerge in July, the males winged and the females wingless or with rudimentary wings only. The female, who is smaller than her parents, crawls down the oak trunk, reaches the ground, and then pierces the roots of the oak producing the other type of gall, the root gall. In other cases the same organ (leaf or bud) may be attacked in each case but different galls are produced. The gall-wasps are small insects with straight antennae and a compressed and usually very short abdomen with the second or second and third segments greatly developed, the rest concealing the partially coiled ovipositor. The transformation from the egg through the larval state to the imago (the perfect insect) takes place in the gall, the imago boring its way out of the gall usually in the autumn. Among the galls produced by *Cynips* and its allies are the "oak-apple" or "oak sponge" produced by *Andricus terminalis*, the currant or berry galls of

FROM: (A TO D) SWANTON, "BRITISH PLANT GALLS" (METHUEN & CO., LTD.); (E) CONNOLD, "PLANT GALLS OF GREAT BRITAIN" (ADLARD & SON, LTD.)

VARIOUS PLANT GALLS CAUSED BY THE ATTACK OF INSECTS

A. Gall on speedwell caused by fly *Perrisia*. B. Turgent of willow with leaves galled by fly (another species of *Perrisia*). C. Leaf of black poplar galled by aphid (*Pemphiquilus*). D. Leaf of oak galled by gall wasp (*Dryophanta*). E. Various types of oak galls caused by gall wasp (*Cynips*)

Spathogaster baccarum and the "oak spangles" of *Neurotenes lenticularis*. The marble galls or "Devonshire woody galls" of oak buds which often destroy the leading shoots of young oak trees are produced by *Cynips Kollar*. They were first introduced into Devonshire about 1847 and after a time spread widely. The large purplish Mecca or Bassorah galls produced by *Cynips insana* have been regarded by some as the Dead Sea fruit, mad apple or apples of Sodom alluded to by Josephus and others, but more probably the fruit referred to is that of a species of *Asclepias*.

Oak galls or gall nuts (produced by cynips) were once a valuable article of commerce (for ink making, etc.)—they may contain as much as 70% of tannin. The "blue," "black" or "green" galls still contain the insect; the inferior "white" galls are lighter coloured and are gathered after the insect has escaped.

The saw-flies (also members of the Hymenoptera) so named on account of the saw-like nature of the egg depositing apparatus (the ovipositor) produce galls on willow, rose and other plants; on the willow, bud galls, stem galls and leaf galls are all produced. The red, oval or kidney shaped swellings on the blade of the willow leaf are perhaps the best known saw-fly galls in Great Britain. Of beetles (Coleoptera) in spite of their large numbers (150,000 or more species) only a very few are responsible for plant galls. Gorse and vetches may be attacked, and also the toadflax (*Linaria vulgaris*). *Ceuthorhynchus sulcicolis* attacks the underground portions of various plants (turnips, swedes, cabbages, etc.) of the family Cruciferae. The swellings produced are sometimes confused with the malformations due to the disease, "finger and toe," caused by a fungus *Plasmiodiophora brassicae*.

Galls caused by moths (Lepidoptera) are also infrequent and not of great economic importance. *Rhyacionia resinella* produces a gall upon *Pinus silvestris*, destroying the terminal bud and thus retarding the growth of the tree. Among the flies (Diptera) those which cause galls belong mostly to the gallmidges (Cecidiomyidae). *Spiraea ulmaria* (meadowsweet) and *S. filipendula* are attacked by *Perrisia ulmariae*, the galls appearing as small, glabrous, light green pustules; over 200 have been counted on one leaf. The germander speedwell (*Veronica Chamaedrys*) and the nettle (*Urtica*) are "galled" by species of *Perrisia*, as are also willows. On willows a number of galls are also produced by species of *Rhabdophaga*. The frit-fly (*Oscinus frit*) causes the new shoots of cereals and pasture grasses to become swollen and distorted. The ash, maple, hornbeam, oak, grape-vine, alder, gooseberry, blackberry, pine, juniper, thistle and fennel are also galled by insects of this class. Among the order of Hemiptera, the Aphidae (green fly), the Psyllidae (plant lice) and the Coccidae (scale insects and mealy bugs) all include forms which are gall producers. The majority of these belong to the first class Aphidae the members of which are generally known as "blight" or "green-fly." Of the galls produced by aphids the best known are probably those found on the spruce fir (*Abies excelsa*), resembling immature cones in size and shape. They are sometimes called "pineapple" galls and are due to species of *Chermes*. The galls develop near one end of a twig and are large and plurilocular containing in some cases as many as twenty-five cavities; a single gall may contain 2,000 insects. The mites belonging to the order Acari of the class Arachnida (which includes the spiders and scorpions) are responsible for a number of galls. The gall-formers have only two pairs of legs, no eyes and belong to the group Vermiformia; they are very minute and are easily developed. The mite-galls are nearly always characterized by a felt of hairs which develop in association with the gall by the abnormal growth of the epidermal cells of the leaf attacked. These galls are mostly caused by species of the genus *Eriophyes*; they are found on the sycamore, pear, plum, ash, alder, vine, mulberry, etc. Those on the sycamore leaf due to *Eriophyes macrorrhynchus* are very common in Great Britain in June and July, and several hundred may be found on a single leaf. They are small, elongated outgrowths, about 2 mm. broad by 3 mm. long, tapering somewhat at the free end. They are bright red in colour with a tuft of hairs at the base and also bearing hairs in the hollow cavity and at the aperture of the gall; they are borne on the upper surface of the leaf. The gall-mite,

Eriophyes ribis causes "big-bud" in black currants and is a serious pest, while *Eriophyes pyri* is the pear leaf blister mite.

Among the order Nematoda the genera *Heterodera*, *Tylenchus* and *Aphelenchus* (belonging to the family Anguillulidae, to the members of which the term eelworms is applied) cause galls. Either the aerial or underground parts may be attacked. A number of the infections are of economic importance.

Guest Flies.—The insect galls often contain, besides the larva of the insect responsible for the gall, so called *inquilines* or lodgers. They feed on the substance of the gall and so deprive the normal "householder" of part of the food supplies and frequently kill off the rightful owner. There are also definite parasites (generally small Hymenoptera belonging to the family Chalcididae) which kill and devour not only the primary occupant of the gall but also the "guest flies." Derham, who has been already referred to, recognized in the early years of the 18th century that galls may contain interlopers. His quaint language may be quoted: "I apprehend we see many vermicules towards the outsides of many oak-apples, which I guess were not what the primitive insects laid up in the germ from which the oak-apple had its rise, but from some supervenient additional insects laid in after the apple was grown, and whilst it was tender and soft." The presence of different classes of insects within the same gall renders investigation very difficult.

Fungi.—A number of fungi cause marked malformations of the portions of the host plant attacked. For example, *Synchytrium endobioticum* causes wart-like outgrowths of the potato, *Plasmiodiophora brassicae* swellings on turnip and cabbage roots. In these cases, however, the tissue of the outgrowth is usually penetrated by the fungus so they are hardly comparable to the insect galls, where the abnormal tissue is purely vegetable in nature and grows round the insect responsible for the malformation. A few cases which are sometimes confused with true galls may be mentioned. Cultivated plums, the sloe and the wild cherry may show a condition in which the fruit is swollen and deformed; this is known as "bladder plum" and is due to the attack of a fungus, *Exoascus pruni*, belonging to the class Ascomycetes (see FUNGI). The so-called witches' brooms (*q.v.*), are found on various trees and are sometimes mistaken for galls; they are conspicuous as groups of short, generally unhealthy twigs with reduced leaves, the branches of the "broom" growing upward. On birch these brooms may be caused by the fungus *Exoascus turgidus* though they may also be caused by a mite of the genus *Eriophyes*. Those on cherry are due to *Exoascus cerasi*, and those on silver fir are due to the attack of a rust fungus *Melanosporella elatina*. The large succulent often reddish swellings found on the leaves of the cowberry (*Vaccinium Vitis-idaea*) and the cranberry (*Oxycoccus quadripetalus*) and the still larger ones on species of *Rhododendron* are due to fungi belonging to the genus *Exobasidium* (see FUNGI).

For further details see A. Kerner von Marilaun, *Natural History of Plants*, Vol. II. (trans., F. W. Oliver, London, 1894); N. Adler and C. Straton, *Alternating Generations: A Biological Study of Oak Galls and Gall Flies* (London, 1894); E. T. Connold, *British Vegetable Galls* (London, 1901); *British Oak Galls* (London, 1908); *Plant Galls of Great Britain* (London, 1909); E. Küster, *Die Gallen des Pflanzen* (Leipzig, 1911); E. W. Swanton, *British Plant Galls* (London, 1912).

GALLUP, a town of north-western New Mexico, U.S.A., on the main line of the Santa Fe, and on Federal highways 66 and 666; the county seat of McKinley county. It has a municipal airport, Moses Field. The population was 3,920 in 1920, and was 5,992 in 1930 by the Federal census. Gallup lies 6,503 ft. above sea-level, in a valley bordered by fantastically coloured cliffs. Coal-mining is the principal industry. It is a trading centre for the Navajo and Zuni Indians. The Navajo reservation is north of the city; 40 m. south is Zuni, one of the largest pueblos in the south-west, and one of the famous seven cities of Cibola, sought by Coronado. South-east of Gallup is the Fort Wingate Military reservation and the Charles H. Burke Indian school. The town was settled about 1880 and was incorporated in 1891.

GALLUPPI, PASQUALE (1770–1846), Italian philosopher, was born at Tropea, in Calabria. He was professor of

logic and metaphysics at Naples. Galluppi's works, which have importance in the history of Italian philosophy, include: *Sull'analisi e sulla sintesi* (1807); *Lettere filosofiche* (1827); *Saggio filosofico sulla critica della conoscenza* (1819-32); *Filosofia della volontà* (1832-42, incomplete); *Considerazioni filosofiche sull'idealismo trascendentale* (1841), a memoir on the system of Fichte; *Storia della filosofia* (i. 1842).

See L. Ferri, *Essai sur l'histoire de la philosophie en Italie au XIX^e siècle* (1869); V. Lastrucci, *Pasquale Galluppi. Studio critico* (Florence, 1890); and G. Gentile, *Dal Genovesi al Galluppi* (1903).

GALLUS, CORNELIUS (c. 70-26 B.C.), Roman poet, orator and politician, was born of humble parents at Forum Iulii (*Fréjus*). At an early age he removed to Rome, where he was taught by the same master as Virgil and Varius Rufus. Virgil, who dedicated one of his eclogues (x.) to him, was much indebted to the influence of Gallus for the restoration of his estate. Nothing by him has survived; the fragments of the four poems attributed to him (first published by Aldus Manutius in 1590 and printed in A. Riese's *Anthologia Latina*, 1869) are generally regarded as a forgery.

See C. Völker, *De C. Galli vita et scriptis* (1840-44); A. Nicolas, *De la vie et des ouvrages de C. Gallus* (1851), an exhaustive monograph. An inscription found at Philae (published 1896) records the Egyptian exploits; see M. Schanz, *Geschichte der römischen Literatur*, and Plessis, *Poésie latine* (1909). See also R. S. Conway, *New Studies of a Great Inheritance* (1923), *The Fall of Gallus*.

GALLUS, GAIUS SULPICIUS, Roman general, statesman and orator. Under Lucius Aemilius Paulus, his intimate friend, he commanded the 2nd legion in the campaign against Perseus, king of Macedonia, and predicted an eclipse of the moon on the night before the battle of Pydna (168 B.C.). On his return from Macedonia he was elected consul (166), and in the same year subdued the Ligurians. In 164 he was sent as ambassador to Greece and Asia, where he held a meeting at Sardis to investigate the charges brought against Eumenes of Pergamum by the representatives of various cities of Asia Minor. Gallus was a man of great learning, an excellent Greek scholar, and in his later years a student of astronomy, on which he is quoted by Pliny.

See Livy xlv. 37, *Epit.* 46; Polybius xxxi. 9, 10; Cicero, *Brutus*, 20, *De officiis*, i. 6, *De senectute*, 14; Pliny, *Nat. Hist.* ii. 9.

GALLUS, G. VIBIUS TREBONIANUS, Roman emperor A.D. 251-253 or 4, held a command in the army that opposed the first invasion of the Goths in 251, and, according to a possibly inaccurate tradition, contributed by his treachery to the disaster that followed, in which Decius and Herennius were killed. Gallus was then elected emperor, and made peace with the invaders, who kept their plunder and were offered a tribute to bribe them not to return; it is the disgrace with which this treaty covered his name that makes the tradition of his earlier conduct suspect. A year later fresh hordes arrived, but were routed by Aemilianus whom his troops proclaimed emperor. Gallus went to meet him, but was defeated and killed at Interamna.

See Zonaras XII. 20 seq.; Zosimus I. 23, 28; Eutropius IX. 5; Victor, *De Caes.* 30; Jordanes, *De Reb. Get.* 19.

GALOIS, ÉVARISTE (1811-1832), French mathematician, was born on Oct. 25, 1811, and killed in a duel on May 31, 1832. His principal work was on the resolubility of algebraic equations by radicals. To him is also due the notion of a group of substitutions (see ALGEBRA; EQUATIONS, THEORY OF; also GROUPS).

See the introd. by C. F. Picard to his *Oeuvres mathématiques* (1897).

GALOP, a spirited dance of German origin in 2-4 time. It was introduced into Paris in 1829 and subsequently became a favourite dance of the Victorian era.

GALOSH. The galosh or golosh was originally a wooden shoe or clog, but later came to mean an overshoe (cf. R. Holme, *Armoury*, 1688: "Gallosios are false shooes, or covers for shooes"). The word is adapted from the French *galoche*, from Low Lat. *galopedium*, a wooden shoe.

GALSTON, police burgh, parish and manufacturing town, Ayrshire, Scotland. Pop. (1931) 4,601. It is situated on the Irvine, 5 m. E. by S. of Kilmarnock, with a station on the L.M.S.R. The manufactures include weaving and lace and hosiery making, and coal is worked in the vicinity.

GALSWORTHY, JOHN (1867-), British playwright and novelist, was born at Coombe, Surrey, on Aug. 14, 1867. Educated at Harrow and New College, Oxford, he was called to the bar in 1890, but devoted himself to literature. His first novel, *Jocelyn*, appeared in 1898, but he attracted wider attention in 1904 with *The Island Pharisees*, and *The Man of Property* (1906). The latter was the first novel of the sequence to be known as *The Forsyte Saga*, the others being *The Indian Summer of a Forsyte* (1918), *In Chancery* (1920), *Awakening* (1920), and *To Let* (1921). As a detailed picture of upper middle-class society during the later Victorian and Edwardian eras, the sequence is a remarkable achievement. That picture was supplemented by the greater number of Galsworthy's other novels, of which it is the characteristic social setting, among them *The Country House* (1907), *Fraternity* (1909), *The Patrician* (1911), *The Freeland* (1915). In 1924 Galsworthy published *The White Monkey*, the first volume of a new trilogy which endeavoured to do for London after the War what *The Forsyte Saga* had accomplished for a generation with more certain standards. Soames Forsyte appears in all three of the new series—*The Silver Spoon* (1926) and *Swan Song* (1928) being the other two—and his death in *Swan Song* gives a climax which is not successful in diverting the critic's attention from the rather erratic form of the trilogy. Galsworthy's sympathy with youth and beauty is tenderly displayed in *The Silver Spoon*; but the new world was too much for him, and much of all three books betrays passing reactions of an observer in a changing world rather than deeper reflections on human nature. Galsworthy also wrote *The Dark Flower* (1913) and many short stories, of varying merit, but often equal to his best work (collected as *Caravan*, 1925), essays on current social and moral questions, marked by liberal and humane feeling, and a commentary on the extravagances of war time, *The Burning Spear*.

As a dramatist also, Galsworthy enjoyed a deserved fame. His plays, for the most part, are based on ethical or social problems and are marked by a scrupulously judicial effort to display the opposing points of view typified by his characters. Some have partaken too much of this scrupulousness to be counted as having an essentially dramatic quality, but at their best Galsworthy's plays reflect a keen sense of dramatic values. He was the first English dramatist of importance to adopt a strictly natural style of dialogue, in strong contrast to the laboured, rather stagey style favoured by Pinero and the dialectically over-charged manner of Bernard Shaw. In consequence his plays do not read so well, and unless acted by players of exceptional gifts, they are too easily infected by the commonplace, prosaic quality which is so characteristic of the spoken English of his day, especially the spoken English of the inarticulate upper and upper-middle class which figure largely in his theatre. In *Escape* (1926) Galsworthy experimented in a technique suggested by the cinematography. He succeeded in showing that a play could easily excel a film in interest and excitement, but not in persuading us that the drama had anything to learn from the devices of Hollywood. Among the plays should be noted *The Silver Box* (1906), *Joy* (1907), *Strife* (1909), *Justice* (1910), *The Pigeon* (1912), *The Eldest Son* (1912), *The Fugitive* (1913), *The Skin Game* (1920), *Loyalties* (1922), *The Forest* (1924). He was awarded the Order of Merit, June 3, 1929.

See S. Kaye-Smith, *John Galsworthy* (1916); André Chevrillon, *Trois Etudes Anglaises* (1924); L. Schalit, *John Galsworthy* (1928).

GALT, SIR ALEXANDER TILLOCH (1817-1893), Canadian statesman, was the youngest son of John Galt, the author. Born in London on Sept. 6, 1817, he emigrated to Sherbrooke in Canada in 1835, where he entered the service of the British American Land Company, of which he rose to be chief commissioner. Later he was one of the contractors for extending the Grand Trunk railway westward from Toronto. In 1849 he became Liberal member for the county of Sherbrooke, but opposed the chief measure of his party, the Rebellion Losses Bill, and signed a manifesto in favour of union with the United States, believing that in no other way could Protestant and Anglo-Saxon ascendancy over the Roman Catholic French majority in his native province be maintained. In the same year he retired from parliament but re-entered it in 1853, and was till 1872 the

chief representative of the English-speaking Protestants of Quebec province.

On the fall of the Brown-Dorion administration in 1858 he was called on to form a ministry, but declined and became finance minister under Sir John Macdonald and Sir George Cartier on condition that the federation of the British North American provinces should become a part of their programme. From 1858-62 and 1864-67 he was finance minister; he introduced the decimal system of currency and adopted a policy of protection to Canadian manufactures. To his diplomacy was due the coalition in 1864 between Macdonald, Brown and Cartier, which carried the federation of the British North American provinces, and throughout the three years of negotiation which followed his was one of the chief influences.

He became finance minister in the first Dominion ministry, but resigned on Nov. 4, 1867. After his retirement he gave intermittent support to the administration of Sir John Macdonald, but advocated independence as the final destiny of Canada. In 1871 he was again offered the ministry of finance on condition of abandoning these views, but declined. In 1877 he was the Canadian nominee on the Anglo-American fisheries commission at Halifax, and rendered brilliant service. In 1880-83 he was Canadian high commissioner to Great Britain. During this period he advocated imperial federation. He was Canadian delegate at the Paris Monetary Conference of 1881, and to the International Exhibition of Fisheries in 1883. From this date till his death on Sept. 19, 1893, he lived in retirement. No Canadian statesman had sounder or more abundant ideas, but a certain intellectual fickleness made him always a somewhat untrustworthy colleague in political life. (W. L. G.)

GALT, JOHN (1779-1839), Scottish novelist, was born at Irvine, Ayrshire, and educated in his native town and at Greenock. In 1804 he settled in London. Charged with a commission from a merchant firm to find methods of evading the Berlin and Milan decrees, he was travelling in the Mediterranean when he met Byron and Hobhouse at Gibraltar. He travelled with Byron to Malta, and met him again at Athens. In 1814 he visited France and Holland on similar business for a Glasgow firm. In 1826 he went to America as secretary of the Canada Land company. Galt opened up a road between Lakes Huron and Erie through the forest country, and founded Guelph in Upper Canada. The town of Galt was named after him. But, though his work was successful, he returned home practically a ruined man. All his life he had been a voluminous writer, and he now devoted himself entirely to literature. The last years of his life were spent at Greenock, where he died on April 11, 1839.

His masterpieces are *The Ayrshire Legatees* (1820), *The Annals of the Parish* (1821), *Sir Andrew Wylie* (1822), *The Provost* (1822), *The Entail* (1823) and *Lawrie Todd* (1830). *The Ayrshire Legatees* gives, in the form of letters, the adventures of the Rev. Dr. Pringle and his family in London. The letters are made the excuse for endless tea-parties and meetings of kirk-session in the rural parish of Garnock. *The Annals of the Parish* are told by the Rev. Micah Balwhidder, Galt's finest character. This work (which existed in ms. before *Waverley* was published) is a humorous and truthful picture of the old-fashioned Scottish pastor and the life of a country parish. In *Lawrie Todd* the life of a Canadian settler is depicted with considerable imaginative power.

BIBLIOGRAPHY.—The best of Galt's novels were reprinted in Blackwood's *Standard Novels* (1841), to vol. i. of which his friend, Dr. Moir, prefixed a memoir. Several of the novels have appeared in later editions. See also G. B. S. Douglas, *The Blackwood Group* (1897); R. K. Gordon, *John Galt* (Toronto, 1920; bibl.); W. Roughhead, Introduction to *A Rich Man and other Stories*, by John Galt (1925).

GALTON, SIR FRANCIS (1822-1911), English anthropologist, was born on Feb. 16, 1822, at Birmingham and received his education at Birmingham hospital, at King's college, London, and at Trinity college, Cambridge. During 1845-46 he travelled in the Sudan, and in 1850 explored Damaraland and the Ovampo country in South-West Africa, publishing on his return, *An Explorer in Tropical South Africa* (1853, 2nd ed. 1889) and *Art of*

Travel (1855). A visit to the north of Spain in 1860 was described in *Vacation Tourists*.

Galton then turned to meteorology. His *Meteorographica* (1863) was the first serious attempt to chart the weather on an extensive scale, and in it also the author first established the existence and theory of anticyclones. About this time, Galton, inspired by his cousin's *Origin of Species* (1859), began to study anthropology, heredity and the application of statistics to human attributes. In a series of remarkable publications, he laid the foundation of the science of eugenics. For the improvement of mankind, he advocated the furthering of the productivity of the fit and the restricting of the birth-rate of the unfit. Galton also made special investigations of colour blindness, mental imagery, instincts, number forms and of criminality; he originated the process of composite portraiture, and paid much attention to finger-prints and their employment for the identification of criminals. In 1909 he was knighted. He died at Haslemere on Jan. 17, 1911, founding by his will a laboratory for the study of national eugenics.

Galton's chief scientific works are: *Hereditary Genius* (1869); *English Men of Science* (1874); *Inquiries into Human Faculty* (1883); *Record of Family Faculties* (1884); *Natural Inheritance* (1889); *Finger Prints* (1892); *Finger Print Directories* (1895); *Noteworthy Families* (1906); *Essays in Eugenics* (1909).

See his *Memories of My Life* (1908) and K. Pearson's *Life of Galton* (2 vols., 1914-24); also the article ANTEROPOMETRY.

GALTON WHISTLE: see ACOUSTICS IN BUILDINGS.

GALUPPI, BALDASSARE (1706-1785), Italian composer, was born on Oct. 18, 1706, on the island of Burano near Venice, and was named Il Buranello. His father, a barber, and violinist at the local theatre, was his first teacher. He studied at the Conservatorio degli Incurabili at Venice, under Antonio Lotti. After producing two operas in collaboration with G. B. Pescetti, in 1728 and 1729, he began to compose operas for the Venetian theatres, writing sometimes as many as five in a year. He visited London in 1741, and arranged a *pasticcio*, *Alexander in Persia*, for the Haymarket. Burney considered his influence on English music to have been very powerful. In 1740 he became *vice-maestro di cappella* at St. Mark's and *maestro* in 1762. In 1749 he began writing comic operas to libretti by Goldoni, which enjoyed an enormous popularity. He was invited by Catherine II. in 1766 to Russia where he composed his opera *Ifigenia in Tauride* (1768). He returned to Venice in 1768, where he had held the post of director of the Conservatorio degli Incurabili since 1762. He died on Jan. 3, 1785.

Galuppi's best works are his comic operas, of which *Il Filosofo di Campagna* (1754), known in England as *The Guardian Trick'd* (Dublin, 1762) was the most popular. His melody is attractive rather than original, but his workmanship in harmony and orchestration is generally superior to that of his contemporaries. He was one of the first to extend the concerted finales of Leo and Logroscino into a chain of several separate movements, working up to a climax.

For details of Galuppi's operas see Alfred Wotquenne, *Baldassare Galuppi, étude bibliographique sur ses oeuvres dramatiques* (Brussels, 1902).

GALVANAUSKAS, ERNEST (1882-), Lithuanian statesman, was born on Nov. 7, 1882 at Vabalninkai. He studied as a mining engineer at Leningrad (St. Petersburg) and Liège, and his activities in the Lithuanian national movement date from his student days. In 1906 he was imprisoned for his attempts to free the country from the Russian yoke. He escaped to Belgium in 1908, where he continued in touch with the Lithuanian liberation movement. The outbreak of the World War found him in Belgrade, and after the enemy occupation of that city, Galvanauskas left with the Serbian army and shared all the privations of the retreat. He subsequently proceeded to France and volunteered for military service. On the recovery of Lithuanian independence in 1918, Galvanauskas served as a member of the Lithuanian delegation to the Versailles Peace Conference. He was several times prime minister and minister for foreign affairs, and also held the portfolios of finance and communications. He became president of the Lithuanian delegation to the League of

Nations and in Aug. 1924 was appointed Lithuania's first envoy extraordinary and minister plenipotentiary to London and simultaneously envoy extraordinary and minister plenipotentiary to The Hague.

GALVANI, LUIGI (1737-1798), Italian physiologist, after whom galvanism received its name, was born at Bologna on Sept. 9, 1737. He was appointed public lecturer in anatomy at Bologna in 1762, and gained reputation as a comparative anatomist from his researches on the organs of hearing and genito-urinary tract of birds. He enunciated his theory of animal electricity in a treatise published in 1791. Twenty years before he had begun his investigations as to the action of electricity upon the muscles of frogs. The observation that the suspension of frogs on an iron railing by copper hooks caused twitching in the muscles of their legs led to the invention of his metallic arc, the first experiment with which is described in the third part of the *Commentary*, under the date Sept. 20, 1786. The arc he constructed of two different metals, which, placed in contact the one with a frog's nerve and the other with a muscle, caused contraction of the latter. In Galvani's view the motions of the muscle were the result of the union, by means of the metallic arc, of its exterior or negative electrical charge with positive electricity which proceeded along the nerve from its inner substance. Volta, on the other hand, attributed them solely to the effect of electricity having its source in the junction of the two dissimilar metals of the arc, and regarded the nerve and muscle simply as conductors. Galvani died at Bologna, on Dec. 4, 1798.

A quarto edition of Galvani's works *Opere edite ed inedite del professore Luigi Galvani* was published at Bologna in 1841-42 by the Academy of Sciences of the Institute of that city. See J. L. Alibert, *Eloges historiques*, pp. 187-338 (1806).

GALVANIZED IRON AND STEEL. Of all the methods which have been adopted to coat the surface of iron and steel to offer resistance to corrosion the applying of a coat of zinc, although a very old device, seems up to the present to be the most effective. There are four methods of applying zinc to the surface of iron or steel, these being as follow:—

- (1) The Hot Dip Process.
- (2) Electrolytic or Zinc-Plating.
- (3) Sherardizing.
- (4) Spraying of Hot Metal.

Of these the Hot Dip Process is the one most widely used, and the one which, when properly carried out, gives the best coating for exposure to the atmosphere.

The Hot Dip Process.—It seems that the idea of using zinc for coating other metals arose as soon as this metal was

FIGS. 1-6 BY COURTESY OF E. A. ATKINS

FIG. 1.—SHEET-GALVANIZING BATH, A PLANT USED FOR THE COATING OF SHEET IRON, OR STEEL WITH ZINC BY THE HOT PROCESS

known in Europe, during the first half of the 18th century. The earliest patent for Hot Dip Galvanizing was taken out by Crawford in England in 1837. Why the term "galvanize" was chosen is difficult to understand, as no particular galvanic action takes place in the process other than that which is common to all forms of chemical reaction. There is, however, a galvanic or electrolytic action brought into operation when the coated iron is exposed to the atmosphere, on account of the zinc being electro-positive to iron, this action resulting in the protection of the latter.

In its application to the coating of small articles the process

is simple. All that is necessary is to have a wrought iron or mild steel pot containing molten spelter, the heat required being applied on the vertical sides. The article requiring to be galvanized is first thoroughly cleaned in hydrochloric acid, dried, and carefully dipped in the molten zinc after the latter has been sprinkled with sal-ammoniac. The surplus spelter is then drained off and the article plunged into water, washing away any spent sal-ammoniac that may remain on the surface.

The manufacture of galvanized mild steel sheets is one of the most important of the metal industries, both in America and Great Britain where about 900,000 tons of sheets are produced annually.

In the carrying out of the process the sheets are first pickled in batches either in hydrochloric or sulphuric acid, and after the scale has been completely removed they are washed in running water. For the actual galvanizing a plant is used of the character shown in fig. 1. The clean wet sheet is passed through a flux box containing sal-ammoniac and so on through the molten metal, leaving the surface of the bath by a pair of horizontal rollers that serve the purpose of regulating the thickness of zinc on the sheets. The amount of spelter taken up on the surface of a sheet may vary from 1½ to 3½ oz. per square foot, depending upon the kind of process used and the condition of same.

FIG. 2.—SPANGLES ON SURFACE OF GALVANIZED SHEET IRON

In the galvanizing of sheets efforts are usually made to produce them with the largest and best form of spangles (fig. 2), as this type of sheet possesses good selling properties. There is a difference of opinion as to what causes the variation in the size of spangles, but without entering very deeply into the scientific explanation it may be said that the spangling is controlled by anything which alters the surface tension of the zinc, the following being the governing factors:—

- (1) The kind of steel used.
- (2) The method and quality of the pickling.
- (3) Variation in the sheet annealing factors.
- (4) The condition of the sheet surface.
- (5) The kind of spelter used.
- (6) The temperature of the galvanizing bath.
- (7) The length of time the sheet is immersed in the zinc.
- (8) The method of galvanizing.

Wire for fencing, telegraph lines and other purposes is galvanized by a continuous process in which the wires, running

FIG. 3.—THE GALVANIZING OF WIRE, A CONTINUOUS METHOD OF ANNEALING AND GALVANIZING WIRE BY THE HOT PROCESS

parallel, are passed through an annealing furnace, an acid cleaning cistern, washing and fluxing tanks, and on through the molten zinc of the galvanizing bath, and finally to the winding blocks, as shown in fig. 3.

To regulate the thickness of the coat on the wires it is usual to have a bed of moist sand or other material on the surface of the out-going end of the bath through which the coated wires pass.

The coatings on wire vary very considerably, both in quality

and thickness. Two kinds of coatings are shown in fig. 4, the one which is hard and brittle breaking off when the wire is bent, whilst the other is flexible and is tenaciously bound to the surface of the wire. When wire is required to have a thin flexible coat it is usual to pass it through wipers instead of drawing it through a sand bed.

Electrolytic or Zinc-plating Process.—The cold or electro-galvanizing process is now commonly used for certain classes of work. Its advantages over hot galvanizing are:—

(1) Greater economy in the use of zinc, and somewhat healthier conditions.

(2) Complete control over the thickness of coating required up to a certain maximum.

(3) The depositing of a coat of pure zinc.

(4) Its suitability for articles such as steel springs, etc., which may be affected by the temperature of the molten zinc, if coated by the hot process.

(5) No distortion or buckling in the coating of flat surfaces as with the hot process.

Its disadvantages are:—

(1) The time required is much greater than with the hot process.

(2) It is very difficult to obtain a thick, non-spongy coat.

(3) The coating is usually not as bright as that obtained with hot galvanizing.

(4) Much greater care is required and greater difficulties are encountered to obtain a correct coat than with hot galvanizing.

(5) For articles that have to be made watertight the electrolytic process does not have the same "soldering" effect as the hot process.

To show clearly the difference between the coatings of the hot and cold methods of galvanizing, figs. 5 and 6 should be closely compared.

Many different solutions for the electrolyte are used in connection with the cold process, but the basis of all of them is zinc sulphate.

Sherardizing.—This consists of heating the material to be coated in metal drums or boxes whilst being surrounded with zinc dust containing metallic zinc. This process is particularly suitable where a thin clear protection coat is required, where the pattern or design on the article will not be interfered with, but it can only be applied to comparatively small articles.

Metallic Spraying.—This is a process which consists of applying a fine spray of molten zinc to the surface of the steel, which has been previously cleaned and warmed. In this process the zinc in the form of a wire or strip is fed at a uniform rate through an oxy-hydrogen or other flame, or through the electric arc, and from these projected on to the surface which is required to be coated. In practice a specially prepared metal spray pistol is used for producing the spray. This method seems to offer some promising results in the way of coating large vessels whilst they are fixed in position. The metal coating, of course, does not alloy with the base metal but simply adheres to it almost the same as a coating of paint or varnish. (See WIRE AND WIRE MANUFACTURES.)

(E. A. A.)

GALVESTON, a city of south-eastern Texas, U.S.A., on the Gulf of Mexico; a port of entry and headquarters of a customs district, the county seat of Galveston county, the leading cotton shipping port in the United States, and one of the leading exporters of wheat. It occupies 8 sq.m. extending across Galveston island, near the eastern end, and is connected with the mainland by a causeway of earth and concrete 2m. long, which carries the railroad tracks and a road for vehicles and pedestrians. Galveston is the southern terminus of the Colorado-to-Gulf and the Meridian highways; and is served by the Galveston, Houston and Henderson, the Missouri-Kansas-Texas, the Missouri Pacific, the Santa Fe, and the Southern Pacific railways, and by 75 steamship lines, operating to all the principal ports of the world. The population in 1920 was 44,255, of whom 6,892 were foreign-born white and 9,888 were negroes; and was 52,938 in 1930 by the Federal census.

The south side of the city, on the gulf, is protected by a massive concrete sea-wall, 17ft. high and 7½m. long, below which stretches a fine bathing beach of hard, clean sand. A wide boulevard, starting from the north-east corner of the city, follows the sea-wall, passing the principal hotels and the beach resorts, to Ft. Crockett and the Air Corps flying field at the south-west corner. The climate is mild and comparatively equable. There is sunshine for 65% of the possible hours in the year, and the normal monthly mean temperature ranges from 53.8° F in January to 83.4° in July. The city is both a summer and a winter resort.

The harbour, stretching along Galveston channel on the north side of the city, has berthing space for 100 ocean-going steamers. Deepening of the channel from 30ft. to 32ft., with an over-depth of 2ft. to allow for siltage, is under way. Waterfront facilities have been developed chiefly by the Galveston Wharf Company, in which the city owns one-third interest. Two of the railways and the principal oil companies have their own piers. There is 3,000,000 sq.ft. of covered storage space on the waterfront. Storage facilities for cotton provide for 2,000,000 bales, and the grain elevators have a capacity of over 5,000,000 bushels. Except for oil, most of the traffic is of a through character. Cargo moves rapidly, as rail and water facilities are well co-ordinated and no lighters are used. The average detention of freight cars at the port is less than three days. In 1916, 1,146 ships cleared for foreign ports and 530 for American ports. The total commerce of the port was valued at \$688,403,560, of which \$288,371,327 represented exports to foreign countries (chiefly cotton, cotton-seed products, sulphur, crude and refined oil, grain and lumber), and \$24,755,766 represented imports (chiefly raw sugar from Cuba, coffee, crude oil and novelties). The value of all the cotton passing through the port was \$454,158,000, nearly as much as for all the other ports of the country combined. The assessed valuation of property in 1927 was \$57,142,449. Manufacturing is less important than commerce, but the factories within the city had an output in 1925 valued at \$13,356,288. There are large flour and rice mills, sugar refineries, the only wire and nail factory in the State, a bagging factory, cottonseed oil mills and a new cotton mill (1927) operating 14,000 spindles. The medical branch of the University of Texas is at Galveston. The Federal Government maintains life-saving, immigration, and quarantine stations, and in 1927 appropriated \$700,000 for a marine hospital. Ft. Crockett is headquarters of the third attack group of the air service.

Galveston Bay was named about 1782 by Spanish explorers, probably after Bernardo de Galvez, governor of Louisiana. In the early days of the 19th century it was the chief rendezvous of the notorious Jean Lafitte and his band of buccaneers and pirates, who were finally dispersed by United States authorities about 1820. The first settlement from the United States was made in 1837, and the town was incorporated by the Republic of Texas in 1839. In 1900, a West Indian hurricane, blowing steadily for 18 hours and reaching a velocity of 135m. an hour, piled up enormous waves which swept across most of the city. About 5,000 lives were lost, and the property loss was estimated at \$17,000,000. The city was rebuilt rapidly on a more substantial scale and measures were taken which constitute thorough protection against the recurrence of such a disaster; the sea-wall was constructed 1.5ft.

higher than the high-water mark of the storm and 7.5 ft. above the previous record; the causeway was built to take the place of several bridges that had been washed away; and the entire grade of the city was raised from one to 15 ft. above the old level.

In the crisis created by the storm the city Government proved so inefficient that the Deepwater Commission (commercial experts concerned with developing the harbour) practically took control, and prepared a charter providing for Government by a board to be appointed by the governor of the State. A modification of this plan was in effect for a time, but in 1901 a third charter was adopted, providing for a commission form of Government (since known as the "Galveston Plan"), which is still in force and which has had a wide influence on municipal Government in the United States. The commerce of the port increased 150% between 1910 and 1925.

GALVESTON AND BRAZOS CANAL, in the United States, connects Galveston, Texas, and Brazos River, Texas, and opens inland navigation 150 m. for vessels requiring 4 ft. draught of water. It is 38 m. long and cost about \$500,000.

GALWAY, a county in the west of Ireland, in the province of Connaught, bounded north by Mayo and Roscommon; east by Roscommon, Offaly county and Tipperary; south by Clare and Galway bay; and west by the Atlantic ocean. With an area of 1,467,850 ac., the county is second in size to Cork among Irish counties. To the east of Lough Corrib the surface rests on a limestone base and has extensive bogs. Its southern portion is partly a continuation of the Golden Vale of Limerick and partly occupied by the Slieve Aughty mountains (highest points c. 1,200–1,250 ft.) in which Silurian and Devonian rocks appear. A broad mass of ice-worn gneiss and granite lies west of Lough Corrib, and its steep edge towards Galway bay suggests an east to west line of fracture. Quartzites, associated with limestone and mica-schist stand out in the Twelve Bens or Pins (highest point, 2,395 ft.). The coast is much indented and studded with islands, providing safe anchorages for fishing vessels.

The Suck, which forms the eastern boundary of the county, rises in Roscommon, and passing by Ballinasloe, unites with the Shannon at Shannonbridge. The Shannon forms the south-eastern boundary of the county, and passing Shannon Harbour, Banagher, Meelick and Portumna, swells into the great expanse of water called Lough Derg, which skirts the county as far as the village of Mount Shannon. The Clare flows southward through the centre of the county, and enters Lough Corrib 4 m. above the town of Galway. The Ballynahinch, one of the best salmon-fishing rivers in Connaught, rises in the Twelve Pins, passes through Ballynahinch lake, and enters Bertraghboy bay. Lough Corrib extends from Galway town northwards over 30,000 ac., with a short of 50 m. in extent, and is studded with islands, some of them inhabited. The district west of Lough Corrib contains many lakes, about 25 of them more than a mile in length. There are also several low tracts, called turloughs, which are covered with water during a great part of the year.

History.—Galway was made a county about 1579 by Sir Henry Sydney, lord deputy of Ireland. The round tower at Kilmacduagh is 112 ft. high, leaning considerably out of the perpendicular. Rathes or encampments are numerous, and several cromlechs are in good preservation. Knockmoy abbey, about 6 m. from Tuam, probably founded in 1180 by Cathal O'Connor, was adorned with fresco paintings, valuable as representations of ancient Irish costumes. Castles and square towers of the Anglo-Norman settlers are numerous. The castle of Tuam was built in 1161 by Roderick O'Connor, king of Ireland, at the period of the English invasion. The small church of Clonfert, with a Romanesque doorway, is a cathedral, the diocese of which was united with Kilfenora, Kilmacduagh and Killaloe in 1833.

Climate and Industries.—The climate is mild, but violent westerly winds are common. Frost or snow seldom remains long on the western coast, and cattle continue unhoused during the winter. The eastern part of the county produces the best wheat. Oats are frequently sown after potatoes in moorland soils. The flat shores of the bays afford large supplies of seaweed for manure.

Limestone, gravel and marl are to be had in most other parts. When manure for potatoes is scarce the usual practice is to pare and burn the surface. In many places on the seashore early potatoes are raised in deep sea-sand manured with seaweed, and the crop is succeeded by barley. Sheep-walks occupy a very large tract between Monivea and Galway and between Athenry and Kinvarra. Pigs and poultry are extensively reared, but a large area is quite barren.

Manufactures are controlled by local demand. Coarse friezes, flannels and blankets are made in all parts and sold largely in Galway and Loughrea. Connemara is noted for hand-knit woollen stockings. Coarse linen called bundle linen is also made. Galway and Clifden are centres of the fishing industry. Black marble is quarried near Galway and red marble is worked at Shantallow. Leenane, at the head of Killary harbour, Renvyle House at its entrance, Letterfrack on Ballynakill bay, Streamstown and Clifden, and Cashel on Bertraghboy bay are fishing villages much frequented by tourists. Recess, near Lough Derryclare, and Ballynahinch, on the lough of that name, are inland tourist centres.

The population of Galway county in 1926 was 169,311. Ballinasloe and Galway are urban districts and Loughrea and Tuam are towns. The county returns nine members to Dáil Eireann.

GALWAY, a seaport and county town of Co. Galway, Ireland, on the north shore of Galway bay, and on the Great Southern railway. Pop. of urban district (1926), 13,255. After the building of its walls (c. 1270) it developed commercially. Richard II.'s charter of incorporation, confirmed by Henry IV., was extended in 1545 to give the port jurisdiction over the Aran islands, and to permit exportation of all goods other than linens and woollens. A charter from James I. formed the town and the land within a radius of 2 m. into a county. During the Civil Wars of 1641, the town surrendered to the Parliamentary forces. The inhabitants were dispersed and their property given to adventurers and soldiers. During the campaigns of William III., the town was again captured.

Lynch's Castle is Spanish in style, with a square central court. St. Nicholas church, a cruciform building founded in 1320, was collegiate from 1484 until 1840, and Edward VI. created the Royal College of Galway in connection with it. There are remains of a Franciscan friary founded in 1296, and the town is the seat of a Roman Catholic diocese. University college, a quadrangular building in Tudor-Gothic style, was founded as Queen's college under an act of 1845, and its name was changed when it received a new charter in 1908.

Claddagh, a suburb, is engaged in sea and salmon fisheries. The harbour is connected with Lough Corrib. The chief exports are wool, agricultural produce and black marble, polished locally. Other establishments are corn-mills, iron-foundries, distilleries, and brush and bag factories.

GAMA, VASCO DA (c. 1460–1524), Portuguese navigator and discoverer of the sea-route to India, was born at Sines, a small seaport in the province of Alemtejo, probably about the year 1460. In that year died Prince Henry the Navigator, to whose intelligence and foresight must be traced back all the fame that Portugal gained on the seas in the 15th and 16th centuries. Explorers sent out at his instigation discovered the Azores and unknown regions on the African coast, whence continually came reports of a great monarch, "who lived east of Benin, 350 leagues in the interior, and who held both temporal and spiritual dominion over all the neighbouring kings." John II. of Portugal resolved that the attempt should be made to reach the country of this potentate, and nine years later, when Emanuel I. had succeeded to the throne, preparations for the voyage were completed.

For the supreme command of this expedition the king selected Vasco da Gama, who had in his youth fought in the wars against Castile, and had gained distinction as an intrepid mariner. The fleet, consisting of four vessels specially built for this mission, sailed down the Tagus on July 9, 1497, after prayers and confession made by the officers and crews in a small chapel on the site where now stands the church of S. Maria de Belem (*see LISBON*), afterwards built to commemorate the event. Four months later the flotilla cast anchor in St. Helena Bay, South Africa, rounded the

Cape in safety, and in the beginning of the next year reached Malindi, on the east coast of Africa. Thence, steering eastward, under the direction of a pilot obtained from Indian merchants met with at this port, da Gama arrived at Calicut, on the Malabar coast, on May 20, 1498, and set up, according to the custom of his country, a marble pillar as a mark of conquest and a proof of his discovery of India. His reception by the zamorin, or Hindu ruler of Calicut, would probably have been favourable enough, but for the jealousy of the Mahommedan traders who incited the Hindus against the new-comers. Da Gama was unable to establish a Portuguese factory, and returned to Portugal in Sept. 1499. The king received him with every mark of distinction, granted him the use of the prefix *Dom*, thus elevating him to the rank of an untitled noble, and conferred on him pensions and other property.

In prosecution of da Gama's discoveries another fleet of thirteen ships was immediately sent out to India under Pedro Alvares Cabral, who, in sailing too far westward, by accident discovered Brazil, and on reaching his destination established a factory at Calicut. The natives, again instigated by the Mahommedan merchants, rose up in arms and murdered all whom Cabral had left behind. To avenge this outrage a powerful armament of ten ships was fitted out at Lisbon, the command of which was at first given to Cabral, but was afterwards transferred to da Gama, who received the title admiral of India (Jan. 1502). A few weeks later the fleet sailed, and on reaching Calicut da Gama immediately bombarded the town, treating its inhabitants with a savagery too horrible to describe. From Calicut he proceeded in Nov. to Cochin, "doing all the harm he could on the way to all that he found at sea," and having made favourable trading terms with it and with other towns on the coast, he returned to Lisbon in Sept. 1503, with richly laden ships. He and his captains were welcomed with great rejoicings and he received additional privileges and revenues.

Soon after his return da Gama retired to his residence in Evora. However he continued to advise King Emanuel I. on matters connected with India and maritime policy up to 1505, and there are extant twelve documents dated 1507-22 which prove that he continued to enjoy the royal favour: The most important of these is a grant dated Dec. 1519 by which Vasco da Gama was created count of Vidigueira, with the extraordinary privileges of civil and criminal jurisdiction and ecclesiastical patronage. During this time the Portuguese conquests increased in the East, and were presided over by successive viceroys. The fifth of these was so unfortunate that da Gama was recalled from his seclusion by Emanuel's successor, John III., and nominated viceroy of India, an honour which in April 1524 he left Lisbon to assume. Arriving at Goa during Sept. of the same year, he immediately set himself to correct abuses, but he died on Dec. 24, at Cochin. His voyage opened up the commerce of the East to the Western world.

BIBLIOGRAPHY.—*Vasco da Gama's First Voyage*, by Dr. E. Ravenstein (London, Hakluyt Society, 1898, is a translation with notes, etc., of the anonymous *Roteiro* (Journal or Itinerary), written by one of Vasco da Gama's subordinates who sailed on board the "S. Raphael," which was commanded by the admiral's brother Paulo da Gama. This is the most important of the original authorities; five accounts of the voyage in letters contemporary with it are appended to the Hakluyt Society's translation. See also J. de Barros, *Decadas da India* (Lisbon, 1778-88, written c. 1540); F. L. de Castanheda, *Historia do descobrimento da India* (Coimbra, 1551, largely based on the *Roteiro*); *The Three Voyages of Vasco da Gama and his Viceroyalty*, by Gaspar Correa (Hakluyt Society, 1869), chiefly valuable for the events of 1524; *The Lusiads* of Camoens, the central incident in which is Vasco da Gama's first voyage; *Calcoen* (i.e., Calicut), a Dutch Narrative of the Second Voyage of Vasco da Gama, written by some unknown seaman of the expedition, printed at Antwerp about 1504, reprinted in facsimile, with introduction and translation, by J. Ph. Berjeau (London, 1874); Thomé Lopes, narrative (1502) in vol. i. of Ramusio.

GAMALIEL. This name, which in Old Testament times figures only as that of a prince of the tribe of Manasseh (Num. i. 10, etc.), was hereditary among the descendants of Hillel. Six persons bearing the name are known.

1. **GAMALIEL I.**, a grandson of Hillel, and like him designated the Elder, by which is apparently indicated that he was a member of the Sanhedrin. According to tradition Gamaliel succeeded his grandfather and his father as *Nāsi*, or president of the Sanhe-

drin. Though this tradition does not correspond with historic fact, and merely reflects later conditions after A.D. 70, it is at any rate certain that Gamaliel took a leading position in the Sanhedrin, and enjoyed the highest repute as teacher of the Law. He was the first to whose name was prefixed the title *Rabban* (Master, Teacher). It is related in Acts (v. 34 sqq.) that he intervened in the Sanhedrin in favour of the Disciples of Jesus and in this connection he is referred to as a Pharisee of wide repute. In the Mishna (*Gittin* iv. 1-3) he is spoken of as the author of certain legal ordinances affecting the welfare of the community. His function as a teacher is proved by the fact that the Apostle Paul boasts of having sat at the feet of Gamaliel (Acts xxii. 3). Of his teaching, beyond the saying preserved in Aboth. i. 16, which enjoins the duty of study and of scrupulousness in the observance of religious ordinances, little is elsewhere preserved. His renown in later days is summed up in the words (Mishna, end of *Sotah*): "When Rabban Gamaliel the Elder died, regard for the Torah (the study of the Law) ceased, and purity and piety died."

2. **GAMALIEL II.**, grandson of Gamaliel I. To distinguish him from the latter he is also called Gamaliel of Jabneh. In Jabneh (Jamnia), where during the siege of Jerusalem the scribes of the school of Hillel had taken refuge by permission of Vespasian, a new centre of Judaism arose under the leadership of the aged Johanan ben Zakkai, a school whose members inherited the authority of the Sanhedrin of Jerusalem. Gamaliel II. became Johanan ben Zakkai's successor, and rendered immense service in the strengthening and reintegration of Judaism, which had been deprived of its former basis by the destruction of the Temple and by the entire loss of its political autonomy. He put an end to the division which had arisen between the spiritual leaders of Palestinian Judaism by the separation of the scribes into the two schools called respectively after Hillel and Shammai. Gamaliel was recognized by the Roman Government as Patriarch. He devoted special attention to the regulation of the rite of prayer, which after the cessation of sacrificial worship had become all-important. He gave the principal prayer, consisting of eighteen benedictions, its final revision, and declared it every Israelite's duty to recite it three times daily. He died before the insurrections under Trajan. His son, Simon, long after his father's death and after the persecutions under Hadrian, inherited his office, which thenceforward his descendants handed on from father to son.

3. **GAMALIEL III.**, son of Jehuda I., the redactor of the Mishna, and his successor as *Nāsi* (Patriarch). The redaction of the Mishna was completed under him, and some of his sayings are incorporated therein (Aboth ii. 2-4). Gamaliel III. lived during the first half of the third century.

4. **GAMALIEL IV.**, grandson of the above, patriarch in the latter half of the third century: about him very little is known.

5. **GAMALIEL V.**, son and successor of the Patriarch Hillel II.: beyond his name nothing is known of him. He lived in the latter half of the fourth century.

6. **GAMALIEL VI.**, grandson of the above, the last of the patriarchs, died in 425. (W. BA.; G. H. B.)

GAMBETTA, LÉON (1838-1882), French statesman, was born at Cahors on April 2, 1838. In his sixteenth year young Gambetta lost by an accident the sight of his left eye, which eventually had to be removed. Notwithstanding this privation, he highly distinguished himself at the public school of Cahors, and in 1857 proceeded to Paris to study law. His southern vehemence gave him great influence among the students of the Quartier Latin, and he was soon known as an inveterate enemy of the imperial government. He was called to the bar in 1859. In 1868 he defended the journalist Delescluze, prosecuted for having promoted the erection of a monument to Baudin, who was killed in resisting the *coup d'état* of 1851. Gambetta seized his opportunity and assailed both the *coup d'état* and the government with an eloquence of invective which made him immediately famous.

In May 1869 he was returned to the Assembly, both by the first circumscription of Paris and by Marseilles, defeating Hippolyte Carnot for the former constituency and Thiers and Lesseps for the latter. He elected to sit for Marseilles, and lost no oppor-

tunity of attacking the Empire in the Assembly. He was at first opposed to the war with Germany, but when it had become inevitable, he threw himself with all his energy into the work of national defence. After Sedan Gambetta himself proclaimed the fall of the emperor at the *corps législatif*, and the establishment of the republic at the *hôtel de ville*. He was minister of the interior in the new government of national defence. He advised his colleagues to leave Paris and conduct the government from some provincial city. This advice was rejected from dread of another revolution in Paris, and a delegation to organize resistance in the provinces was despatched to Tours, but when this was seen to be inefficient Gambetta himself (Oct. 7) quitted Paris in a balloon, and upon arriving at Tours took the supreme direction of affairs as minister of the interior and of war. Aided by M. de Freycinet, then a young officer of engineers, as his assistant secretary of war, he organized an army, which might possibly have effected the relief of Paris if Metz had held out, but after the surrender of Bazaine and the defeat of the French near Orleans early in December the seat of government had to be transferred to Bordeaux. When Paris surrendered at the end of January, Gambetta submitted to the capitulation concluded with Prince Bismarck. He immediately resigned his office. Elected by nine departments to the National Assembly meeting at Bordeaux (March 1, 1871) he chose to sit for Strasbourg, which by the terms of the treaty was to be ceded to Prussia, and when the treaty was adopted by the Assembly he resigned in protest and retired to Spain.

He returned to France in June, was elected by three departments in July, and agitated for the definitive establishment of the Republic. His new journal, *La République française*, soon became the most influential in France. His orations at Bordeaux on his return, and at Grenoble on Nov. 26, 1872, in which he spoke of political power having passed to *les nouvelles couches sociales* showed him at the height of his oratorical powers. But in spite of his republican convictions Gambetta urged moderation on his supporters on the fall of Thiers and the accession to power of the conservative MacMahon. His tact and parliamentary dexterity, no less than his eloquence, secured the voting of the constitution in Feb. 1875. This policy he continued during the early days of the now consolidated Republic, and gave it the appropriate name of "opportunism." It was not until May 4, 1877, when the peril from reactionary intrigues was notorious, and the clerical party had begun a campaign for the restoration of the temporal power of the pope, that he delivered his famous speech denouncing "clericalism" as "the enemy." On May 16 MacMahon perpetrated his parliamentary *coup d'état* in support of the clerical reactionaries and on Aug. 15, Gambetta, in a speech at Lille, gave him the alternative *se soumettre ou se démettre*. He roused the republican party throughout France in a campaign which culminated in a speech at Romans (Sept. 18, 1878) formulating its programme. MacMahon had no choice but to dismiss his advisers and form a moderate republican ministry under the premiership of Dufaure.

After the abdication of MacMahon, Gambetta declined to become a candidate for the presidency, but gave his support to Grévy; nor did he attempt to form a ministry, but accepted the office of president of the chamber of deputies (Jan. 1879). This position did not prevent his occasionally descending from the presidential chair to make speeches, one of which, advocating an amnesty to the communards, was especially memorable. Although he really directed the policy of the various ministries, he maintained a neutral attitude as far as possible; but events hurried him on, and early in 1881 he placed himself at the head of a movement for restoring the *scrutin de liste* in place of *scrutin d'arrondissement*. A bill to re-establish *scrutin de liste* was passed by the Assembly on May 19, 1881, but rejected by the Senate on June 19.

Gambetta's supporters were in a large majority, and on the reassembling of the chamber, he formed a ministry—known as *Le Grand Ministère*. Every one suspected him of aiming at a dictatorship; attacks, not the less formidable for their injustice, were directed against him from all sides, and his cabinet fell on

Jan. 26, 1882, after an existence of only sixty-six days. His declarations leave no doubt that he would have cultivated the British alliance and co-operated with Great Britain in Egypt; and when the Freycinet administration shrank from that enterprise only to see it undertaken with signal success by England alone, Gambetta's foresight was quickly justified. His fortunes were in the balance. At his house in Ville d'Avray, near Sèvres, on Nov. 27, 1882, he was shot in the hand by a revolver which accidentally went off. He died on Dec. 31, as the result of this accident.

REAL STATESMANSHIP

Gambetta rendered France three inestimable services: by preserving her self-respect through the gallantry of the resistance he organized during the German War, by his tact in persuading extreme partisans to accept a moderate Republic, and by his energy in overcoming the usurpation attempted by the advisers of MacMahon. His death cut short a career which had given promise of still greater things, for he had real statesmanship in his conceptions of the future of his country, and a potent eloquence to secure their acceptance. The romance of his life was his liaison with Léonie Léon (d. 1906), with whom Gambetta fell in love in 1871. Gambetta himself constantly urged her to marry him during this period, but she always refused, fearing to compromise his career; she remained, however, his confidante and intimate adviser in all his political plans. The date of the marriage had been fixed, when the accident which caused his death occurred in her presence. It is certain that there was no question of suicide. Their correspondence is of absorbing interest. But in various matters of detail the serious student of political history must be cautious in accepting her later recollections.

Gambetta's *Discours et plaidoyers politiques* were published by J. Reinach in 11 vols. (1881-86); his *Dépêches, circulaires, décrets . . .* in 2 vols. (1886-91). The principal biographies are J. Reinach, *Léon Gambetta* (1884), *Gambetta orateur* (1884) and *Le Ministère Gambetta, histoire et doctrine* (1884); Neucastel, *Gambetta, sa vie, et ses idées politiques* (1885); J. Hanlon, *Gambetta* (1881); Dr. Laborde, *Léon Gambetta, biographie psychologique* (1898); P. B. Gheusi, *Gambetta, Life and Letters* (Eng. trans. by V. M. Montagu, 1910); P. Deschanel, *Gambetta* (1919). See also G. Hanotaux, *Histoire de la France contemporaine* (1903, etc.); H. Stannard, *Gambetta and the Foundations of the Third Republic* (1921). F. Laur's *Le Cœur de Gambetta* (1907, Eng. trans., 1908) contains the correspondence with Léonie Léon; see also his articles on "Gambetta and Bismarck" in *The Times* of Aug. 17 and 19, 1907, with the correspondence arising from them.

GAMBIA, the smallest and most northerly of the British West African dependencies. It consists of a stretch of land on both sides of the Lower Gambia. The colony, with the protectorate dependent upon it, has an area of approximately 4,000 sq.m. and a population (1921) of 210,530, an increase of 60,000 in ten years. The colony proper has an area of about 69 sq. miles. The protectorate consists of a strip of land extending 10 km. (about 6 m.) on each side of the river to about 200 m. in a direct line (250 m. by the river) from the sea. The land outside these limits is French.

Physical Features.—The country derives its character and value from the river Gambia (*q.v.*), which is navigable throughout and beyond the limits of the protectorate. Away from the swamps by the river banks, the country is largely "bush." The region above McCarthy's island is hilly. The fauna includes a few maneless lions, a few elephants, leopards, several kinds of antelope, monkeys, bush-cow and wild boar. Hippopotami are found in the upper part of the river, and crocodiles abound in the creeks. The birds most common are bush-fowl, bustards, guinea fowl, quail, pigeon and sand-grouse. Bees are very numerous in parts of the country. The flora resembles that of West Africa generally, the mangrove being common. Mahogany and rosewood (*Pterocarpus erinaceus*) trees are found, though not in large numbers, and the rubber-vine and oil-palm are also comparatively scarce. There are many varieties of fern. The cassava (manioc) and indigo plants are cultivated.

The climate during the dry season (December-May) is considered fairly healthy for Europeans. The mean temperature at Bathurst is 77° F, the shade minimum being 56° and the solar maximum 165°. Up river the variation in temperature is even greater than at Bathurst, from 50° in the morning to 100°-104°

at 3 P.M. being common at McCarthy's isle. The rainfall varies from 35 to 65 or more inches a year, the average is about 50 in. a year. Save for showers in May and June there is rarely any rain except between July and October. A very dry east wind known as the *harmattan* blows intermittently from December to March.

The inhabitants, who are both thrifty and industrious, are almost entirely of negro or negroid race, the chief tribes represented being the Mandingo (*q.v.*), the Jolof and the Jola. Numbers of Fulani (*q.v.*) are also settled in the country. Some four-fifths of the natives are Mohammedans. Of the remainder, considerable numbers are converts to Christianity. The European residents are officials, traders or missionaries.

The capital, and the only town of any size in the Gambia, is Bathurst, pop. (1921) 9,227, including 265 Europeans (130 British). It is built on St. Mary's island, which lies at the mouth of the river, near its south bank, and is connected with the mainland by a bridge across Oyster creek. Founded in 1816, it is named after the 3rd earl of Bathurst, then Secretary of State for the Colonies. Bathurst is a fairly well-built town, the chief material employed being red sandstone. It lies about 12 to 14 ft. above the level of the river. The principal buildings face the sea. The market place is shaded by a fine avenue of bombax and other wide-spreading trees. A trading station called Georgetown is situated on McCarthy's island, but the chief up-river port is Kuntaur (150 m. from Bathurst). At Kuntaur ships drawing up to 17 ft. can berth alongside. Albreda is a small port on the north bank of the river, near its mouth, of some historic interest.

Products and Trade.—Ground-nuts (*Arachis hypogaea*) are the staple product for export, and millet and rice are the staple food of the people. The curing of hides, the catching and drying of fish, boat-building, and especially the weaving of cotton into cloths called *pagns*, are minor occupations. Formerly the principal exports besides slaves, were gold-dust, wax and hides, the gold being obtained from the Futa Jallon district, farther inland. Between 1830 and 1840 from 1,500 to 2,000 oz. of gold were exported annually, but shipments ceased soon afterwards, though small quantities of gold-dust can still be obtained from native goldsmiths. The cultivation of the ground-nut, first exported in 1830, assumed importance by 1837, and by 1850 had become the chief industry of the country. Nearly the whole male population is engaged in it for eight months of the year. Planted in June, after the early rains, the crop is reaped in the months of October or November. Owing to the efforts of the Agricultural Department, established in 1924, the quality and the quantity of the nuts exported from the Gambia increased, the output in 1927 being about 70,000 tons as against some 40,000 tons in 1907. Apart from ground-nuts the agricultural resources are little developed, and food crops have often to be imported.

Surrounded, save seaward, by French territory, the Gambia is dependent upon its own resources, for while there is some entrepôt trade, the French, in general, prefer to send their exports to their own ports rather than use the fine highway provided by the river Gambia. As it is, a good proportion of the trade is with France, which before the World War took some 75% of the ground-nuts exported. The nuts were sent to Marseilles for the extraction of the oil, which found its way to markets as "olive" oil. During the war the nuts went to England; since 1925 they have gone in fairly equal proportions to England, France and Holland. The oil now forms a main ingredient of margarine. The other exports include palm-nuts and hides, but are almost negligible. The chief imports are cotton goods (from England), kola-nuts (from Sierra Leone), rice, sugar and tobacco. The volume of trade had risen from about £600,000 annually in the period 1898–1907 to some £1,500,000 in 1914. There was an abnormal increase during and immediately after the war (in 1920 the volume of trade was nearly £5,000,000). In 1923, which may be regarded as a normal year, the volume of trade exceeded £1,710,000. In 1927 the value of exports was £999,000 and of the total the ground-nuts were worth £967,000. In the same year the value of imports was £863,000. The balance of exports over imports in the decade 1916–26 averaged £140,000 yearly. Shipping is chiefly British (771,000 tons in 1926 out of a total of 1,255,000 tons), with

French and German ships next in order.

Administration and Revenue.—The Gambia is governed on Crown Colony lines, with a nominated legislative council including unofficial members. Education is almost wholly in the hands of Christian missions, which receive small grants; there is a school for Mohammedans at Bathurst very largely supported by the Government. The protectorate is divided into five provinces, with an official, styled "travelling commissioner," in each. Native law courts are established; from them appeals may be made to the supreme court at Bathurst. Between 60 and 70% of revenue is derived from customs duties; an export duty of 5s. a ton was first imposed on ground-nuts in 1862; the duty was raised in 1874 to 6s. 8d., and in 1920 to £1. A "yard" or hut tax, averaging 10d. a head, is levied in the protectorate. Revenue, which in 1906 for the first time exceeded £60,000, was in 1927, £252,000.

HISTORY

The Portuguese visited the Gambia in the 15th century, and in the beginning of the 16th century were trading in the lower river. Apart from a traffic in slaves their main object was to reach "the land of gold" supposed to be not far distant, and in fact considerable quantities of gold reached the lower Gambia from Bambara. It was on the initiative of Portuguese living in England that Queen Elizabeth, in 1588, granted a patent to "certain merchants of Exeter and others of the west parts and of London for a trade to the river of Senega and Gambia in Guinea." This company's operations led to no permanent settlement in the Gambia. In 1618 James I. granted a charter to "the Company of Adventurers of London trading into Africa," formed at the instigation of Sir Robert Rich, afterwards earl of Warwick, for trade with the Gambia and the Gold Coast. This company sought to open up trade with Timbuktu, then believed to be a great mart for gold. Timbuktu was not reached, and the company's first agent, George Thompson, was murdered by natives after his ship, the "Catherine," had been seized and the crew murdered by Portuguese and half-castes. Dutch traders now appeared and about 1660 a merchant named Vermuyden asserted that he had reached from the Gambia a country full of gold.

The Company of Adventurers had built a fort near the mouth of the Gambia. This was superseded in 1664 by a fort built by Captain (afterwards Admiral Sir Robert) Holmes on a small island 20m. from the mouth of the river and named Fort James, in honour of the duke of York (James II.). This fort was built expressly to defend the British trade against the Dutch, and from that time the British remained in permanent occupation of one or more ports on the river. In 1723 Captain Bartholomew Stibbs was sent out by the Royal African Company, which had succeeded the earlier companies, to verify Vermuyden's reports of gold. He proceeded 60m. above the Barraconda falls, but the land of gold was not found. From the 17th century the French had been rivals for the trade of the Gambia, but the treaty of Versailles in 1783 assigned the trade in the river to Britain, reserving, however, Albreda for French trade, while it assigned the Senegal to France, with the reservation of the right of the British to trade at Portendic for gum. This arrangement remained in force till 1857, when an exchange of possessions was effected and the lower Gambia became a purely British river. In the period between the signing of the treaty of Versailles and 1885 the small territories which form the colony proper were acquired by purchase or cession from native kings. During this period the colony had gone through an economic crisis by the abolition of the slave trade (1807), which had been since 1662 its chief financial support. The beginning of a return to prosperity came in 1816 when some British traders, obliged to leave Senegal on the restoration of that country to France after the Napoleonic wars, founded a settlement on St. Mary's isle. From that year the existing colony, as distinct from trading on the river, dates. The Gambia witnessed many administrative changes. When the slave trade was abolished, it became dependent upon Sierra Leone; in 1843 it was made an independent colony, its first governor being Captain Henry Frowd Seagram, R.N. In 1866 the Gambia became a portion of the officially styled "West African Settlements," but in 1888 it

regained, and has retained, a separate entity.

In 1870 negotiations were opened between France and Great Britain on the basis of a mutual exchange of territories in West Africa. Suspended owing to the outbreak of the Franco-Prussian War the negotiations were resumed in 1876. "Definite proposals were at that time formulated by which the Gambia was to be exchanged for all posts held by France between the Rio Pongas (Pongo river, French Guinea) and the Gabun. This would have been a comprehensive and intelligible arrangement, but so strong a feeling in opposition to any cession of British territory was manifested in parliament, and by various mercantile bodies, that the government of the day was unable to press the scheme." (Despatch of Lord Salisbury to the British ambassador to France, March 30, 1892.) Nothing was done, however, to secure for the Gambia a suitable *hinterland*; the French pressed forward from Senegal and when the boundaries were settled by the Anglo-French agreement of Aug. 10, 1889, Great Britain was able to secure only a ten-kilometre strip on either side of the river as far inland as Yarbata, a town situated at the limit of navigability of the Gambia from the sea. By Art. 5 of the Anglo-French convention of April 8, 1904, Yarbata was ceded to France, with the object of giving that country a port on the river accessible to sea-going merchantmen. No use was made of this privilege, the French preferring to divert trade to their own ports. Thus the Gambia has remained without access to the interior, an example of how political barriers can stifle the development of commerce.

The people of the protectorate are in general prosperous and contented. There was occasional trouble with slave-raiding chiefs; in particular with Fodi Silla who in 1894 ambushed a force under Capt. E. H. Gamble, R.N., the British losing 15 killed and 47 wounded. Another slaver, Fodi Kabba, was also a thorn in the side of the Government. With the co-operation of the French his stronghold (in French territory) was stormed and Fodi Kabba killed, March 1901. After that slave raiding ceased and the country enjoyed peace. Provision was moreover made by an ordinance of 1906 for the extinction of slavery itself throughout the protectorate. The Gambia has been self-supporting since 1871 and has weathered various economic crises, such as that of 1922, for example, when the French five-franc piece—the usual currency—was demonetized at the cost of a whole year's revenue.

See H. F. Reeve, *The Gambia* (1912), a monograph by a retired official; *The Gambia*, a British Foreign Office handbook (1920); and the Annual Reports issued by the Colonial Office, London. (F. R. C.)

GAMBIA, a large river of West Africa, and the only river of Africa navigable by ocean-going boats at all seasons for over 200 m. from its mouth. It rises in about 11° 25' N. and 12° 15' W., within 150 m. of the sea on the north-eastern escarpment of the Futa Jallon highlands. Although the distance from the source to the mouth of the river is little more than 300 m. in a direct line, the length of the stream owing to its serpentine course is about 1,000 m. It flows first N.N.E., receiving many left-hand tributaries, but about 12° 35' N. takes a sharp bend N.W. and maintains this direction until it leaves the fertile and hilly region of Bondu. The descent to the lower district is marked by the Barraconda rapids, formed by a ledge of rock stretching across the river. From the Barraconda rapids to the Atlantic the Gambia has a course of about 350 m. Throughout this distance the waters are tidal. At Yarbata, a few miles below Barraconda, the river has a breadth, even at the dry season, of over 300 ft., with a depth of 13 to 20 ft. From the falls to McCarthy's island, a distance of 200 m., the river valley, which here presents a park-like appearance, is enclosed by low rocky hills of volcanic character. For 50 m. below the island, where the stream is about 800 yds. wide, the banks of the river are steep and thickly wooded. They then become low and are fringed with mangrove swamps. From Devil's Point, a sharp promontory on the north bank, the river widens and enters the Atlantic, in about 13½° N. and 16½° W., by a broad estuary. Near the mouth on the south side is St. Mary's island (3½ m. long by 1½ broad), and opposite is Barra Point, the river being here contracted to 2½ m. Eighteen miles lower down the distance from shore to shore is 27 m. There is a sand-bar at the entrance to the river, but at the lowest state

of the tide there are 26 ft. of water over the bar. Vessels drawing 13 ft. can ascend to McCarthy's island and those drawing 6 ft. to Barraconda all the year round. The Gambia is in flood from June to November, when the Barraconda rapids can be passed by small boats, while above the rapids the stream is navigable for 160 m. Politically the Gambia is divided between Great Britain and France—Britain possessing both banks of the river up to, but not including, Yarbata.

The Gambia was one of the rivers passed by Hanno the Carthaginian in his voyage along the west coast of Africa. It was known to Ptolemy and the Arabian geographers, and was at one time supposed to be a mouth of the Nile, and, later (18th century), a branch of the Niger. It was possibly visited by Genoese navigators in 1291, and was certainly discovered by the Portuguese c. 1446, but was first explored for any distance from its mouth (1455) by the Venetian Alvise Cadamosto, who published an account of his travels at Vicenza in 1507 (*La Prima Navigazione per l'Oceano alle terre de' Negri della Bassa Ethiopia*). Afterwards the Gambia became a starting-place for explorers of the interior, among them Mungo Park, who began both his journeys (1795 and 1805) from this river. It was not until 1818 that the sources of the Gambia were reached, the discovery being made by a Frenchman, Gaspard Mollien, who had travelled by way of the Senegal and Bondu. The middle course of the river was explored in 1851 by R. G. MacDonnell, then governor of the Gambia colony, and in 1881 Dr. V. S. Gouldsbury also navigated its middle course. No native craft of any kind was seen above Barraconda.

GAMBIER, JAMES GAMBIER, BARON (1756–1833), English admiral, was born on Oct. 13, 1756, at the Bahamas, of which his father, John Gambier, was lieutenant-governor. Family interest procured him rapid promotion in the navy, which he entered in 1767, and in 1778 he was raised to the rank of post-captain and appointed to the "Raleigh," in which he took part in the capture of Charlestown (1780). He commanded the "Defence" in the war of the French Revolution. For his services in the battle of June 1 (1794) he received a gold medal and was made colonel of the marines, and the following year he became rear-admiral and a lord of the Admiralty. From 1804 he remained at the Admiralty, with a short break in 1806, until 1807, when he was given command of the Baltic fleet, which in concert with Lord Cathcart's army enforced the surrender of the Danish navy. He received the thanks of Parliament, and was rewarded with a peerage.

In 1808 he gave up his seat at the Admiralty on being appointed to the command of the Channel fleet. In this capacity he missed the opportunity of destroying the French fleet in Basque roads, by failing to give effective support to Lord Cochrane. Although he was acquitted on the charge of delay and neglect of duty by a partisan court-martial, his incompetence is undoubted. He retained command of the Channel fleet for the full period of three years. In 1814 he was made G.C.B. for his offices in negotiating a treaty of peace with the United States, and in 1830 was raised to the rank of fleet admiral. He died on April 19, 1833. Although he was an upright man himself, Lord Gambier's membership of the Admiralty was marked by scandalous maladministration, and his command of the fleet in the Bay of Biscay was equally unfortunate.

See the so-called *Memorials, Personal and Historical, of Admiral Lord Gambier* by Lady Chatterton (1861); *Minutes of a Court Martial, holden on board his Majesty's ship Gladiator on the Trial of Lord Gambier* (Portsmouth, 1809); J. Marshall, *Royal Naval Biography* (6 vol., 1823–35); J. Ralfe, *The Naval Biography of Great Britain* (4 vol., 1828); D. Cochrane, Lord Dundonald, *The Autobiography of a Seaman* (1890); and general history of the period.

GAMBOGE (gām-bōōj') (from *Camboja*, a name of the district whence it is obtained), a gum-resin from *Garcinia Hanburii* (Nat. Ord. Guttiferae), a dioecious tree with leathery, laurel-like leaves, small yellow flowers, and usually square-shaped and four-seeded fruit, indigenous to Cambodia and parts of Siam and the south of Cochin China, formerly comprised in Cambodian territory. The juice, which when hardened constitutes gamboge, is contained in ducts in the middle layer of the bark, and from this

it is procured by making incisions, bamboo joints being placed to receive it as it exudes. Gamboge occurs in commerce in cylindrical pieces, known as pipe or roll gamboge, and also, usually of inferior quality, in cakes or amorphous masses. It is of a dirty orange externally; is hard and brittle, breaks with a conchoidal and reddish-yellow, glistening fracture, and affords a brilliant yellow powder; is odourless, and has a taste at first slight, but subsequently acrid; forms with water an emulsion; and consists of from 20 to 25% of gum soluble in water, and from 70 to 75% of a resin. Its commonest adulterants are rice-flour and pulverized bark.

Gamboge is a drastic hydragogue cathartic, less active only than croton oil and elaterium. A small quantity is absorbed, adding a yellow ingredient to the urine and acting as a mild diuretic. Its irritant action on the skin may cause the formation of pustules. Gamboge is used as a pigment, and as a colouring matter for varnishes. It appears to have been first brought into Europe by merchants from the East at the close of the 16th century.

GAMBREL ROOF, a roof in which, on each side of the ridge there are two slopes, the lower more steep, the upper less so, and which has gables at the end walls. They are particularly

characteristic of American colonial work in New England, New York and New Jersey, although found in many parts of the world. The origin of their common use in America is not definitely known, and may be purely an independent invention in the effort to obtain greater head room in the attic or upper floor. In the New England examples the slope of the lower portion approximates 60° , that of the upper portion varying from 30° to 40° ; in places where Dutch influence was strong, the lower slope was more nearly 45° , and the upper about 30° , and frequently there was a large projection at the eaves. In Europe the form occurs spasmodically in work of the 17th century and later throughout the Teutonic countries, especially in Scandinavia. There are also rare examples which may be seen in the south of England. (See **ROOF**.)

GAMBRINUS, a mythical Flemish king who is credited with the first brewing of beer. His name is usually derived from that of Jan Primus, *i.e.*, Jan (John) I., the victorious duke of Brabant (1261-94), who was president of the Brussels gild of brewers; his portrait with a foaming glass of ale in his hand had the place of honour in the gild-hall, and this led in time, it is suggested, to the myth of the beer king who is usually represented with a tankard in his hand.
